At this juncture the furnace dealer should step in and demonstrate to the house owner the economy of replacing the worn out stove with a hot air furnace, and he will have no difficulty in so doing if he simply cites the facts with which he is already familiar as to the comparative merits of the two methods of heating.

I would suggest further that each dealer compile a list of the house owners of his city or town who are not provided with furnaces and devote his spare time to a careful canvass of such owners, bringing the merits and economy of the hot air furnace to their attention, and do so systematically and persistently, and sales will undoubtedly result.

Even if times are hard and money tight people will not do without heat, and it can be seen that the furnace dealer is in a good line for a close year, as his wares are a necessity, and if he presents them as such he need not fear the result.

In many towns there are public halls, schoolhouses, stores and churches which in ordinary times would possibly be heated by steam or hot water, but owing to the scarcity of money these contracts can be turned to hot air heating and afford considerable work to the dealer.

Furthermore, if there is a cessation of building throughout the country the furnace dealer will have his capital formerly invested in carrying a large stock of builders' hardware and materials unemployed, and if he chooses he can offer to the class of wage worker who is perhaps the owner of a modest house a furnace on the installment plan, so much in vogue in other lines, and thus stimulate a trade that will yield a good margin and be a reasonably safe business risk.

The low prices now ruling in this line of trade will probably continue and the tendency in prices is constantly downward, so that the market in '94 will be in the buyer's and dealer's favor as against the manufacturer, and this in itself should stimulate the demand for furnaces in 1894, and if the dealer will work his territory carefully he will have no occasion to be displeased with his sales during the coming year. Times may be close and theater tickets and party dresses very scarce, but the country will be here and the people will keep comfortable and economize if they must in the luxuries of life and not in the necessities.

(To be continued.)

Rat Tail.

BY DR. EDWARD KIRK.

When visiting stove foundries I am frequently asked to give a reason for, and a remedy to prevent, the formation of the small scar on the surface of plate known as rat tail through the New England States and by various other names in other sections of the country. Rat tail is a small scar from $\frac{1}{8}$ to 2 inches in length and from $\frac{1}{16}$ to $\frac{1}{4}$ inch wide at the widest part, and tapering off to a small point. It is generally found on covers near the outer edge and on taps near the collar, but may be found on other castings.

This scar is formed when molten iron is poured into a mold for light plate, and is forced between the two surfaces of the mold by the pressure of iron in the gate. When the iron enters a mold it does not flow evenly from the gate, but streams shoot off in different directions until they reach the extremity of the mold. Each stream or branch from the gate is then spread out by the pressure in the gate until the edges come together and the mold is filled. If the rounded edges of the streams are too cold when they come together they do not unite, and the result is a cold shot in the casting. If the iron is hot enough for the edges to unite, but is a thick, non-fluid iron, then the rounded edges on the surface of the mold that have become more chilled than the center do not unite fully and the result is a scar, which is the widest and deepest at the greatest distance from the gate where the iron is chilled to the greatest extent.

The same phenomenon is seen in plate poured with two or more ladles where the streams from different ladles are too cold when they come together. The remedy for this scar is to use a more fluid iron or place a larger gate upon the casting and fill the mold more rapidly. Scars are frequently formed on the surface of plate by the blacking, washing or rolling up before the iron until the drifferent streams come together in the mold, where it is held in one place and leaves a scar upon the surface of the plate where the iron forms over it in filling the mold. This scar is generally flat, wide and smooth, and when narrow the edges are rough and show the marks of the blacking. This scar is often due to carelessness of the molder in putting the blacking on the mold too thick, and also to the use of poor blacking. To prevent its formation put the blacking on light and use a good quality of blacking.

ODD PLATES.

J. H. Beach, one of the founders of the Bridge & Beach Mfg. Company of St. Louis, Mo., died September 21 at his home in New York City. In the year 1849 he entered the employ of the late H. E. Bridge as a clerk, and eight years later he was taken in as a partner, the firm name being changed from Bridge & Brother to that of Bridge, Beach & Co. Afterward the concern was incorporated as the Bridge & Beach Mfg. Company, the success of which is well known to the stove trade of the country. At the time of his death Mr. Beach was in the sixty-fifth year of his age.

The Michigan Stove Company favor us with a copy of the gorgeous picture of their World's Fair exhibit which they are now sending their customers. The special feature of this exhibit is the mammoth Garland cooking stove, whose hight is 25 feet, length 30 feet, and width 20 feet. Its weight is 20 tons, and it filled three cars. This great stove is in every respect, except as to size, an exact representation of one of the company's standard stoves. Supported on four pedestals, one under each foot, it forms a cover or pavilion for the company's general exhibit of fine stoves and ranges. The total size of this exhibit is 30 x 40 feet, and it is valued at $25,000. It is by common consent one of the unique features of

the great exposition. The chief of the Department of Manufactures characterized it as the most typical of all the exhibits in the great Manufactures Building, the largest building in the world. A painting of the exhibit was made by Will H. Crane, the celebrated artist, and from it were copied the pictures which are now being distributed. These pictures reproduce the colors of the original faithfully. They are so artistic as to merit the suggestion made by the company that they be framed and placed in show windows of stores. We have also received from the same company samples of transparent signs to be affixed to the glass tops of showcases, warning loungers, "Don't lean on the glass," and tastefully designed match scratchers for wall use.

The Comstock Castle Stove Company of Quincy, Ill., issued under date of September 30 a stock sheet for the month of October, 1893. The object of this sheet is to call the attention of dealers to the kind and sizes of stoves which the company can promptly ship on receipt of orders. The company state that although "a very large proportion of manufacturers of stoves closed their works during the late monetary stringency, thereby causing a very short supply," the company have by special effort kept their foundries running full so that they now have a large and well assorted stock, as indicated by the list which they publish.

The Griswold Mfg. Company of Erie, Pa., have issued under recent date a circular letter addressed to their friends in the trade. Reference is made to the marked increase of orders with which the company have been favored during the past few weeks, indicating that business is reviving and that the future is likely to show a good volume of trade. The company state that they are prepared to promptly fill orders, and suggest to customers that they indicate at once their requirements. In addition to their regular line of hollow ware and American dampers, the company call special attention to their assortment of model or toy ware for the holiday trade. They refer to the new American waffle iron with improved hinge and handle, and to their line of post boxes, cuspidors, letter presses, tobacco cutters with name plates, French waffle irons, as well as to the great variety in style and finish of their lid lifters, pokers, stove scrapers, &c.

Among the minor souvenirs distributed in Chicago is a little circular card by the makers of Buck's stoves and ranges, in representation of a monocle, or, rather, the eye without the glass. The legend on the back relates to Buck's stoves and ranges.

We have received from Secretary D. M. Thomas a copy of the report of the proceedings of the twenty-second annual meeting held by the National Association of Stove Manufacturers of the United States, at Chicago, May 31 and June 1 of the present year. The report of this meeting makes a volume of 228 pages and contains much that is of interest and value to the trade at large. The arrangement of the matter is similar to that which has been followed in previous reports, the only noticeable change being the interpolation of pages of advertising in the early part of the volume. Another feature is a buyer's guide, consisting of a list of names of concerns dealing in goods employed in the manufacture of stoves. The report concludes with an index of the advertisers and a copy of the constitution and by-laws of the National Association. The interleaving with colored advertisements may be commendable from a financial point of view, but hardly from any other point of view.

J. H. Moses, an enterprising stove dealer at Croton Falls, N. Y., is at present visiting the Metropolis for the purpose of making his usual fall purchases. During his sojourn he will be the guest of George H. Butcher of Southard, Robertson & Co.

"Compliments of Peninsular Stove Company, Detroit, Chicago, Buffalo," is the inscription in raised letters upon the back of a nickel plated easel which the company named are distributing to those visiting their exhibit at the World's Columbian Exposition in Chicago. The little easel stands 5½ inches in hight and has an average width of about 2½ inches. The central portion is embellished with a sunken panel carrying, in relief, a representation of a stork standing amid rushes and cat tails. The raised surfaces of the easel are nickel plated and finished with a high polish.

Mosher's Lilliputian hot air furnace is the subject of a four page circular which reaches us from M. J. & M. R. Mosher of West Troy, N. Y. This device is referred to as a new and powerful furnace, lilliputian in size, but a giant in heating capacity. It is said to be simple in construction, having no joints except packed ones between the fire pot and dome, no bolts and no flues to fill up. The fire pot and dome are made extra heavy. In connection with this heater the manufacturers call attention to the fact that they have made laundry stoves since 1880 and have shipped them to all parts of the world.

The Milwaukee Gas Stove Company, 15 and 17 Erie street, Milwaukee, Wis., send us a miniature copy of their catalogue of Perfection gas grates. The little volume measures 2½ x 3¾ inches, and opens the long way of the book. The engravings are clear cut, and the text, although small, is yet readily readable.

Foster Brothers, proprietors of the Central Stove Works, at Lebanon, Pa., tested their new plant on October 5, with great success. We understand that their expectations were fully realized with regard to the melting apparatus and to the machinery with which the works are equipped. The plant has been constructed with due regard to the requirements of their business, and the company are now fully prepared to receive orders for stoves constructed after the latest improved patterns, using the best materials and employing skilled mechanics.

A. Weiskittel & Son, Baltimore, Md., have issued a pretty little catalogue descriptive of the Fire King gas heating stoves and ranges. It is made up of about 50 pages of letterpress, profusely illustrated, and bound in paper covers with attractive side title. The Fire King gas heating stoves are shown in several varieties and are made in such a way as to take the cold air from the floor and discharge it in a highly heated condition through openings in the top of the drum. Under the name Fire King the company offer a line of stoves somewhat resembling open Franklins in their general appearance and ornamented with brass plated fender and corrugated copper reflector. The other goods have asbestos flame plate and copper sides and bottom with a sheet iron upper section. A line of hot plates are provided with the company's new loose top burner, the top of the stoves being loose so that they may be removed for cleaning. This line of goods, we understand, is a new departure on the part of the company, the tops being extra wide and perfectly flush so that combination cookers or extra wide pots or pans can be set on without danger of tipping over. Fire King ovens, sad iron heaters, tubing for gas stoves, independent connections and other matters likely to prove of interest in connection with gas burning appliances occupy several pages of the pamphlet. The Fire King gas ranges with water heaters attached are illustrated and described, while a long list of testimonials show the favor with which the Fire King gas stoves and ranges have been received at the hands of those practically demonstrating their merits.

A neatly finished Maltese cross in bright red material, which might be mistaken for coral, is the souvenir of the Columbian Exposition that is distributed in the interest of the Red Cross stoves and ranges. The Co-operative Foundry Company of Rochester, N. Y., have given such wide renown to the Cross of Malta that a sight of this emblem is sure to bring to mind a certain line of stoves and ranges, where it formerly was only suggestive of an ancient order of knighthood.

The Joseph Bell Stove & Range Company of Muncie, Ind., recently shipped a stove which is destined for a long journey. It was purchased by Rev. T. A. Holliday, formerly of Cadiz, Ohio, and now a missionary in Northern India. The cook stove will cross the ocean on the steamer "Arizona," sailing on October 14. Upon reaching the other side it will journey something like 1700 miles further before its destination is reached.

Some of the people who reside in the natural gas districts do not seem to take kindly to the use of natural gas as a fuel for cooking purposes, if we may judge from a short article contained in a late issue of the *News*, published at Toledo, Ohio. This paper states that the hardware dealers in that place have noticed this fall that in the sale of stoves about 90 per cent. of the purchasers have taken coal burners. Several oil stoves have been sold, but the demand for those burning natural gas seems to be limited. The article in question continues: Of the old stoves thrown out or exchanged with the dealer the great majority are gas burners. There are very few coal burners being returned, and those which are taken in exchange are replaced by new coal burners. The hardware dealers say that they never had such a heavy business in the sale of stoves, especially heaters, as they are having at present. Everybody in the city appears to want stoves at the same time. The purchasers of stoves inform the dealers when they come to make a purchase that they will stand no more freezing or fooling with natural gas this winter. They claim that last winter's experience was enough for them.

At a recent meeting of the Vapor Stove Manufacturers' Association of the United States, held in Cleveland, Ohio, it was decided, owing to the numerous accidents which have occurred on account of a stationary tank on Junior stoves, that hereafter all Junior stoves turned out by the Manufacturers' Association shall be fitted with the lay down tank. The claim is made that the use

of this device makes it impossible to fill the reservoir while the burners are lighted. The manufacturers decided that there should be no extra charge for this attachment.

THE PLANT at Florence, Mass., of the Central Oilgas Stove Company recently began running full time in all departments, and the company, we understand, are shipping a large number of stoves.

JOHN P. BARSTOW, one of the best known and most respected business men of Norwich, Conn., died at his home on Huntington place, Tuesday afternoon, October 3. He was born in Augusta, Maine, the latter part of November, 1822, remaining in his native place until 1844, when he went to Canterbury, Conn., and entered the employ of his uncle Isaac Backus, who was engaged in the business of making cast iron stoves. In 1846 they moved to Norwich, the firm becoming Backus & Barstow. At the end of a few years Mr. Backus' health began to fail and he retired from the firm, his interest being purchased by Col. Edwin Palmer, then a resident of Preston. For a dozen years the firm name was Backus & Palmer, but ill health caused Mr. Palmer to sell his interest to the senior member of the firm, who continued alone until 1876, when Frank H. Smith and George S. Byles were taken into partnership, the style of the firm being J. P. Barstow & Co. In point of active service Mr. Barstow was the second oldest business man on Water street. In the years 1880 and 1881 he represented Norwich in the Legislature and at one time was a member of the Court of Common Council. He was one of the founders of the Storrs Agricultural College, a trustee of the Middletown Industrial College, a life member of the New London County Agricultural Society and director of the Chelsea Savings Bank.

THE BRAND STOVE COMPANY of Milwaukee, Wis., have issued a circular letter calling attention to the fact that they have a complete stock of goods on hand, and are in a position to fill all orders with which they may be intrusted. They express the hope that the financial disturbances which seriously affected the early fall trade and which made many of their customers hesitate to place large orders have come to an end. In view of the fact that the company's corps of traveling salesmen cannot this season cover their entire territories, customers are strongly recommended to mail their orders early. The wisdom of such a course, the circular states, will be apparent when it is remembered that if the present inflow of orders is maintained the excellent shape the company are in to do customers justice cannot endure, notwithstanding great exertions on their part.

W. JACKSON'S SONS, 246 Front street, New York, manufacturers of grates, fire places, &c., have prepared for the season's trade a number of new designs in fire place trimmings, including andirons, fenders, frames, grates and other fire place appurtenances. They have been arranged to suit almost any taste, and they cover a wide range in price from the primitive and inexpensive to the more pretentious and elaborate, where buyers are disposed to pay well for handsome goods.

W. H. LANDERS of the Syracuse Stove Works, Syracuse, N. Y., who was in New York during the week, is not complaining of the amount of business done by his firm. Through the early months, in fact, sales were much larger than a year ago, and even taking into account the relative dullness of the last two months, he is not anticipating a bad showing for the whole year.

WE ARE IN RECEIPT of a copy of a special edition of the Belleville *Illustrated Daily News-Democrat* of Belleville, Ill., which contains references to the stove foundries located in that city, as follows: "The Belleville Stove Works manufacture a full line of cook stoves and ranges in all styles and sizes. The trade-marks 'St. Clair' and 'Belleville' are everywhere regarded as synonyms of high grade and absolute perfection. The Snyder & Baker Stove Works employ 60 hands regularly and have a manufacturing capacity of 500 stoves weekly. They enjoy excellent shipping facilities, and their trade extends throughout the entire South and West. This company's success attests their merits and the esteem in which they are held at home and abroad. The Eagle Foundry is another of Belleville's important iron industries. It had its inception in 1882, and since that time has built up a large and increasing trade. The products of this foundry are the Star cannon, St. Louis box and O. K. stoves, which they sell largely in Illinois, Missouri, Nebraska and Kansas, the goods being particularly adapted to these sections."

THE QUICK MEAL STOVE COMPANY, St. Louis, Mo., are issuing to the trade their 1893 "pie" or diagram showing the number of stoves sold during the present year, which aggregate 71,316, or a total of 295,004 stoves sold since the business was started in 1882. During the present year they have sold 81 stoves to every one stove sold during 1882, and had their sales amounted to 1168 more during the present year they would have just doubled their business of 1891. When the conditions which have prevailed during the past six months are taken into consideration the record they have made for 1893 is certainly an enviable one and reflects much credit on the house and its management.

A FEATURE of the window display of the Barstow Stove Company, at the corner of Beekman and Water streets, New York, is a fine bas-relief casting of the "Beloved Disciple."

THE EXCELSIOR HARDWARE COMPANY, 58 Warren street, New York, have recently arranged for the sale of their imported English wall fires and gas grates at Philadelphia with E. J. Mahood & Co. and at Baltimore with A. W. Martin.

THE FULLER & WARREN COMPANY of Troy, N. Y., are represented at the Pure Food Exhibition in the Cyclorama Building, Baltimore, Md., by A. B. Morton & Sons, the enterprising stove jobbers of that city, who show the company's Splendid parlor fire place heaters. We understand that the manufacturers are meeting with a very gratifying demand for this line of goods from dealers in the Middle and Southern States.

"READ ME FIRST, and if I cannot help you throw me away" is the striking request made at the top of a folder which is a sample leaf from the "Furnace Estimate Book," published by Daniel P. Holmes, Norwich, N. Y. The book, as noticed some time ago in *The Metal Worker*, has two blank pages for drawings of special fittings or floor plans of houses or memoranda, and two pages enumerating all the different fittings to prevent anything being overlooked in estimating. It is convenient in size and having a record of prices quoted and jobs done, with the goods used, is a valuable possession, particularly in the off season when prices of such work have been forgotten.

HEATING NOTES.

UNDER DATE of October 1, Samuel I. Pope & Co., 360-364 Dearborn street, Chicago, Ill., announce that they have been incorporated under the name of Samuel I. Pope Company, with a capital stock of $60,000, fully paid. The corporation will be under the general management of Samuel I. Pope, the mechanical department under the charge of W. A. Pope, superintendent, and Henry F. Smith, heating engineer. The financial department will be in the care of Charles H. Patton.

THE REX HEATING COMPANY of Norwich, Conn., send out neat circulars relating to the Rex hot water heaters of their manufacture. One of them, an eight-page catalogue, is bound in highly colored paper covers, and within contains description with illustrations of the different forms of the Rex heaters, together with table of dimensions, capacities and prices. A second folder shows the application of the Rex heaters to various purposes. One is connected with a circulating boiler for supplying hot water in hotels, apartment houses, bathrooms, &c. The second sectional view shows a circulating boiler and heater, the former connected with a supply tank and supplying water to an adjacent bathroom. The third illustration shows the application of the Rex heater in a conservatory.

THE W. H. PAGE BOILER COMPANY of Norwich, Conn., have completed plans for a new foundry, which they propose to build in connection with their present plant, to accommodate increasing business.

THE AMERICAN RADIATOR COMPANY, New York, are sending to the trade an engraving on a fine cardboard of the new municipal building at Hamburg, Germany. With it is sent a newspaper clipping stating that the contract was closed at their World's Fair exhibit with the official engineers for four carloads of radiators for heating it, which is one of the largest orders taken at that office.

VICE-PRESIDENT PIERCE of the American Radiator Company is temporarily lending assistance at the New York office, where some night work has been necessary to give proper attention to their orders for radiators. F. S. Heywood is now talking radiation at the Chicago office.

C. B. THOMPSON AND C. C. FINKLER have purchased the interest of Frank Wheeler in the Illinois Heating Company, 88 Lake street, Chicago. As Mr. Wheeler resigned the presidency of the company, Mr. Thompson was elected to take his place. Mr. Finkler was elected secretary and treasurer.

Final estimates of the Kansas Board of Agriculture place the total wheat harvest of that State for the present year at 24,881,448 bushels, an increase of 5,000,000 bushels over the September estimate.

TRADE REPORT.

The Iron Market.

The terrific struggle for work continues, and on large orders accompanied by satisfactory terms of payment unprecedented prices are made. The sacrifice of all profits along the whole line, the low cost of raw materials and the reductions in labor have brought down the theoretical cost of manufacture to figures hitherto undreamt of in this country. We say advisedly "theoretical," because it is dependent upon full employment. To reach the condition begotten by a fairly well filled order book is what so many are striving for. Spot cash, too, fetches very low figures. In fact, the terms are so potent a factor now that reports as to prices accepted for prompt settlement are no criterion as to what could be done on transactions on the ordinary basis. This fact must be kept in mind steadily.

Pig Iron statistics reflect as closely as it is possible for any one article in the line of Iron products to do so the volume of current consumption. They show that we are still accumulating a little metal in spite of the fact that current production is only 43 per cent. of the normal output of say 9,000,000 tons per annum.

In a general way the conclusion is warranted that very few of the works throughout the country can touch the costs proclaimed by some, and that therefore any inferences based upon them as to the permanency of present values are dangerously unsafe to the buyer. That lasting reductions in the cost of producing Iron and Steel have been made no one will deny, but neither labor nor capital can long suffer as they are now doing. The present range of values is abnormal and cannot last long. Even now far more than half of the aggregate manufacturing capacity is helplessly out of the race. When consumers need their product they will have to accord prices which will pay them to start.

Pig Iron.—Buying in the New York market continues on a moderate scale. Sellers, notably of Southern Iron, are inclined to some firmness. An offer to take 15,000 tons of warrant Iron, which was widely circulated in this market during the past ten days, did not lead to any business, because no seller could be found to meet the buyer's views. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

The Pig Iron market in the Philadelphia district is about as dull and uninteresting as it possibly can be. Buyers appear to be utterly indifferent to low prices; if they need Iron they will order just a little; if they do not need it, price is no inducement. Sales therefore are to a great extent carload lots, 50 tons or 100 tons, and occasionally it may be a 200 or 300 ton lot at quoted rates, but on a larger lot special terms must be arranged, either by a concession in price, time for delivery, or in terms of payment. Sales are usually within the following range of prices, varying according to quantity, brand, delivery, terms of payment, &c.: $12.25 @ $12.75, delivered, for Plain No. 2; $13.75 @ $14 for No. 2x; $14.25 @ $14.50 for No. 1x.

The past week in the Chicago market is reported as having been quiet, with not even the rumor of a large sale. The few transactions reported in Coke Iron are principally in Southern brands. The situation is regarded by prominent dealers as one of waiting on the part of buyers. They believe that nothing favorable or unfavorable can be based on present conditions. Consumers are wholly at sea regarding the future, and not knowing what to do they naturally do nothing. Meanwhile everything hesitates. Quotations are now as follows for cash:

Lake Superior Charcoal.....	$16.00 @	$16.50
Local Coke Foundry, No. 1...	13.50 @	14.00
Local Coke Foundry, No. 2...	12.75 @	13.00
Local Coke Foundry, No. 3...	12.50 @	12.75
Local Scotch.....	14.00 @	14.50
Ohio Strong Softeners No. 1..	15.50 @	16.00
Southern Silvery, No. 1.	@	14.50
Southern Silvery, No. 2.....	@	14.00
Southern Coke, No. 2..... ...	12.35 @	12.60
Southern Coke, No. 3	11.60 @	11.85
Southern, No. 1, Soft.....	12.35 @	12.60
Southern, No. 2, Soft.....	11.85 @	12.10
Tennessee Charcoal, No. 1...	16.00 @	16.50
Alabama Car Wheel.....	18.50 @	18.75
Hocking Valley, No. 1	15 25 @	16.00
Jackson County Silvery.....	16.00 @	17.00

Advices from Pittsburgh describe the Pig Iron market in that section as being about as dull as it is possible for it to get, and with more Iron being made than is being used there does not seem to be any hope of improvement for some time. At furnaces in the Pittsburgh district, and in the valleys as well, large stocks of Iron are piled up, and these are being depleted very slowly, owing to the light demand. For ordinary lots ranging from 100 to 500 tons the following figures prevail, but on good sized blocks, with favorable time of payment, it is altogether probable that concessions would be offered. Quotations are as follows:

No. 1 Foundry	$12.75 @	$13.00,	cash.
No. 2 Foundry	11.75 @	12.00	"
Charcoal Foundry No. 1	14.00 @	15.00	"
Charcoal Foundry No. 2,	13.00 @	14.00	"

Reports from Southern markets indicate unusual dullness, even for these dull times. There has been about the usual current consumptive demand for car lots, but they seldom run above 200 tons each; and even the orders from the East have been for reduced quantities, and notwithstanding the comparatively light offerings of Southern Iron there is an ample supply for the wants of the trade. The stove works are buying generally in a small way, and while prices as a rule are sustained there have been concessions made in some instances. The current demand is mainly for No. 2 Foundry and No. 1 Soft, and for these pretty full quotations are realized. There appears to be no movement in Charcoal Iron. Collections are not improving much, if any. Quotations are as follows:

Southern Coke, No. 1.	$12.75 @	$13.00
Southern Coke No. 2.....	10.75 @	11.00
Southern Coke No. 3.....	10.25 @	10.50
Ohio Soft Stone Coal, No. 1....	15.50 @	16.00
Ohio Soft Stone Coal, No. 2....	14.50 @	14.75
Lake Superior Coke No. 1.....	15.00 @	15.25
Lake Superior Coke No. 2.	14.00 @	14.25
Hanging Rock Charcoal, No. 1..	18.50 @	19.00
Hanging Rock Charcoal, No. 2..	17.50 @	18.00
Tennessee Charcoal, No. 1.....	14.00 @	14.25
Tennessee Charcoal, No. 2.....	13.00 @	13.25
Standard Southern Car Wheel	17.75 @	18.00
Lake Superior Car Wheel and Malleable.....	17.00 @	17.25

Metal Market.

Pig Tin.—There has been a reverse movement in the price of this metal, the outcome of pressure by operators who have latterly figured with more or less prominence as "bears" in the speculative line and lack of support from the opposing interest. Comparatively little Tin has changed hands in a speculative way, however, except perhaps on old contracts, but the movement of stock into the channels of consumption has continued nearly up to the average for the season and the statistical position is stronger, if anything, at the present time, than it was prior to the reaction. However, the "bear" interest forced a decline of about 0.35¢ @ 0.40¢ in prices, carrying Straits to 20.65¢, regular terms, and 20.50¢ for immediate cash payment. At the close of the week under review the market was a trifle firmer, with 20.70¢ bid for current month delivery. Jobbers' prices for small lots are quoted at 22¢ for Straits Pig and 22½¢ for Banca Pig, with only a fair demand from consumers.

Copper.—There has been freer offering of Lake Superior Ingot by some of the smaller producers and by dealers, the outcome of which is reflected in a decline to 9¾¢ as common selling price. Some of the larger producers claim to

be sold ahead, and therefore place their quotations at 9⅞¢ @ 10¢, but it is an open secret that at least 250,000 pounds have been sold at 9¾¢, regular terms, and that offers were made openly at 9.70¢ on the Metal Exchange for deliveries running through the balance of the year. The cheaper varieties have fared no better. Electrolytic may easily be secured at 9⅝¢ @ 9½¢, and sales of common casting stock at above 9½¢ are the exception at present. In fact, it is intimated that those figures have been shaded, and that the general market is weaker below than above the surface, despite quite free movement of stock from this to European points of late. The domestic consumptive demand for Copper has not kept up to the level of the last few weeks; and a falling off in orders and inquiries is noted by dealers. Prices for small lots remain unchanged.

Sheet Copper.—The general state of suspense in which all business remains, pending the outcome of repeal at Washington, has been felt during the week in the market for Sheet Copper. Jobbers report a sensible slacking off in sales as well as in the number of inquiries. This is attributed to the contraction in building enterprises attendant on the recent money stringency and to conservatism among consumers, who do not purchase more material than they absolutely need for present use while the trade situation continues so unsatisfactory. Prices for small lots remain unchanged as per list.

Pig Lead.—Prices have undergone a sharp decline, and the market at this writing is in somewhat unsettled condition. Common Western Lead has been sold at from 3.70¢ down to 3.50¢. Between that range about 500 tons changed hands. Forced realization on speculative holdings is partly accountable for the decline, but there was some evidence of artificial pressure by a few local operators. At the close the market was about 3.45¢ bid, 3.55¢ asked. The consumptive demand for Pig Lead is quite small, such business as is current being usually confined to very moderate quantities; while retail prices are rather inclined to soften. American Pig is quoted for small lots at 4¼¢ @ 4⅜¢, but this rate might be shaded under favorable conditions.

Lead Pipe and Sheets.—Extreme dullness has settled down upon the market for Manufactured Lead. There is so little building doing at present that the demand for plumbers' supplies is of the slightest, nor is it thought, now the season is so far advanced, that much improvement is likely to occur uutil building is resumed in the spring, when, other things being favorable, a good business may be looked for, as stocks in consumers' hands are very narrow.

Spelter.—The market has been unsettled and irregular, with comparatively little business in this quarter and no sign of livelier demand from dealers or consumers at the decline. Ordinary Western brands have been secured at 3.65¢ @ 3.70¢, and the latter is at present a common selling price. Special brands bring about the usual premium. Jobbers' price for Western Spelter, in small lots, is given as 4¼¢ @ 4⅜¢ ℔ lb.

Antimony.—About the ordinary business has been effected and prices remain practically unchanged. We quote at 9¼¢ @ 9⅜¢ for Hallett's, 10¢ @ 10¼¢ for L. X., and 10⅛¢ @ 10¼¢ for Cookson's, in round lots, with an advance of ⅛¢ @ ¼¢ ℔ lb for small quantities.

Tin Plates.—The principal feature of the Tin Plate market during the week has been a revived demand for ordinary Bessemer Cokes, spot delivery, for canners' uses, which has drawn heavily on the stocks of certain descriptions of Plates, 100 lb in particular. These Plates are consequent'y somewhat scarce and command outside prices. A rather livelier interest has been manifested in future deliveries, but the business in this direction still continues extremely light, nor is it likely to grow to any considerable proportions until confidence is restored and money again flows readily in trade channels. A fair hand to mouth business is noted in Roofing Ternes, which suffices to keep the market from stagnation, but otherwise trade is quiet, prices remaining without radical change. Dealers' agents report the stocks of Tin Plates in all parts of the United States to be at an almost unprecedentedly low ebb, with no intention on the part of retailers and consumers to replenish them beyond the point of present requirements.

Sheet Iron.—Galvanized Iron is in fair demand, and as stocks are not large, while there are few signs of any immediate increase in the output of this material, some scarcity is looked for before long, which may induce an advance in price. Meantime the price continues unchanged per list. Black Iron shows considerable movement, as is natural at this season, and the mills that are now running appear to be busy. Still, consumptive orders are not up to their normal volume for the time of the year. Prices are, if anything, rather firmer and concessions on quoted rates harder to obtain, though not yet out of the realm of the obtainable where spot cash or other desirable inducements are offered.

THE EATON-RITCHELL COMPANY, manufacturers of Tinware, Denver, Col., have decided to remove to South Omaha, Neb., and will commence the erection of a plant at that point at once. The building will be 60 x 190 feet and will cost about $6000. The firm will give employment to 50 men.

AT THE TOP MILL, Wheeling, W. Va., operated by the Wheeling Iron & Steel Company, the 52-inch sheet mill is in operation, also one small sheet mill, each running double turn.

Chicago Report.

Scrap.—Inquiry is better, but actual sales are still slow. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$8.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	9.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	2¼¢

Anthracite.—Business is good and considerable complaint is heard that deliveries are far behind on contracts. So little Coal has been sent here by vessel during the summer that much of the supply must be forwarded by rail from the mines. Reports from Colorado are to the effect that the Colorado Fuel & Iron Company are making plans to supply Anthracite as far East as Omaha in competition with Pennsylvania shippers. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

THE LARGEST hot blast Dry Kiln for timber in Great Britain was shipped some months since to Manchester by the Huyett & Smith Mfg. Company, Detroit, Mich. Its successful operation resulted in an order for a duplication of the plant to go to Germany, and the house have recently opened an office in London to properly care for their growing trade abroad.

THE HAMMER HOUSE of the W. Dewees Wood Company, McKeesport, Pa., which has been idle for several weeks, has resumed in full. The steel mill has also resumed after a week's shut down, so that almost the entire mill is now in operation.

CONDITION OF THE

Hardware Trade.

SINCE the opening of October there has been a perceptible increase in the volume of business, but orders for the most part are small and jobbers report those received by them as very carefully assorted, covering a considerable range of goods in small quantities. As customary at this season, seasonable goods constitute a considerable portion of the business, but they are not moving in the usual quantities. Skates are referred to as in especially good demand, owing to the fact that stocks in dealers' hands were pretty generally cleared out last winter. In Builders' Hardware the demand is only moderate and limited principally to goods required to finish buildings in course of construction. Very little building is in progress, a fact which also accounts for the limited demand for Nails. A good deal of complaint is made in regard to Mechanics' Tools, of which much less than the usual quantity are being sold. In manufacturers' supplies also the volume of business is comparatively small and houses dealing in these lines of goods complain much more than those who handle or manufacture articles which go directly to the trade. A fair business is reported by dealers in Tin Plate, most of whose orders are referred to as coming from retailers and in comparatively small parcels. There are few quotable changes in price, but the market has rather a weak tone, the tendency being toward lower values. Collections on the whole are fair, but some houses refer to them as being difficult and unsatisfactory.

Advices from Chicago.—The Shelf Hardware jobbers were agreeably surprised the past week by a decided increase in their business. The character of the orders received, however, was about the same as previously, regular Hardware not constituting more than the recent proportion. The large numbers of very small orders sent in entailed an unusual amount of work. The packing force in several establishments was obliged to work for several nights in order to make prompt shipments, owing to the necessity of handling so many broken packages. It is an annoying feature of the present condition of the Hardware business. In ordinary time, with the demand running on full packages, there would have been no necessity whatever for night work in handling as large a volume of business as that of the past week. Quite a large number of Hardwaremen from the West have visited Chicago within the past few days in attendance at the fair. They report that business with them is not likely to be of a more than hand to mouth character this fall, because farmers are disposed to hold on to the bulk of their crops. The quantity so held is very large, but the means of providing better business is thus seen to be in hand whenever the farmers decide to sell. Heavy Hardware jobbers report a somewhat larger volume of business, but their trade is also running in the direction of very small orders requiring more than usual work to fill them. Collections are good; no complaint is heard on this score.

Notes on Prices.

Wire Nails.—The Wire Nail market continues in substantially the same condition as at our last report, and $1.30 may be named as a general price for carload lots at mill. Some of the manufacturers have endeavored to obtain a slightly higher figure, but on especially large or attractive orders it is understood that this price has been shaded. The volume of business is moderate, and none of the mills are running to their full capacity. They are careful to avoid an accumulation of stock, and in some cases have not been able to ship goods as fast as required, their orders being for the most part for immediate shipment. The tone of the market is not at all strong.

Advices from Chicago.—Wire Nail manufacturers report inquiries only moderate. Buyers who placed orders at very low prices some time since are complaining of trouble in getting delivery on such contracts and threats are made that the Nails will be bought elsewhere and the difference charged to the delinquent manufacturers unless they more speedily comply with their agreements. Prices on factory lots continue at $1.40 to $1.45, Chicago. Small lots are selling at $1.55 from stock.

Cut Nails.—Notwithstanding the fact that the demand is moderate, the market for Cut Nails seems this week to be in a slightly better condition than last week, and the quotation of $1 for carload lots at mill is quite generally adhered to, concessions being made in special cases. The market, however, is not strong, and it is not unlikely that a large order for a desirable assortment would secure relatively low figures. Small lots from store in New York are quoted at $1.25 to $1.30.

Advices from Chicago.—Cut Steel Nails are in the same condition as previously reported. Orders are not large but are moderately numerous. Manufacturers are still quoting carload lots at $1.20 to $1.25, and jobbers quote $1.30 for small lots from stock.

Barb Wire.—The market for Barb Wire is not in a very satisfactory condition, and somewhat lower prices have been developed. The quotation of $2.25 to $2.30 for Four-Point Galvanized at mill fairly represents the market, but a concession on the lower of these figures is made by some leading manufacturers. Painted is held regularly at 40 cents less. The volume of business is moderate, but it is understood that a good many small orders have been secured.

Advices from Chicago.—Manufacturers are doing a large business in Barb Wire. They have made decided inroads on the trade of jobbers, who report that for the past couple of weeks their business in this branch has been exceedingly light, while manufacturers talk much more cheerfully on the condition of the trade from their point of view. Carload lots of ordinary Galvanized Barb Wire are selling at $2.40, while Glidden is quoted at $2.50. The jobbing price for small lots of ordinary Galvanized Barb Wire from stock is $2.55.

Lawn Mowers.—The volume of business during the last season is referred to by the manufacturers as having been exceptionally heavy, the fact being that the 'low' prices which have ruled have induced a very large sale of the goods, the season on this line having practically closed so far as the manufacturers are concerned before the financial disturbance of the summer. The outlook for next year is regarded by the manufacturers as promising, provided general business conditions are reasonably favorable. An announcement in regard to the coming season is made by Dille & McGuire Mfg. Company, Richmond, Ind., for whom S. A. Haines, Indianapolis, Ind., is manager of sales department. Their catalogue, just issued, contains the following revised list of their Mowers, which is subject to a discount of 70 per cent.

Inch.	McGuire's Diamond. Style D.	Diamond High Grass. Style L.	Western. Style U.	Magic. Style W.	Crown. Style K.
8	.....	.....	....	.....	$12.00

Pony Lawn Mower, each.....$100

Oil and Gas Heaters.—The Oil and Gas Heaters put on the market by the Manhattan Brass Company, 44 Murray street, New York, and 506 Masonic Temple Building, Chicago, and illustrated in this issue, are sold at a discount of 25 per cent. from the following list:

Star Heaters.

	Each.
No. 40, Brass finish	$7.00
No. 40, Nickel "	7.75
No. 40, All Brass, including Cylinder	7.50
No. 44, Brass finish	8.00
No. 44, Nickel "	8.75
No. 44, All Brass, including Cylinder	8.50
No. 46, Brass finish	10.75
No. 46, Nickel "	12.00
No 46, All Brass, including Cylinder	11.25

No. 45, Brass finish	9 75
No. 45, Nickel "	10 75
No. 45, All Brass, including Cylinder	10.25

Hygienic Heaters.

	Each.
No. 48, Brass finish	11 00
No. 48, Nickel "	12.50
No. 49, Brass "	13 00
No. 49, Nickel "	14.50
No. 50, Brass "	14.50
No. 50, Nickel "	16.00
Gas Heater	5 00

Cordage.—Cordage at present is probably lower in price than for a long time. During the past few weeks, while there has been little quotable change, prices have been tending downward and are now slightly lower. Manila is maintained pretty firmly at 8 cents basis for large lots, f.o.b. factory or New York; but it is understood that in some special cases this quotation has been slightly shaded. Sisal and New Zealand are about ¼ cent lower than a few weeks ago. The volume of business is comparatively small and there is a good deal of competition among the manufacturers. The following are the present quotations for large lots, f.o.b. factory or New York, which are shaded in exceptional cases and are subject to a discount of 1½ per cent. for cash in ten days:

Manila, 7-16 in diam. and larger	℔ 8 ¢
" ⅜ in	℔ 8½¢
" ¼ and 5-16 in	℔ 9 ¢
" Tarred Rope	℔ 7½¢
" Hay Rope, Medium	℔ 8 ¢
Sisal, 7-16 in. and larger	℔ 6¼¢
" ⅜ in	℔ 6¾¢
" ¼ and 5-16 in	℔ 7¼¢
" Hay Rope	℔ 6¼¢
" Tarred Rope	℔ 5¾¢
" Medium Lath Yarn	℔ 6 ¢
New Zealand, 7-16 in. and larger	℔ 6 ¢
" ⅜ in	℔ 6¼¢
" ¼ and 5-16 in	℔ 6¾¢
" Hay Rope	℔ 6 ¢
" Tarred Rope	℔ 5½¢

Stove Boards.—While as seasonable goods there has been a fair demand for Stove Boards, the volume of business is referred to as considerably less than usual. In the matter of prices there has been comparatively little irregularity, as the leading makers agree pretty well in quotations. There is, however, some difference in the prices quoted, and careful buyers usually find it worth their while to look into the market before placing orders.

Glass.—Manufacturers of Glass evidently consider that the condition of trade does not justify them in starting up their factories. This apparently has more to do with the lack of interest which they take in an adjustment of the wage scale than because an agreement could not be reached. If there was a prospect of making money if the manufacture of Glass was begun and continued the fires would be started even if last season's wages had to be paid. It is reported that the low prices at which Glass has been sold to the jobbers who are members of the National Window Glass Association has left no profits for the manufacturers, and that they now feel that it would have been better if jobbers had not been admitted as members. The situation is intensified by the announcement of a further reduction in the price of foreign Glass on the other side. Quotations on all kinds of Glass remain unchanged.

Old Metals.—The market for Old Metals maintains the dullness reported last week, there being generally but little business doing beyond absolutely needed purchases. Heavy Cast Scrap Iron is, however, scarce and in fair demand. The following represent outside prices, New York delivery:

Heavy Copper	℔ 6¾¢
Light and Tinned Copper	℔ 6¼¢
Heavy Brass	℔ 5¼¢
Light Brass	℔ 4½¢
Lead	℔ 3¢
Tea Lead	℔ 2½¢
Zinc	℔ 2½¢
No. 1 Pewter	℔ 14¢
No. 2 Pewter	℔ 6¢
Wrought Scrap Iron, ℔ gross ton	$11.00 @ $12.00
Heavy Cast Scrap, ℔ gross ton	12.00 @ 13.00
Stove Plate Scrap, ℔ gross ton	7.00 @ 8.00
Burnt Iron (delivered at mill) ℔ gross ton	5.00 @ 6.00

Old Rags, Paper, &c.—Trade in these materials shows no improvement over last week. The demand is of the slightest description, consumers waiting a settlement of the silver question at Washington before making purchases. The quotations given below represent about the price of Old Rags, Paper, &c., delivered in New York:

No. 1 White Rags	℔ 3¼ @ 3½
No. 2 White Rags	℔ 2¼ @ 2½¢
Mixed Rags	℔ ¾¢
Blues and 3ds	℔ 1 @ 1¼¢
Hard Sized White Shavings	℔ 2¼¢
No. 1 White Book Shavings	℔ 2 @ 2⅜¢
No. 2 White Book Shavings	℔ 1 @ 1⅛¢
Light Book Shavings	℔ ¾¢
No. 1 Mixed Shavings	℔ ¾¢
No. 2 Mixed Shavings	℔ ½¢
No. 1 Printed Books	℔ 1 @ 1¼¢
Ordinary Mixed Books	℔ ½ @ ¾¢
Newspapers	℔ 3-5¢
No. 1 Manila Paper	℔ ¾ @ 1 ¢
No. 2 Manila Paper	℔ ⅝ @ ¾¢
Bogus Paper	℔ ½¢
Common Paper	℔ ¾ @ ½¢
Straw Chips	℔ ½ @ ⅝¢
Binders' Clippings	℔ ½ @ ⅝¢
Jute Butts	℔ 1¼ @ 1⅜¢
No. 1 Jute Bagging	℔ 1 ¢
Mixed Bagging	℔ ¾ @ 1 ¢
No. 2 Bagging	℔ ½ @ ¾¢
Hemp Twine	℔ 2¼¢
Manila Rope	℔ 2½¢
Jute Rope	℔ 1½ @ 1¾¢
Mixed Rope	℔ ⅝ @ ⅞¢

Old Rubber.—There is little or no market for Old Rubber at present. Prices at present ruling are about as follows:

Car Springs, ton lots, ℔.	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔.	@ .03
Rubber shoes, less than carloads, ℔.	0.02¼ @ .03⅛
Large Hose, ℔ ton	@ 9.00
White Wringer Rolls, ℔.	@ .04¼
White Syringes, ℔.	@ .05

Trade Notes.

I. P. FRINK, of 551 Pearl street, New York, writes us that he has been awarded a prize for superiority of Reflectors at the World's Columbian Exposition.

WE ARE IN RECEIPT of the fall catalogue of seasonable and other goods from C. Sidney Shepard & Co. of Chicago, the publication being issued under date of October 2. The first pages are devoted to Sheet Iron, Russia Iron, Galvanized Iron and Steel, with tables of prices and sizes, and Tin Plates, various grades being quoted, both bright and terne. Metals are likewise noted in the list, with Wire, Rivets, &c. Among the seasonable goods several pages are devoted to Stove Boards, Coal Hods, Fire Shovels, the latter line being particularly full. Adjustable Elbows and Heaters close the pamphlet.

SEVERAL MORE SHEET MILLS were put in operation last week at the plant of the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio. All the sheet mills formerly included in the Standard plant are running except No. 9. The sheet mills of the Ætna works are not yet in operation. The three-high plate mill differences have been settled and it is now running.

AT THE WORKS of the Whitaker Iron Company, Wheeling, W. Va., four sheet mills are now in operation. Repairs and alterations are being rapidly made on three others and a new mill is being built. This will make eight sheet mills at this company's plant.

THE SWAMSCOT MACHINE COMPANY of South Newmarket, N. H., doing business in Boston under the firm name George K. Paul & Co., have assigned. It is hoped to pay creditors in full and to continue the plant in operation, which gives employment to practically the whole town of South Newmarket. The company's assets consist of bills receivable and cash amounting to $81,500; real estate, tools, machinery, &c., $110,000; stock in trade in store in Boston, $66,000. The debts amount to $140,000. The directors' object is to realize the best possible price on the stock in the store in Boston, pay up the debts, and thus free the corporation at South Newmarket.

A CERTIFICATE OF INCORPORATION is on file in the Hudson County Clerk's office in Jersey City for the Block Mfg. Company. The company are organized with a cash capital of $100,000, of which $50,000 has been paid in, for the manufacture of Tinware, Enameled and other Metallic Ware. The manufacturing plant will be erected at Union Hill.

W. H. ROUSH, Horton, Kan., has sold a half interest in his stove and tin business to his brother, A. J. Roush, the new firm being known as Roush Bros. Both members are practical tinsmiths and will increase their stock by other lines embracing the novelties of the times.

Owing to the accident to the cruiser "Montgomery," now at New London, Conn., the board of naval officers appointed to witness the trial of the vessel has been dissolved. It is estimated at the Navy Department that the accident and the delay will cost the builders, the Columbia Iron Works of Baltimore, fully $25,000; but this sum, it is said, could be materially reduced if the contractors will allow the trial to take place at once, notwithstanding the damage. Admiral Belknap's official report shows that while the injuries to her hull are serious, they are not such as to disable her. The damage cannot be determined until the ship is put in dry dock, but it is estimated that $10,000 will be necessary to repair her, and that the work will consume a month.

The estimated quantity of gold yielded from the mines of Victoria, Australia, from 1851 to 1892 is 58,101,429 ounces, valued at $1,115,547,437.

Professor Lippman is reported to have succeeded in photographing simultaneously all the colors of the rainbow on a layer of albumen.

WORLD'S FAIR NOTES.

R. E. Dietz Company of New York, and Steam Gauge & Lantern Company

of Syracuse, N. Y., who have a branch office at 25 Lake street, Chicago, have fitted up a joint exhibit of Lanterns and Oil Stoves in Manufactures Building, section N, block 3. Their space is 20 x 24 feet, inclosed by a neat railing in front, with counters for the display of goods on two sides and a wall in the rear on which shelves have been fitted, while a roof has been built over the top, composed wholly of Lanterns, with a row of Baby Lanterns in front, next Boy Lanterns, next Racket Lanterns, and the remainder up to the peak all tubular goods, with globes of different colors, making a very unique display. On the corners are globe and square street Lanterns, or corporation Lamps. Hanging from the eaves of the roof, like a fringe, extending completely around the space, are Baby Lanterns. Railroad goods are shown inside the pavilion, covering all kinds of Lanterns, from locomotive Headlights of great power and station Lamps of large size, down to very convenient and beautifully made hand Lanterns for conductors. The Reflector Lanterns are made for both oil and electricity. The display of Tubular Lanterns is very fine and covers many varieties, including Dashboard Lamps, which will neither blow out nor jar out. The Oil Stoves shown are manufactured by the R. E. Dietz Company, also on the tubular principle, and consist of both heating and cooking Stoves. The cooking Stoves are mounted on their own stands, so that they are complete in themselves. In capacity they correspond with a No. 8 cooking Stove. The special claim made for the tubular system on which the Dietz oil goods are constructed is that the oil is perfectly consumed, so that there is no odor, which is a very strong objection ordinarily made to the use of oil for heating, cooking or lighting. In a fine frame are shown the 35 medals received at different exhibitions by the R. E. Dietz Company.

The Erwin-Welch Hydraulic Machine Company

of Chicago have on exhibition, in operation, at Column I 34, Machinery Hall, their automatic hydraulic pump, water motors, automatic cellar drainer and a hydraulic ram of Rife's manufacture, at Roanoke, Va. In the last named, instead of a metal valve, a rubber one is used, which has been found to be a great improvement in not wearing the metal, while it may be adjusted to any pressure of water. Another feature which recommends the ram is that it automatically supplies itself with air. The automatic hydraulic pump above mentioned avoids dependence on the suburban storage tank, and is capable of supplying four or six families without the tank or from 40 to 50 with it.

The Walworth Mfg. Company

of Boston, Mass., have a large and comprehensive exhibit at Column O 27, Machinery Hall, of the many articles for which they have long been known as manufacturers. In a handsome case of ebony finish, supported by Ionic pillars, displayed against a black background, a beautifully finished assortment of nickel-plated steam and water fittings stands out in strong relief. Two sections of the Mills boiler, which they now manufacture, and the Walworth automatic sprinkler, are conspicuously shown. Cast iron fittings, valves and an extensive variety of expansion joints are displayed. The Ashley and Stillson wrenches, so well known as the product of this company, are tastefully arranged, while an attractive feature is the Hall tapping machine, which is used for tapping street mains of from 4 to 24 inches in diameter while under pressure. A brass railing surrounds the entire exhibit, while on each corner a support for street railway service, either for trolley wires or elevated system, blocks off their large space.

J. G. Hoffman

of Chicago, inventor of the Tornado fan blower, exhibits one at Column L 33, Machinery Hall. A forge of his design, supplied with a trough, is also shown. The Tornado fan blower has a combined crank and lever motion and gives an after blast the same as a bellows. There is no dead center and it can therefore be operated from any point with either a long or short stroke. All parts are interchangeable, and the fan shaft runs on hardened centers with self oiling supplies. These goods are manufactured by the Hurlbut Mfg. Company of Racine, Wis.

Allington & Curtis Mfg. Company

of East Saginaw, Mich., have one of their dust collectors in full operation at Column E 53, Machinery Hall, in connection with a Sturtevant fan. The efficiency of their collector is made apparent to every one who visits the exhibit.

Curtis & Curtis

of Bridgeport, Conn., exhibit samples of their specialties in pipe working tools at Column J 38, Machinery Hall. Among these are several power cutting and threading machines, the largest being shown belted up and in practical operation on 8-inch pipe. Half a dozen other sizes of such machines for either hand or power are exhibited, but not in operation. Two of them are mounted on bases with countershaft and driving pulleys attached, but the others consist merely of the cutting head, shown as a portable hand machine. All have samples of threaded pipe attached to show the exact work done on each size of machine. The Forbes die stock used in these machines is a complete tool, being all that is required to thread or cut off pipe, while much lighter than the old style of stock and the vise which must accompany it. With it one man can cut off and thread large pipe up to 8 inches diameter by hand and without assistance, while with the smaller sizes a boy can thread 2 and 3 inch pipe with but one hand on the crank. The bits draw back out of the way when the thread is cut. The parts are shown of an ingenious pipe and bolt threading attachment for lathes. This attachment has been devised to meet the wants of those whose work does not warrant the purchase of a regular power pipe threading machine. It can be fixed to any lathe within certain limits of size. It consists of a die carrying head attached to the spindle like a chuck, an adjustable self-centering vise attached to the carriage, and an adjustable pipe rest attached to the bed of the lathe to support long lengths of pipe. The feeding is done by hand, or an automatic feed can be arranged by setting the lead screw of the lathe to the number of threads corresponding to the standard of thread to be cut. Samples are shown of pipe vises, both hinged and solid frame, also reversible ratchet drills and reversible ratchet die stocks.

MANUFACTURING.

Machinery.

Among orders received by A. L. Ide & Son of Springfield, Ill., during the last ten days are the following: One 100 horse-power Ideal engine for the Ludington Building, second order; one 125 horse power engine for the Hoopeston Canning Company, Hoopeston, Ill.; three 175 horse-power Ideal tandem compound engines for the new Stock Exchange Building, Chicago; two 125 horse-power and one 100 horse-power Ideal engines for the Southern Hotel, St. Louis. The Stock Exchange and the Southern Hotel engines are all to have General Electric Company multipolar armatures directly attached to their crank shafts, the stock Exchange engines driving 100 K. W. machines and the Southern Hotel engines driving 50 K. W. machines. The two 125 horse-power engines each drive in addition one 50 arc light dynamo bolted from its governor pulley.

The newly incorporated firm of Harrington, Son & Co., Philadelphia, will erect a large machine plant.

The Lehigh Valley Railroad shops, at Easton, Pa., are now working full handed on full time.

Frisbie Elevator & Mfg. Company, New Haven, Conn., have recently put in what is said to be one of the largest electric elevators ever built. It is located in the car house of the Consolidated Street Railway Company, Worcester, Mass., and is used for elevating cars. Its capacity is 9 tons, with platform 34 x 10 feet and 15 feet high.

The W. H. Page Boiler Company of Norwich, Conn., have completed plans for a new foundry, which they propose to build in connection with their present plant, to accommodate increasing business.

The machine shops of the Southern Pacific Railroad Company, which for some time past have been working but four days per week and eight hours a day, are now running on full time with a full force.

The Hay-Budden Mfg. Company of Brooklyn, N. Y., have been incorporated to manufacture and sell dies and anvils and carry on a general forging and blacksmithing business. The capital is $20,000.

The National Iron Works and the Vulcan Brass Works, at Cleveland, Ohio, have been damaged by fire, the former sustaining a loss of $7000 and the latter $4500.

John Adt & Son, well-known builders of machinery at New Haven, Conn., are operating their plant with about one-quarter of their usual force, eight hours a day and six days a week. While the tone of business with them has considerably improved during the last month, they do not look forward to any considerable improvement in the situation until Congress takes action on the tariff question.

Thurman & Powell, machinists and foundrymen of Louisville, Ky., have assigned. The assets are $36,468.29, and the liabilities $31,401.49.

The Swamscot Machine Company of South Newmarket, N. H., doing business in Boston under the firm name of George K. Paul & Co., have assigned. It is hoped to pay creditors in full, and to continue the plant in operation, which gives employment to practically the whole town of South Newmarket. The company's assets consist of bills receivable and cash amounting to $81,500; real estate, tools, machinery, &c., $110,000; stock in trade in store in Boston, $66,000. The debts amount to $140,000. The directors' object is to realize the best possible price on the stock in the store in Boston, pay up the debts and thus free the corporation at South Newmarket.

The Finance Committee of Montreal, Canada, have recommended to the Council the purchase of a Worthington high duty pumping engine having a capacity of 12,000,000 United States, or 10,000,000 Imperial gallons of water per 24 hours. The Worthington Company offer to deliver and install within 60 days from the closing of the World's Columbian Exposition the pumping engine now on exhibition at the fair for the sum of $55,000. The engine in question is of the same type and capacity as the one already in operation at Montreal, so that the water capacity of that city will be doubled.

Hardware.

The cutlers of the Humason & Beckley Mfg. Company, New Britain, Conn., have resumed work.

The nailers and the Laughlin Nail Company, Martin's Ferry, Ohio, have come to an agreement, the former accepting the 15 per cent. reduction in wages proposed by the company. The works are again in operation, giving employment to nearly 700 hands.

The implement works of the Parlin & Orendorff Company, Canton, Ill., have resumed work with 800 employees.

The Parker Mills Nail Works, Wareham, Mass., which have been idle for six weeks, have started up.

The Eaton-Ritchell Company, manufacturers of tinware, Denver, Col., have decided to remove to South Omaha, Neb., and will commence the erection of a plant at that point at once. The building will be 60 x 190 feet and will cost about $6000. The firm will give employment to 50 men.

The Birmingham Iron Foundry, founders and machinists, Birmingham, Conn., continues to run six days a week, with nearly a full complement of hands. The company are troubled with slow collections, but otherwise the outlook with them is quite satisfactory under the circumstances.

The American Wringer Company's plant at Woonsocket, R. I., which has been running three days a week during the past two months, will probably start in on full time in a few days.

G. W. Denison & Co., Winthrop, Conn., manufacturers of wood planes, are closing out their business.

The Hatch Cutlery Company, South Milwaukee, Wis, and 97 Chambers street, New York, are congratulating themselves on the amount of Christy knives sold since they undertook to market the entire output in July last. They refer to the aggregate number of sets disposed of since that time as 10,000, and assure us they are making an effort to execute orders promptly.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

Will commence on Oct. 16, 1893,

TERMS, $14.

☞ The Plumbing department is under the supervision of a Trade School Committee appointed by the New York Master Plumbers' Association.

Day Instruction is also given in Bricklaying and Plastering, House and Fresco Painting, Carpentry, Sign Painting and Printing.

Evening Classes in Bricklaying, Carpentry, House Painting, Plastering, Fresco Painting, Stone Cutting and Blacksmiths' work.

The New York Trade School has attained a high reputation and is largely attended each year, the young men coming from all parts of the United States and Canada. Excellent lodging accommodations are provided near the school for pupils desiring them.

Catalogue, illustrated with 30 photo engravings, mailed free on application. Address

1st AVE., 67th and 68th STREETS,
NEW YORK.

YOU CAN TIN CAST IRON AS READILY AND CHEAP AS MALLEABLE IRON.

The Flanders process for tinning cast iron is now an assured success and is in use by some of the largest firms in the country. Correspondence solicited for the erection of galvanizing or tinning plants. Mr. W. T. Flanders will continue to superintend the building and starting of all plants.

Foresight Better Than Hindsight.

It is encouraging to perceive in current discussions of the subject of ventilation an emphatic demand for the preparation of plans for ventilation and heating prior to the commencement of the construction of buildings. It has been shown that a large part of the expense often attending the securing of good and sufficient ventilation is due to want of consideration of this question at the proper time; that is to say, at the time the rudimentary scheme of a building is being worked out. The chosen system of means and appliances for heating and ventilation should always be decided upon, incorporated in and form part of the perfected general plans. When this is done, the cost of a sufficient supply, as compared with a largely deficient one, will not be so great as many have been led to suppose.

General Application.

The force of the above remarks equally applies to plans for heating apparatus for dwellings and other buildings wherein no special system of ventilation, other than afforded by grates, &c., is intended. The whole category of extra charges that so frequently come in with bills for heating work is properly to be laid at the door of architects who neglect to consider the requirements for heating in drawing their plans; or who, if they do consider the matter, do so without such a practical knowledge of the heating business as enables them to properly plan a heating apparatus, and without the always easily obtained aid of a competent adviser. There is no good reason assignable why a building should not be designed with full reference to its being properly heated and ventilated any more than that windows should be omitted from plans and left to be put in by the builder, during construction, according to his own judgment. But this is exactly what is done, in the majority of cases, with heating apparatus for dwellings. The building is first planned, and, as a general thing, almost completed before the heating engineer is called for consultation and requested to make plans upon hard and fast lines necessitated by the architect's plans; and when some utter impracticability is encountered an alteration, attended with extra cost, is the result. Such was recently the case in the heating of a large dry goods store, in which a workroom that required to be heated was found inaccessible for the purpose except by an objectionable position of risers, where they would be not only in the way of incoming customers, but greatly mar the effect of the desired display of goods. To remove this impracticability an extra cost of about $500 was entailed. To have avoided the introduction of such an impracticability under the advice of a competent heating engineer and to have secured a better job of heating work than was ever possible under the obstacles introduced would not have cost over $50.

New York Trade School.

The thirteenth annual session of the New York Trade School, to which reference was made in our last week's issue, was inaugurated on Monday evening, October 16. The evening classes in plumbing, bricklaying carpentry, house and fresco painting, blacksmithing and stone cutting on that day commenced their respective courses of instruction, the number in each department being as follows: Plumbing, 115; bricklaying, 32; carpentry, 41; house painting, 15; fresco painting, 17; blacksmithing, 21; and stone cutting, 4. The evening class in plastering will not begin work until December 11. This attendance is fully up to the average of recent years and speaks well for the sustained popularity of the school, which has now attained to such prominence as to be the model for similar institutions throughout the country. The present season of work opens under the shadow of a great loss which has fallen upon the institution since the classes were last in active session. The honored founder and active manager of the school has been removed by death, and his wise and invaluable personal influence and efforts are no longer at its service. Happily Colonel Auchmuty left his cherished enterprise on so firm a basis, and its machinery in such a complete state of efficiency, that it is not likely to languish now, even though his guiding hand has been removed. Colonel Auchmuty's co-workers in the school have been thoroughly imbued with his enthusiasm in the work and with the ideas formulated in the now celebrated "Auchmuty system," under which it is conducted; and they will undoubtedly be competent to carry on the good work successfully on the old lines. Our best wishes go with the New York Trade School in its new year of existence.

The Closing Month of the Fair.

The World's Fair is winding up its career in a blaze of glory. As Chicago suprised the world with the grandeur of its exposition buildings, and as the magnificence of the display in its entirety far surpassed anything previously accomplished in the same line, so has the attendance outrun all expectations, and in that respect another phenomenal triumph has been scored. High water mark was struck on the 9th inst., "Chicago Day," when the total attendance reached 761,942 including those admitted on passes, or 716,881 paid admissions. Several days in the same week the paid attandance ran above 250,000 and on two days it was over 300,000. The total paid attendance for the week, including Sunday, the 8th, was 2,131,719. This far outnumbers the attendance in any similar period at any previous international or any other kind of exposition, or, in fact, any other kind of gathering of which there is any authentic record. A figure is thus set for the future that will be very difficult to exceed, and it is safe to say that for years to come any very great gathering of people will be compared with this stupendous occurrence in Chicago on the 9th of October, 1893.

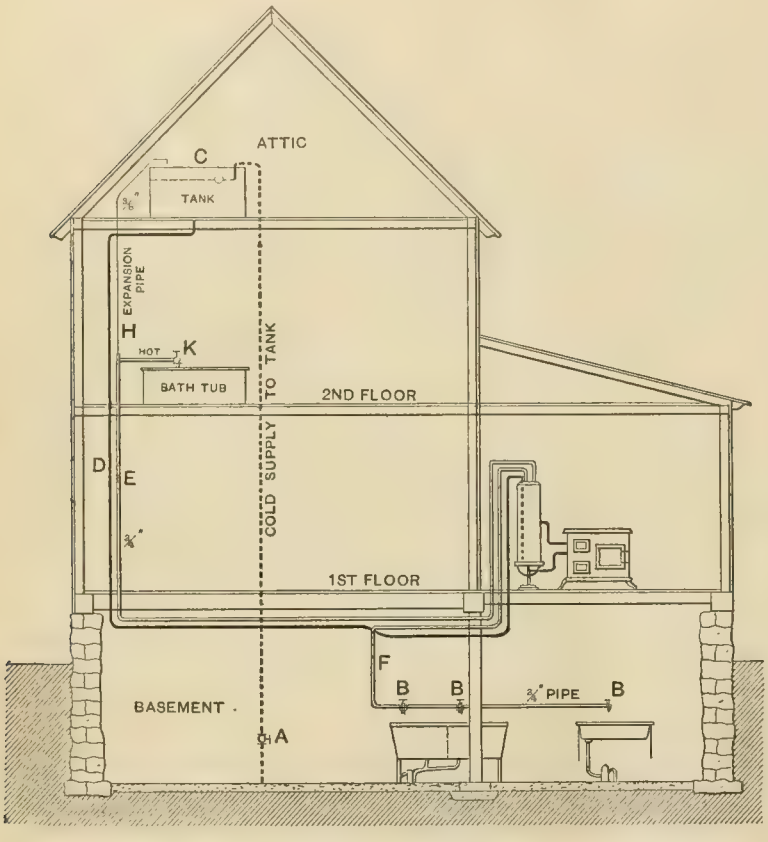
Chicago's Boast.

The attendance at the exposition for the week is another most notable matter. The figures are staggering. But Chicago boasts not alone of this achievement in attendance. To the surprise of many shrewd business men, who had not looked for such success, the exposition managers signalized Chicago Day by paying off the floating debt and the mortgage on the gate receipts, thus leaving the enterprise free of all obligations to any persons but the stockholders, who may now reasonably expect a dividend in due season. The check drawn on this memorable occasion for the payment of the trustee of the several classes of creditors called for $1,565,310.76. Thus has Chicago gloriously redeemed the obligations incurred when she assumed the task of building a World's Fair. Chicago's business men started out to prepare for a finer, bigger and more successful enterprise than the world had ever seen in this line. The verdict of the jury of the nations of the earth who have seen it is that it is unquestionably bigger and undoubtedly finer, and now it is assuredly more successful. Great is Chicago, and we are prouder than ever of her.

THE LETTER BOX.

To Prevent Collapse of Boiler.

From T. L., *Natick, Mass.*—Will *The Metal Worker* please give me information as to the result of the conditions shown by the sketch? Cold water supply at A cut off, all the bibbs in the bathroom K closed, and the bibbs B B B on the hot water pipe in the laundry open. From the top of the hot water pipe in the bathroom a ⅜-inch pipe is carried to the supply tank. Will the supply of air through the ⅜-inch expansion pipe be sufficient to prevent a partial collapse of the boiler?



To Prevent Collapse of Boiler.

Note.—It is possible that a ⅜ inch pipe would prevent the boiler from collapsing, but a safer practice is to use a larger size. A ½-inch pipe is used by many experienced plumbers, though some observe a rule of making this pipe the full size of the pipe which leads from the boiler, and others use a vacuum valve at the top of boiler.

School of Pattern Cutting.

From F. D., *New York.*—Please inform me, through *The Metal Worker*, if there is a school in New York City where pattern cutting for cornices and skylights is taught. It is not taught in any of the public schools nor in Cooper Union.

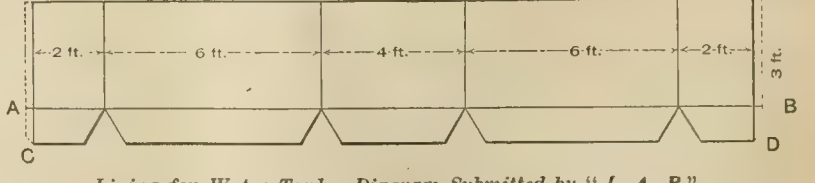
Note.—We do not know of any place in New York City, or elsewhere, for that matter, where instruction can be obtained in pattern cutting, outside of the shops devoted to that sort of work. If there is such a school in New York City, or any other place in the country, we shall be glad to know of it.

Bending Iron Pipe.

From J. HAWK, *Nevada.*—Will some of the practical contributors to the Letter Box tell a backwoods tinner and all around workman how to bend wrought iron pipe into a coil to be used in a hot air furnace for heating water?

Lining for Water Tank.

From J. A. B., *Riverhead, L. I.*—In answer to H. and S., Marietta, Ohio, who wish information regarding the material and method to be used in lining a 60-barrel water tank, I would advise the use of 16-ounce tinned copper, for the reason that it is easier to place in the tank than sheet lead; besides, it will not injure the water. I am informed that the boards of health in some of the large cities require all water tanks to be lined with tinned copper, as sometimes the water is used for cooking and drinking purposes and is not injured by coming in contact with the tinned metal. I have lined about 20 tanks with tinned copper, some of which have stood nearly 14 years, and never had a leaky tank. Other tanks, lined with sheet lead and put in by tinners, have failed because the tinners could not solder the upright seams with a soldering iron strong enough to stand the water pressure. Suppose a tank 6 feet long, 4 feet wide and 3 feet high is to be lined with tinned copper. First get out the sides and ends in one piece, as shown in the accompanying diagram. The sheets of copper would be locked together and the seams well soldered. Below the line A B allow for bending in, which makes it easier for joining the bottom. Also allow for end seam, as shown by the dotted lines. Form the lining as indicated by the solid lines, place in tank, and finish the end seam. When soldering the upright end seam use very small bars of solder, which are light to handle and melt easy at the point of the soldering iron. After the lining is in position, turn over the edges from C to D, so a locked joint can be made with bottom piece, which is also to have its edges turned over. The seams thus formed are to be pounded down and well soldered. For securing lining to tank use copper nails, as iron nails are liable to corrode and cause leaks.



Lining for Water Tank.—Diagram Submitted by "J. A. B."

Water Back and Boiler Connection.

From F. M. P., *Washington, N. J.*—I would like to say to "G. E. M." of New Hampshire, whose letter appears in *The Metal Worker* of October 14, that I fear he will have to resort to heroic treatment. Two remedies suggest themselves to me: One is to put the boiler upstairs, in a closet if convenient, over the range, and the other is to change the range for one with the boiler resting horizontally on a high shelf. If he overcomes the difficulty he should report to the Letter Box for the benefit of other readers of the paper.

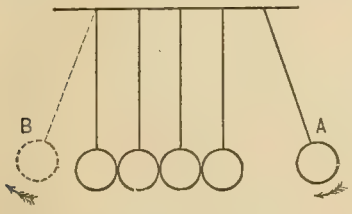
Connecting Bathroom Radiator With Water Back.

From INQUIRER, *New Jersey.*—Will the practical readers of *The Metal Worker* please tell me which is the better place to connect the pipes from a radiator in a bathroom to the kitchen apparatus? Should the pipes be joined by means of a Y branch with the pipes between the boiler and the water back, or should the flow pipe to the radiator con-

nect with the hot water service pipe at the top of the boiler? I favor the top of the boiler and think that, as a rule, better circulation would follow and the boiler would not be likely to be robbed of hot water by suspended or sluggish circulation, which would be possible if the flow pipe connected with the branch on the hot water pipe from the water back.

Riveting Hammers.

From B. S., *Boston, Mass.*—Let a number of balls be suspended as shown in Fig. 1, and one of the balls, as A,



Riveting Hammers.—Fig. 1.—Effect of Light Hammer.

lifted and allowed to strike the row. One ball, as B, will be made to swing off on the other side, regardless of the velocity with which the first ball strikes the others. If two balls, as C and D, are allowed to fall against the three, as shown in Fig. 2, then two balls, as E and F, will be thrown off on the other side, and as in the previous instance, regardless of the velocity with which the two balls struck.

Let us suppose the balls in line represent the atoms of a body, and the striking balls to be hammers of different weight. The heavy hammer, as illustrated in Fig. 2, can be said to transfer its force into the interior of the object struck, while the light hammer, as illustrated in Fig. 1, does not put so much of the material in motion. When riveting with a heavy hammer, we may infer that the rivet would be made to expand, and thus fill in the recesses of the rivet hole, besides forming the usual head on the hammered end. The lighter

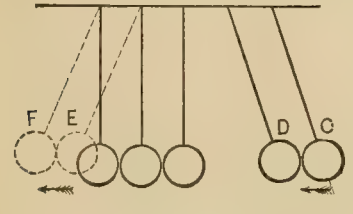


Fig. 2.—Effect of Heavy Hammer.

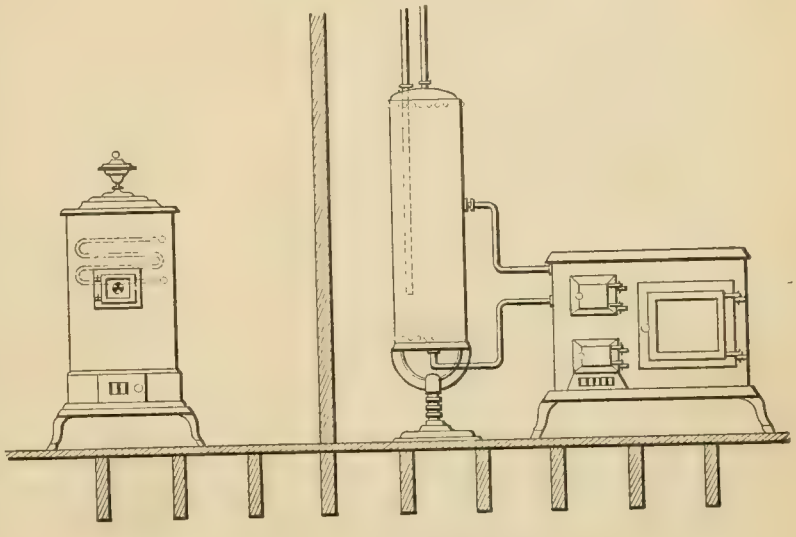
hammer being used, as indicated in Fig. 1, it would simply form a head on the hammered end of the rivet without expanding its body to any great extent.

Note.—Our correspondent has given a very interesting illustration, but we are by no means sure that his reasoning is correct, although his results are plausible. He seems to think that the force of a blow depends upon the weight of the hammer. As a matter of fact, the force of a blow is dependent upon two things, the weight of a striking body and the velocity with which it moves. A 1-pound hammer when striking with the velocity of 2 feet a second delivers the same blow as a 2-pound hammer when striking with a velocity of 1 foot a second. When it comes to the matter of riveting there is another curious fact that must be considered. A light hammer striking with high velocity will give, as we have pointed out, just as heavy a blow as the heavy hammer that is swung more slowly. The effect of the latter, however, would be more likely to fill up the rivet holes our correspondent mentions, as it would give more time for the rivet metal to "flow," as the term is.

Boiler Connected with Two Stoves.

From B. & S., *Franklin, N. Y.*—Will *The Metal Worker* give the best method of doing the work suggested by the accompanying sketch? It represents a 40-gallon boiler connected with a range in a farm house kitchen, which has been in satisfactory operation one year. In an adjoining room, separated by a partition, is a heating stove in



Boiler Connected with Two Stoves.

which a coil is to be placed and properly connected with the boiler. The object is to secure a supply of hot water from the heating stove when the range is not in use. There is about 20 pounds pressure and I wish to ask if it would be advisable to run a supply pipe under the floor to a heating coil in the stove? How many elbows or return bends should be used in the coil?

Note.—A branch from the cold water pipe at the bottom of the boiler should be run under the floor to the coil in the stove. A pipe taking the hot water from the coil in the stove should run up to the ceiling and then through the partition, where an air cock should be placed, and be connected with the hot water service pipe from the top of the boiler. Some may prefer a more direct connection with the boiler, even by running down and connecting with the return from the water back; but either way will answer. A condition that may be troublesome will arise when there is a good fire in both stoves, which may heat the water more than is desirable. The size of the coil in the stove and the number of elbows or returns to use is difficult to decide without knowing the size of the stove and how much of the time its door is left open to check the draft. However, to give something that our correspondent can use as a basis from which to make a decision according to his own judgment, with all the conditions before him, a coil of 1-inch pipe running once around inside of a 14 inch cylinder stove and located just above the top of the fire would do the work. Such a coil would not interfere with adding fuel, and if the door of the stove was opened the inflow of cold air would not strike directly against it. If a coil is used, as shown in the illustration, more surface should be exposed in it to do the work, possibly one-third more.

Check Valves and Steam Heaters.

From H. W. W.—In reply to "Inquirer," in the issue of *The Metal Worker* of October 14, I would say that where two boilers or more are working together, check valves must be used to prevent the water from backing out of one into the other, as the steam capacities of both boilers are not at all times equal. This is owing to the covering of the fire with green coal, &c. Where one boiler is used checks are seldom put in, and this, I think, is a mistake, as many boiler tubes and sheets have been burned and destroyed simply because there was no check in the return to prevent the pressure from backing the water out of the boiler. I maintain that every heating apparatus should have checks in the return. The horizontal swinging check valve will not obstruct or offer any more resistance than an ordinary right angled bend when properly adjusted. They are as important and reliable a fixture as any connected with a steam heating outfit. It has happened where a steam pipe burst that the attendant shut off the steam valves first, which had the effect of lowering the water level about 12 inches below the top row of tubes, and this with a brisk fire going. If there had been a check valve used it would have saved a great deal of trouble and expense. I believe in the check valve for every heating apparatus, particularly where they are handled by careless or indifferent employees.

THE TIN SHOP.

Pattern for an Elliptical Flaring Article.

From W. S. C., *Tallahassee, Fla.*—would like to be informed how to describe the patterns for an elliptical flaring article, similar to a foot bath.

From W. F. S., *Bayfield, Wis.*—Will *The Metal Worker* publish a simple method of describing the patterns for an oval flaring pan, the body to be in two pieces?

Answer.—The first step to be taken in describing the patterns for the articles mentioned above is to obtain the shape of an approximate ellipse, or one struck from two sets of centers, which can be done as follows: In Fig. 1, let B C represent the length of the ellipse, and D E the width. Draw B C and D E at right angles to each other, intersecting at A. Take the width D E and set off from C on C B, as shown at F. Divide F B into three equal parts, as indicated by the small figures. Then take two of these parts, as B 2, and, with A as center, establish the points H and G on B C. With H G as radius, and G as center, strike an arc indefinitely, as shown by J K H, and in a similar manner, with H as center, describe the arc K G J. From K draw lines through the points H and G indefinitely, as shown by K N and K O.

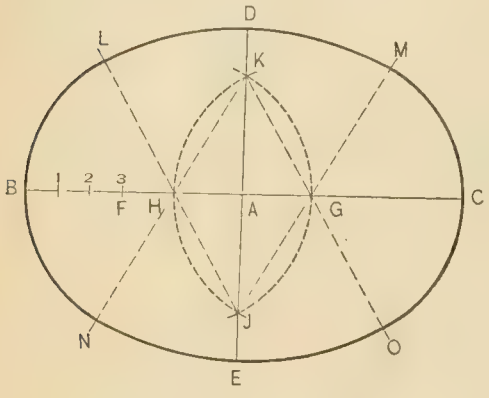


Fig. 1.—Method of Describing an Ellipse.

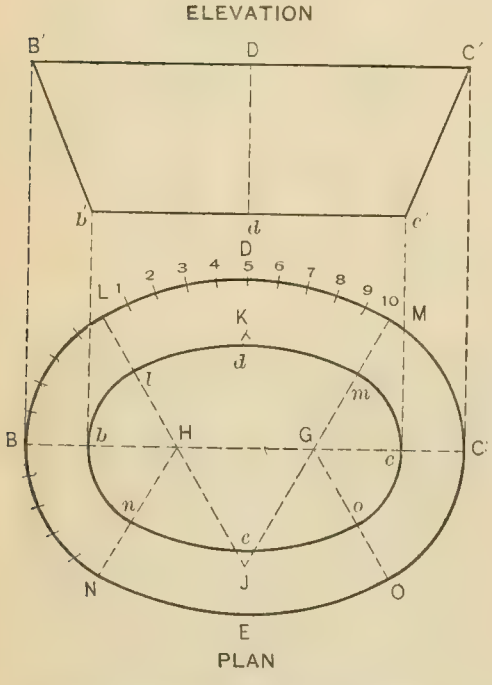

Fig. 2.—Plan and Elevation of Article.

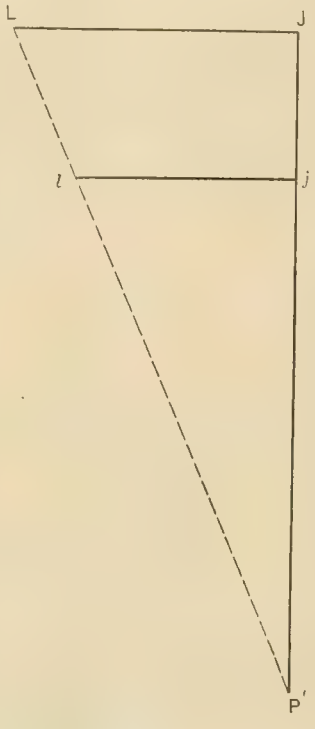

Fig. 3.—Method of Obtaining Radii for Sides.

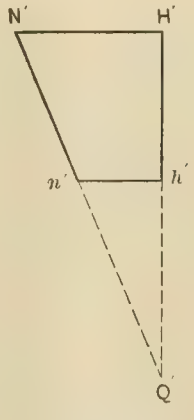

Fig. 4.—Method of Obtaining Radii for Ends.

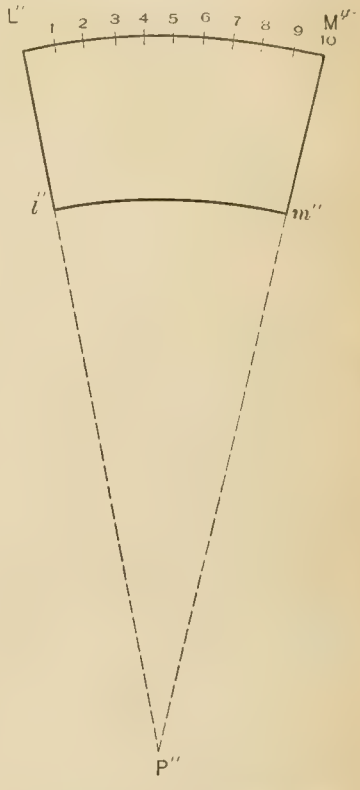

Fig. 5.—Pattern for One of the Sides.

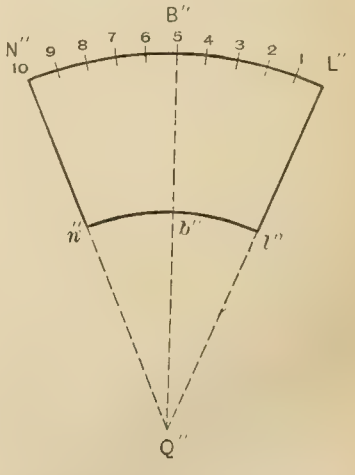

Fig. 6.—Pattern for One of the Ends.

Lines are to be drawn in a similar manner from J through points H and G, as shown by J L, J M. With J D as radius, and J as center, strike the arc L D M, and with K as center, and K E as radius, strike the arc N E O, thus forming the sides of the figure. With H as center, and H B as radius, strike the arc N B L. With G as center, and G C as radius, strike the arc M C O, which completes the figure, a duplicate of which is shown in Fig. 2. Supposing this figure, as shown by B D C E, to represent the top of the article, the next step will be to draw the elevation of the article corresponding to and in line with the plan, making the hight D′ *d*′ and length of bottom *b*′ *c*′, as may be desired. Place the T-square at right angles to B C and bring the blade against point *b*′ and drop a line cutting B C at *b*. In a similar manner drop a line from *c*′ to *c*. Then *b c* gives the length of bottom of article on plan. With H as center, and H *b* as radius, strike the arc *n b l*, cutting H N and H L, as shown. Also, with G as center, and G *c* as radius, strike the arc *m c o*, cutting G M and G O. With J as center, and J *l* as radius, strike the arc *l d m*. In a like manner, with K as center, and K *e* as radius, strike the arc *n e o*.

Then in Fig. 2, B′ C′ *c*′ *b*′ represents the elevation of article, B D C E the plan of top, and *b d c e* the plan of bottom. If so desired the elevation could be first drawn, giving the length of top, bottom and hight of the article, after which the plan could be drawn, as shown. While the elevation is necessary to show the shape of article it is not required in obtaining the patterns, providing the hight of article is known. The next step is to construct the diagram shown in Fig. 3 for obtaining the radii of sides. Draw the perpendicular line J′ P′ indefinitely, and at right angles to it draw J′ L′ indefinitely. Make J′ L′ equal to J L of the plan. From J′ on J′ P′ set off the vertical hight of the article, as shown by D′ *d*′ of elevation. Draw *j*′ *l*′ parallel to J′ L, and from *j*′ set off the distance J *l*′ of plan. Having established the points L′ and *l*′, draw the line L′ *l*′, which continue until it intersects J′ P′ at P′. Then P′ L′ will be the radius for describing that part of the pattern indicated on plan by L D M, as P′ *l*′ will be the radius for describing the part of pattern indicated by *l d m* of plan. The diagram in Fig. 4, representing method of obtaining radii for ends, is obtained in a similar manner. Draw the right angle N′ H′ Q′, and from H′ set off the distance H N of plan. Make H′ *h*′ equal to the vertical hight of article, as shown by D′ *d*′ of elevation. Draw *h*′ *n*′ parallel with H′ N′, and from *h* set off the distance H *n* of plan. Through the points N′ *n*′ draw N′ Q′, as shown. Then Q′ N′ will be the radius for describing N B L of plan, and Q′ *n*′ for describing *n b l* of plan.

We are now ready to describe the pattern of one of the sides, to do which proceed as follows: In Fig. 5 draw any line, as L″ P″. With L′ P′ of Fig. 3 as radius, and point P″ of Fig. 5 as center, strike the arc L″ M″. With the same center, and with P′ *l*′ of Fig. 3 as radius, strike the arc *l*″ *m*″. Make L″ M″ of Fig. 5 equal to L D M of plan, either by measuring with a strap or by dividing into equal parts, as shown by the small figures. From the point M″ draw a line to P″, as shown. Then L″ M″ *m*″ *l*″ is the pattern for part of article shown on plan by L D M *m d l*.

For pattern of end piece, which includes the part of plan between N and L, draw the line L″ Q″ of Fig. 6 indefinitely. With Q″ as center, and Q′ N′ of Fig. 4 as radius, strike the arc L″ N″, making it in length equal to N B L of the plan. With Q″ as center, and Q′ *n*′ of Fig. 4 as radius, strike the arb *l*″ *b*″ *n*″. From the point N″ draw a line to Q″. Then N″ B″ L″ *l*″ *b*″ *n*″ is the pattern for that part of article shown on plan by N B L *l b n*. To construct the article shown in Fig. 2 two side pieces and two end pieces similar to Figs. 5 and 6 are required. As the net patterns only are shown, allowance is to be made for joining, burr and wire. If it is desired to have the article made from two pieces, so the seams will be at the ends, as indicated by B *b* C *c* in plan, describe the pattern as shown in Fig. 7. In this figure L‴ M‴ P‴ is a duplicate of Fig. 5, and is drawn as previously described. It is then only necessary to draw the half of pattern of end, Fig. 6, on each side, as shown. This can be done as follows: From the points L‴ and M‴, in the direction of P‴, set off the distance N′ Q′ of Fig. 4, thus locating points X and Y. From X as center, describe the arcs L‴ B‴ and *l*‴ *b*‴, using the radii X L‴ and X *l*‴, or Q′ N′ and Q *n*′ of Fig. 4. Make L‴ B‴ of pattern equal to L B of plan, and from B‴ draw a line to X. In a similar manner describe the arcs M‴ C‴ and *m*‴ *c*‴ from the center Y, using the same radii as in the previous instance. Make M‴ C‴ equal to L‴ B‴ and draw C‴ Y, which completes the half pattern. As the net pattern only is shown, the usual allowances are to be made for joining, burr and wire.

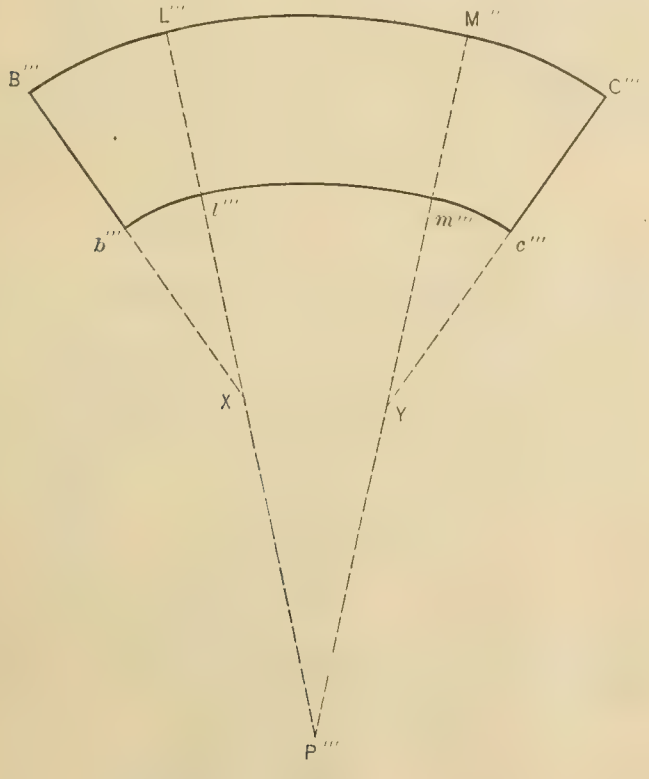

Fig. 7.—Pattern for One-Half of the Article.—Seams on the Ends.

PATTERN FOR AN ELLIPTICAL FLARING ARTICLE.

The fire loss of the United States and Canada during September amounted to no less than $10,508,700, which, although a decrease of $2,714,000 from that of August, still shows a serious increase, amounting to $2 628,900, over the loss of September, 1892. The total value of property destroyed by fire for the first nine months of the present year now reaches the enormous figures of $120,832,700, or over 25 per cent. greater in the aggregate than those of the same period in 1892.

Prof. Sylvanus Thompson of London believes that ocean telephony is not only possible, but that it will be among the developments of the near future.

Among those who will lecture before the Franklin Institute of Philadelphia during the coming season will be Henry R. Towne of Stamford, Conn., who will speak, on January 26, on "American Bank Locks and Fastenings."

ROOFING AND CORNICE.

Some Western Methods of Cornice Work.

BY C. H. ARGO.

In this article we will endeavor to illustrate some of the simplest points about galvanized iron cornice constructions as practiced in the West, and show, perhaps, where some time may be saved by describing the different steps to be taken, from the time the drawing is received from the architect to the setting of the cornice on the building ready for the mason to back up.

We have chosen for this purpose a plain, ordinary main cornice, with a head block on each end, as shown by Fig. 1. The first thing to do is to make a full size detail, if none be furnished, and place it on the drawing table in the lower left hand corner, so as to facilitate the drawing of the horizontal lines. About the first pattern cut on a cornice of this kind is the bracket side, which is marked (with muriatic acid in which some copper filings have been dissolved) with the number required, the 7 *m* in Fig. 3, meaning seven more, which, with the pattern, makes eight sides, the number required for four brackets, as called for in the elevations. The scroll in the side is a single cut of the snips. It will be observed that in addition to the ⅞-inch lap allowed to turn out for riveting purposes, we have two pair of prick marks on the outside edge, the use of which will be explained further on. We next take, with a strip of thin metal, the stretchout of the top part of the bracket face, from the top of the sink at A, Fig. 2, upward, allowing a ⅞-inch lap to turn out, to which the crown mold will be fastened. Transfer this stretchout to a piece of iron the width the brackets are to be, and mark it as before described 3 *m*, which will be four with the pattern, the number required. We should here state that it is usual to use up the patterns, as it would be found a costly system to keep the patterns for all the cornices made, in this age of keen competition and variety of designs. The stretchout of the foot of the bracket is next taken from the point B downward, turning out ¼ inch on the wash of foot mold.

It is these little details of construction which count in putting the work together, the getting enough laps and edges to make a good job without getting in anything of the kind that will impede the putting together of the work. We next draw a half section of the face, as shown by C, Fig. 2, giving the depth of sink and width of strips on each side of it, the middle strips or back of sink being cut to the exact length called for on dotted lines, but ⅛ inch wider, for convenience in putting together. Now take the pattern of the side and laying it on a piece of iron scribe along its curved edge from one pair of prick marks to the other and put the marks in. Cut out along this line, then with a gauge made of sheet iron the depth of sink, as shown at G, Fig. 3, mark off the pattern and cut off ends through prick marks, which gives the right length. There are no edges or laps on these strips, the different pieces being soldered together sharp.

The head block will be treated in the same way, only the pattern for the side

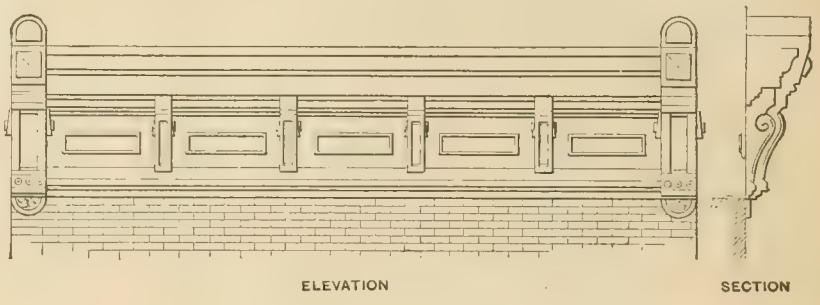

Fig. 1.—Example of an Ordinary Cornice.

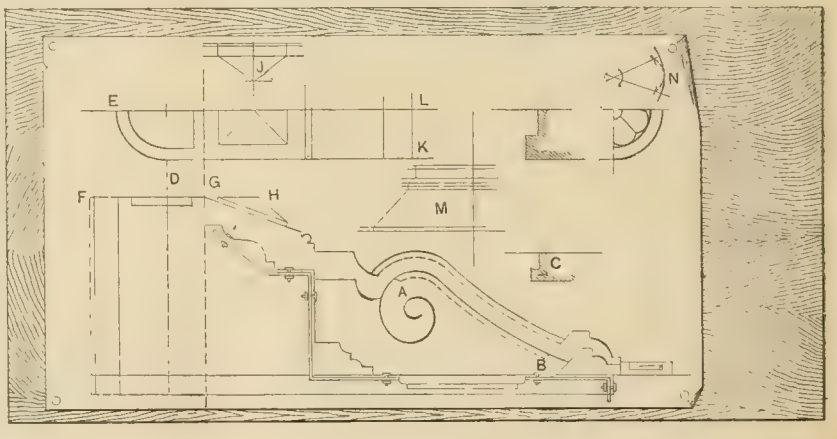

Fig. 2.—Drawing the Patterns.

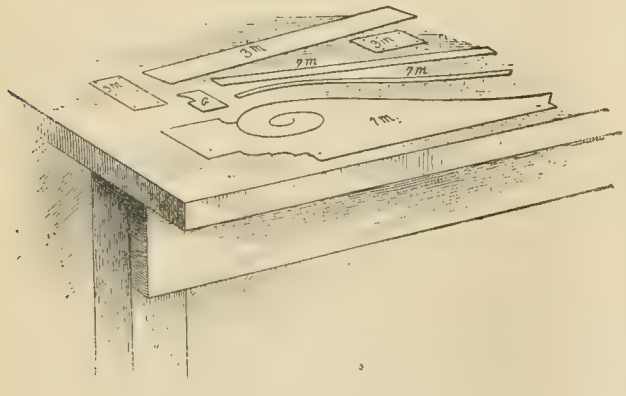

Fig. 3.—Patterns for Bracket.

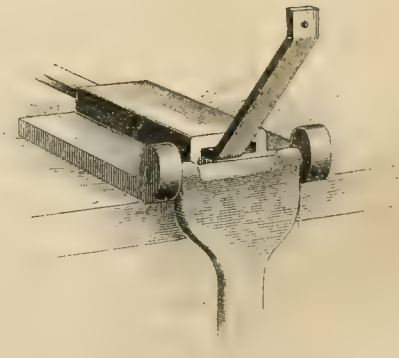

Fig. 4.—Anchor Bending Device.

that goes on the outside will run back 2 inches over the wall line with a 1 inch edge turning in, while the side butting the cornice will be cut to fit moldings of cornices with edges left to turn over same. It will be readily seen from an inspection of the drawing, Fig. 2, that we have laid off a stretchout of face down to top of sink, giving a true face of the part that takes the raised panel H, the pattern for one quarter of which we also show at J.

Take the pattern for this part of the front off the paper in this way, slide a

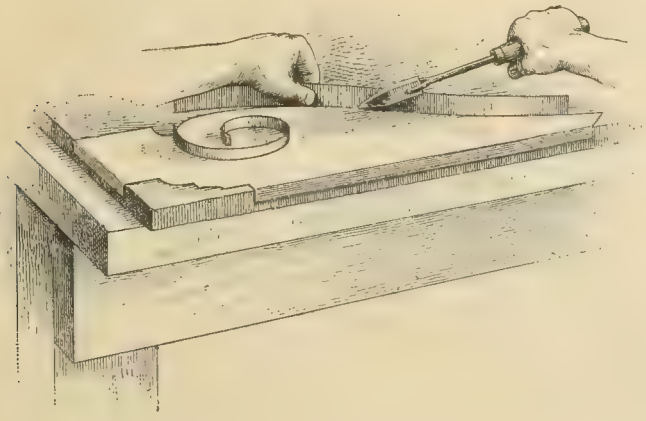

Fig. 5.—Soldering Strip on Outside Edge of Bracket.

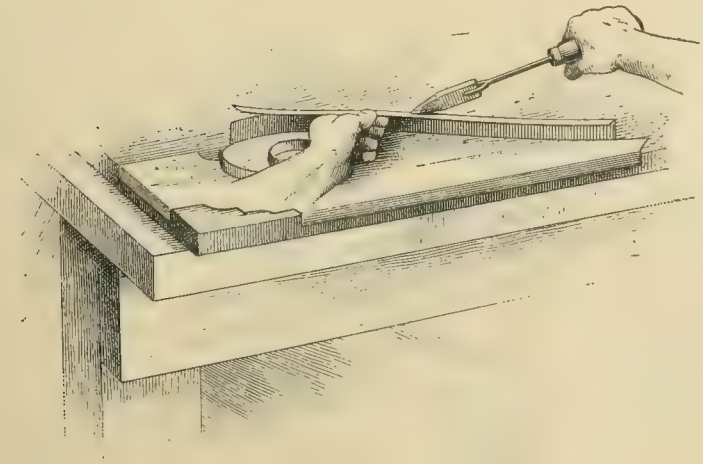

Fig. 6.—Soldering on Sink Strip.

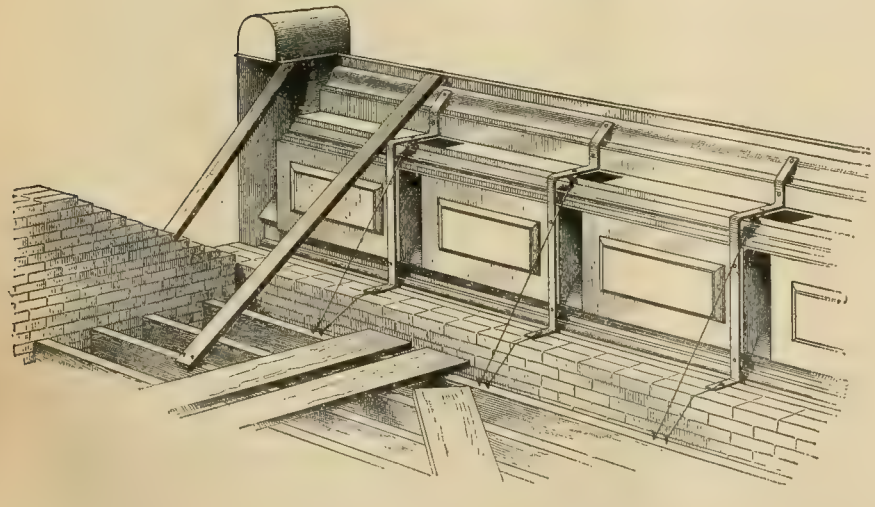

Fig. 7.—Back View of Cornice.

SOME WESTERN METHODS OF CORNICE WORK.

we have taken the stretchout of the top part of head block from the spring line D to center line E, which we have laid off in its proper place on side of head block, and allowed a lap where the sides will meet on top, all as shown by F. From the line G downward piece of iron large enough for the whole pattern under the paper, feeling its position from the outside of the paper, bring one edge about parallel with the line D K, and put in the necessary prick marks for bending, and one mark each at E and L on center line. Turn the iron over, bringing the reverse side of the prick marks at E and L (which can be plainly felt as the iron is being slid around under the paper) to their respective places, and repeat the pricking process, giving the whole pattern. It takes longer to describe this than it does to do it, and it has the advantage of not only saving time and space in the making of the drawing, but it is very accurate as well. The panel head M is taken off in the same way, where its advantages are still more apparent. The sinks in the face at top and bottom of head block are cut in, the piece falling out making the back. The strip used for sink is straight with one edge on it turned in, so that where the before mentioned back is dropped in it will lay on it and be tacked there. The pattern for flutes in base of head block is shown at N.

The molding is the next thing to get out, and as there are no miters in the cornice we take the stretchout with a strip of thin metal. The crown mold runs down to the face of the brackets usually, but sometimes the crown and bed are made all in one: this, of course, depends on whether the stock cuts to good advantage that way or not. The body of the panel is usually cut all in one, but this also depends on the size of it, and is cut by using the panel head for the four miters, the distance between the panel moldings being the length of the head itself. The anchors come next and are made of $\frac{1}{4}$ x $1\frac{1}{2}$ inch band iron, and are fastened to the cornice with $\frac{1}{4}$ x $\frac{3}{4}$ inch flat head stove bolts. For the pattern we take a strip of metal and obtain the stretchout, indicating where a bend is to be made by a line drawn across it, and where holes ought to come by a dot of the marking stick. The anchors, after being punched, are bent to shape in the vise or by a contrivance fastened to the bench, as shown in Fig. 4, and which is made of cast iron.

The next thing we turn our attention to is the putting together of the various parts, and the bracket side comes first, as before. We put a $\frac{1}{2}$-inch strip around the scroll, starting at the terminus of the scroll and cutting off when it comes to the face of the bracket. This strip is soldered on the inside of the bracket side and on the side of cut furthest from wall line of bracket at the starting point, which will allow the scroll to be pulled out when the bracket is together, showing the volute shown in the elevation. This strip is held while being soldered by the forefinger and thumb of the left hand, in the same way as shown for the strip on the outside edge in Fig. 5. Instead of tacking about every inch, as is often done, and then going over it the second time to solder through, we solder right through in the first place by drawing the tack along until it meets that already done.

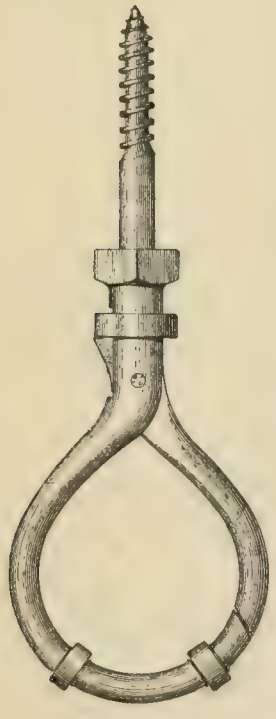
The strip on the outside edge is next put on, as shown in Fig. 5, and right here is where those prick marks save time, as this strip is started from the lower pair on one set of sides and from the upper pair on the other set. Next the sink strip is put on, as shown in Fig. 6, by putting the acid on the inside and soldering from the outside, the solder soaking through and taking a firm hold. These are done in pairs, of course, and after putting the head and foot on one side and soldering fast, the bracket is ready to be put together, which is done by laying the side with head and foot attached flat on the slab and laying the opposite side on top, soldering from the outside as before described. This finished, the bracket is turned up and the back of sink is

pressed up against the sink strips and soldered fast. Care should be taken that the work is true, as this piece makes the bracket rigid. When the molding is formed and put together to the right length, and the panels made up, we are ready to put the sections together. The brackets are spaced off as called for on the elevation and soldered to the bed mold, then the crown and foot are put on, and the panels are dropped in and tacked; finally the whole is riveted off with small rivets headed up on the inside.

The anchors are put on about 4 feet apart and placed so they do not interfere with the panels; that is, they are set near the brackets clear of the panels. This done and the cornice is ready for the building, and is set on the wall, as shown by the section, Fig. 1, and also by the inside or back view of cornice, Fig. 7. Wires are tied to the anchors at convenient points and a spike tied to the wire and driven into any stationary timbers that are handy, such as roof joists or ceiling joists. This mode of fastening allows the cornice to be drawn to proper position and held there by the help of a few braces of wood, all as shown in Fig. 7.

Beaton's Patent Pipe Hangers.

In the accompanying illustrations we show what are known as Beaton's patent pipe hangers, which are being manufactured by the Beaton & Corbin Mfg.



Beaton's Patent Pipe Hanger.—Fig. 1.—Hanger Closed.

Company of Southington, Conn. The hanger shown in Fig. 1 is made of malleable iron, the parts being so adjusted that it can be lengthened according to requirements by simply taking out the screw and inserting a piece of pipe, as the thread employed is a pipe thread. This pipe hanger is referred to as having no bolts, screws or nuts to be removed, and by simply slipping up the ring the jaw may be kept open, as indicated in Fig. 2 of the cuts, while by lowering the ring the jaw is closed and locked, as indicated in the first illustration. The small rolls in the hanger are for the purpose of providing for expansion and contraction of the pipe. The hanger is made in various sizes to meet different requirements. In Fig. 3 of the illustrations is shown what is known as

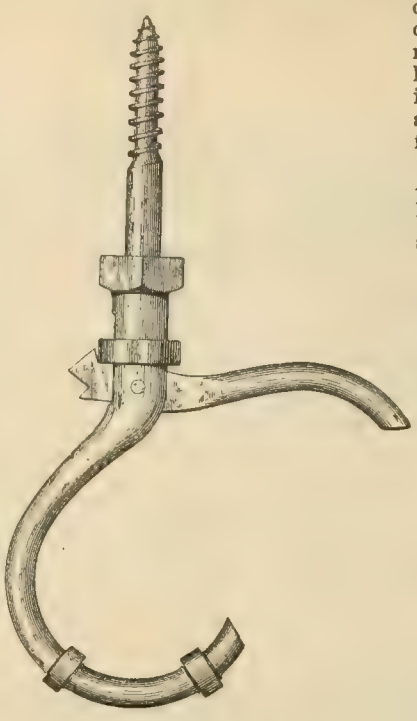


Fig. 2.—Hanger Open.

Beaton's patent chain pipe hanger, constructed of malleable iron and involving several interesting features. It is made in sizes from ½ inch to 6 inches, each hanger having 1 foot of chain attached. This hanger is of such a nature that it can be used by plumbers for hanging soil pipe or for hanging wrought iron pipe.

Fig. 3.—Patent Chain Pipe Hanger.

FLASHINGS.

The Illinois Roofing & Supply Company, 203 Lake street, Chicago, have a prominent exhibit of some of their specialties on the Midway Plaisance at the World's Fair. The Hindoo jugglers' pavilion is roofed with their Perfection steel roofing and the sides are finished with their imitation in steel sheets of brick and rock faced siding. The rock faced siding forms the lower courses of the building above the foundation. Next comes apparently a belt of red brick and above that a belt of yellow brick. The colors are an exact imitation of the natural materials, and at a short distance the illusion is perfect.

A French consular report from Mexico mentions a steady increase in the imports of British sheet iron and sheet zinc for roofs in that country.

Proudman Bros. have bought the old established business of H. B. Todd, Meriden, Conn., and will continue the manufacture of light metal goods, including the well-known Yankee eave trough hangers and other patented articles.

The Columbia Corrugating Mfg. Company, formerly known as the Chicago Steel & Iron Roofing Company, and now located at Niles, Ohio, have almost completed their new buildings and expect to begin active operations in a few days.

The Cortright Metal Roofing Company, Broad and Hamilton streets, Philadelphia, Pa., are making strong claims for their system of roofing and the quality of material employed. They state that they make no low grade goods, no iron shingles and no goods from waster tin plate. Their product is turned out from tinned steel, and the workmanship is referred to as being first class in all particulars.

The Skyes Steel Roofing Company of Chicago, Ill., and Niles, Ohio, write us that they have been awarded a medal and diploma at the World's Columbian Exposition on Sykes' patent cap steel roofing.

Incoming vessels report an unusual crop of derelicts in the Atlantic, many of which are in the direct path of the ocean liners. Twenty of these obstructions were recently reported to the Hydrographic Department in various positions off the coast from Maine to Florida, and the dynamite cruiser "Vesuvius" was sent last week on a mission of destruction toward those floating off the Jersey shore. It is probable that another naval vessel will be detailed to remove the derelicts since located, the number of which is said to have been augmented by last Friday's storm.

One outcome of the recent financial stringency in New York City is noted in an almost complete cessation of speculative building during the past few months. Real estate journals regard this as a not unmixed evil, as the demand for houses is said to be rapidly catching up to the supply, causing greater steadiness in the market. The concomitant lack of employment is, however, pressing hardly on workmen in the building trades.

It is said that Secretary Herbert does not think that the Holland submarine boat, selected by the expert board, fulfills all the requirements sufficiently fully to justify him in expending $150,000 in constructing and experimenting with a boat of this type. The Secretary believes it will be better to wait awhile before building a submarine vessel, so that time may be allowed for the development of a thoroughly trustworthy one.

PLUMBING and GAS FITTING.

The Leading Principles of Scientific House Drainage and Sanitary Plumbing.—II.

By Wm. Paul Gerhard, C.E.

IV.—ACCESSIBILITY.

The fourth principle of modern sanitary drainage is the accessibility of all parts of the work.

By this we obtain not only a greater feeling of security and acquire more actual safety, but we also secure better workmanship, give easy access for inspection of the work, facilitate cleaning operations, secure greater purity and a circulation of air about the plumbing fixtures, expose any slight leaks and render repairs to plumbing work less difficult, less troublesome and less costly.

Applying the principle of accessibility to the drains of a house, we carry them, wherever practicable, in plain sight above the floor and along the cellar wall. Where we are obliged to put the main house sewer under a concrete, tiled or asphalt floor, we provide frequent cleaning and flushing hand holes to gain access to the drain in case of stoppage, and we keep all such hand holes accessible by means of man holes, with cast iron frames and covers. The rest of the pipe may then be safely buried in concrete; in fact, I prefer this method of construction to the method sometimes required of putting such underground drains in trenches with brick walls and flagstone covering, for these in time accumulate dust, dirt and dampness, besides not infrequently forming channels for rats and harboring places for vermin.

This principle efficiently carried out requires all pipes for drainage, water and gas to be placed in plain sight and kept accessible throughout. All soil and waste pipes should be thus arranged, and, as a rule, can be kept exposed and standing free from the walls except possibly on the parlor floor, and here they should be covered by a hinged face board so as to be readily got at. No pipes should be built into walls or put in plastered partitions.

The same rule applied to water supply pipes requires these to be kept outside of walls, plastered partitions and floors. Water pipes in the cellar should not be buried under the concrete floor, and the proper place for distributing pipes for hot and cold water for the upper floors is at the kitchen and laundry ceiling, and not under the parquet floor of dining rooms or parlors, as is still so often done. All rising lines should be carried exposed in closets and in the bathrooms, and no supply pipes should be concealed behind marble casings or tile wainscoting.

Even in regard to gas pipes, which are generally buried out of sight, an effort should be made to keep all risers and main lines exposed, while distributing pipes laid under floors should be kept accessible by screwing down the floor boards over the pipes with brass screws.

Rain water pipes, overflow pipes, refrigerator wastes and other disconnected wastes should also be kept accessible and means provided for flushing them out at regular intervals, and all these pipes should have access holes for removing obstructions.

What is true of the pipes is also applicable to the valves and shut offs on supply lines and gas services, so that in case of the bursting of a water pipe or in case of fire the water and gas may be readily shut off, either from the whole house or on the different floors, without losing much valuable time in searching for hidden stop valves

All traps should likewise be kept accessible. The trap on the main drain should, if under the floor, be incased in a brick man hole. Rain water area and yard drain traps should not be buried out of sight in the ground, but placed in the cellar where they can be got at. All traps under fixtures should remain exposed and access be given to them by clean out caps or brass screws.

The main house drain should be made accessible by placing frequent hand holes, closed by brass trap screws, at the foot of all vertical lines, at all bends, at junctions, at traps, and so on.

Last, but not least, all plumbing fixtures should remain open, exposed and accessible, and all wood casings, which only serve to conceal defects, should be done away with. Until quite recently the custom has been to box up and incase the various fixtures, water closets, wash basins, bathtubs and sinks with much useless wood work. Fortunately, this custom has slowly but surely given way to the new method of open fixtures. This principle is particularly important in the case of water closets and of slop sinks, although it is equally desirable for lavatories and bathtubs, and the less wood work all these fixtures have the better they are. Until recently it required strong arguments to secure a client's approval to the open arrangement of water closet seats, but happily its advantages are now being more universally recognized and adopted.

With the desire of making exposed plumbing as showy and handsome as possible, it has become the custom to specify nickel plated brass piping and traps at all open fixtures. This has recently led, owing to the increased labor for the servants of the household involved in keeping the nickel plated work bright and polished, to a certain amount of prejudice, even in architects' offices, against open work. This misunderstanding—for as such it must be regarded—is a very unfortunate one, for it is not at all necessary, in order to have open plumbing work, to use nickel plated brass piping. On the contrary, work of equal quality from a sanitary point of view can be secured with lead or galvanized pipes, which may be suitably painted with enamel paint, or covered with silver or aluminum bronze and made to look quite attractive.

In the servants' quarters of a house, however, under kitchen, scullery and pantry sinks and laundry tubs, the use of lead traps and waste pipes in open work should, in my opinion, be discouraged, and lacquered brass traps and pipes should be given the preference as being much stronger than lead work in resisting blows or indentations caused by the careless knocking about of pails, cans, &c., under these plumbing fixtures.

Not only should all plumbing fixtures be arranged in an open manner, leaving all parts accessible, but preference should be given in the selection of fixtures to those without hidden, inaccessible waste valves, overflow pipes or traps.

V.—SAFE TRAPPING.

A fifth principle consists in the safe trapping of all house drains, of area and yard drains, of the subsoil drains, if connected with the sewer, and of all plumbing fixtures, in order to prevent the escape of sewer or soil pipe air and disease germs into the house. Rain water pipes should likewise be trapped if they open near dormer windows or near vent flues or light and air shafts.

The trap on the main drain serves to shut off the house from the sewer air in the common street sewer, and thus maintains a perfect isolation of each dwelling. All sanitarians agree that such a trap is necessary where houses discharge into cesspools or sewage tanks, and also where they are connected with old, ill constructed sewers without ventilation and proper flushing appliances. It is also generally considered permissible to omit the trap where the house connects with a well constructed, amply ventilated sewer system, provided always that the soil pipe system in the house is absolutely air tight and the fixtures safely trapped.

But since dangers to health may arise just as much, and even more so, from bad gases and germs evolved from the foul discharge pipes inside of a house than from the outside sewers, it is necessary to trap all plumbing features of a house separately. A popular fallacy is that all so-called "sewer gas" comes from the public sewers In many cases, on the contrary, house pipes generate more "sewer gas" than is found in a well flushed, well ventilated street sewer. Therefore, each fixture should have its own trap, set as close to the fixture as practicable. This trap should be one absolutely safe against self syphonage, against syphonage produced by the flow from adjacent fixtures or fixtures on upper floors, against back pressure and against loss of water seal by capillary attraction and by evaporation.

Space does not permit to discuss separately the numerous forms of water seal and mechanical traps which have from time to time been invented.

In my judgment, mechanical traps should not be used except where the waste water is comparatively clean, as at tank overflows, fountain wastes and the like. For fixtures discharging befouled waste water the simple water seal traps only should be used.

To render the trapping of fixtures safe against the above named dangers two methods may be adopted, one being the method now largely called for in Board of Health regulations of the venting or back airing of traps, the other and the more advanced one being the

use of non-syphoning traps or of anti-syphon trap attachments, or security shut offs. The former method is costly, complicated, fraught with new dangers and not altogether reliable, whereas the latter is simple, efficient and safe, if judiciously arranged. My personal preference, in conformity with the third fundamental principle of simplicity of arrangement, has always been for the second method. With few exceptions, Board of Health and Building Department rules still require the method of back air pipes. It seems quite desirable that all such rules should make it at least optional with the owner or architect which of the two systems he will adopt.

Double trapping of house drains is likewise objectionable and unnecessary, and so is the double trapping of fixtures, particularly of water closets. Double trapping in the case of fixtures having traps with back air pipes often leads to the establishment of dangerous "by passes."

As regards the supply system, as well as the gas pipe system, it is almost superfluous to state that all manner of traps in such piping must be carefully avoided.

The disconnected pipe systems, such as refrigerator wastes, boiler blow offs, floor drains, fountain wastes, safe wastes, tell tales, overflows and the courtyard and area drains, if disconnected, as is sometimes done, need not ordinarily be provided with traps, because they are not connected directly with any soil, waste or drain pipe. They should discharge over a properly trapped water supplied sink, placed in the lowest part of the house, and all that is necessary is to prevent their acting as conductors of cellar air by placing a hinged brass flap valve over the outlets at the sink. Overflows and blow offs from tanks on roofs of buildings may safely discharge into a roof gutter or into a leader pipe.

VI.—THOROUGH VENTILATION.

We come now to the consideration of a very important principle in house drainage, the thorough ventilation of the drainage system. In order to render the soil, drain and waste pipe system of a building safe it is necessary that the air contained in these pipes be kept constantly in motion and continually changed. This is effected by extending all soil, waste and vent pipe lines the full size up to and through the roof. It is even better to increase all pipes from under the roof upward, and this enlargement is very necessary in the case of the smaller waste and vent pipes, because roof pipes smaller than 4 inches become sometimes closed in winter by hoar frost.

All pipes above the roof should be kept open, free and unobstructed. Return bends, ventilating caps and all forms of patent ventilators practically do more harm than good.

But in order to have a circulation of air in the soil pipe system, the pipes ought to be open not only at the top, but should have a foot vent at the lowest point. Where the trap on the house drain is omitted this foot vent is not needed, as air is then admitted from the street sewers. Where the trap is used a fresh air inlet pipe connected with the drain at the house side of the main trap should be provided. The fresh air pipe should not terminate in close proximity to windows, but it is equally important to avoid placing it where it may become obstructed by snow, ice or dirt.

It should be a rule to avoid all dead ends in the pipe system, and hence where a fixture cannot practically be located within 5 or 6 feet from the main ventilated soil pipe the lateral waste should under all circumstances be continued upward to the roof independently, and this rule applies whether the fixture is trapped by a common S-trap or by a non-syphoning trap, or by a mechanical trap. Where the traps of fixtures are located within a few feet from a well ventilated upright line it may be safely assumed that a sufficient diffusion of air takes place in the short lateral pipe, particularly if the fixtures are in constant daily use.

The ventilation of plumbing fixtures is suitably accomplished where open or exposed work is used by the proper ventilation of the apartment, and hence it is important to place fixtures in well lighted rooms having outside windows. Fixtures such as water closets or housemaids' slop sinks should never be located in dark interior closets without ventilation, nor should servants' water closets be located in dark, out of the way corners of a cellar.

Ventilation should also be provided for the tank for drinking water, as well as for refrigerator waste pipes, particularly in the case of apartment houses.

VII.—EFFICIENT FLUSHING.

Another cardinal principle is the efficient flushing of the whole plumbing system. It should apply not only to the main house drain, but likewise to the soil pipes, waste pipes, the lateral branches, the traps and the fixtures.

The regular flushing of house drains is accomplished, 1, by laying them with a grade which will insure a cleansing velocity of the flow, and, 2, by restricting them in size so as to concentrate the sewage flow. Where this object can be attained the drains may be called self cleansing. Where the fall is necessarily slight artificial flushing appliances, such as automatic syphon flush tanks, should be constructed at the head of the drain. This matter has, in my judgment, received far too little attention in the past. It has been customary to rely too implicitly upon the scouring power derived from the connection of rain water pipes with the sewage drains. While the beneficial effect of a good rain storm in the flushing of house drains cannot be denied, it must not be overlooked that there are often protracted periods of dry weather, particularly in the summer season, when house drains are most in need of a regular periodical flush.

With soil and waste pipes restricted in size it is believed that the daily flow from the plumbing fixtures will keep these upright pipes sufficiently scoured for all practical purposes.

The disconnected refrigerator waste pipes need a frequent application of a thorough flush, which can in most cases be readily accomplished by branching the blow off from the kitchen or laundry boiler into the refrigerator waste and blowing off the boiler at regular intervals. Where this cannot be done, it will be found useful to put over the refrigerator waste pipe a small automatic flush tank.

Safe waste and drip pipes ordinarily receive no flushing whatever, and hence I am inclined to favor their entire omission, except where they serve to protect expensively decorated ceilings. Safe waste or drip pipes from urinal platforms are particularly objectionable and are often the cause of bad odors in toilet rooms. Where floors in toilet rooms of office buildings or in hospitals, railroad stations, etc., are tiled, and where an abundance of water for floor washing is available, and this washing is done regularly, large size floor drains may with advantage be employed, and should discharge openly over trapped sinks on the lower floor.

The principle of constant flushing should also be applied to the traps under the fixtures, and it is suitably accomplished, 1, by restricting the diameter of the traps so as to insure a scour through the traps, and, 2, by the use throughout of quick emptying fixtures, having large outlets. In this respect a great improvement in the manufacture of plumbing appliances has been noticeable during the past years. The old fashioned lavatories, with small waste outlets obstructed by strainers, have been replaced by basins with large outlet, and the same is true of bathtubs and plug sinks. In the case of kitchen sinks with open strainer, the flow from which is generally a mere dribbling stream, an improvement in the discharge may be effected by the use of a flush pot or similar sink attachment, which collects the dribbling stream until it becomes full, and then discharges rapidly the whole contents either by an automatic device or by the lifting of a plug. Such a device is also useful as a grease trap, and much superior to the forms of grease trap commonly used under sinks, which accumulate putrefying grease, and are seldom, if ever, cleaned by kitchen servants.

As regards plumbing fixtures those receiving the alvine discharges from persons—viz.: water closets, urinals and slop sinks—should always be efficiently flushed from special flushing cisterns, discharged either by hand or automatically, and the bowls should be provided with proper flushing rims.

Water closets as well as other fixtures with movable mechanism in the bowl or with mechanical obstructions of any kind, or those having unnecessarily large fouling surfaces, should be avoided as being liable to remain imperfectly flushed.

(*To be concluded.*)

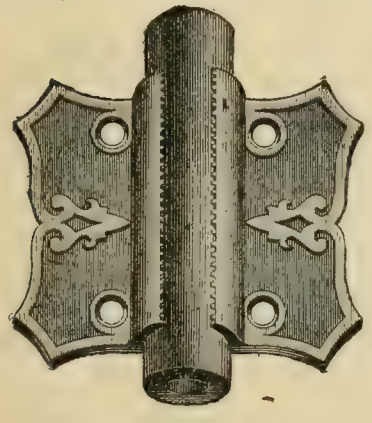
The Pratt Institute Trade School.

The 1893-94 course of the trade school attached to the Pratt Institute, Brooklyn, commenced on Monday, September 25, with a promising number of students in the various trades in which instruction is given; namely, plumbing, carpentry, house, sign and fresco painting, and machine work. The entries in the plumbing class were, as usual, the most numerous, numbering 45 young men, nearly all of whom are working as helpers in the trade in the city of Brooklyn. As the plumbing school only accommodates 50 pupils, this leaves but 5 vacancies, which will probably be filled before the close of this month, when the registration of candidates closes. The course of instruction followed in the Pratt Institute plumbing class, which applies in its salient features to those of the other trades, was fully outlined in *The Metal Worker* of June 24, 1893. It may be of use, however, to state that the full course, entitling a pupil to a certificate of profiency, after examination by a committee of the Journeymen Plumbers' Association of Brooklyn, extends over two periods of six months each; a fee of $15 being payable for each half-yearly term. All tools and materials are furnished free of charge; and the hours of instruction are from 7.30 to 9.30 p.m. on Mondays, Wednesdays and Fridays. Applicants for instruction must, according to the rules of the

institute, be between the ages of 16 and 25. The equipment of the plumbing shop is complete and the instruction given, both practical and theoretical, is said to be the best obtainable.

Evory's Plumbers' Tacks.

The illustration herewith shows a plumbers' tack, now being introduced to the trade by the Evory Mfg. Company, 21 and 23 Ann street, New York. It is made of cast iron, and furnished either plain, tinned or nickel plated. The claim is made that the device does not need to be soldered to the pipe, thereby saving time and material. The jaws are ridged and so made that the tighter the screws that fasten up to the wood work are turned the tighter they grip the pipe, tests having shown, it is claimed, that they will sustain a strain far in excess of any that is likely to be put on a lead pipe. Several new modifications have recently been added to the variety,



Evory's Plumbers' Tack.

adapting them to all the requirements for ceilings, side walls, corners, cornices, &c. One form is made to hold two pipes for the flush and supply of water closet tanks and for holding bibbs or T-branches. Their quick adjustment and wide usefulness have made them popular with plumbers who have used them.

TRAPS AND VENTS.

A PLEASING FEATURE of the recent convention of the Master Plumbers at Springfield, Mass., was the banquet in the evening and after dinner speeches that followed.

AN EXCHANGE SAYS that the jokes innumerable that have been perpetrated on the subject of plumbers' bills pale before an episode in real life which happened in Washington. Bills to an enormous amount having been frequently rendered by a plumber of that city on a piece of property without the result of liquidation, law proceedings were finally instituted. As a result the house sold under the hammer failed to bring the amount charged in the bill of the disgruntled mechanic.

BUCKINGHAM PALACE is at present in the hands of the sanitary engineers, says a London paper. For several years considerable sums have been spent upon the drainage, but it has been rather surface work than otherwise, and the object of the present work is to bring the system in full accordance with modern science. The huge structure so familiar to Londoners is a comparatively modern building, and takes its name from John, Duke of Buckingham, who built himself a residence on the spot just two centuries ago. The palace was never occupied by George IV, and it was not till 1857 that the Queen chose it as her residence; but after the death of the Prince Consort her Majesty apparently took a dislike to the place. The value of the property has increased at an enormous rate, and several well-known experts place its present value at 5,000,000 sterling—five times as much as its original cost.

THE PLUMBING HOUSE of McDonald & Glennin, at Macon, Ga., recently lost its senior partner by death.

AUGUST WAGNER, a prominent young plumber of Wheeling, W. Va., was recently married to Miss Honora Walton. The ceremony was witnessed by a number of friends.

THERE STILL EXISTS at Norfolk, Va., some slight difference between the master and journeymen plumbers as regards the number of helpers or apprentices that shall be employed in a single shop.

PRESIDENT DANIEL J. FINNERTY of the National Association of Master Plumbers was recently the guest of the Massachusetts Master Plumbers' Association at their convention in Springfield, Mass. The new plumbing laws of the State were the subject of considerable discussion.

THE BOARD OF PLUMBING EXAMINERS was organized in New Bedford recently, consisting of City Physician Kelly as chairman; John Green, secretary, with Superintendent of Buildings Rielly as third member of the board.

J. P. FOX secured the contract for plumbing in the Seventh Ward Schoolhouse at Eau Claire, Wis., at a reported price of $673.95.

THE CONTRACT for the plumbing and sanitary arrangements in the High School building at Portland, Maine, has just been awarded to M. C. Hutchinson of that city, the consideration being $5080. Mr. Hutchinson is a young man whose close attention to business and strict integrity have obtained for him a large share of the best patronage of the city.

A LATE ISSUE of one of the Detroit evening papers states that A. D. Benjamin, a wealthy Toronto hardware dealer and one of the principal stockholders of the Detroit Steel Clad Bath Company, has recently fallen heir to an immense fortune through the death of his father in England.

AT A RECENT MEETING of the Board of Health of Los Angeles, Cal., a report was made of the sanitary condition of the public buildings, with the statement that very little improvement had been made since the previous report, which gave very much the same information. Steps are now being taken, however, to improve the character of the plumbing work in the different public buildings. A complaint was made to the board of the work done for a citizen by a plumber, and after some discussion on both sides, the board decided the matter was a breach of contract rather than a question for them to decide.

E. BAGGOT, 169 and 171 Adams street, Chicago, is doing the plumbing in the St. Nicholas Hotel, and is supplying the electric light fixtures for the residence of Adolphus Busch, St. Louis, Mo.

AN EASTERN PAPER of recent date gives some particulars of the house of S. Wilder & Co., Holliston, Mass., manufacturers of copper force, well, cistern and air chamber pumps. The house was founded by Houghton & Joslin, who were succeeded in 1849 by the present firm, which consists of Charles and George Wilder.

THE PLUMBER'S ASSISTANT was plugging away at a piece of lead pipe when a city missionary happened along, says the Detroit *Free Press*, and after a little preliminary talk said:

"My dear young friend, do you know the value of time?"

"You bet I do," was the frank response, "I am working by the day."

To encourage the mining industry of Chile the Government of that Republic has, as previously mentioned in these columns, decided to hold a mining and metallurgical exposition at Santiago, opening on March 15, 1894. Foreign manufacturers have been invited to exhibit machinery and tools and other apparatus connected with mining, the suggestion being made that only models or drawings of heavy machinery, motors and boilers be sent. The space needed will be given to exhibitors who apply for it before January 1, 1894, and motive power will be supplied. The freight on exhibits from Europe or the United States will also, it is understood, be paid by the Chilian Government. The exposition will close on April 30, 1894.

Co-operation has, says the *Mining and Scientific Press* of San Francisco, Cal., been successfully adopted as the method for starting several of the idle mines at Leadville, Col. The Maid of Erin has set the example, and others are expected to follow. The plan whereby the resumption took place was an agreement between the men and the management to deduct the expenses of operating from the gross receipts and divide the net profits on a percentage mutually satisfactory. Between 50 and 100 men went to work on the first day, and should the scheme prove successful the force will be largely increased, and many idle men thus be employed.

One of the novel business trades of Boston is that of a dealer in second hand plate glass. Nearly all of this glass, says an exchange, is bought by the dealer from insurance companies. The large plates of this kind of glass are insured when put in a window, and when any of them is broken the owner of the injured glass usually prefers that the insurance company should replace the broken piece rather than that he should be paid its price. The dealer in the second hand glass contrives to utilize what remains of the unbroken part of the glass.

At the office of the Ansonia Brass & Copper Company, 19 Cliff street, New York, is prominently displayed a large sheet of Tobin bronze similar to those used in the construction of the victorious cup defending yacht "Vigilant," the material for which was supplied by the Ansonia Company.

The following details of the amounts of various materials used in the construction of the new Tower Bridge in London are given by an English journal: Bricks, 24,000,000; granite, 415,000 tons; cement, 19,000 tons; concrete, 72,000 cubic yards; and iron and steel, 15,800 tons.

TIN PLATES.

The British Tin Plate Outlook.

The position of the British tin plate trade, according to late advices, is very discouraging to manufacturers. Prices are at the lowest point on record, and there is thought to be little prospect of improvement for some time to come, notwithstanding the large reduction of output that has prevailed for the past three months. Bessemer cokes are being quoted at 11 shillings a box, f.o.b. Swansea, a price, says an English iron trades journal, which would until recently have been regarded as ruinous to the producer. Steel, however, is now bought at very low figures, and throughout the trade, since the introduction of the United States tariff on tin plates, the Welsh works have been remodeled and nothing left undone that would tend to lower the cost of production. Although some of the makers can, it is believed, make a bare profit out of the present market prices, many of the works are for the present shut out of the trade. The cause is, of course, mainly due to the falling off in American orders, owing, perhaps, in a measure to American competition, but principally to the late financial stringency on this side and the uncertainty in regard to tariff legislation. Until these causes are removed or modified it is not expected by Welsh tin plate makers that any revival can take place in their business. Meanwhile many tin plate works are still closed, while others are mentioned as having given notice to their work people of an intention to do so shortly should trade not improve. The majority of the works still in operation are, moreover, either running on short time or with greatly reduced forces; consequently severe distress exists in the tin plate districts, and the resources of the Tin Platers' Union are taxed to the utmost to provide for members out of work.

The Jaques Tinning Pot.

We show in the accompanying engravings illustrations of a new tinning pot for which a patent has just been granted to George W. Jaques of the firm of A. A. Thomson & Co. of New York city. Fig. 1 is a side elevation of the pot, while Fig. 2 is a sectional view showing the position of the bath and the arrangement of the special feature of the pot, which is the air flues at the exit N. The object in the construction is to obtain two temperatures at the bath with one fire and to regulate the temperature of the metal under the grease pot. The great difficulty heretofore has been that plates in their continuous passage through the metal became so highly heated at the delivery end that they ignited the oil, while if two fires were used to regulate the temperature greater expense was involved. Another method of overcoming the difficulty to which the patentee refers is the passage of air currents about the grease. A side elevation in Fig. 1 shows the brick work of the apparatus and the position of the single furnace, as well as the opening to the cooling flues at the right. Fig. 2, which is a sectional view, shows the interior construction more clearly. A is the main portion of the bath with the furnace under it. The sheets are fed at the left hand and delivered at the right hand, being guided along the bottom of the bath by the guides C. They are drawn out through the grease through rollers. At the delivery end is an inclosure, A^1, the side A of which dips down into the metal in the bath, thus cutting off from the main bath a portion, within which inclosure the oil rests

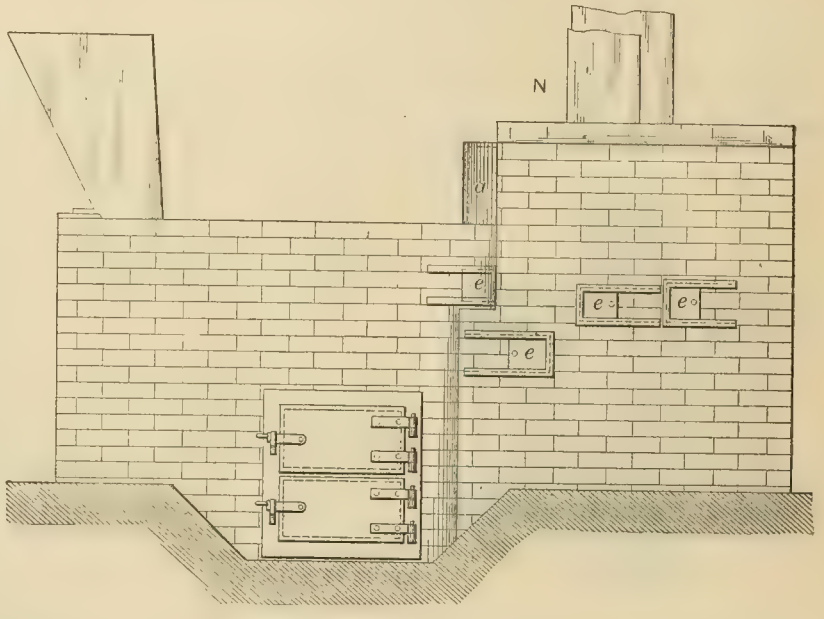


Fig. 1.—Side Elevation of Pot.

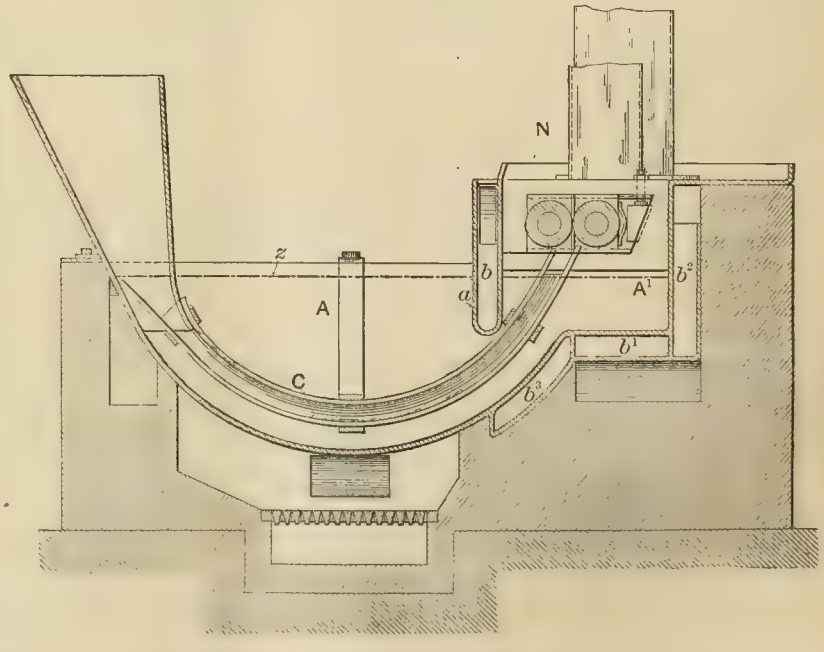

Fig. 2.—Sectional View of Bath.

THE JAQUES TINNING POT.

on the molten metal. The dotted line Z shows the usual level of the metal in the bath, the oil level being at about the axes of the rollers. A special feature of this apparatus is the control of the temperature within the grease pot A^1, maintaining it lower than the main body of the pot by means of air flues. The walls and bottom of the inclosure A^1 are made double, so as to leave flues around the inclosed metal and oil through which the air may be made to circulate. In the illustration four flues are shown, b, b^3, b^1 b^2. The flue b^3 is under the curved portion of the bottom of the bath, the flue b^1 is under the flat portion or shelf of the bottom of the inclosure A^1, and the flue b^2 is in the wall opposite A. The air enters these flues at openings shown in Fig. 1 at *e e e e*, which openings are controlled by slides. After circulating through the cooling flues the air enters either through the flue in the chimney or into a separate uptake. The front flue b and back flue b^3 are connected by a cross flue; on the other side, where the uptake is situated, the several flues b, b^3, b^1 and b^2 open into a cross flue, which forms the enlarged base of the uptake. The arrangement is such that the air may be allowed to flow through any one or more flues, and may be regulated by register slides, thus controlling the temperature of the metal and oil within the inclosure A^1 and keeping it normally below the temperature of the main portion of the bath instead of permitting the oil and metal to become gradually hotter from the passage of the hot plates.

American Tin Plate Production.

The *American Metal Market* of October 14, 1893, in printing Special Agent Ira Ayer's report on domestic tin plate production for the quarter ended June 30, 1893, puts the increase in the output of American tin plates made from black sheets rolled in the United States in a very striking manner, as follows: The black plate produced and used in this country amounted to 785,547 pounds for the quarter ending September 30, 1891. In the 21 months following this date the production increased in the proportion indicated by the rules below, so that for the quarter ended June 30, 1893, the American plate used in this country was 18,264,225 pounds, showing that the product of this country has increased to about 2314 per cent. of its former dimensions.

Quarter ended

No compilation of statistics and reports could tell the tale of progress more effectually than the above presentation.

SCRAP.

The New Castle Tin Plate Mill, New Castle, Pa., resumed operations last week, with all departments of the large establishment in full work, employing about 500 persons. The machinery is reported as running very smoothly, and the plates turned out as of an entirely satisfactory character. American workmen have, so far as possible, been engaged in the works.

In striking contrast to the general run of Welsh tin plate works at present, those of William Williams & Co. of Morriston are reported by a London trade journal to be busy on a contract to supply an American firm with 500,000 boxes of 19¼ plates. The price to be paid is said to be very low.

A. A. Thomson & Co., 213 Water street, New York, manufacturers of tin plates, report their Central brand of American ternes to be receiving a very wide appreciation at the hands of the trade. Their tin plate works have been kept fairly busy, even during the recent depression, on orders for these plates. The recent addition of a third tinning machine has enabled the firm to increase their output nearly 50 per cent.

The port of Swansea, Wales, ships about 65 per cent. of the total exports of tin plates from Great Britain.

The New York *Journal of Commerce and Commercial Bulletin* has been obtaining the opinions of prominent representatives of various trades in this city in regard to the prevailing business depression. Among other firms engaged in the tin plate and metal trades, Phelps, Dodge & Co. are reported as saying that trade has suffered 25 per cent. from the inaction of the Senate in regard to the Silver Purchase Repeal bill. The firm of C. S. Trench & Co., tin plate brokers, are of the opinion that 50 per cent. has been lost in a majority of branches in the trade, owing to the same cause having destroyed reviving confidence.

J. O. Hughes of the firm of Hughes & Patterson, rolling mill proprietors, Philadelphia, Pa., died a few days ago of apoplexy.

Recent troubles in Central and South American republics have caused an active drain on our naval resources for war vessels for the protection of United States interests in the disturbed quarters.

The situation of the unemployed miners on the Gogebic range is reported by Western papers to be becoming serious. Bread riots have already occurred in several towns, and further disturbances are feared. Efforts are meanwhile being made to relieve the distress by raising money to feed the men and their families, as no present prospect of employment can be be held out to them.

Representative Caminetti of California has introduced in the House a bill to provide for the establishment of a gun factory for the finishing and assembling of heavy ordnance at Benicia, Cal., at the cost of $1,000,000.

Ground was broken on October 12 for the new Bourse Building in Philadelphia. The work will, it is said, be vigorously pushed, and the building is expected to be well under way by spring.

Canada's mercantile fleet on the registry books last year numbered 7007, with a tonnage of 964,129, a decrease in the year of 84,364 tons.

A notable exodus of Hungarians from Pennsylvania has occurred during the past two months. At least 7000 laborers of that nationality are reported as having left the State, owing to the poor labor market. Most of them have returned to their own country.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

Shumway & Rielly, Northampton, Mass., will use a Victor steam heater in P. Dewey's new residence.

Daniel S. Ingersoll will do the heating and R. & J. Robertson will do the plumbing in the new Universalist Church at Beverly, Mass.

A. L. Fessenden, Townsend, Mass., is about to have a steam heating apparatus put into his house.

The city of Bath has expended $2000 for a steam heating plant in the High School building. A recent test proved it to be satisfactory in every respect.

A new steam heating plant has been installed by W. H. Hill in the freight and passenger depot at Marlborough, Mass., for the Consolidated Road.

A steam heating plant is being installed at the Cathedral at Burlington, Vt., and it will also heat the Bishopric residence.

A steam heating plant has just been completed in the Lutheran Orphans' Home, at Mount Airy, Pa.

Manchester & Ward of Turners Falls, Mass., are doing a fine plumbing job in the new Jacobus mansion. They will also install the heating apparatus, which will be on the Gurney system.

The Hamburg American Packet Company have made contracts for the construction of five large twin-screw steamers for Transatlantic service. Three of the new steamers will be built at Belfast, and the other two at Stettin and Hamburg respectively. They will each be of 7800 tons and 465 feet in length, and will have a very large freight capacity. When these five steamers are completed, the Hamburg-American line will own the second largest tonnage in the world, being less than that of the Peninsular and Oriental Company only.

The contract for building the much talked of Syrian railroad from Haifa to Damascus has been awarded to a Chicago firm, Huss & Townsend. Work is to be begun immediately. The enterprise has been initiated by English capitalists, who purpose ultimately extending the road to India if Persian concessions can be obtained.

A combination of all the street railways of San Francisco is announced, with a capital stock of over $18,000,000, the greater portion of which is understood to be owned by the Southern Pacific Company.

Professor Bland of Vermont University is making experiments with the view of converting culm into a fertilizer.

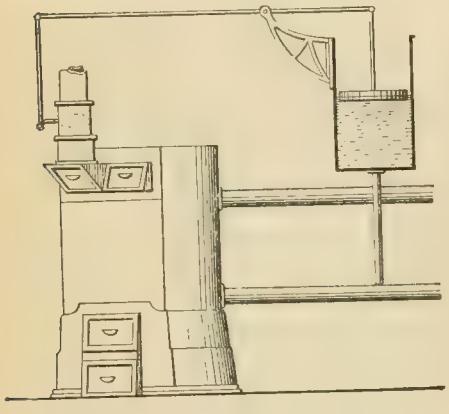
The great coal strike in England, which began on July 28, is practically over, a large majority of the strking miners having resumed work.

The recent depression in business has had a marked effect in decreasing the consumption of tobacco and beer, as shown in a material falling off in the internal revenue from those manufactures.

STEAM AND HOT WATER.

A Hot Water Regulator.

The illustration which we present in this connection is reproduced from a London exchange, and shows a device for regulating the fire in a hot water apparatus. It is made by the Patent Automatic Damper Company, 97 Fleet street, E. C., London, and depends for its operation upon the increase in the bulk of water in the cistern as it becomes heated and which acts upon a float that rises and falls as the water in the pipes becomes hotter or colder. It consists of a small tank connected with the return pipe of a hot water system and a float connected by levers and rods with the draft dampers. The apparatus shown is evidently intended for greenhouse use, but could be applied to a house



A Hot Water Regulator.

system by modification. The explanation given does not say how the damper is to be regulated, but it is possible that by an adjustable connecting rod or a system of weights the temperature of the water in the system could be regulated to meet the requirements of the weather.

The A. A. Griffing Iron Company.

A catalogue in blue covers and printed in red and black reaches us from the A. A. Griffing Iron Company, 15 Dey street, New York. It is devoted to their newest goods in the way of steam and hot water radiators. The Bundy Columbia, which was illustrated in *The Metal Worker* a short time since, occupies the first page, followed by the Bundy Elite. Half-tone engravings are used to show the Bundy Pyro, Pyro wall radiator, the Bundy Princess and the Bundy Renaissance, the latter being represented in several forms for both steam and hot water. These are followed by some of the makers' standard goods and the Bundy hot closet dining room radiator. A page is devoted to showing the Bundy box radiator for the direct-indirect style with a fresh air inlet. The Bundy Crescent dampers are for use in connection with direct-indirect-radiators to control the air supply. Then follow the Bundy Perfect direct-indirect radiators, the Bundy Climax indirect radiator and the Bundy Pin radiator. The Bundy Climax is also made as a vertical direct radiator. Several pages are then devoted to Bundy separable mercury bath hydrothermometers, Bundy bonnetless quick opening valves, full opening radiator valves, automatic air valves, bronzing powder and liquid enamels, expansion tank and floor and ceiling plates. This catalogue will be found very convenient in having grouped together the newer goods of this concern. It is now being mailed to the trade and will also be distributed among the architects and builders.

HEATING NOTES.

THE RICHMOND steam and hot water heaters are the subject of an interesting little pamphlet of 32 pages which reaches us bearing the imprint of J. W. Gifford & Co., heating and plumbing engineers, Bank and Park streets, Attleboro, Mass. The goods named are carefully illustrated and described in a manner to attract the attention of the trade, while numerous tables give prices and capacities of the various sizes manufactured. A feature of the pamphlet is found in a number of testimonial letters from those who have used the Richmond heaters, while numerous engravings represent buildings heated with these goods.

T. C. JOY, 48 Centre street, New York, reports an increasing demand for low or window radiators. Some new samples of this character of radiators are to be seen in the showroom at the address given.

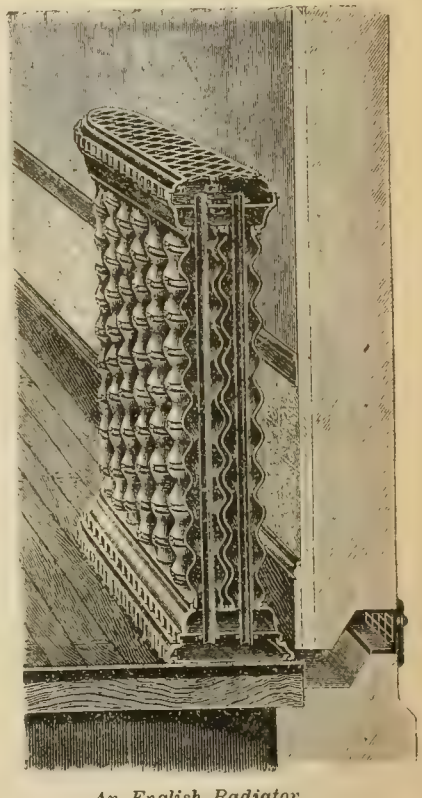
COUNCILS' HIGHWAY COMMITTEE of Philadelphia, Pa., had before it recently an important ordinance, which was to grant permission to the Overbrook Steam Company to enter upon streets, avenues and highways of the Carpenter Land & Improvement Company, at Upsal street and Germantown avenue, in the Twenty second Ward, and to lay pipes, conduits and service pipes to supply steam for heating purposes. It was agreed to report this favorably after the adoption of an amendment of U. C. Smith that all streets shall be dedicated within three years, or sooner if requested by the Director of Public Works. The ordinance provides for the filing of a bond for $25,000 to meet possible damages, and the free heating of all school houses, fire, patrol, and police station houses and other public buildings now existing or hereafter constructed on the line of the steam mains.

E. RUTZLER, 178 Centre street, New York, president of the National Association of Master Steam Fitters, is installing a steam heating plant in the new Continental Life Building. An order has been placed with the American Radiator Company for the Excelsior radiator for use in this building.

THE AMERICAN BOILER COMPANY, at 94 Centre street, New York, have recently received a number of orders for hot water apparatus for greenhouse heating. Among them may be noted one from John T. Herr of Dover, N. Y., who has recently set a No. 25 Perfect hot water heater in an asparagus house as an experimental venture, and if it proves a success a number of similar houses will be built later on ; one from J. T. McNab, who is setting a No. 41 Double Tropic to heat three greenhouses in Paterson, N. J., and one from F. W. Grant of Nyack, N. Y., who is setting a No. 16 Little Giant for a small rose house.

An English Radiator.

The illustration herewith, from a foreign exchange, shows one of Richardson's patent radiators, made by the Meadow Foundry Company, Mansfield, England. Of it our contemporary says: The heat is radiated equally in every direction, including the floor,



An English Radiator.

thereby preventing cold drafts. The annular corrugated tubes occupy the same space as ordinary 2-inch pipes, and contain but little more water than the latter, though they present a radiating surface equal to that of 4-inch pipe. The radiators are made as direct radiators only, or with provision for the distribution of warmed fresh air through the air chambers and tubes. All the joints are lathe faced and packed. The general form of this radiator will not be novel to American readers, but the particular combination of features shown may be suggestive.

FRANK WILLIAMSON AND WILLIAM COLE, employees of R. & J. Robertson of Beverly, Mass., are being congratulated on the superior job of steam fitting they have done in remodeling the heating plant in the fire engine house.

J. Augustus R. Hall.

Supplementing the brief notice of the death of J. Augustus R. Hall, one of the oldest and most prominent metal merchants in the city of Philadelphia, and late of the firm of Hall & Carpenter, we present this week an excellent likeness reproduced from a photograph. Mr. Hall was born in Paterson, N. J., in the year 1824, and early in life was, by the death of his father, thrown on his own resources. After receiving a common school education he found employment for a time on a farm in his native State, but after a few years he left agricultural pursuits to enter the United States Navy, in which service he remained nearly five years, visiting nearly all the principal seaports of the world. Subsequently he entered the house of W. N. & G. Taylor, importers of tin and terne plates, metals, &c. In January, 1862, Mr. Hall, by reason of his excellent business qualifications and marked executive ability, was admitted into copartnership in connection with William B. Taylor, the style of the firm being N. & G. Taylor Company. He took entire control of the sales department, and commenced the direct importation of tin and terne plates by a line of steamers between Philadelphia and Liverpool, which was started with his assistance. In February, 1867, he withdrew from the firm of N. & G. Taylor Company and founded the house of Hall & Carpenter at 709 Market street. In the year 1883 Mr. Carpenter died, leaving Mr. Hall the sole proprietor of the business. Mr. Hall was liberal in dispensing charity, and was connected with some of the leading clubs and organizations of the Quaker City. He was a member of the Board of Trade, Commercial Exchange, Maritime Exchange, Master Builders' Association, Historical Society of Pennsylvania, Franklin Institute, Manufacturers' Club, Philadelphia Lodge No. 72, F. and A. M., Jerusalem Chapter No. 3, R. A. M, Kadosh Commandery, K. T., and was Sovereign Grand Inspector-General of the Ancient Accepted Scottish Rite of Freemasonry.

The funeral services took place from Mr. Hall's late residence, 1742 Green street, after which the remains were taken to the family plot at Mount Vernon Cemetery. The deceased leaves four sons and a daughter.

J. AUGUSTUS R. HALL.

A certain experimenter, says the *American Architect and Building News*, has been trying the comparative effect of various sorts of decoration upon the lighting of rooms. Taking a room hung with black cloth, he illuminated it with 100 candles, and then counted the number of candles necessary to bring rooms decorated in other ways to the same degree of illumination. He found in this way that a room with a dark brown paper required 87 candles to make it as light as the black cloth one with 100; a room with blue paper took 72 candles, and one with a pale yellow paper required 60. A room lined with panel work, either in natural wood or in white paint, needed 50 candles; one with dirty paneling required 80, and a room with plain, whitewashed walls took only 15.

Metallic Furniture.

In speaking of the increasing use of metal in the manufacture of furniture a maker of brass and iron bedsteads is quoted in the New York *Sun* as follows: Although metallic bedsteads match well with almost any kind of furniture in a sleeping room, the metallic craze has extended to other articles. Besides bedsteads, we make metallic bureaus, dressing tables, cheval glasses, shaving stands, towel racks and clothes trees. Parts of the bureaus, of course, have to be made of wood, usually mahogany or oak, and always highly polished. These articles are not likely to come into general use on account of their cost. A mahogany bureau with good brass trimmings costs $140. The trimmings can be attached to any bureau that is handsome enough to support them. They consist of six handles, four cast brass feet, three keyhole escutcheons and a brass cheval frame. Such a set of trimmings sells for $65. A brass dressing table, all of metal but the two oak or mahogany shelves, sells for $50. A cheval glass, 69 inches high, with brass mountings, is worth $70; a brass shaving stand, with polished mahogany drawer, $35; a smaller one $20. Brass towel racks sell for $10, and clothes trees the same. This makes an entire metallic outfit for a bedchamber except the chairs, and there are several firms making ornamental brass chairs.

Palm Oil.

The part played by palm oil in the manufacture of tin plates gives interest to the following information, relating to the production of this material, presented in an export exchange: The export of palm oil and kernels forms by far the largest part of the West African export trade. In 1890 the value of the palm oil exported from Sierra Leone was $13,599 and of the palm kernels £107,827. The tree is more abundant further down the West African coast, and appear to prefer alluvial, often marshy, ground near the sea. It particularly seems to thrive on the rich soil of the mangrove accumulations. There are a large numbers of palm trees in the Mahela district, where a factory once existed, and there are also a considerable number up the Scarcies River and in the lower part of the Limba district. It grows also on low sandstone or gneissose hills, but probably does not produce so much in such places as on the low lying rich alluvials. The palm is propagated from the offshoots that appear at its base, and these are said to begin in the second or fifth year, and are in full bearing about the tenth or fifteenth year. They continue producing for 60 years. A single tree yields from 1 to 3 gallons of palm oil, or, according to Selmer, 16 liters annually, and this amount of oil will give from $\frac{1}{6}$ to $\frac{1}{3}$ hundredweight of kernels. This would be a profit of from 2 shillings to 6 shillings a tree per annum, as about 300 gallons of palm oil give a ton of oil and about $2\frac{1}{2}$ tons of kernels. Hence plantations of these trees should be profitable in time. It is, however, exceedingly difficult to get any trustworthy information, and the above must be regarded as very approximate. The palms require no care, and are not, apparently, attacked by any injurious insects. The preparation is of a very rough and makeshift character; the fruits are thrown into a tank and left till decomposition begins. They are then boiled and afterward pounded in a mortar. Probably 25 per cent. of the oil is lost in preparation.

Sealed proposals will be received until November 9, at the office of the Supervising Architect, Washington, D. C., for all the labor and materials required for the interior finish, &c., including marble floors, plumbing, lathing, plastering, wood stairs, joiner work, wood flooring, marble work, painting, polishing, glass, hardware, approaches, &c., of the United States Post Office building, at Jackson, Mich.. in accordance with the drawings and specification, copies of which may be had from the office of the Supervising Architect, at Washington, or from the Superintendent at Jackson, Mich.

THE RETAIL STORE.

Enterprise New Slaw Cutter No. 94.

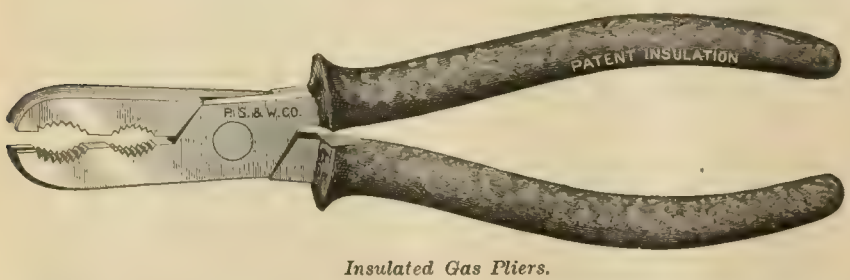
The Enterprise Mfg. Company of Philadelphia, Pa., are putting on the market a slaw cutter, as herewith shown.

Enterprise New Slaw Cutter No. 94.

In operation the article to be sliced is placed on the platform, being fed or pushed gradually against the revolving cylinder, which contains three knives, the sliced product falling into a receiver underneath. The cutter is intended especially for family use, but also for hotels, restaurants, provision dealers, farmers, &c. The manufacturers recommend the cutter for slicing potatoes—Saratoga chips, for instance—onions, cabbage, cucumbers, citron, &c., and for general slicing purposes.

Insulated Gas Pliers.

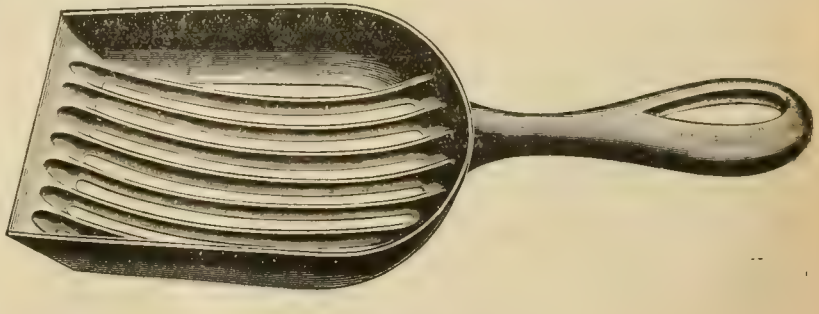
Peck, Stow & Wilcox Company, Southington, Conn., and 27 Chambers street, New York, are introducing insulated gas pliers, as illustrated herewith. The insulation with which the handles are covered is molded mica, mica being, it is understood, one of the best insulators known to modern science. The manufacturers state that the pliers will insulate against 1500 volts of electricity or even more; and that the mica will not chip or come off. The pliers are made in one size—7 inch—and are designed as a protection to those working about gas fixtures which are connected with electric wires.



Insulated Gas Pliers.

Coal Shovel and Sifter.

N. R. Streeter & Co., Groton, N. Y., are offering a coal shovel and sifter, as illustrated herewith. The shovel is made of cast iron, nicely jappaned, 9½ inches long including the handle, and 4⅛ inches wide in the widest place. The openings between the ribs are about $\frac{3}{16}$ inch, making it especially very valuable where pea coal is used. The shovel is designed for removing unburned coal from a stove or range when the fire has gone out, instead of dumping the whole mass, as the coal can be taken from the top of the fire box and sifted without raising dust. The point is made that enough coal can often be saved in this way to run a fire from after breakfast until the fire is needed at noon. The shape of the shovel is such that coal can be taken from between the magazine and the fire pot of a parlor or heating stove, a feature which will be appreciated by those whose fire has gone out with the magazine full of coal. The shovel is designed to retail for 10 cents.



Coal Shovel and Sifter.

Pneumatic Oil Can.

Nail City Stamping Company, Wheeling, W. Va., for whom the Ross & Fuller Association, 33 Chambers street, are agents, are offering the Nail City Pneumatic 5-gallon oil can. The can is made of heavy galvanized iron, to hold 5 gallons of oil, the oil being forced from the can by atmospheric pressure. By pressing down a plunger, the air forces the oil out by way of the spout, and when the pressure is released the oil ceases to flow. The spout, which is curved at the end, is jointed at the can, and when filling a lamp it is turned down to a horizontal position, so that the lamp is filled without lifting it from the table on which the lamp and can stand. The spout is also reversible, and when reversed the can, it is stated, is vapor proof, thus preventing the escape of gasoline or other vapors from the can. The point is made that the absence of a faucet for drawing lessens the liability of the oil or gasoline being tampered with by children.

B. P. Lovejoy has succeeded to the stove business of Cyrus Carpenter & Co., at 44 Hanover street, Boston, Mass.

A course of lectures in metal plate work is a commendable feature of the present season's trade school course at the Borough Polytechnic Institute, London. These lectures are said to have beed found very useful by the students and others engaged in sheet metal work in the British metropolis.

After exhaustive experiments in New York harbor with the torpedo boat "Cushing" to determine the best color to paint such boats in order to escape detection by search lights, it was found that a dull green hue rendered the boat almost indisguishable from the water. A recommendation is to be made to the Navy Department that all torpedo boats should be of this color.

STOVE TRADE NOTES.

Future of the Hot Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

LIMITATIONS OF THE HOT AIR FURNACE.

In advocating the use of hot air heating the dealer should not overlook the limitations of the hot air furnace. It is true that the hot air furnace supplies the most admirable form of heating for a very wide range of buildings, including residences, cottages, flats, apartments, stores, audience halls, public buildings, churches and school houses, but there are individual cases where it is not advisable to use furnaces for heating buildings of each class referred to.

Air is a vapor and in this respect is subject to the same rules as the handling of any other vapor and while air can be driven to a certain extent, it has always been found a good policy to coax rather than drive hot air when using the same as a vehicle for the heating of homes and buildings.

Steam is likewise subject to many of the laws that govern the heating by hot air, but is more tractable than is the latter, yet we all know that certain buildings when heated by steam are so much affected by the wind that at certain times one portion of the building will be overheated, whereas another portion will be very cold and it is impossible in cases like this to obtain an equal heat through the entire building with the use of steam.

I have in mind the present moment a building occupied as a school in one of the Eastern cities in which a corridor runs through the center of the building on each floor, and it has never been possible in winter time with the system of steam heating employed to warm the rooms on the north side of said corridor when the wind blows from that direction Students at the college have complained bitterly of the defective heating and not a few have attributed sickness and trouble in after years to the colds and other troubles contracted in the building owing to the defective heating.

The anxiety on the part of the dealer to secure a contract often leads him to overlook the fact that there is a limit to the capacity of the hot air furnace, and also to its capabilities. A great many buildings are so situated that they have long and exposed wings, in many cases facing the north or northwest. Such buildings should not be heated by the hot air furnace, as it would be practically impossible to carry air in the face of a strong wind to the exposed wings. The attempts of dealers and furnacemen to heat such buildings have usually resulted in almost total failure, with the result that hot air heating has been condemned in many towns owing simply to these cases where bad judgment has been exercised by the dealer in attempting to do what was impossible.

SIZES OF FURNACES.

A great mistake has also been made in many places by attempting to make one very large furnace do the work where two smaller ones should have been used. There is a limitation to the sizes of hot air furnaces, much more so than to the sizes of steam and hot water plants, for the reason that hot air can be conducted safely from a distance not exceeding 20 to 30 feet, provided the elevation can be had for the pipe; and where it is necessary to run pipe a longer distance than 20 feet great care should be taken to obtain for these pipes sufficient elevation, and in such cases many pipes when wrapped with asbestos paper have failed to do the work expected of them.

POSITION OF PIPES.

The furnaceman is often called upon to install a job for a party in which pipes are to be run a distance of 15 or 20 feet, and where the elevation from point of bonnet where pipe is taken to the register is less than 12 inches, and in such cases it is likewise almost impossible to obtain effective results owing to the great loss of heat by the radiation of pipes in the basement.

It is often the case when working in country houses that the furnace is to be located in the cellar, which extends under but a very small portion of the house, and in order to reach rooms in various parts of the building it is necessary to tap the cellar wall and convey the air by pipes which pass beneath the floor, and here again there is great danger that the pipes will be so greatly chilled on entering the space without the cellar wall that sufficient heat cannot be carried through these pipes to heat the rooms to a proper degree of temperature no matter how well wrapped the pipes are with asbestos paper.

Such cases as those cited above are met by the furnace dealer in the course of a season's work, and it would certainly be a great benefit to the trade at large if furnaces were not used in the cases cited, or if furnaces are used the owner of the building should be notified in advance of what may be expected, and the guarantees should be withheld on all such work.

Almost every dealer can call to mind cases where he has installed furnaces where hot water or steam should have been used, and where he would have been better off had he the courage to recommend to the owners the use of a system for heating other than hot air.

I know personally of dozens of such cases that have come to my knowledge, and the majority of these furnaces have invariably been taken out and steam or hot water substituted, and in each case the furnace business was injured in the immediate locality through no fault of the furnace, but simply owing to the defective judgment on the part of the dealer. This certainly has a bearing on the future of the hot air furnace, for the reason that each furnace taken out owing to failure to accomplish the work expected of it does great injury to the progress of the furnace business, as the circumstance is taken advantage of by advocates of other forms and methods of heating.

(*To be continued.*)

An Old Base Burner.

A correspondent signing himself "Old Boy" writes us under recent date as follows: In looking over *The Metal Worker* of September 23 I find an illustration of the first base burning stove produced in this country. I at once recognized it as the stove invented by Dr. Mott and which was sold in a store on Water street in New York City. It came under my notice when a boy in 1836. The grate was a basket inverted, and the back flue was on a line with the lower part of the grate. In lighting the fire it was necessary to open a damper in the flue, this damper being about on a line with the feed cover. After the fire was properly started the draft, by closing the damper, was up the flue from the lower part of the grate. This stove was used in all first-class residences in its day, which was before the introduction of steam or hot air, and was first class in all respects.

The Eclipse Stove Company

of Mansfield, Ohio, favor us with a copy of the catalogue which they have issued from the press illustrating and describing their lines of Eclipse stoves and ranges. The volume is made up of 136 pages of letterpress, neatly printed upon good paper and bound in colored paper covers, carrying a gilt side title. In their announcement to the trade the company state that since the last catalogue was issued they have added several new stoves, made a number of additional sizes, and incorporated many improvements, to which the attention of dealers is invited. The first 25 pages of the catalogue are devoted to ranges, the leading place being given to the Grand Eclipse, made in two sizes, for burning wood only. The design is neat, the constructive features of the modern type and the operation claimed to be entirely satisfactory. The Radiant Eclipse, also for burning wood and made in two sizes, is illustrated and described. The cook stoves for burning wood are next considered and occupy something like ten pages. They are made under such names as Pride Eclipse, offered in six sizes, and the Yucatan Eclipse, in seven sizes. Next in order are the coal and wood ranges, including the Brilliant Eclipse, a very neat first-class four-hole construction with ventilated sectional fire back, interchangeable end walls, shaking or dumping grate, large draw out hearth, patent oven door opener and adjustable oven shelf; and the Solar Eclipse, an attractive medium priced construction, made in two sizes and the usual modifications, several of which are shown. The coal and wood cook stoves are known as the Venus Eclipse, made in five sizes; the Superb Eclipse, in six sizes; and the Postal Eclipse, a cheap stove with the modern improvements, offered in seven sizes. The heaters occupy the closing portion of the catalogue, with the Matchless Eclipse leading. This is what the manufacturers call a wood base heater, the bottom flues being along the side of the ash pan instead of under it, and permitting the main body of the

fire, where is the greatest heat, to come nearer the floor. The makers claim that, the heat being compelled to pass around the outside of the base of the stove, brings it where it is most needed and gives a greater radiating surface, with the same amount of fuel, than would otherwise be the case. The store is attractive in its ornamentation and is made in two sizes. A sectional view shows the course of the cold air from the time it enters the stove until it is discharged in a heated condition through openings at the top. The Acme Eclipse is a new direct draft wood cottage stove of tasteful design, and embodies features of construction which are likely to render it popular with the trade. The Star Eclipse, Cosy Eclipse, Total Eclipse and Royal Eclipse are some of the other goods to which attention is invited.

C. M. McClung & Co.

of Knoxville, Tenn., have just issued an interesting publication which is known as Stove Catalogue No. 4. It is devoted to stoves, tinware, grates and house furnishing goods in extensive variety, and in connection with the illustrations are given descriptive particulars which are likely to prove interesting and of value to the trade. Some of the stoves presented include the Favorite six-hole range, made in two sizes; the Atlantic and Pacific wrought steel ranges, made in several varieties; the Improved Excelsior six-hole range, for coal or wood; the Favorite, Virginia Beauty, Excelsior, Leader, Sentinel, Our Mutual Friend and the Southland cook stoves, some of which are designed for burning coal and wood, and others for using wood only. The heaters are represented with the Art Garland square base burner occupying the leading place. Following this is the Foster Oak, the Foster Franklin, the Iron Age, Atlas, Jumbo, Zip, Burnside, Horizontal Oak Franklin for wood only, the Vernon and Buckeye box stoves, together with a line of grates made in numerous styles and sizes. An extensive assortment of hollow ware, stove trimmings, fire sets, stove boards, coal hods, coal vases, corrugated and crimped iron for roofing purposes, water coolers, ice cream freezers, galvanized iron ware, pieced tinware and culinary appliances occupy the closing pages.

ODD PLATES.

THE TAUNTON IRON WORKS COMPANY of Taunton, Mass., resumed operations last week, and the plant is now being operated full capacity in all departments.

"THE STOVE FOUNDERS' NATIONAL DEFENSE ASSOCIATION" is the title of a little pamphlet of pocket size which reaches us from Secretary D. M. Thomas. Its 16 pages are devoted to a statement of what the association is, what it has done and what it aims to do. In connection with these statements is a list of the officers of the association, who are Henry Cribben, president; A. C. Mott, treasurer; W. T. Bradberry, vice-president, and D. M. Thomas, secretary.

THE INDIANAPOLIS STOVE COMPANY of Indianapolis, Ind., are busily engaged in all departments filling orders, and President Bennett is reported to have stated to the representative of a local paper that there were sufficient orders on hand to keep the works going until the holidays.

IN OUR REFERENCE LAST WEEK to the exhibit of the Fuller & Warren Company at the Pure Food Exhibition in the Cyclorama Building, Baltimore, Md., a slight error occurred in regard to the name of the local concern having the display in charge. The firm name should have read A. W. Martin & Co.

WE ARE INDEBTED to Fletcher, Russell & Co., Limited, Warrington, England, for a copy of their list No. 175 of gas heating appliances. The volume bears date of September of the present year and consists of 126 pages of letterpress, profusely illustrated, and giving an idea of the extensive assortment of gas burning appliances manufactured by the company. A part of the volume is a supplement bearing date of October, and showing a new pattern of range which the makers have added to their lines of cooking apparatus. The new range is decorated in a neat and attractive style, and has the broiling device raised slightly above the top of the stove instead of being placed below it, as is the case with gas stoves of American manufacture. The range stands 33½ inches high, is 22½ inches wide and 20½ inches deep. It has a double case and is jacketed with slag wool, patent removable linings, enameled with porcelain, being furnished when so ordered.

I. F. GRUMBEIN, local agent at Lebanon, Pa., for the Howard Furnace Company, is placing the company's system of heating and ventilation in the new Keystone Bank building at Manheim, and also in the school building in Pennsylvania Township, Lancaster County, Pa.

THE ART STOVE COMPANY of Detroit, Mich., are meeting with a very gratifying demand for their specialties, and state that the volume of trade is steadily maintained, while the general depression seem to be wearing away. They have issued an illustrated circular of their Oakland parlor stove, designed for burning hard coal, soft coal or wood, and which is made in four sizes. It is of attractive appearance, and is referred to by the makers as perfect in all respects. They state that "the merit of this stove has won it success." The circular also shows by circles of solid black the volume of business during the last ten years, and they expect that next year they will have a much larger black spot to record than the one for 1892.

THE HUETTE-BARLER MFG. COMPANY of Chicago have issued a little pamphlet entitled "A Reason Why," which is a work of art. It treats of the special merits of Barler's Ideal oil heater, put in the form of a narrative by a World's Fair visitor who has seen the company's exhibit of oil heaters in Section O of the Manufactures Building. The story is well told and contains many excellent points. The pamphlet is profusely illustrated, beautifully printed and has an illuminated cover.

THE BOARD OF DIRECTORS of the Lebanon Stove Works, Lebanon, Pa., held a meeting on October 7, at which H. H. Kreider was elected president of the company, to succeed the late Adolphus Reinoehl. By the action of the Board of Directors J. M. Reiley was made general manager of the company from October 1.

THE MICHIGAN STOVE COMPANY have issued a capital advertising wall picture in colors and bearing the title, "A Model Stove and a Model Husband." A woe-begone man is trying to pacify two children, while his wife, who is in street dress, is represented as saying to him "Good by, dear, mind the children and put them to bed. The 'Garland' will take care of itself." And the Garland base burner standing near either glows with pride at the compliment or reddens with shame at the shrinking, henpecked husband, we are not sure which. Another novel advertising device is a muslin backed card which begins, "This cloth is not all wool and a yard wide," and then follows a glowing tribute to the excellence of Garland stoves and ranges.

A HARDWAREMAN said this morning: "If you want to know who people are and how they live look at their kitchen stove," as he tried to pick up one side of one that had just been brought in for repairs and it slipped out of his hand. "There is oil enough on that hearth to furnish greased pigs for a year's tournament. As for blacking, the stove never saw it," and he wiped off his hands as he sat down to meditate.

THE CARTON FURNACE COMPANY, 83 and 85 Wabash avenue, Chicago, are to furnish six Carton furnaces for school buildings at Clinton Junction, Wis., and two for Alexis, Ill.

SOUTHARD, ROBERTSON & CO, Peekskill, and 21–25 Peck Slip, New York, have just brought out the Waldorf range, made both right and left hand, and either portable or brick set. In it have been combined what appear to be many admirable features, the design being such as to enable the intelligent cook or housekeeper to have at all times complete control of fire, draft and oven temperature. There is a new compensating device for controlling the intensity of the flue current. The range has six covers and the size is 8–20. It can be had with regular or skeleton hot closet, flat or rocking grate and with or without ash sifter. In the collar box is a Read's patent damper, the rod of which is removable without disturbing the top. Both grate and water back may be replaced without interfering with the bricks. One hole is fitted with three rings, affording a 3, 6 or 8 inch hole for different utensils when direct contact with the fire is desirable. The oven door has a swell front extending outward about 2 inches. This can be opened with a kicker, nickeled to correspond with other minor parts. At the lower left hand corner of the oven door is a circular ventilating draft wheel, to be used in connection with a slide at the upper right hand side of the interior of the oven, for modifying the temperature when baking, if desired. A slide attachment in bottom of oven for shortening or lengthening the flue plate operates to restrain or increase the chimney current, according as it is too much or too little. The brick set range can be set from 8 to 12 inches in a 33-inch jamb.

MEISTER & ROHRER of Sterling, Ill., held a baking reception on Friday and Saturday, the 13th and 14th of the present month, sending out something like 1200 invitations. The baking was done in a Monarch Peninsular range, and was a great success in every way. A large number of those to whom invitations were extended were present, and we are told that there were consumed over 300 dozens of biscuit.

AUGUSTINE C. WEST of Cambridge, Mass., has patented an oil stove in which the object sought is to decrease the cost while producing a device free

from the objectionable features of sweating and heating of the oil tank and burner. The oil stove is supported upon a wooden shelf forming a base and having a metallic plate on its upper face. From the under face the oil reservoir is suspended. The wooden shelf has one or more openings for the cylinders or heating bodies of the stove. A one-half interest in this patent has been assigned to Page Brothers & Co. of Boston, Mass.

THE HOWARD FURNACE COMPANY, with main office and factory at Syracuse, N. Y., are distributing among their friends a little folder telling of the merits of the Howard heater. It winds up with the request that if the reader is interested and cares for more information, or desires an estimate for heating, to address the manufacturers or any of their authorized agents in New York, Boston, Mass., Grand Rapids, Mich., and Toronto, Canada.

AT THE LAST CONVENTION of the National Association of Stove Manufacturers, held on June 1 in Chicago, numerous papers were read dealing with subjects of interest and value to members of the trade. One of the papers, written by special request and read before the national body, was that presented by Lazard Kahn of Hamilton, Ohio, on "The Stove Industry and the Ethics of Consolidation." This paper has recently been published in pamphlet form and is now being distributed among members of the trade.

A MONTREAL, CANADA, DISPATCH of October 19 states that the establishment of William Glendening & Sons, founders and stove manufacturers, of that city, was the scene of a fire which occurred on Thursday last, causing serious damage.

LEWIS M THATCHER, secretary of the Thatcher Furnace Company, 33 Peck slip, is at present absent from the Metropolis on a business trip through the Western States. We understand that he is meeting with a hearty welcome by the dealers, and that he has booked a number of very gratifying orders. One of the latter, which he has sent in, comes from Chicago and calls for 25 furnaces and 20 ranges; another from Indianapolis calls for 20 ranges and 15 furnaces, and some from St. Paul and Minneapolis aggregate 40 ranges and 50 furnaces. He has written the home office that he will continue his trip to Denver.

THE FRONT RANK STEEL FURNACE COMPANY of St. Louis, Mo., are constantly in receipt of testimonial letters referring to their Front Rank furnace. Among those recently received is one which was sent to a prospective customer by Frank Wyman of the Simmons Hardware Company and reading as follows: "In regard to the Front Rank furnace, would say that in my new house I have placed two of them. A great many of my neighbors have them, and I have yet to hear the first word against them. I do not know that they are any more economical than any other furnace, but I do know that they are no more expensive in the amount of coal they burn, while the heat they give is pure, fresh hot air sent up into the rooms in a healthy condition. They have what is known as a cold air box which furnishes air to the furnace and is then sent up into the house, heated fresh air, instead of burning up the oxygen which is in the room. The company are at present rushed to death with orders and are just as busy as they can be, so if you want to order a Front Rank you had better do so at once."

THE NEW ELECTRIC PLANT which the Thatcher Furnace Company of 33 Peck Slip, New York, have recently installed in their foundry at Newark was tested on October 15 with very satisfactory results. We understand that the works are fitted with 250 incandescent lamps, which present an exceedingly brilliant appearance when lighted. The test was conducted under the immediate supervision of Edward Benedict, treasurer of the company.

WORLD'S FAIR NOTES.

The Keasbey & Mattison Company

of Ambler, Pa., have an exhibit in Section D of the boiler house annex, Machinery Hall, where they have erected a neat and serviceable platform, around the outer edges of which showcases have been built containing specimens of their magnesia sectional steam pipe covering. It is composed of magnesia and asbestos and is intended for all manner of steam pipe, both high and low pressure, and also for boilers. It is further available for connections and fittings separately.

The Joseph Dixon Crucible Company

of Jersey City, N. J., have erected a very artistic *façade* of cherry and mahogany to mark the boundary of their space, which is richly furnished with fine carpet and handsome show cases, while numerous chairs have been provided for the hospitable reception of visitors. Arranged in the showcases are products of graphite in many forms, such as crucibles and silver and gold retorts, from No. 0000 up to No. 300, dippers, bowls, stirrers, nozzles, stoppers, electrical appliances, forms for incandescent lights, electrotypers' facings, founders' core wash, foundry facings, shot glazing, graphite lubricants, machinery oil, cylinder oil, inside and outside grease, dry lubricants, roof paint, boiler and smoke stack paint, yacht graphite, hatters' lead, pigment for paint, flake graphite, &c. These exhibits are in many instances arranged in glass jars, with richly enameled labels. One showcase contains specimens of graphite in special shapes, such as great bunches of pencil leads in all shapes and thicknesses, and resistants for electrical purposes in bars, coils, rings, rods, &c. On a mahogany table stands a Dixon crucible which was used at the American Bronze Works, Grand Crossing, Ill., in casting the solid silver statue of Justice for the Montana display in the Mines and Mining Building. The finest specimen of graphite ever mined, according to experts, is here exhibited, and an award has been granted the company on that ground. It weighs 269 pounds, and is said by mineralogists and chemists to be at least 98 per cent. pure. It was mined on the island of Ceylon. Numerous other specimens of graphite are shown which run up to almost 100 in fineness. The company's graphite is principally obtained from their own mine at Ticonderoga, N. Y. So little is known of graphite by the general public that the company's representative in charge of the exhibit, John H. Baird, may be said to be delivering a perpetual lecture on this useful mineral to a stream of visitors. The special lead pencil display of the Jos. Dixon Company is located at Column F 98 in the northeast gallery of Manufactures Building. It occupies a small space, but the exhibit is nevertheless a very fine one. Samples of lead pencils in almost every conceivable shape and size are tastefully arranged on a four-sided frame in a handsome glass showcase. Returning to the Mines and Mining Building, another exhibit in the east gallery worthy of mention is that of

Robert J. Taylor & Son,

Nineteenth and Callowhill streets, Philadelphia, who show a great variety of crucibles and retorts for all purposes. These are arranged on a set of shelves, receding from very wide ones at the bottom to narrow ones at the top, to accommodate the different sizes of crucibles. A much larger display, however, in the same line is that of the

Phœnix Crucible Company

of Taunton, Mass., who have erected a great pyramid of shelves, crucibles of all sizes completely covering the four sides. Banners prominently displayed state that this is the oldest incorporated crucible manufacturing company in the United States. A large gilt phœnix surmounts this exhibit. In close proximity is the display of

The Tanite Company

of Stroudsburg, Pa., which can be best described by quoting from a circular prepared by this company. They were requested by the exposition authorities to treat "abrasives" from an educational standpoint. The exhibit here illustrated and described is the result, and its compact character is due to the fact that the exhibit will be presented as a gift to the Smithonian, the Chicago University, or some other suitable institution. While some of the articles were furnished by the Tanite Company many were contributed by liberal minded manufacturers.

Emery, being the most important abrasive, is illustrated fully. Emery ore is shown from Turkey, Greece and the United States. In one piece clear blue sapphire can be seen with the naked eye. On a platter of pure aluminum are shown sapphires, corundum and emery, with the explanation that alumina is the oxide of aluminum, and that the articles on the platter are largely composed of crystallized alumina, the sapphire being almost pure alumina. Emery is then shown in its successive stages—first as it comes from the crusher; then in the form of grain and flour; then as polish (powder, liquid and paste); and, lastly, in the shape of whetstones and solid emery wheels. Fragments of various classes of Tanite wheels are displayed to show the internal texture. There are bottles containing the dust gathered under Tanite wheels after the grinding of cast, malleable and wrought iron, and of brass and steel. These are for experimental examination with magnifying glass and magnet. "Petrified sparks" are an interesting feature. These are strangely shaped cones formed of the matter which fuses below an emery wheel when grinding under heavy pressure. The comparative products of the emery wheel, file and cold chisel are tabulated on a framed sheet, while the case contains pieces of cast iron and saw steel with the cuts made by file and wheel. The piece of saw plate demonstrates that in a given time the wheel did 126 times as much work as the file. In the case and on the ends of the stand are numerous parts of machines, all of which have been surfaced by the Newman emery plater. These appear to be as true as if planed, and

tabulation shows that this machine has taken a maximum cut ¼ inch deep, and has taken a $\frac{1}{16}$-inch cut over a surface of 100 square inches in six minutes and nine seconds. Its ordinary cut is from $\frac{1}{64}$ to $\frac{1}{32}$ inch.

Emery wheels are usually thought of in connection with metal grinding, but in this case are shown blanks for long combs and ladies' back combs, made of vulcanite, and other samples showing that the long comb has been edged and the back comb had the spaces between the teeth cut out with Tanite wheels. Glass guides from a silk spinning mill are also shown. In these guides the silken thread wears a tapering groove which eventually breaks the thread, and these grooves are ground out by the use of Tanite wheels.

As curious and instructive examples of abrasion, the parts of various machines used in the Tanite factory are shown, all testifying to unequal and destructive wear due to unequal stress and the friction of emery dust.

Samples of carbon or black diamond and also samples of clear or gem diamond, suitable for turning or dressing emery wheels, are shown by the Tanite Company. The evolution of razors and table knives is shown in two series of samples, beginning in each case with the rough ingot or blank of steel, progressing through various stages of polish to the final bright finish.

An interesting series of photographs shows emery veins and mining processes in Westchester County, N. Y.

After showing how wide a range of materials and processes is covered by this compact and unique exhibit, we can close in no better way than by referring to two pictures: One of these seems to represent the tail of a comet, though what is really shown is the stream of fiery sparks streaming off from a Tanite emery wheel while engaged in grinding through a file. The other is a photograhic reproduction of a picture in the Royal Gallery, Berlin. The photograph was contributed by Markt & Co., Hamburg, and the painting was by Gerard Ter Borch, who was born in Holland in 1617. This painting represents with much detail "The Grinder's Family," and depicts clearly the rough and primitive grinding processes then employed.

The many articles already mentioned form only a part of this exhibit; but enough has been said to show how much unexpected interest, even for the unlearned, may be found in an exhibit whose name suggests nothing but a dry, hard, technical study.

H. W. Johns Mfg. Company

of New York, Chicago, Boston, Philadelphia, Atlanta, Jersey City and London, have six exhibits of their specialties, owing to the variety of claims covered by their productions. In the Mines and Mining Building they have machinery in operation manufacturing asbestos fabrics, on the ground floor in the northeast corner of the building, Section Q. In the same building, in the northeast gallery, Section T, Column 11, they exhibit a collection of asbestos minerals from all parts of the world. In the Electricity Building, west gallery, Section U, they show insulating materials for electrical purposes, vulcabeston, &c. In Machinery Hall asbestos pipe and boiler coverings are in actual use. The feed pipes for 70 engines and about 50,000 feet of main steam supply pipes are covered with asbestos sectional coverings. In the great Manufactures Building paints are shown on the ground floor in the northwest part of the building, Section H, Block 1, while the general exhibit of the manufactures of the company is located in the gallery in the northeast corner, Section F. This last exhibit covers an enormous variety of asbestos goods, such as drop curtains for theaters, fire proof building paper, gaskets for pipe joints, pipe coverings, &c.

The Electrical Forging Company

of Boston, Mass., make one of the most novel exhibits at the exposition. The operation of heating and working metals by electricity on the Burton system is shown on quite a comprehensive scale in Electricity Building, Section D, Space 2, in the northeast quarter of the building. Appliances for forging, welding, rolling, brazing and for rolling balls and taper pins are in regular operation. One of Merrill Bros.' large drop forges is used for the manufacture of miniature horseshoes, which are in eager demand by spectators for souvenirs. Everything is done by electricity, the machines being operated by an elecric motor. A large electric heater with several metal holders is used for heating bars for forging, rolling and welding, also for welding tubes or pipes. This heater is so governed by a regulator or rheostat that pieces of different diameters and varying lengths are heated at the same time, the heater dividing its current automatically. Iron or steel or copper can be heated easily and in a remarkably short time. The holders for heating bars to be rolled into balls are located close to the rolling machine. There are four of these holders, so that the operator can be kept supplied with heated rods. The metal thus heated is not oxidized, and the most ignorant workman is in no danger of burning it. Experiments of many kinds were made in the presence of the writer to demonstrate the remarkable mildness of the heat thus applied. A striking peculiarity of the heated bars is that at a white heat the part of the metal not exposed to the electric current is quite cold within a very short distance of the heated portion. A portable heating apparatus is shown, which is adapted for use in heating rivets in the construction of buildings or in other isolated locations. A bucket containing water is connected with one pole of an electric current, which may be taken from an electric light, a trolley wire or other convenient source of electric energy. A pair of tongs is connected with the other pole. A piece of metal held by the tongs being dipped in the water the circuit is completed and the metal at once begins to heat. It will melt if kept in the water any length of time, the action being very rapid. A jacket of hydrogen, it is explained, is generated which envelopes the metal and protects it from the action of the oxygen, so that the iron or steel is not injured by the heat as applied in this manner. A piece of steel held in the water until the end fused was found to be unburnt after it was allowed to cool. A medal and diploma have been awarded this exhibit "for originality, rapidity in placing and removing the metal to be heated and adjusting the heating devices to varying sizes, shapes and lengths, and for original and superior construction and apparatus."

Franklin Brass & Bronze Company have about finished a new factory at Derby, Conn., which they expect to occupy and operate the latter part of this month. They will manufacture the same class of goods formerly made by the Franklin Brass Company, at their factory in Buchanan, Va., destroyed by fire two years ago, soon after starting up. They now have at Derby a well equipped plant for producing Refrigerator and Box Trimmings, Hinges for water closet seats, Hasps, Door Numbers, Molding Hooks, Cabinet and Builders' Hardware, Escutcheons and Shutter Bars, Flush Lifts, Brackets, Cabinet Hinges and Butts. They expect to increase their line of builders' hardware largely. They have a foundry also for casting special goods to order, and will make this department a feature of their business. W. F. Brainerd will be in charge of the business at 111 Chambers street, New York.

Fire Proofing with Mineral Wool.

We quote the following from a paper by R. Gordon Hyndman, read before the Royal Victorian Society of Architects:

My partner (Mr. Bates) and I have made a number of experiments as to the fire resisting qualities of this substance (mineral wool), and so satisfied were we with the results that we determined to use it for the fire proofing work at the Australian Mutual Provident Society's offices in Collins street. In this case we had a somewhat awkward problem set us. We had to fire proof the whole of the ceiling of the new main office, and also the attached board room and accountant's room, without working from the top, disturbing the floor above, or in any way inconveniencing the tenants who hold offices on long lease from the company. This being so, we had to find some fire proofing that could be put in position from below, and put up dry (the ceilings and walls having to be decorated at once), and of no great weight or cost; and, last but not least, a material that would satisfy the building referees. As I said before, after experiment we decided to make use of silicate cotton, if allowed by the building referees. I am glad to say that by practical demonstration we were able to satisfy these gentlemen as to the fire resisting qualities of the material, and obtained their consent to the method of using it, which I am about to describe. In the old office building the first floor joists were supported on 10 x 5 inch rolled iron joists running from wall to wall (a span of about 30 feet), the ceiling joists of the main office being supported on the lower flanges of the joists, and on these ceiling joists a lath and plaster ceiling of the ordinary construction was formed. In order to form the new fire proof ceiling we removed the lath and plaster ceiling and wood ceiling joists, and inserted new 5 x 4½ inch rolled steel joists between the old 10 x 5 inch rolled iron joists, and carried the whole on a new set of girders, and then on the lower flanges below the iron and steel joists we placed buckled boiler plate, 3-16 inch, and in the space thus formed inserted a packing of the silicate cotton, The new ornamental ceiling below is formed of fibrous plaster. I do not for a moment suppose that as a fire resisting floor this iron and silicate cotton construction can compete with iron and coke concrete, or iron and terra cotta, as to effectiveness or price in ordinary cases; but I feel sure that, given conditions such as we had, you will find it difficult to obtain any fire proofing more easily handled, effective, and, last but not least, that will satisfy the building referees of the city of Melbourne.

TRADE REPORT.

The Iron Market.

The best that may be said is that the past week has not brought any more particularly unfavorable developments in the Iron trade proper. Like every other industry and business throughout the country, it is suffering from the failure of the Senate to put our currency question into proper shape. With admirable patience the business community has suffered without displaying more than pardonable exasperation. We do not believe that this phase will last much longer. It will take, but a small impulse to bring about the ears of the Senators a cyclone of wrath from the business world which will put an end to dallying. It will be made apparent who are the masters and who are the servants.

Every day's delay pushes further into the future the prospects of a recovery. Every day's delay drags nearer to the brink of bankruptcy many merchants and manufacturers. It is steadily sapping the vitality of the strongest. Business men not only owe it to themselves but to their employees to adopt vigorous measures. When the threatened bread riots come this winter, with their loss of life and of property, they will not be quite free from their share of blame, since they have not yet exhausted their power of coercion.

From the majority of the Iron trade centers comes the same talk of discouragement. In isolated cases there are reports that a moderate volume of business is coming up, but orders which would hardly cause comment in ordinary times are eagerly pointed to now as offering some encouragement. The Iron trade needs the immediate repeal of the purchasing clause of the Sherman act, and wants peace for a long time after that.

Pig Iron.— The New York market continues featureless and exceedingly dull. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

In the Philadelphia market the feeling is reported as exceedingly dull. Prices are weaker and lower, yet with a production of only 40 % of what it was a few months ago, there is more unwillingness to buy than when prices were very much higher and production twice as large. There is no disposition to buy anything that is not actually needed, no matter what inducement may be offered as regards prices. The usual quotations are about $13 @ $13.50, delivered, for No. 2 Foundry, and $14 @ $14.50 for No. 1. Southern Irons can be had at less money, several lots having changed hands at $11.50 @ $11.75, with a fair chance that orders could be readily placed at the same or slightly lower figures for good sized lots and prompt settlements.

Only a few sales of fair importance are reported from the Chicago district. Among these were 500 tons Southern Coke Foundry, 500 tons Lake Superior Charcoal, 300 tons local Coke and a few 100-ton lots. Carload orders have been fair but not very numerous. Some Iron houses reported the past week as one of almost complete stagnation with them. Shipments of Coke Iron from the furnaces are steadily increasing, largely on account of the growing consumption of agricultural concerns. Some little improvement, however, is noticed in the consumption by general foundries. Quotations are given as follows for cash:

Lake Superior Charcoal.....	$16.00 @ $16.50
Local Coke Foundry, No. 1...	13.50 @ 14.00
Local Coke Foundry, No. 2...	12.75 @ 13.00
Local Coke Foundry, No. 3...	12.50 @ 12.75
Local Scotch.....	14.00 @ 14.50
Ohio Strong Softeners No. 1..	15.50 @ 16.00
Southern Silvery, No. 1.	@ 14.50
Southern Silvery, No. 2.....	@ 14.00
Southern Coke, No. 2.....	12.35 @ 12.60
Southern Coke, No. 3	11.60 @ 11.85
Southern, No. 1, Soft.....	12.35 @ 12.60
Southern, No. 2, Soft.....	11.85 @ 12.10
Tennessee Charcoal, No. 1...	16.00 @ 16.50
Alabama Car Wheel.....	18.50 @ 18.75
Hocking Valley, No. 1	15 25 @ 16.00
Jackson County Silvery.....	16.00 @ 17.00

The Pittsburgh market is described as a waiting one, and although buyers are aware of the fact that furnaces are offering their product at about cost, or perhaps below, orders continue to come in for immediate requirements only. Production in that district has been increased to the extent of about 250 tons per day by the blowing in of the stack of the Monongahela Furnace Company, at McKeesport, on Mill Iron. For ordinary lots asking prices are $12.50 @ $13, cash, for No. 1 Foundry and $11.50 @ $12 for No. 2, on the same basis.

There has been very little change in the general features of the Southern Pig Iron markets during the week; the transactions have been restricted to supplying the current wants of the jobbing foundries and the stove works, but the purchases of the latter are not large, seldom running over 200 tons at any one time, and frequently much less; there has been no large demand for forward delivery, and while the stronger Iron companies in the South are not urging sales, and, in fact, have withdrawn from the market, because they have sold as far ahead as they care to, yet there are indications that almost any kind of Pig Iron could be bought for spot cash about as low as it has ever sold in a regular way, although it seems certain that there is no margin of profit in its manufacture. Quotations are as follows:

Southern Coke, No. 1.	$12.75 @ $13.00
Southern Coke No. 2.....	10.75 @ 11.00
Southern Coke No. 3.....	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2....	14.50 @ 14.75
Lake Superior Coke No. 1.....	15.00 @ 15.25
Lake Superior Coke No. 2.	14.00 @ 14.25
Hanging Rock Charcoal, No. 1..	18.50 @ 19.00
Hanging Rock Charcoal, No. 2..	17.50 @ 18.00
Tennessee Charcoal, No. 1.....	14.00 @ 14.25
Tennessee Charcoal, No. 2.....	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable.....	17.00 @ 17.25

Metal Market.

Pig Tin—Comparatively little Tin has changed hands in a speculative way during the past week, but the market has gained somewhat in tone, although purchases by distributors and consumers have been on a rather moderate scale. Straits shipments during the first half of the month, it was advised, amounted to 1450 tons, including 1125 tons to Great Britain and 325 tons to the Continent, against 1275 tons during the corresponding period last year. Some few lots have been sent from Europe to this market, but not enough to have any decided influence upon the situation here. Bids were raised on Tuesday to 20.90¢, net cash, for prompt or current month delivery, but at the close of the week the buying spirit was exceedingly tame, and bids above 20.80¢ were strictly the exception. The retail demand for Pig Tin is very moderate, and quotations for small lots remain unchanged at 22¢ for Straits and 22½¢ for Banca.

Copper.—Exports continue liberal, and deliveries on home trade orders are fairly large. Between the two a considerable portion of the product of various concerns has been taken up, and with general trade conditions in better shape than they are at present the market would probably show stronger tone. It happens, however, that there is more than enough Copper to go around, and prices are soft in consequence, although showing no radical change. In remote instances 10¢ is quoted for Lake Superior Ingot, but there have this week been more sellers than buyers at 9¾¢, and rumor had it that sales were made at as low as 9⅝¢, net cash. It was rumored that some sales of ordinary casting stock have been made at 9½¢ on net

cash terms. Jobbers report orders and inquiries to have fallen off materially in volume during the past two weeks, and the impression prevails that little improvement may be expected until the currency question is settled by Congress. Prices for small lots of Ingot, although nominally unchanged, are inclined to weaken.

Sheet Copper.—The market has relapsed into dullness, nothing but a hand to mouth trade being done. No immediate prospect of any improvement is in sight, or is looked for until general business revives again, and some impetus is given to the roofing and cornice trade and other trades using Sheet Copper. Prices remain unchanged, as per list.

Pig Lead.—There has been a further decline in prices and the market has had a depressed appearance. Consumers purchased indifferently, while other buyers virtually did nothing. At from 3.50¢ down to 3.30¢ probably 500 tons changed hands, with 150 @ 200 tons at the lowest figures. With Western markets quite as low, relatively, the position at the close was the reverse of encouraging. Bids of over 3.25¢ for carload lots delivered here were strictly the exception. At 3.35¢ the offering was fairly free at the close. Jobbers' prices for small lots are quoted a shade lower at 4⅛¢ @ 4¼¢ for American Pig, with little business doing.

Lead Pipe and Sheets.—The market for manufactured Lead remains dull and featureless. Demand for Plumbers' Supplies is of the narrowest, owing to the inactivity existing in the building trade. Collections are reported as good, comparing favorably with those of previous years. New York retail prices for Sheet Lead and Lead Pipe remain unaltered, as per list.

Spelter.—Prices for ordinary Western brands have fallen about 0.20¢, or to about 3.55¢ @ 3.60¢. This brings the cost of the metal down to an unusually low point, and, according to most calculations, leaves very little, if any, margin of profit to producers. Despite this, it does not appear that either consumers or dealers manifest any inclination to buy except as imperative wants necessitate, and exporters are not doing enough to relieve the situation. Hence a rather demoralized market and little chance of improvement in the immediate future, unless production be curtailed considerably.

Antimony.— For ordinary jobbing quantities there has been a fair demand, but the market is otherwise slow and prices are easy. We quote for small lots at 10¼¢ @ 10½¢ for Hallett's, and 11¢ for Cookson's.

Sheet Zinc.—The market for Sheet Zinc continues without change. The exceptionally low prices which are now ruling are due principally to the low price of Spelter and the inactivity of both the Spelter and Sheet Zinc markets. The demand for Sheet Zinc is, however, somewhat stimulated by the reduced prices which are now prevailing, but the trade are not disposed to purchase much beyond their early requirements.

Tin Plates.—Ordinary Cokes continue in very fair demand, and sufficient business has been done in these Plates, both for prompt and future delivery, to keep prices quite firm. Business in Bright Charcoal and Ternes has fallen into a narrow, hand-to-mouth groove, with only moderate inquiry. Prices for these lines of stock are consequently softer, but without radical change. Futures continue almost entirely neglected. Stocks in the hands of dealers are very moderate, yet they appear to be amply sufficient for present narrow requirements.

Sheet Iron.—A fairly active demand continues for Galvanized Sheets. Owing to the restricted output of this material, however, jobbers have considerable difficulty in getting mills to fill their orders promptly, and some scarcity already exists, which with any marked revival of trade would be apt to develop into a veritable famine of Galvanized Iron. Prices, nevertheless, continue unchanged. Black Iron is in fair demand, the Charcoal quality being reported in greater favor than Common Iron, owing to the reduction in price, which has placed so comparatively small a difference between the two kinds that consumers willingly pay a little more to obtain the better quality. Prices for Black Iron are firm, the demand being nearly on a parity with production.

The American Well Works of Aurora, Ill., have secured a medal for their revolving process machine, by which wells are sunk by the revolving of the tubing and a stream of water washes out the borings. The deepest and largest wells sunk in alluvial formations, quicksand, &c., have been sunk with it. J. W. Byrnes & Co. have sunk a well with it at Galveston, Texas. It was commenced with 22-inch bore, and is sunk to a depth of 3067 feet in quicksand and clay, with alternate strata of hard materials.

The Homer D. Bronson Company, Beacon Falls, Conn., make a specialty of fine Art Metal Work of electro bronze from architects' drawings, models, carvings, &c., for interior decoration of all descriptions, including panels for dadoes, friezes, doors, mantels, sideboards, houses, steamboats, palace cars, furniture, pianos and organs, billiard tables, &c. The company have just completed a quantity of ornamental bronze work finished in gold for the Columbus Building, Wabash avenue, Chicago, from architect's designs. In addition to the above work the company manufacture wrought brass Butt Hinges, finely polished and plated Piano and Organ Hinges, Continuous and Sectional Hinges for every purpose, any width and length, fancy and irregular shapes to order, wrought brass Pressure Bars and brass goods in general.

The Peck, Stow & Wilcox Company's main factories, at Southington, Conn., are again in full operation.

Chicago Report.

Scrap.—The demand for Old Material is still very light. An occasional sale is reported, and at long intervals some consumer takes a round lot, but generally trade is extremely dull. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$8.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	9.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3½¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	2¼¢

Anthracite.—Dealers report a much heavier demand, but stocks here are so small that difficulty is experienced in filling orders. Those who did not buy early in the season are now likely to be put to much inconvenience. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

The Hollands Mfg. Company, Erie, Pa., have issued a neat advertising novelty which they are sending through the mails to their many friends in the trade. It is in the shape of an ornamental folder, gotten up by Livermore & Knight of Providence, R. I., and bearing on the address side "Forewarde Quicklye—Thys Lettre beareth Tidynges of Greate and Exceedinge Value." Upon opening the folder we find one page devoted to an illustration the central feature of which consists of some of the company's specialties. Standing about in various attitudes are numerous "Brownies," which Palmer Cox has made famous, while three of the little imps are manipulating a Vise. Opposite the picture are lines telling of the merits of the Chucks, Vises, Stocks, Dies, Pipe Wrenches and tools generally which the Hollands Mfg. Company are offering the trade.

CONDITION OF THE

Hardware Trade.

BUSINESS on the whole shows little or no improvement during the past week. Some houses report a fairly active trade, but most jobbers and manufacturers do not give quite so favorable advices. There is certainly an important diminution in the volume of business this season as compared with last year. Seasonable goods are most active, but a good deal of complaint is made concerning the lateness of trade, which is, perhaps, explained in part by the fact that exceptionally fine weather has generally prevailed. It is not thought, however, that even in these lines the volume of business will be up to the average. Prices are, with a few exceptions, without change, but the undertone of the market is not strong, and it is expected that if present conditions continue there will be a tendency toward lower values.

Advices from Chicago.—The Shelf Hardware trade has fallen off again, very much to the discouragement of jobbers, who hoped and expected that the improvement noted last week would continue. It seems, however, to have been but a spurt with no lasting qualities. Some attribute the falling off to the very mild weather experienced during the greater part of the week, and have a slight hope that a recurrence of cold weather will again stimulate the demand. Others, however, are inclined to believe that the fall trade is now about over, and that from this time forward orders will only come in in small quantities as merchants run out of stock. The character of the trade is unchanged. Such orders as are being received are for broken lots, causing very much more than the usual trouble in packing. Western Hardware merchants continue to visit the fair in large numbers and are frequent visitors at the wholesale houses, but their visits are not attended with very much business. The Heavy Hardware trade was considerably better last week than during previous weeks. The improvement in business has been principally in the demand for Iron and Steel. It does not indicate a better condition of trade among the usual patrons of Heavy Hardware jobbers, as a considerable part of this business comes from large consumers who ordinarily buy from mills.

Notes on Prices.

Wire Nails.—The Wire Nail market is in about the same condition as for the past week or two, and without evident improvement. There is, however, perhaps a slight increase in the demand, but orders are not placed with any freedom. Prices are substantially as at our last report—namely, $1.30 for carload lots at mill. This quotation is quite general, and is but slightly shaded in exceptional cases, so that anything below this figure may be regarded as somewhat under the market. Some business is being done in anticipation of an early closing of navigation, but this fact has not as much effect as usual, inasmuch as the trade are very conservative in their purchases, and even the low prices ruling are not sufficient inducement to secure the placing of liberal orders.

Advices from Chicago.—Manufacturers of Wire Nails report a considerably better inquiry and numerous sales of round lots. Quite a number of jobbers through the Northwest have realized the fact that navigation will close within the coming month and are now placing contracts in order to receive stock at the low freight rates prevailing by the water routes. The demand is also based to some extent on the very low prices ruling for Wire Nails and the belief that they are selling either at or below cost. They reason that this will compel a heavy curtailment of production in the near future and that it may possibly be followed by an advance in price. The inquiries and sales are for the most part for the month of November, but in some cases cover the whole period intervening to the close of the year. Prices on factory lots are still quoted at $1.40 to $1.45, Chicago, but these rates have been shaded on the largest quantities sold. Small lots from stock are quoted in a regular way at $1.55, but a large part of the trade is done on the basis of $1.50.

Cut Nails.—The volume of business in Cut Nails is light, but there has been no weakening in prices. The Eastern market is represented by the quotation of $1 base on carload lots at mill and manufacturers are indisposed to make concessions, except in special cases. There are indications of a disposition on the part of Western mills to strengthen their prices somewhat, and in some cases extreme quotations have been withdrawn. As a result of this condition some of their most recent quotations name a slightly higher base or require a better average. This is not regarded as indicating the probability of an advance or any radical improvement in the tone of the market, but is rather a result of the conservative disposition on the part of the mills, who desire to obtain more remunerative prices. Small lots from store in New York are quoted at $1.25 to $1 30.

Advices from Chicago.—The Cut Steel Nail trade is hardly in as active condition as the Wire Nail trade. Orders are still confined to small quantities, on which manufacturers continue to quote $1.20 @ $1.25. Jobbers quote small lots from stock at $1.30.

Barb Wire.—The Barb Wire market continues weak and there is only a moderate volume of business. Manufacturers are desirous of securing orders and are going to the relatively small trade to a larger extent than usual, their business with the jobbers being this season comparatively light. Quotations are on a basis of $2.25 to $2.30 for Four-Point Galvanized, at mill, but these figures are sometimes slightly shaded. Painted is held regularly at 40 cents less.

Advices from Chicago.—The Barb Wire business shows no improvement. Manufacturers are sending out their travelers and endeavoring to secure what trade they can, but reports thus far are not encouraging. Jobbers are doing very little in this branch of trade, and state that such business as is going is still handled almost entirely by manufacturers. Quotations are repeated on carload lots of ordinary Galvanized Barb Wire at $2.40 and Glidden at $2.50. Less than carload lots of ordinary Galvanized are quoted at $2.55.

Hardware Shelf Boxes.—We give below the price-list of A. H. Green, successor to S. H. Green, 22 Park place, New York, covering the line of Lock Corner Wood Boxes which he is manufacturing for the trade. These Boxes, it will be observed, are made so as to be interchangeable. The sizes given below are outside measurement and without covers. The list is as follows, subject to a discount of 50 per cent.:

No.	Long.		Wide.		High.	Each.
1.....	10½	x	3	x	3½.....	$0.07
2.....	10½	x	4½	x	3½.....	.08
3.....	10½	x	6	x	3½.....	.09
4.....	10½	x	9	x	3½.....	.13
5.....	10½	x	12	x	3½.....	.16
7.....	10½	x	18	x	3½.....	.24
22.....	10½	x	4½	x	7	.11
23.....	10½	x	6	x	7	.14
24.....	10½	x	9	x	7	.18
25.....	10½	x	12	x	7	.24

To parties fitting up with new shelving Mr. Green suggests that if each division is made 36 inches wide, 7 inches between shelves and 10½ inches front to back, these boxes will completely fill them, either of one size or a variety of sizes in the same shelf. All the above sizes are carried in stock. Special sizes are also made to order in quantities of 50 and upward of a size.

A Screw case containing 80 drawers, furnished with chestnut knobs, is also made, the price being $7.50 each, net. The size of the case is as follows: 29½ inches high, 25½ inches wide and 8¼ inches front to back. Each drawer is intended to hold at least 1 gross of Screws.

Stove Truck.—The Lock Frame Stove Truck, manufactured by Randall & Ward, Le Roy, N. Y., and described in a recent issue, is sold to the trade at $15 per dozen for the wood and $18 per dozen for the steel.

Cordage.—Within the past week there has been no quotable change in the price of Cordage, but the market is weak, and somewhat lower quotations can be obtained in special cases.

Glass.—Jobbers report the demand about the same, orders being for small quantities, and that orders are filled with imported Glass when Ameri-

can Glass of the desired sizes cannot be obtained. Grinders and polishers are at work on rough Plate Glass in manufacturers' hands to supply the demand, and there seems a probability of Plate Glass factories starting up before the first of the year. Quotations on all kinds of Glass are unchanged.

Old Metals.—The demand for Old Metals continues moderate and prices are inclined to be weak and irregular. The present low prices of Scrap Iron are, however, commanding a little more attention on the part of buyers in some quarters, and some fair sales of Wrought and Cast Scrap have been noted. Quotations for New York delivery are about as follows:

Heavy Copper	₩ lb 6¾¢
Light and Tinned Copper	₩ lb 6¼¢
Heavy Brass	₩ lb 5¼¢
Light Brass	₩ lb 4½¢
Lead	₩ lb 3¢
Tea Lead	₩ lb 2½¢
Zinc	₩ lb 2½¢
No. 1 Pewter	₩ lb 14¢
No. 2 Pewter	₩ lb 6¢
Wrought Scrap Iron....₩ gross ton	$11.00 @ $12.00
Heavy Cast Scrap.....₩ gross ton	11.50 @ 12.00
Stove Plate Scrap.....₩ gross ton	7.00 @ 8.00
Burnt Iron (delivered at mill) ₩ gross ton	6.00 @ 7.00

Old Rags, Paper, &c.—The market for this material shows little indication of improvement. Prices remain at about the level of last week, with a dull demand. Quotations rule about as follows for New York delivery:

No. 1 White Rags	₩ lb 3¼ @ 3½
No. 2 White Rags	₩ lb 2¼ @ 2½¢
Mixed Rags	₩ lb 3¼¢
Blues and 3ds	₩ lb 1 @ 1¼¢
Hard Sized White Shavings	₩ lb 2¼¢
No.1 White Book Shavings	₩ lb 2 @ 2⅛¢
No.2 White Book Shavings	₩ lb 1 @ 1⅞¢
Light Book Shavings	₩ lb ¾¢
No. 1 Mixed Shavings	₩ lb ¾¢
No. 2 Mixed Shavings	₩ lb ⅝¢
No. 1 Printed Books	₩ lb 1 @ 1¼¢
Ordinary Mixed Books	₩ lb ⅛ @ ¾¢
Newspapers	₩ lb 3-5¢
No. 1 Manila Paper	₩ lb ⅞ @ 1 ¢
No. 2 Manila Paper	₩ lb ⅝ @ ¾¢
Bogus Paper	₩ lb ½¢
Common Paper	₩ lb ⅜ @ ½¢
Straw Chips	₩ lb ½ @ ⅝¢
Binders' Clippings	₩ lb ½ @ ⅝¢
Jute Butts	₩ lb 1¼ @ 1⅜¢
No. 1 Jute Bagging	₩ lb 1 ¢
Mixed Bagging	₩ lb ¾ @ 1 ¢
No. 2 Bagging	₩ lb ½ @ ¾¢
Hemp Twine	₩ lb 2¼¢
Manila Rope	₩ lb 2½¢
Jute Rope	₩ lb 1½ @ 1⅝¢
Mixed Rope	₩ lb ¾ @ ⅞¢

Old Rubber.—There is little or no market for Old Rubber at present. Prices at present ruling are about as follows:

Car Springs, ton lots, ₩ lb.	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ₩ lb..	@ .03
Rubber shoes, less than carloads, ₩ lb.	0.02¼ @ .03⅛
Large Hose, ₩ ton	@ 9.00
White Wringer Rolls, ₩ lb.	@ .04¼
White Syringes, ₩ lb.	@ .05

Trade Notes.

E. P. Fisk, traveling for F. H. Cunningham & Co., Iron Pipe and Fittings, Boston, is the hero of the following tale told by some of his fellow travelers. According to the story, Mr. Fisk was awakened one night by a burglar, and, sitting up in bed, addressed the intruder, saying, "Well, what are you looking for?" The burglar replied "I'm looking for money." "Money," echoed Fisk, "looking for money here! Wait a moment and I will strike a light and help you."

Charles Gallager of S. G. Davis & Co, Boston, is another victim of the gossiping propensities of the Brotherhood of New England Prevaricators. It is reported that on one occasion, visiting a town soon after the demise of an old customer, he called to tender his sympathy to the widow, but being somewhat unused to such duties and naturally inclined to timidity, twisted his language and said, "I tender you my sincere regards."

The large establishment of the John F. Henzlen Elbow Tinware Mfg. Company, Detroit, Mich., was totally destroyed by fire on October 15. The losses are stated to be entirely covered by insurance.

The Gartland Foundry Company, Cleveland, Ohio, report an improving business, and state that they have orders on hand sufficient to keep them running for some time.

A postal card, bearing date of October 12, contains the announcement that Rodney W. Beach and James F. McGregor have purchased the plant of the Michigan Galvanizing Works, 762, 764 and 766 Woodbridge street, West, in the city named, and are now prepared to fill all orders promptly for galvanizing Cast, Malleable and Sheet Iron. A specialty is made of galvanizing Wire Cloth.

James H. Brady of Kansas City, Mo., has recently patented a system for heating, cooling and ventilating buildings, applicable more especially to school houses, churches, places of amusement, hotels and the like. The improved warming and ventilating apparatus consists of a furnace having an air mixing chamber connected with the outside air and radiating tubes so located as to heat the air in the mixing chamber and connected by pipes to receive the heating liquid from the boiler of the furnace. A single large flue contains a series of parallel vertical straight passages which extend from the mixing chamber and project through the roof of the building, the lower end of each passage communicating with the mixing chamber. There are also horizontal partitions which divide each of these passages into separate lower and upper chambers, each upper chamber being connected with the lower portion of separate rooms in such a way as to form a separate outlet for the air discharged into a given room by a different chamber or passage. The lower chambers referred to are connected by an opening with the upper part of separate rooms in the stories below the rooms to which the upper chambers are connected, and forming supply passages for the rooms in the stories below entirely separated from the discharge passages from the same rooms, whereby the air of all the rooms is supplied by the lower chambers of said passages, but is discharged from said rooms by way of the upper chambers thereof, which are out of alignment with the lower chambers through which the same air was delivered to the rooms. The upper and lower chambers have like cross sectional area to provide both a free supply and discharge of air to each room. In each passage of the flue mentioned is a pair of liquid circulating heat radiating pipes, these extending from end to end through the partitions and connected at their lower ends with the boiler of the furnace.

H. H. Buzzell & Son are about to start a brass foundry at Laconia, N. H.

The Ferracute Machine Company of Bridgeton, N. J., manufacturers of Presses, Dies and other Sheet Metal Tools, have kept their works running during the entire summer with a part of their force. Orders are now coming in much better than a month ago, and trade prospects seem much brighter.

Attention is directed to the advertisement of J. E Clarey, secretary of the Weir Furnace Company, Des Moines, Iowa. Any parties who contemplate embarking in the furnace business may write Mr. Clarey, who is in a position to interest them in this direction.

MANUFACTURING.

Hardware.

The Northwestern Barb Wire Company, Rock Falls, Ill., commenced operations on a small scale on the 2d inst., and expect to put on their full force in the near future.

A cut down of 10 per cent. in all departments of the Concord Axle Works, Penacook, N. H., went into effect on the 9th inst.

Blenkhorn & Son's axe factory, at Canning, N. S., was destroyed by fire on the 29th ult. Loss, $8000; insurance, $1000.

The Eagle Lock Company, Terryville, Conn., have commenced to work on short time and until further notice will run only four days per week.

The shovel works of the Oliver Ames & Sons' Corporation, North Easton, Mass., are running but nine hours a day.

The Vermont Farm Machine Company, Bellows Falls, Vt, closed down on the 30th ult. for the annual inventory. Advantage will be made of the shut down to make needed repairs.

At the annual meeting of the stockholders of the Portland Screen Company, Portland, Maine, the following persons were elected directors: W. S. Eaton, Wm. H. Stevens, F. A. Neal, Chas. W. Allen, Chas. J. Chapman, Fred. E. Haskell and Lewis A. Goudy. W. S. Eaton was elected president and Chas. R. Lewis treasurer. The reports of the officers showed that the company have earned a gratifying profit on the business of the past year, and a dividend of 6 per cent. was declared.

The Ely Hoe & Fork Company, St. Johnsbury, Vt., have resumed operations, after spending about $5000 on repairs to the works, putting in a new dam, &c.

The Western Screw Company, Chicago, Ill., have been incorporated, with a capital stock of $100,000. The incorporators are Michael J. Dunne, John T. Boos and Frank M. Burwash.

The Canton works of the Cleveland Axle Mfg. Company, Cleveland, Ohio, have resumed operations with a force of 160 hands. It is expected that 200 will be employed by November.

Wellsboro, N. Y., is to have a new industry in the form of a lock factory. A stock company has been formed, with a capital of $50,000, $10,000 of which has already been raised.

The Peck, Stow & Wilcox Company's main factories, at Southington, Conn., are again in full operation.

Lees Mfg. Company, Westport, Conn., are making over 100 different kinds of twine and make special twine for any purpose and put up in any way. They are running full time, and have only stopped for two weeks during the present year.

Clayton Bros., manufacturers of stee laid and cast iron shears, hardware specialties, &c., Bristol Conn., and 122 Chambers street, New York, have enlarged their plant so that their facilities for filling orders are much improved.

W. H. Davenport Fire Arms Company, Norwich, Conn., are preparing new designs and models for next year's business, and are intending to issue a complete catalogue which will represent their present as well as their new models.

The Frazier Cycle Company, 373 and 375 Wabash avenue, Chicago, with factory at Aurora, Ill., have so far built no bicycles, their attention having been confined exclusively to the manufacture of pneumatic sulky wheels, ball bearings for high wheels, &c.

The Kilmer Mfg. Company, Newburg, N. Y., are extremely busy and behind their orders.

The loss in the fire at the works of the Clinton Wire Cloth Company, Clinton, Mass, on April 19 last, has been adjusted, the loss being fixed at $170,000. This covers the loss to buildings, machinery and stock in process of manufacture. Through the system of insurance followed, the company's loss not covered by insurance is very small. Work on the new mill is progressing rapidly. The mill will be ready for the placing of machinery about December 1.

The factory of F. E. Myers & Bro., Ashland, Ohio, is now running full force. The firm have made a number of valuable improvements and are better equipped than ever before. They have recently placed a new 15-ton Colliau cupola in their foundry, and refitted the cleaning room with the latest equipments in that line, which will increase the capacity of the foundry nearly one-half.

J. E. Rhoads & Sons, manufacturers of oak tanned leather belting, Wilmington, Del., and 229 Market street, Philadelphia, make specialties of heavy driving belts and Volto dynamo belting, which they refer to as a superior brand and which is treated with their preparation for increasing adhesive power and pliability. They have recently put in several new machines and have a very well equipped shop. They have several power presses, the widest of which will make a 72 inch belt. They also have improved machines for working, stretching and finishing their leather. The firm are also dealers in lace leather, rubber belting, hose, packing, &c.

The American Ormonde Company, New York, will hereafter conduct their wholesale and retail departments entirely independent of each other. The wholesaling will be done at a new depot, soon to be opened in the down town portion of the city, while their retail department will be carried on in their new store, 135 West 125th street. It is understood that the Ormonde wheel will in future be manufactured in this country, and not imported, as formerly.

Mossberg Mfg. Company, Attleboro, Mass., have recently united their Attleboro and North Attleboro plants and added to them by the purchase of additional machinery, so that they now occupy a new building with more than double their former floor area. With a better arrangement of departments and improved methods the company are now in a position to produce any work in their line more satisfactorily and economically than ever before. It is the company's intention in the future to always carry a complete line of jewelers' tools, while still paying particular attention to designing and constructing special complicated and automatic machinery of any kind.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

Special Notices.

SALE OF VALUABLE PROPERTY of the corporation known heretofore as The Albany Stove Company. Whereas, by order of the Supreme Court of the State of New York, granted in the City of Albany, N. Y., on the 10th day of October, 1893, the undersigned, receiver of the assets and effects of the corporation known heretofore as The Albany Stove Company, was directed to offer for sale the following described property, viz.: The real estate and buildings owned by the said corporation "The Albany Stove Company," situated on Tivoli street, in the City of Albany, N. Y., being the same premises used by the said corporation in carrying on its business of manufacturing stoves and iron castings, and is the same real estate conveyed by Eugene Van Rensselaer and others, as executors, etc., to The Capital Co-operative Foundry Company, by deed dated October 15, 1869, recorded in Albany County Clerk's office, December 15, 1869, in Book No. 228 of Deeds, on page 241, and by Van Rensselaer Land Company to Albany Stove Company by deed dated January 10, 1890, recorded January 14, 1890, in Book No. 412 of Deeds, on page 318, together with the machinery, tools and implements used in carrying on the business above referred to.

Now, therefore, in pursuance of said order, the undersigned offers for sale to the highest bidder the property above described.

All bids to be sealed, and must be distinctly marked on the envelope in which they are enclosed, "Bids for property of the Albany Stove Company," and addressed and delivered to the undersigned at No. 82 State street, Albany, New York, on or before the 17th day of November, 1893. The right to reject any and all bids is hereby reserved, and sale can only be completed upon order of the court.

Bids will be opened by the receiver at the office of Francis H. Woods, No. 116 State street, Albany, New York, on Saturday, November 18, 1893, at 10 A.M. Terms, purchase price to be paid within twenty days after notification of acceptance of bid.

Dated October 11, 1893.

JOHN GUTMANN,
Receiver of The Albany Stove Company.

SALE OF VALUABLE PROPERTY of the corporation known heretofore as The Albany Stove Company. Whereas, by order of the Supreme Court, granted in the city of Albany, N. Y., on the 10th day of October, 1893, the undersigned, receiver of the assets and effects of the corporation known heretofore as The Albany Stove Company, was directed to offer for sale the following described property, viz.: The patterns, shop rights and flasks owned by the said corporation, and being the patterns, shop rights and flasks for the "Home Yale" parlor and range, "Yale" cook, "White Oak," "Art Yale Range," "Rose" range, "Oneida," and for other castings, formerly manufactured by the said corporation, a more particular description of which will be given on application to the undersigned.

Now, therefore, in pursuance of said order, the undersigned offers for sale to the highest bidder the property above described.

All bids to be sealed and must be distinctly marked on the envelope in which they are inclosed, "Bids for property of The Albany Stove Company," and addressed and delivered to the undersigned, at No. 82 State street, Albany, N. Y., on or before the 17th day of November, 1893.

The right to reject any and all bids is hereby reserved, and sale can only be completed upon order of the court. Bids will be opened by the receiver at the office of Francis H. Woods, No. 116 State street, Albany, New York, on Saturday, November 18th, 1893, at 10 A.M.

Terms: Purchase price to be paid within twenty days after notification of acceptance of bid.

Dated October 11th, 1893.

JOHN GUTMANN,
Receiver of The Albany Stove Company.

Growing country and plenty of work to be had. Good place for a live Tin worker with little capital. Excellent reasons for selling. Address

P. T. LEWIS,
Somerton, Philadelphia, Pa.

FOR SALE.

A well-equipped stove foundry, located in the iron region of the South; has been in operation ten years; the buildings and machinery are new, having been erected on a new site recently, the patterns are of good salable stoves; it is located on three trunk lines and a navigable river and in one of the largest cities of the South; the present owners will agree to take half of the output; terms, one-third cash and balance can be paid in product of the foundry in two or three years. Owners have other interests which engage their attention. For further information address

"STOVEMAN,"

care of JAMES J. SMITH & CO., 119 Dearborn St., Chicago, Ill.

FOR SALE.

Having purchased the patterns, tools and the business of the Hotel Car Range Co., we have a complete set of tinners' and sheet iron tools and such as required for a range shop. Both hand and power bending machines, power drills, &c. Will sell cheap, apply

BRAMHALL, DEANE & CO.,
79, 81 & 83 Market St., Chicago, Ill.

FOR SALE.

As I wish to retire from business, I offer my stock of Hardware and Stoves of about $10,000 for sale. A splendid paying business; will stand the very closest investigation, and a chance of a lifetime. Situated in a lively town in Wisconsin. Don't answer this unless you mean business. Address "BUSINESS," office of *The Metal Worker*, 59 Dearborn street, Chicago.

FOR SALE.

A valuable Stove Plant, comprising stoves, ranges and heating stoves, wood and iron patterns, flasks and fallow boards, carrying with it a large repair trade, sufficient to pay for plant in short time. Address

"INVESTMENT,"

office of *The Metal Worker*, 96-102 Reade St. New York.

!!! FOR SALE !!!

BAKER BLOWERS, Nos. 1, 4½, 5, 6 and 7.
ROOT BLOWERS, Nos. 1, 2, 3, 4, 5, 6 and 7.
Sturtevant Blowers. Nos. 4, 5, 6, &c.
1 Corliss Band Wheel, 12 ft. x 24 in., in halves.
A variety of Machinery, such as Boilers, Engines, Pumps, Crushers, &c., very cheap.
Do you want to buy or sell Machinery? If so, write

C. R. BIGELOW, Machinery Expert,
45 Dey St., New York City

Special Notices.

YOUNG MAN
DO YOU WISH TO
LEARN A GOOD TRADE?

The New York Trade School Affords You the Opportunity.

THIRTEENTH SEASON.

A Three Months' Day Course of Instruction in
PLUMBING and GAS FITTING
Will commence on Jan. 2, 1894.
TERMS, $40.

A Six Months' Evening Course of Instruction in
PLUMBING
Will commence on Oct. 16, 1893.
TERMS, $14.

☞ The Plumbing department is under the supervision of a Trade School Committee appointed by the New York Master Plumbers' Association.

Day Instruction is also given in Bricklaying and Plastering, House and Fresco Painting, Carpentry, Sign Painting and Printing.

Evening Classes in Bricklaying, Carpentry, House Painting, Plastering, Fresco Painting, Stone Cutting and Blacksmiths' work.

The New York Trade School has attained a high reputation and is largely attended each year, the young men coming from all parts of the United States and Canada. Excellent lodging accommodations are provided near the school for pupils desiring them.

Catalogue, illustrated with 30 photo engravings, mailed free on application. Address

NEW YORK TRADE SCHOOL,
1st AVE., 67th and 68th STREETS,
NEW YORK.

ESTABLISHED 1853.

Trade Schools in Philadelphia.

In another column will be found an interesting communication from William A. H. Allen, the superintendent of the Master Builders' Mechanical Trade Schools in Philadelphia, in which he gives a good report of the past work of that institution, and of the prospects for the fourth term, now in session. It will be remembered that the late Colonel Richard T. Auchmuty of New York contributed to those schools the sum of $3000 a year for the first three years, in order to give them a fair start. This sum nearly covered the expenses of tuition, cost of materials, &c., over and above the fee of $27 charged to each pupil. But as Colonel Auchmuty's contribution has now ceased, the members of the Master Builders' Exchange are making strenuous efforts to raise an endowment fund for the schools. At their quarterly meeting, held on Tuesday, the subject was brought up, and the sum of $10,000 was asked for, of which $5500 was promptly obtained. Resolutions were also adopted asking the city of Philadelphia to make an annual appropriation sufficient to cover the running expenses of the schools, on the ground that they are doing a most useful public service in educating American boys in useful trades, over 300 young men having there been taught the rudiments of carpentry, blacksmithing, plumbing, bricklaying, plastering or painting since their establishment. The schools have so far proved a success, and it is to be hoped that adequate provision may be found for their maintenance and extension.

Sheet Metal Pattern Cutting.

Mr. Allen expresses his regret that it has not yet been found practicable to start a class for instruction in sheet metal pattern cutting, this being a subject for which a considerable demand exists in the trade, if we may judge by the inquiries we have received in relation to it. The matter has, we know, been under consideration by the managers of more than one of the existing trade schools, but hitherto it does not appear to have materialized, for various reasons, such as those offered by Mr. Allen. We are, however, happy to call attention to the announcement made in another part of this paper as to the possible inauguration of a class for sheet metal pattern work in connection with the trade school of the Pratt Institute, Brooklyn. Such a class will be formed there, provided there is a sufficient demand for it from the younger members of the trade.

Accident Record for 1893.

The record of railway accidents in the United States for the current year has been unusually large. The number and character of these accidents indicate that the general standard of efficiency in railroad practice has not been maintained. Has this state of things any relation to the financial situation? A curious inquiry might be instituted with a view to ascertain how far such epidemics of accidents as have been recently experienced are related to false economies practiced under financial stress. But the prevalence of killing and maiming and the destruction of valuable property have not been confined to railways. The list of bursting fly wheels and of injuries in shops and manufactories is this year a formidable one. Some of these have been peculiar as regards the circumstances under which they occurred.

Gas Accidents.

Two destructive as well as instructive accidents, one in the city of Brooklyn and the other in New York, have quite recently occurred. In Brooklyn a small lad poked an ignited piece of wood through a hole in a sewer manhole cover, and the result was an immediate explosion of illuminating gas which had escaped into the sewer from leaking gas mains. Fifty feet in length of a large sewer were thus blown up. Fortunately, however, no one was killed, though a number of people were injured. The incident illustrates how modern improvements, apparently of an innocent sort, may secretly create unseen and unsuspected dangers. The accident in New York terminated more fatally. Three policemen, accompanied by another man, entered a toilet house in Central Park to take a comfortable snooze in the night time. Through the sewer connections illuminating gas, leaking from mains into the sewer, passed up into the house in such quantity that three of the men were killed by breathing it, and the fourth was taken to a hospital nearly dead. This illustrates a possible danger arising from leakage of gas into sewers that is rarely suspected by people in general —the escape into buildings from unguarded sewer connections of illuminating gas issuing from defects in city gas mains.

Risks Attending Changes.

The use of improved methods is nearly always attended with some new risk. Much has been said concerning the risks attending the introduction of modern electrical devices. Perhaps nothing too much has been written and published about the trolley system of street railroading, which has been subjected to a storm of deprecation. The more the real dangers, as well as the imaginary ones, are discussed and protested against, the greater is the probability that measures tending to reduce risks will be adopted. But if the number of injuries received by patrons of this system be compared with the total number of passengers carried, this method of car propulsion will not make a bad showing, this year at least, with the steam railways.

The World's Fair Closes October 30.

The managers of the World's Columbian Exposition have acted wisely in deciding to close on the 30th inst. This is the day which has been set for the termination of the fair from the time when the preliminary arrangements for the enterprise crystallized into definite announcements. It is not surprising that the enormous increase in attendance which has characterized October should have inspired many individuals interested in the affairs of the exposition to plan for its prolongation beyond the official date of closing. They are so numerous and influential that at one time an apparently authorized statement was published that the fair would be continued as far into the winter as the weather would permit, and that next year another six months' fair would be held on the exposition grounds, even if it were confined entirely to domestic exhibits. The legal advisers of the management, however, promptly showed that there were many obstacles in the way in the nature of legislative enactments and innumerable contracts, all based on an early termination of the existence of the enterprise. Complications of an apparently insurmountable character were thus set forth, and enthusiastic advocates of prolongation became convinced that their plans were not feasible. This is well, as it would be a reflection on the splendid management of the fair hitherto if it were to be permitted to run until it simply "petered out" as it would assuredly do. A general feeling of regret is ex-

perienced that the magnificent architectural effects of the exposition buildings cannot be preserved. If it were possible to permit the buildings to stand as they are, there is no doubt that they would prove a great attraction to strangers visiting Chicago who have not had an opportunity to attend the fair. But there are many reasons why even this cannot be done. The buildings will be demolished and every vestige of them removed at as early a day as possible, and their beauty will then only be a memory.

As Foreigners See Us

Thousands of foreigners have visited the United States for the first time this year. The majority of them are men who are fairly prosperous at home. A few of them are professional exhibition visitors, and a small number are people of leisure traveling to escape boredom. With these few exceptions they are professional and business men who have come to study for themselves the resources and the methods of work of this country. The last few decades have opened the eyes of Europe to our development, and the appearance of American products in many branches of commerce and industry has foreshadowed threats of rivalry from the rapidly growing Western giant. Reports of the impressions thus gathered are becoming numerous in the European press and are not altogether flattering. Many of them are crude, and others are tainted by a spirit of fault finding Some of our foreign visitors have failed to grasp the fact that conditions are not the same on both sides of the Atlantic, and that what may be good practice there would be an unprofitable method here. Still, honest criticism and kindly comment should be carefully considered by the victim.

One of the things which seem to have struck our visitors is the worship of bigness in America. The one thing which we are accused of never failing to urge with pride is the magnitude of what we show. They are struck by our love of inspiring awe rather than admiration. Our eagerness to dwell on numerical maxima astonishes and amuses them. To them there is little merit in the "biggest thing in the universe." Mere magnitude in their estimation fades into insignificance as compared with the merit of finished excellence and beauty. Unprejudiced Americans will admit that there is a good deal of truth in that criticism, but they will at the same time acknowledge to themselves that in that respect we are not now really quite as bad as we were.

Another matter which foreign visitors are apt to refer to is coupled with the utilization of our enormous resources. We have often observed that a feeling akin to envy pervades their study of our natural advantages. But the one point raised, particularly by the thrifty men from the Continent, is the reckless and often criminal wastefulness which characterizes so many of our operations. Our skinning of the soil, our savage inroads into our forests, the careless destruction for further use of much of our mineral treasures, our neglect in utilizing waste products and old materials, are astounding to them, and at times give rise to indignation and disgust. They point out that we are quick to adopt some makeshift and go on renewing it at frequent intervals rather than spend the money for one lasting structure. The same lavish extravagance pervades the whole community from the laborer to the captain of industry. It obtrudes itself upon the foreigner in private, municipal, national and industrial affairs, and is to him our greatest reproach and our most serious source of danger.

Let it be conceded that it may pay to waste, that posterity has no rights which the living are bound to respect, and yet, with all that eliminated, the criticism that Americans are wickedly wasteful remains only too true. It cannot be contemptuously waved aside as a proof of a mean spirit. We believe that, on the whole, it is one of the principal sources of comfort which has come to those Europeans who have studied our capacity as rivals in the early future. They frankly say that as long as we go on in the extravagant manner apparently habitual with Americans, high and low, they need not fear us as competitors. It is possible that the very sharp lesson which is now being taught us will rid us earlier of a national sin than our foreign friends anticipate.

Sheet Mill Wages.

When the iron and steel roofing business, says *The Iron Age*, commenced its rapid development into a very important industry some 12 years ago competition became brisk, and in order to compete successfully many roofers decreased the weight per square foot of flat sheets used without changing the gauge marked thereon, so as to keep their cost down and even up on the reduced prices at which their finished goods were sold. According to the old standard No. 27 used to weigh 72 pounds per square, flat, but it was reduced to 68 pounds, 66 pounds, and finally to 64 pounds. When the lowest figures were reached the Iron and Steel Roofers' Association condoned the sin of their brethren by adopting a new standard, taking Haswell for authority. According to the new table of weights No. 27 was made to weigh $\frac{64}{100}$ pound per square foot, but according to the rolling mill table of weights as printed in the agreement entered into with the Amalgamated Association of Iron and Steel Workers sheets rolled to this weight should be classed as No. 28 gauge, and upon that basis the mills of the Wheeling district have always paid their rollers. When the Roofers' Association established their weights attempts were made to get $\frac{64}{100}$-pound sheets rolled at No. 27 price, but the workmen objected and have always received the full No. 28 gauge price, which was $10.40 per ton. Pittsburgh mills also made settlements on the same basis, but many mills outside these two districts succeeded in getting $\frac{64}{100}$-pound rolled for No. 27 price, $9.60 per ton, thus gaining an advantage of 80 cents per ton over some competitors, while the scale of wages signed was in each case identical. Since July 1 the legal standard of weights for various gauges of iron and steel sheets has become the basis of settlements and No. 27 now weighs $\frac{68}{100}$ pound, the price for rolling the same being $10 per ton. This change places the mills that formerly paid $9.60 for No. 27 gauge in a worse position than they were prior to July 1, as they now pay $10 for rolling $\frac{68}{100}$ pound whereas they used to get $\frac{64}{100}$-pound rolled for $9.60, a difference of 40 cents per ton. This is the principal concession known to have been made. In explaining the matter workmen will say that they were ignorant of the exact weight of the sheets they were rolling, but such a statement does not destroy the fact. In like manner many other concessions were made (with a wink) when mills were able to secure large orders for sheets rolled to special weights which came between two gauges of the recognized table. Although contrary to the rules of the A. A. of I. and S. W., one instance is known where No. 27½ gauge was paid, half the difference between No. 27 and No. 28 being added to the price of No. 27. This occurred at an isolated mill. It is right that concessions of this kind should be made between employers and employees, provided neither side belongs to an organization, but when organization does exist and both manufacturers and workmen are supposed to be placed upon an equal basis in their respective competition, the basis should be maintained or organizations should be disbanded and local agreements govern the matter of prices to be paid for labor.

C. R. Richards, director of the Department of Science and Technology in the Pratt Institute, Brooklyn, has been appointed chairman of the section on manual training of the Department of Pedagogy of the Brooklyn Institute. It was under Mr. Richards' direction that the trade schools attached to the Pratt Institute were organized and to him is due the credit of their development into the present state of efficiency.

The comparative value of the hands and fingers has been estimated in a scale supplied by the miners' unions and miners' insurance companies of Germany. The loss of both hands is reckoned as a depreciation in working capacity of 100 per cent.; of the right hand, 70 to 80 per cent.: left hand, 60 to 70 per cent.; thumb, 20 to 30 per cent.; right forefinger, 14 to 18 per cent.; left forefinger, 8 to 13.5 per cent.; third finger, the least in value, 7 to 9 per cent.; little finger, 9 to 12 per cent. The range in percentages is due to the difference in occupation.

A method has been invented in Germany of covering tissues of cotton yarn with a flexible and brilliant deposit of tin. A clear paste of commercial zinc powder and white of eggs is first made and spread on the textures with a brush, the coating coagulating when drying. The tissue is then placed in a bath of perchloride of tin, which metal is precipitated on the zinc; and the article, after rinsing and drying, is calendered, an operation imparting luster to the layer of tin.

PLUMBING and GAS FITTING.

The Leading Principles of Scientific House Drainage and Sanitary Plumbing.—III.

By Wm. Paul Gerhard, C.E.

VIII. — DURABILITY, EFFICIENCY AND CONVENIENCE.

A further principle is that of durability, efficiency and convenience of the plumbing work. All materials, pipes, traps, fixtures and appurtenances should be the best obtainable consistent with due economy, and all parts of the work should be so put together as to require a minimum of repairs. In this matter of subsequent repairs in particular the modern exposed accessible plumbing work differs strongly from work as usually done in the past.

In order to be efficient a house drainage system should be so arranged as to effect a complete, rapid and as far as possible automatic removal of all liquid and semi-liquid wastes. In the traps and pipes everywhere all stagnation of water and air should be avoided.

Furthermore, to be thoroughly efficient, soil and drain pipes, waste pipes and traps should be restricted in diameter, should be run with perfect alignment, avoiding all unnecessary offsets, sharp bends and right angled connections. The water supply system, on the contrary, to be efficient must be constructed with pipes of large size, to give a good flow of water at every fixture in the house. In like manner all shut off valves should be of the full bore, so as not to restrict the waterway. Gate valves should be used in preference to globe valves (except possibly where the water is very gritty) and round way stop cocks in preference to the ordinary kind which have a reduced cross sectional area.

The same principles apply to the pipes for the distribution of illuminating gas. Sound gas pipes, properly welded and put together with galvanized fittings, should be employed, and in order to supply ample volume of gas to the gas burners for efficient illumination the pipes should be of large bore.

Plumbing fixtures, in order to be efficient and convenient, must be quick emptying, must have no large fouling surfaces and should be without mechanical obstructions of any kind. There are numerous kinds of waste valves for sinks, basins and bathtubs, and it is true of these appliances as well as of water closets that the simpler they are constructed the more efficient will they prove in actual use.

Of water closets there are a number of different types. It would lead me too far to consider in detail the requirements of a good water closet apparatus. Suffice it to say that all mechanical types—*i. e.*, those having more or less complicated mechanical apparatus to effect a discharge—stand self condemned. To these belong the old-fashioned pan or Bartholomew closet, the valve or Bramah closet, and the plunger or Jennings type of closet. Equally bad, because liable to become befouled, are long hoppers, with oval bowl and whirl flush (so-called Philadelphia hoppers). The only good and efficient types are flushing rim, straight back long hoppers and flushing rim short hoppers, the wash out closets and the wash down closets, the syphon jet and the syphon closets. The wash out closets, both of the front and back outlet type, have in practical use developed a number of defects, such as fouling the outlet shaft, the insufficient depth of water standing in the bowl and the incomplete flushing of the trap. I venture to predict that they will rapidly go out of use. My decided preference is now and has long been for wash down, syphon jet and syphon closets.

IX.—NOISELESSNESS IN OPERATION.

The principle of noiselessness in operation requires in the supply system that all service pipes be free from water hammer, that ball cocks in cisterns fill the same without hissing or roaring noise, that kitchen boilers do not rumble when overheated, and that the faucets deliver water without sputtering and noise.

In the soil and waste pipe system this principle requires that the sound of flowing water be not transmitted to the occupants of rooms. This easy transmission of sound forms, perhaps, the only objection to the free exposure of soil and waste pipes, and it must be conceded that it is not easy to overcome the drawbacks incident to such arrangement.

The discharge of modern flushing rim water closets is generally accompanied with more or less disagreeable noise, due to the falling water and escape of air in the flush pipes. There are, however, ways in which this defect can be obviated, and some of the best types of approved sanitary closets and flushing cisterns are made comparatively noiseless in action.

All plug, waste valve or stand pipe fixtures, such as washtubs, bathtubs and wash basins, having large outlets cause more or less noise in emptying, due to the sucking in of air into the waste pipe, and this is another minor fault inherent to some of the best modern plumbing appliances which it has not been possible to overcome readily in all cases.

X.—PREVENTION OF WATER WASTE AND OF FREEZING.

The importance of the principle that there should be in a good system of plumbing no useless waste of water should not be underestimated. In the supply system, at faucets and valves and cisterne, as well as at fixtures, this requirement should be observed, and no leaky faucets or ball cocks should be tolerated. Much waste of water is incurred where drinking water is drawn at faucets in summer time, by letting the water which has laid in the pipe system flow off unused. For this reason it is well always to keep hot and cold water pipes suitably far apart, particularly where such pipes are carried in a boxed up casing. Again, where it is desired to draw hot water, much water is uselessly wasted by letting the hot water run in systems where no hot water circulation pipe is provided. It is, therefore, true economy, wherever a hot water supply is provided, to run from the highest fixtures on each line a circulation pipe back into the hot water boiler, so as to keep up a continual flow and circulation. The circulation pipe must, of course, be carefully graded, and if properly arranged will enable a person to draw at once hot water at any fixture in the house.

Water waste also occurs in winter time where the water is kept running to prevent the freezing of the pipes; but in a well arranged system due care is taken to locate all supply pipes in positions where they cannot freeze; thus pipes are never run along outside walls, and where they are of necessity exposed to freezing, pipes are carefully protected with some approved non-conducting covering.

XI.—ABSENCE OF COMPLICATED MECHANISM.

A leading requirement in modern plumbing and drainage work is the absence of all manner of complicated mechanism liable to derangement and to fouling or giving rise to obstructions. Thus, a good water seal trap is considered preferable to the numerous mechanical trap seals, whether flap valves, floating balls, gravity sealing appliances, &c. For the same reason, the hinged pan in the pan closet, the flap valve of the valve seal closet, the plunger of the plunger type of closet, are recognized as objectionable and detrimental. In automatic flushing appliances preference is rightly given to syphons without movable parts.

Finally, with wash basins, bathtubs, and pantry sinks, the form of waste plug and overflow known as the "standing overflow" is generally preferred, from a sanitary point of view, to fixtures with more complicated mechanism, and it can safely be asserted that in practical use such standpipe overflows are quite as convenient as other more complicated arrangements.

XII.—CLEANLINESS AND PURITY.

This last requirement applies in particular to the fixture system and the method of trapping their waste pipes. It involves the entire exclusion of all manner of miniature cesspools of containers or enlarged chambers liable to retain and accumulate foul matter. The old fashioned pot trap, as used under wash basins, bathtubs and sinks, and the still worse D-trap, as used under water closets, are illustrations of such faulty methods, defeating every endeavor to obtain cleanliness and purity. Pan closets, valve and plunger closets, and all kinds of unsanitary waste valves and concealed overflows which never receive a flushing and cannot be properly cleaned, also belong to this class of defects, to which we might add the safe drip pipes as usually found under incased fixtures.

The principle of cleanliness as applied to the pipe system signifies that after construction all pipes be suitably cleaned and finished off. The drain pipes should be neatly painted with metallic or enamel paint or else varnished, all supply pipes should be left

without tool marks and covered with silver, gold or aluminum bronze, and all holes in walls, partitions, ceilings and floors should be properly closed by the plasterer and carpenter. This is quite important in order to prevent any upward currents of air and the passage of foul odors along soil or waste pipes from floor to floor.

Much depends, finally, upon the proper maintenance and care of plumbing apparatus in a household after it is put in use, but it must suffice to merely mention this subject here.

TESTS OF PLUMBING AND HOUSE DRAINAGE.

Having carefully applied the principles enumerated above in the planning and execution of the drainage and plumbing of a building, it becomes desirable to obtain some positive knowledge or proof of the soundness and safety of the work. This is now accomplished by a series of tests, which in any work, whether small or large, should always be carried out. Similar tests are applied in old buildings wherever there is any doubt or suspicion as to the condition of the drainage or the healthfulness of a house.

These tests may be conveniently considered under the following headings—viz.:

(*a*). Tests of the materials.
1. Pipes and fittings.
2. Traps.
3. Fixtures.

(*b*). Tests during construction.
1. Soil pipe system.
2. Supply system.
3. Gas pipe system.

(*c*). Tests after completion.
1. Soil pipe system.
2. Supply system.
3. Fixture system.

(*d*). Tests of old plumbing work.

The tests of the materials employed in plumbing work are usually applied by the manufacturers, but it is important that the contractor, in buying the materials, secures a guarantee that the tests have been actually applied. Thus cast iron soil pipe and fittings are tested at the foundry by a hydrostatic pressure and a hammer test, wrought iron pipes for water and gas are similarly tested at the pipe mills. Valves, faucets, traps, brass ferrules and other fittings should be inspected and proven. Finally, a test should be applied to the fixtures, particularly to the earthenware water closets, many of which are turned out at the potteries in a defective condition as regards the flushing rim or the syphon jet.

During the construction of the plumbing work the soil, drain, waste and vent pipe system should be tested, by filling the pipes with water (water test), or by applying a test with air force pump and mercury gauge (air pressure test). Defects in material as well as in workmanship are readily discovered by both tests. My preference is for the water test, which, although severe, is very positive in its indications and less troublesome in application than the air pressure test. It can be applied at all times, before the fixtures are set, except during freezing weather.

It is important to include in this test the branch waste and vent pipes which are connected to the main lines with brass ferrules and calked joints. Indeed, it is advisable to set all lead bends for water closet branches, and also where practicable the lead or brass traps under the fixtures, before applying the test. Where this is done—and I have in many cases in my own practice been able to carry this out—that entire part of the plumbing system which may contain sewer air up to and including the traps is put under inspection and test, with the only exception of the floor joints of earthenware closets, which must be left out and can only be tested by the air, peppermint or smoke test.

It is equally important to test the supply pipe system in a building before the fixtures are connected and the water turned on. The test should subject the pipes and fittings to a much heavier pressure than they are likely to carry in actual use. Thus water pipes and fittings should be tested by a water pressure test with pressure pump and gauge up to from 50 to 100 pounds per square inch, according to the pressure which will obtain in the pipes when in actual use.

The gas piping system should likewise be tested under a severe pressure, and in my own practice I always insist upon an air pressure of from 15 to 18 inches in the mercury gauge, and do not consider the piping tight if the mercury column falls more than from ½ to 1 inch in an hour, this depending upon the extent of the piping system under test.

When the plumbing work of a building is completed it is desirable to apply further tests. The drainage, trap and fixture system should be tested by applying either a smoke test or a pepper mint test, which would help to discover leaky floor joints of water closets, or defective joints at nickel plated brass couplings, or traps which have lost their water seal by tipping, or holes in lead pipes caused by driving nails and the like. The water supply system is tested by turning on the water at all fixtures, by regulating the ball cocks in cisterns so as to work noiselessly and without spattering, by repairing dripping faucets, leaky stuffing boxes of shut off valves, &c. Finally, the operation of the fixtures is tested, particularly the flush of water closets, urinals and slop sinks, also the proper and quick emptying of bathtubs, sinks and lavatories, and the automatic action of syphon or other flushing appliances.

It would lead me too far to describe in detail the proper methods of inspecting and testing old plumbing work. The tests usually applied in such cases are the peppermint, the smoke test and sometimes an air pressure test. The water test is not practically applicable to plumbing work in actual use, because it necessitates the disconnection of all fixtures, and even then it is somewhat risky to apply, owing to the possibility of flooding parts of the house and damaging furniture, carpets and valuable interior decorations in case there are leaks.

The peppermint test is useful in a measure, but unless great care is taken in its application its results are at times misleading. Therefore, it is in the hands of inexperienced or unscrupulous persons a rather dangerous and objectionable test. It is not always possible to locate by the peppermint test the exact position of the leak, or to determine exactly what the defect is. On the other hand, in the more positive smoke test any leakage becomes apparent to the sense of both smell and sight, in fact in nearly all cases, except where leaks are very slight, the issue of smoke will indicate the exact point at which plumbing is unsafe.

Perhaps it is well to mention that in order to have continued assurance that the plumbing and drainage remain safe, it is advisable to repeat such tests from time to time. Walls of a building may settle, pipe joints may become untight, or joints may open by expansion where much hot water passes through the waste, or else pipes may break, or traps may sag or tip over, rubber gaskets of floor joints may disintegrate and rot, leaving open cracks through which sewer air may pass, or joints made with brass couplings may become loose; in short, there are numerous points which in a plumbing system may become defective after being in use for some time. Hence the necessity of periodical reinspection, which is just as desirable with plumbing work as it is with steam boilers or other machinery.

In locating and arranging the drainage and plumbing work in a modern building—be the same a dwelling house, an office building, a warehouse or factory, a church or school house, a theater or club house, a hospital, railroad station or what else—architects should constantly bear the above principles in mind.

The details of the plumbing work may vary, the choice of the supply system and the selection of the fixtures best adapted to each class of buildings may be a matter requiring skillful treatment and the exercise of good judgment in each case, and in these respects each building may present a problem in itself, yet the general requirements as to planning, location, materials, workmanship and arrangement remain the same.

It has become quite a general practice in some of the leading architects' offices to have this part of the work looked after—from its conception to its execution—by a specialist, and house owners are gradually becoming convinced of the utility of such a plan.

It has been my good fortune in the past years to have been associated with many prominent architectural firms in this branch of domestic engineering, and I have always in the preparation of the plans and specifications, as well as in laying out the work in the building, endeavored to make the plumbing work conform to the above outlined requirements or principles. The results due to the advanced standpoint taken have been invariably satisfactory to the owners. Not only did the work prove a success from a sanitary point of view, but repairs to plumbing work so arranged have been few, and where required they have been much less costly and annoying, owing largely to facility of access and simplicity of arrangement.

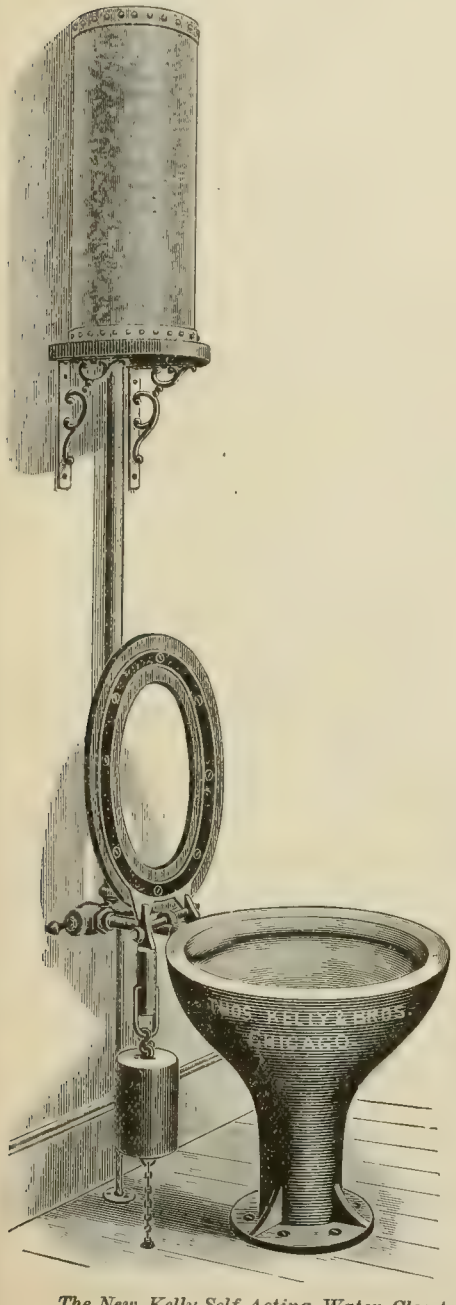
(THE END.)

G. W. Davis Plumbing Company.

G. W. Davis of the G. W. Davis Plumbing Company, El Paso, Texas, called at our Chicago office the past week while in the city visiting the fair. A photograph of the interior of his store, left as a memento of his visit, shows a remarkably fine room, fitted with modern plumbing devices in a very tasteful manner, and in every way superior to what would be expected in that remote part of the country. We take from a recent issue of the El Paso *Times* a reference to some work just completed by his company:

G. W. Davis has just completed one of the largest plumbing contracts ever undertaken by any one establishment in this city. We refer to the water supply plant and plumbing of Government buildings at the new post, Fort Bliss, which was begun in September, 1892, by the then firm of Davis & Symons, but was continued on the dissolution of the partnership by Mr. Davis on his own account. The work

performed by Mr. Davis consisted in laying about 1¾ miles of cast iron water mains, together with all the valves, hydrants, &c., pertaining to the underground distributing system, furnishing, setting up and putting in running order the steam pumping machinery, consisting of two 40 horse-power boilers and two 30 horse-power pumping engines, and furnishing all the material and services required in the plumbing of all the buildings at the post, 20 sets of officers' quarters and non-commissioned staff officers' quarters, stables, storehouse, guard house, mess hall and administration building, outbuildings for two double barracks for four companies of troops, and the post hospital. A conception of the magnitude of the work performed by Mr. Davis may be gained from the fact that his contracts involved an expenditure of nearly $36,000. The fact that his work has been accepted after the rigid inspections and severe tests to which it has been subjected is sufficient assurance that it was well done.



The New Kelly Self Acting Water Closet.

CHARLES HAGGERTY of Huntingdon, Ill., has moved his plumbing shop to the *Herald* building.

The New Kelly Self Acting Water Closet.

Thomas Kelly & Brothers, 123 Franklin street, Chicago, are putting on the market an improved form of water closet, which is herewith illustrated. The manufacturers claim that before introducing this closet precautions were taken to make it as simple and devoid of complications as possible, so no more skill would be required in setting than in connecting an ordinary garden hose. The flush tank and pipe are galvanized, and all parts shown in the engraving are furnished with the closet. There is no regulating of parts required, or no way possible for an unskilled workman to put the closet up wrong. The water supply to valve is arranged for either lead or iron pipe, as may be required. In case it is desired to place the valve below the floor instead of in the position shown, the chain that passes through floor can be attached to the valve. The flush tank is simply an air tight chamber without any movable parts, and the connections are so made that it will fill as far as the pressure of water will compress the air. The seat being released, the water causes it to rise, and at the same time opening the valve, water is allowed to flush the hopper. The valve is self acting, being closed by water pressure. As the weight tips the seat up when not in use the closet can be used as a slop sink or urinal, and on account of the seat being pivoted to the flush pipe convenience in setting is obtained.

Massachusetts Plumbing Regulations.

From H. H. W., *Taunton, Mass.*—Please inform me through *The Metal Worker* where I can obtain a copy of the Massachusetts plumbing regulations passed by the State Legislature some time in June or July?

Note.—In *The Metal Worker* of July 29, page 50, we made extensive reference to the Massachusetts plumbing law, giving its important provisions. Our correspondent probably can get the full text of the law by applying to the Secretary of State, Boston, Mass.

TRAPS AND VENTS.

CAHILL BROTHERS, Utica, N. Y., issue an interesting little catalogue and price list of the P. J. Cahill Universal closet seat. The circular, of 20 odd pages, contains many illustrations of closets and separate views of the seat, together with full description; also a considerable number of testimonial letters from those who have used the Universal closet seat with satisfactory results. A special feature of the seat is that it can always be adjusted to fit the closet bowl before the bowl is set up and when desired before leaving the shop. It is further mentioned that when the closet is set in place the seat can be attached to the bowl in less than five minutes.

IN THE SINKING of the steamer "Dean Richmond," which recently occurred with the loss of many lives on Lake Erie, the Colwell Lead Company, 63 Centre street, New York, lost 96,000 pounds of pig lead.

THOMAS F. ASHE has been appointed plumbing inspector at Knoxville, Tenn., and as the city has accepted some new sewers and notified the property owners to have connections made, the outlook for some activity among the local plumbers is bright.

THE FOLLOWING PLUMBERS have taken out licenses at Utica, N. Y.: George L. Brucker, J. F. & J. J. Cahill, William H. Kavanaugh, William H. Pryor, Edmund W. Stradling, Henry A. Welch, Edward Martin, Patrick J. Cahill, Charles A. Hurley, Wicks, Hughes & Griffiths, Charles J. Mahany, Dennis Nugent, Thomas Bear, Joseph Brought, Quinlan, Tuigg & Co., Joseph Morath, A. B. Johnson.

PRESIDENT ELIAL BERLA, Treasurer Joseph Smith and Secretary Alexander Don of Newark, N. J., Master Plumbers' Association, have just returned from a visit to the World's Fair.

EDWARD MOSS, 592 Third avenue, Brooklyn, N. Y., departs from the usual custom of window decoration followed by the average plumber in making an attractive display in his window of tacks, solders, traps, bibbs, water closets and basins. The plumber has as attractive material to make a fine window display as the hardwareman, yet too often the plumber's window presents anything but a pleasing appearance.

JOHN F. BRENEHAN has been appointed an Inspector of Plumbing at Fitchburg, Mass., his appointment to take effect November 1, at a salary of $900 a year.

IT IS REPORTED that the Huntington, Hopkins Company of San Francisco, Cal., are preparing to retire from business. Crane & Co. have taken their plumbers' supply trade in that city, and Miller, Sloss & Scott have purchased their stock of plumbers' supplies at the Sacramento branch.

THE PROVIDENCE, R. I., *Journal* gives a portrait of Reuben S. Bemis, the recently elected inspector of plumbing for the city. Flattering testimonials of Mr. Bemis' competency on sanitary matters were read previous to a vote by the joint convention of the aldermen and Common Council. As a reward for this service to the city they unanimously accepted an invitation to attend the Westminster Theater and see the fighting kangaroo.

A FIRE BROKE OUT unaccountably in the middle of the forenoon in the plumbing shop of E. J. Brady at 58 Warren street, New York. The principal damage done was to a large stock of gas stoves and other goods from the water used to stop the fire. The loss will approach $3000, and is fully insured. The fire department did not reach the building till 25 minutes after the alarm was struck, which accounts for the use of so much water. Mr. Brady's plumbers say they can run a water supply to a building in less time.

The Chicago Master Plumbers.

The Chicago Master Plumbers held a meeting at their rooms, 197 Madison street, Monday evening, October 23. The following master plumbers were elected members of the association: E. F. Shanahan, 4703 Indiana avenue; T. J. Sanford, 5238 State street; M. Dillingberg, 1511 Fifty-first street; Wm. Kirkwood, 662 East Sixty-third street; David Walsh, 6848 South Chicago avenue.

The Ladies' Auxiliary Society now has such a large membership that the meetings are to be held in the rooms of the Master Plumbers' Association instead of at private residences, as formerly.

THE LETTER BOX.

Philadelphia Mechanical Trade Schools.

From WM. A. H. ALLEN, *Superintendent of the Master Builders' Mechanical Trade Schools, Philadelphia.*—The fourth term commenced September 4, with very fair promise of exceeding the work of last year. As is usual, there are many pupils who find one term too short to furnish the knowledge they wish to obtain, and, as this becomes better known, it is gratifying to find that the recommendation of those who have attended the schools during the previous terms has often determined the application of their friends or relatives.

Recognizing the loss of allowing pupils to drift back into occupations unconnected with any trade, the committee uses its best endeavors to find places for the graduates in the trades of their choice, and has been able to provide for all the graduates, chiefly with members of the exchange. The third term was especially favored in that respect, and, with the reduction of the term of apprenticeship consequent on the obtaining of a certificate, several of the graduates of the first term are now receiving journeymen's wages. In fact, from the progress made by some of these young men, it would seem reasonable to discard any rigidly fixed term of apprenticeship, and when one can perform journeyman's work to allow him journeyman's pay.

There have been very many applications for trades, such as machine work, outside the list of those connected with building, but cramped quarters and the decision to confine instruction to trades represented in the exchange forbids their being placed on the list. To the first cause, and some technical questions yet unsettled with the trade, must be ascribed the failure to take up sheet metal work. It is not, however, absolute, though greatly to my regret.

The drawing which was added to the instruction in each trade has been of great benefit, and in most cases has excited great interest in the pupils. It is not, as you are aware, mechanical drawing in its generally accepted sense, but that which belongs to each trade. Few, if any, of the pupils intend to become draftsmen, but when one finds on inquiry how little a drawing represents to many workmen it can be easily understood that two drawing evenings per week could be fully occupied.

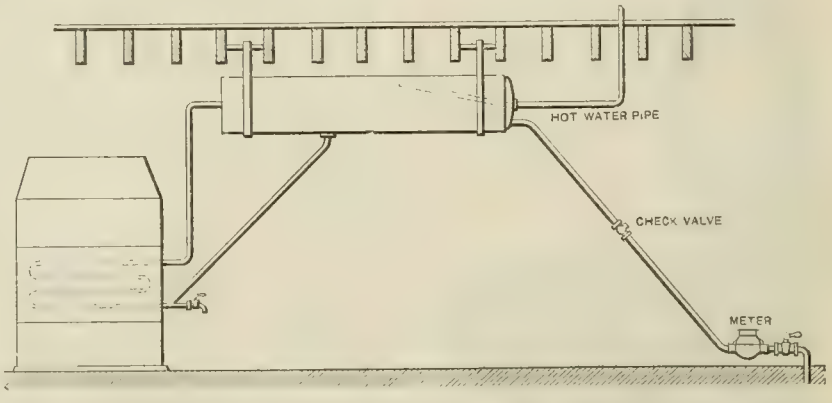
That many workmen recognize their deficiency in this respect is shown by the applications for instruction in drawing only, from journeymen as well as apprentices. So many have made such request as to warrant me in believing that if a school were established where what might be called trade drawing was taught, there would be no want of pupils. For the preparation for the profession of a draftsman involves more preliminary work than any of the mechanical trades, and workmen cannot afford either the time or the expense.

At the risk of making a communication more lengthy than valuable, I will add that our experience shows a defect in the public school education, in that the pupils have not been taught the practical application of their knowledge. All our pupils have had a knowledge of reading, writing and the ordinary rules of arithmetic, but very many, in the simple calculations necessary to their work, had no confidence in the use they could make of it. And they are not alone in this respect, for men who unwisely left school too early have wished for instruction in the same line; and if the objects of the schools were not the instruction of apprentices it might be a matter of regret that they could not be accommodated.

No day classes are at present in contemplation, but if the progress toward an endowment fund warrants removal to new quarters, there will be an opportunity of extending the sphere of usefulness and of taking up trades which present circumstances do not allow.

Keeping Hot Water Out of Meters.

From J. O. G., *Battle Creek, Mich.*—Will *The Metal Worker* please advise me of the different methods now in use to prevent hot water from range boilers getting back into meters by expansion or by syphonage? I am quite familiar with putting a hole in the conducting tube, but that will not always overcome the difficulty. Suppose the boiler be suspended from the cellar joists and connected with a coil in a furnace, as shown in the illustration. The regulations here require that a check valve shall be placed between the meter and the boiler, which I consider a dangerous practice, and as yet have never done it, as there would be no chance for expansion. Am I right? The meters here are easily spoiled by hot water, as the pistons are made of hard rubber.



Keeping Hot Water Out of Meter.

Note.—It is probable that some of our readers can offer suggestions to this correspondent. Some put a small notch or hole in the check valve to provide for the expansion, depending on the cool pipe and water to overcome the heating effect of the small quantity of water that passes through. It is probable that a safety valve, located so the overflow would be caught in some fixture, would answer every purpose.

Grate, Boiler and Radiator Surface.

From C. S. H., *Marblehead, Mass.*—Will you kindly give in *The Metal Worker* the rule for apportioning the grate surface to the boiler surface and the boiler surface to radiating surface per square foot on an average for both steam and hot water apparatus?

Note.—The variety of constructions used will make any approximation seem wide of the mark when applied to some particular case. The following, however, which is a rather conservative estimate, may prove satisfactory to our correspondent:

	Grate surface. Sq. feet.	Boiler surface. Sq. feet.	Radiator surface. Sq. feet.
Hot water	1	15 to 20	.....
Hot water	..	1	8 to 12
Steam	1	25 to 30	.....
Steam	..	1	4 to 6

Steam Boiler Too Small.

From P., *New Jersey.*—I have a steam job to overhaul where the boiler is too small and it is not practicable to change it. Will *The Metal Worker* please tell me if it will help matters any by putting in larger radiators? If so, why?

Note.—As a building is heated by the amount of radiating surface that is kept well heated by a liberal supply of steam from an ample boiler, there seems little probability of increased radiating surface proving a remedy for lack of capacity in the boiler. Cutting off one or two rooms from the present boiler and heating them by some other means will doubtless prove more satisfactory.

A Heating System.

From R. A. C., *Philadelphia.*—I think "G. P.'s" heating system for a school, in *The Metal Worker*, October 14, is open to some improvement. His first mistake is making the pipe in the ventilating flue so large, as it should not be over 8 inches; and it ought to be of cast iron, for terra cotta will crack from heat. A large amount of warm air is wanted for the classrooms and a sepa-

rate flue should be provided for each room. In a building where the janitor is not always present the fire is apt to be neglected and the rooms cool off while the school is in session. If the registers on both floors are left open at one time all of the heat will go to the upper floor and the first floor would be cold. I would suggest that two registers be put in the same flue in each room, one register to be 4 inches and the other 7 feet above the floor. There should be two ventilators in each room, one 4 inches above the floor and the other 2 feet below the ceiling, with self indicating cards.

A Smoking Stove.

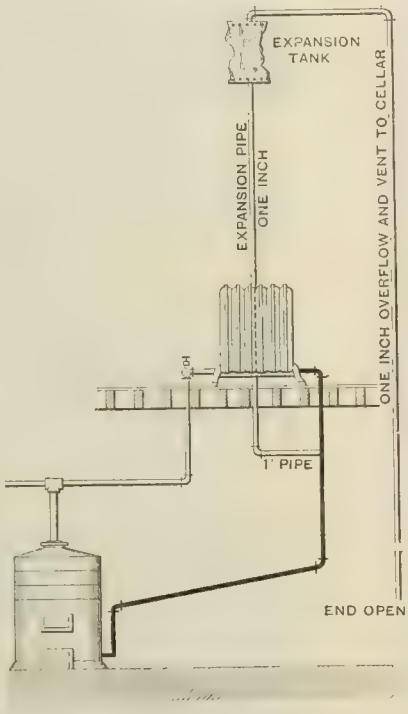
From J. C. K., *Charlottesville, Va.*—I wish to know the cause of a smoking stove and apply to *The Metal Worker* for help. The stove is on the Franklin order, made to go in a fire place and heat an upper room. I was told that the chimney smoked badly and was ordered to make a chimney top. I found the chimney to be 23 x 40 inches, containing three flues each 8 x 15 inches. A top was made after the method of "I. T." in *The Metal Worker* of May 13, which is very good. I made the top 2 feet 6 inches high, tapering it to 10 inches, running it up 2 feet higher and putting on it a swivel top. The stove still smoked and smoke came out of the fire places in rooms connected with the other flues, the smoke coming up one flue and down the others.

I then put 7-inch pipes in the chimney top, directly over the other flues, but that did not work. I then made two short tapering pipes to fit the flues and connect with the 7-inch pipes in the chimney top; this stopped the side flues from smoking, but the stove continued to smoke. I then took off my chimney top and ran a 6-inch pipe from the top of the chimney down to the flue stopper and connected it with the stove pipe, making one continuous pipe from the stove. But the stove still smoked even with a little fire. The stove has been up three years, but has just commenced to smoke. The pipes to the stove have not been altered in the least and the stove seems perfect. There are no trees near that would cause trouble. I have explained this case to our stove men, but they cannot suggest a remedy. The chimney runs up some distance above the roof and is in good order This is the first stove that has got the best of me in 25 years, and I hope some of the readers of *The Metal Worker* will give me some help, which will be thankfully received.

Note.—This appeal to our readers will no doubt bring aid. The fact that the stove has worked two years encourages the belief that it can be made to work again when the conditions are exactly the same. The changed condition is the thing to find. It may be an accumulation of soot, dust or ashes in one of the flues of the stove, or the stove may have a hole rusted through it somewhere which partially kills the draft, or the pipe connection may have been broken at some place. The stove may have cracked or a nut come off of a bolt, letting the plates apart, or the cement may have been destroyed, and there is now an opportunity for a free entrance of air where there never was before, which would make the stove smoke. We would suggest that the stove be taken where it can be thoroughly cleaned, examined and cemented, and if any plate or part needs renewing or readjusting it can be readily seen and fixed. If this is done and the stove again set up with care to make the pipe connections tight we think it will work. It is doubtless something so simple as to escape notice that has baffled the skill of our correspondent. The top of the chimney is less often to blame for the troubles with a chimney than is imagined, and where a stove has once worked without a top on the chimney it can be made to work again.

Collapsed Expansion Tank.

From P. M., *New Milford, Conn.*—Please inform me through *The Metal Worker* what caused the expansion



Collapsed Expansion Tank.

tank shown in the illustration to collapse. It has no vent, except through the overflow pipe, which has an open end in the cellar.

Note.—Without some stoppage in the overflow pipe which prevented the entrance of air and so permitted a vacuum, it is difficult to account for the collapse. If steam formed and caused the system to overflow the expansion tank the water running down the overflow pipe would not only stop it, but by dropping down would tend to create a vacuum at the same time that the steam would condense and the water in the system would drop to its level to increase the vacuum. If the end of the overflow is connected with the cellar drain, and from any cause water rose so as to close it, air could not enter to relieve any tendency toward a vacuum. The collapse can be prevented in future by running an air pipe up a few inches from the top of the horizontal part of the overflow pipe. In the case of an overflow water would run along the horizontal pipe without rising in the air pipe, and as soon as the water passed air could enter readily to prevent the formation of a vacuum. If any fear of overflow in the air pipe is entertained a swinging check valve placed in it will prevent it.

Spinning Aluminum.

From G. M., *Camden, N. J.*—Will *The Metal Worker* please inform me if an article the size of an ordinary thimble can be spun from aluminum and how it is done?

Answer.—An eminent authority on aluminum, J. W. Richards, says aluminum can be spun on a lathe into all sorts of round and hollow forms; it may also be pressed or stamped into shape in the cold; it is of advantage in doing this to use a kind of a varnish composed of 4 parts oil of turpentine and 1 part stearic acid. Soap water is always to be avoided. The best means of burnishing is to use a piece of soft wood soaked in olive oil; this closes the grain and gives a brilliant finish.

Laying Water Pipe.

From E. A. W., *Vermont.*—Please inform me which arrangement of piping will discharge the most water, the fall being 190 feet from a spring, and the distance traveled 150 rods. Would it be better to have the first half of 3-inch and the last half of 2-inch pipe, or to reverse it and have the smaller pipe near the spring? Or would a still better arrangement be to have both ends of 3-inch and the middle 75 rods of 2-inch pipe?

Note.—We judge from our correspondent's letter that he has 75 rods of 3 inch and 2 inch pipe which he wishes to utilize in carrying water from a spring. Under the circumstances, he would do well to run the first 75 rods from the spring of 3-inch pipe and continue it to the outlet with 2-inch pipe. Generally speaking, however, it is the diameter of the 2 inch pipe that will determine the flow, and there would be no very great difference in the results obtained by laying the pipe in the two ways mentioned.

Two Styles of Air Ducts.

From R. A. C., *Philadelphia.*—As occasionally we all get a customer like the one reported by "J. H. T." in *The Metal Worker* of October 14, a helping hand must be lent, though too much space should not be wasted on them. I would say in reference to cold air ducts that there are in the Philadelphia schools no less than 1000 ducts built as shown in Fig. 2 in his letter, with a damper in them, and that they continue to be built.

Determining Water Pressure.

From H. E. M., *Brooklyn, N. Y.*—Please publish a simple method for computing the pressure of water from pipes at different elevations.

Answer.—For the pressure of water in pounds per square inch multiply the depth in feet by 0.434.

STEAM AND HOT WATER.

Run the Pipes Carefully.

The following, from the London *Plumber and Decorator*, should impress the fitter that a spirit level is as essential and indispensable for the correct running of pipes as his wrenches, and that it can be more generally used with great advantage for detecting the cause of unsatisfactory service:

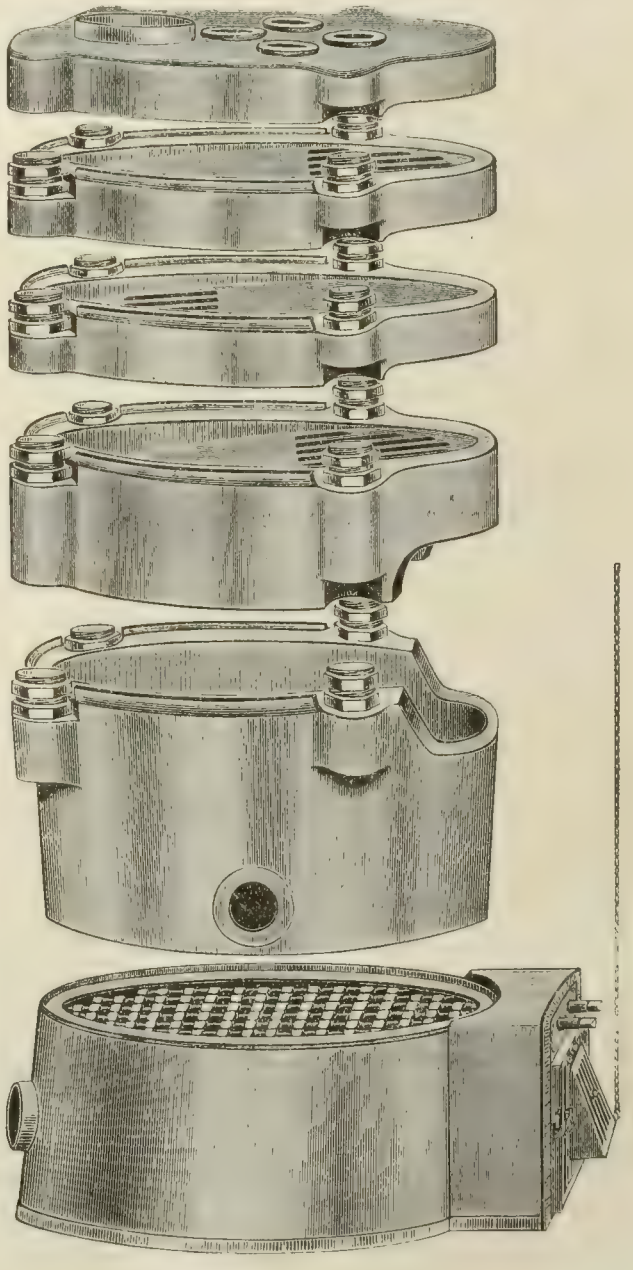
That there is a wide difference in the effectiveness both of hot water heating and steam heating apparatus is a fact known to all well informed men engaged in the heating trade, but in many instances this difference is accounted for by referring it to anything but the proper cause—namely, defects in the system of piping between the steam boiler or water heater and the radiators. The boiler may be good, the radiators may be the best in the market, yet the result is unsatisfactory. In most such cases it will be found that not enough study and care have been given to arrangement of pipes and radiator connections, to their proper sizes with reference to the surface they are to supply, to their pitch, to the supply in steam heating pipes of proper relief pipes, to avoidance of traps in pipes, to provisions for expansion under the action of heat, and so on to the end of the chapter.

These remarks apply to both large and small installments. Some of these defects are not always chargeable to the contractor who puts in the apparatus. Many buildings, large and small, can be found wherein, when first erected, the heating apparatus worked excellently, but in a year or two began to snap and pound vigorously, while its lack of vigor in heating some parts of the building became uncomfortably apparent to complaining occupants. What has happened during the interval between satisfactory testing and the failure to heat successfully is that the building has settled unequally, thus neutralizing, and in many cases often reversing, the inclination given by the fitter to the pipes and canting radiators so that their outflow connections are higher than their inlets. Examine the boiler; you will find nothing there to prevent efficiency. Radiators and valves, water feeding and draft regulating appliances may be all in first rate working order. The fault is that the piping has been disarranged because the building has settled, and settled unequally. The "skin builder," not the fitter, is to be blamed in such a case.

Improved Palace King Hot Water Boiler.

Russell Wheeler & Son, Utica, N. Y., are now placing on the market their Improved Palace King hot water boiler, the accompanying illustrations of which show the chief features of its construction. They write us that the success of their boiler in the past four years has proven the practical value of the inclined waterways and horizontal boiler surface, which are features of their construction, and that these points are all retained in the Improved Palace King.

The new construction has a wrought iron nipple connection with running thread, and this nipple is so set in the boiler that the use of it allows the retaining of the proper proportions of the boiler. Fig. 1 shows the boiler with sections suspended over each other, and nipples set in each bottom section ready to be backed out and to engage the water post of each upper section. The upper lock nut of the nipple is pinned firmly on to the nipple and acts as a shoulder for the wrench to engage, and also as a lock nut. The lower lock nut runs on the nipple, and is an assurance of safety if the thread on boiler or nipple should be damaged any way in shipment. By staggering the pockets in which the nipples set, the manufacturers claim to have attained a perfectly proportiond boiler, in which the sections lay close together and in which the flue spaces between boiler sections are not excessive. Again, the manufacturers state that, owing to the inclining of the waterways from rear to front in each section, it is impossible for a water or air trap to form in the Palace King, as the water when being drawn out of the boiler will drain down through the rear water posts, and upon filling up the air will pass up through front water posts. Fig. 1 also shows their new triangular shaking and rocking grate. This grate is so arranged that one or more grate bars can be removed at will without disturbing the rest of the grate, and they state that a boy can in a few minutes renew any grate bar, if it is so desired. The ash pit is large and roomy,



Improved Palace King Hot Water Boiler.—Fig. 1.—Boiler with Sections Separated.

having lift door and chain attachment, and each pit is provided with a collar on the rear for use as dust flue.

Fig. 2 shows a transparent cross section of the Palace King boiler and gives an excellent idea of the circulation of the heated water. The manufacturers claim that the inclining of the sections greatly decreases the friction in water travel, and that it is a recognized fact that water when heated circulates much more quickly and with less friction in a vertical column than in a horizontal section, but it is also a fact that vertical boiler surface is greatly inferior to horizontal boiler surface as an absorber of heat, and that 1 square foot of the latter is as effectual as 2½ square feet of the former. Russell Wheeler & Son therefore claim that in the construction

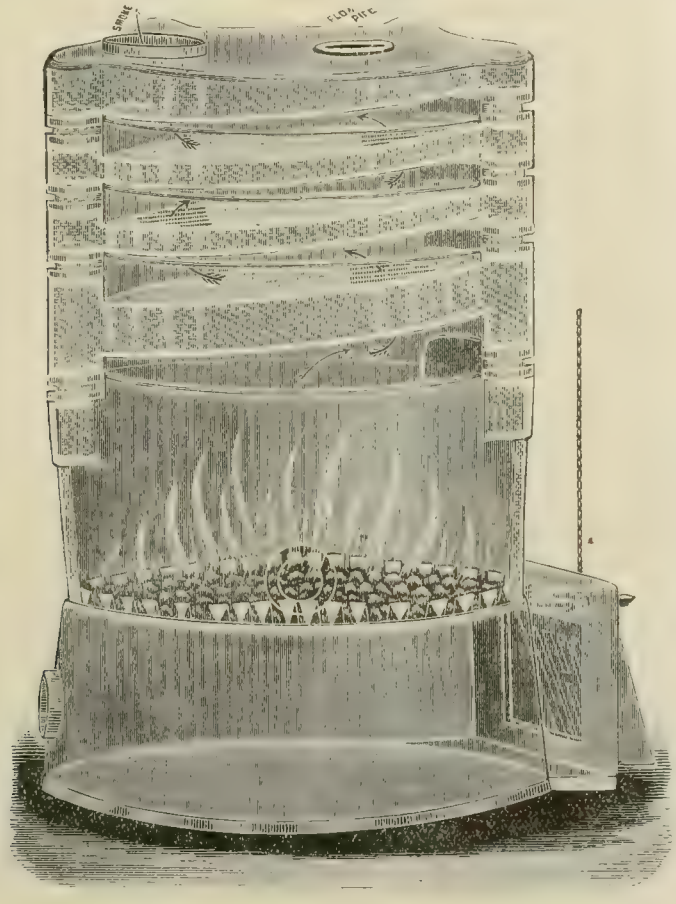


Fig. 2.—Vertical Section through Boiler.

of the Improved Palace King boiler, they have embodied two vital principles, viz.: Vertical circulation and horizontal boiler surface. The inclining of the waterways renders steam space forming and water lifting out of any of the sections impossible, and very rapid, positive upward circulation is attained under any pressure. By their construction the products of combustion are compelled to pass four times across the boiler before they will reach the smoke pipe collar. The manufacturers desire to call attention to the simple manner in which the boiler can be cleaned, large doors being placed on each section so that every part of the boiler can be reached with the hoe and steel flue brush provided for cleaning.

JOHN A. SCOLLAY, 72 and 74 Myrtle avenue, Brooklyn, N. Y., has recently received in one consignment 39 hot water boilers from the foundry of John Davies, the opening up of the heating season having exhausted Mr. Scollay's stock on hand.

A Steam Heating Episode.

BY L. M. W.

Stopping at a hotel not long ago in which the recently installed steam heating plant was a noticeable feature, an unusual entertainment was afforded. Supper had been enjoyed in company with a well preserved old gentleman of the old school, and later in the evening we went upstairs together. On retiring the rooms were found agreeably warm, though there was snow on the ground and the weather cold. This was due to heating coils arranged all along the halls, which suggested traps by an occasional rattle. The length of my nap previous to its being broken is of no consequence compared with what followed. I heard a severe thumping on the headboard in the adjoining room, and at the same time a hammering in the coils that would have rivaled the noise of a dozen tinners, all making stove pipe.

Above all rose the voice of my old friend, who was not so profane as he was prolific of promiscuous epithets. "Go away from there, you man mule! Why don't you do your blacksmithing in the daytime."

All was quiet for a few minutes, as if the order was obeyed, when a more elaborate racket started. He immediately shouted, "You think it is fun, you night buzzard, but I'll show you different." Another cessation of a few minutes enabled me to realize that my old friend imagined that some one was creating the disturbance, and I laughed outright as the music again began. "You laughing hyena, I'll make you yell like a pack of jackals if you'll stay there long enough." A voice from across the hall inquired, "What's the matter, grandad?" Then the old man delivered himself extemporaneously in a manner creditable to his blue stocking education, and jumped out of bed full of fight, when all became quiet again.

When the next racket started his door flew open with a bang, and a soap cup sped down the hall in the direction of the noise, accompanied by the remark, "You miserable midnight maggot, I'd like to bang your brains out." The soap cup struck a baluster and dropped down stairs with a crash that scattered its pieces. It brought the night clerk up just as a terrific hammering started behind the old man. This time he yelled, "You offspring of a swill pail, your dirty sides ought to be staved in! Are you an idiot that you rob the night of its quiet? Begone with you!"

The clerk grasped the situation at once and came up laughing to explain, but before he had a chance the old gentleman assumed that he was the culprit. He called him "a dirty ditch water tadpole, a mean skunk, a rotten squash," and flooded him with titles representing equally choice specimens of animal and vegetable life till his breath gave out, and the hammering started in fine style on both sides of the hall.

Then the clerk explained that it had got colder outside and the fire had got down, which made the steam condense, and when the water was not drawn off from the coils such a noise often resulted. For the balance of the night he promised to keep the coils clear and stop the noise. The old man remarked as he went into his room that he knew steam was powerful, and had just learned that it could be a powerful nuisance, as he gave his door a powerful slam. A cheer went up for the old man and the steam heater from several rooms, and the coils joined in with a final rattle, bang and hiss, and as the condensed water had escaped a permanent quiet followed.

Cement for Steam Fitters and Plumbers.

The German technical papers are remarkable for the practical receipts which they contain; not that our own journals do not contain practical receipts, but because those in the German papers, instead of being copied from ancient receipt books or concocted at random, usually bear the name of some well-known scientific man, and are based on reasoning as well as experience. One of these receipts, by Herr K. Keyfar, is copied in the *Bautechnische Zeitschrift*, and is worth remembering by steam fitters and plumbers. As is well known, the cement used for making tight the joints of steam pipes and other iron work exposed to heat and pressure is a pinkish putty, now commonly made with a mixture of white and red lead, although it is not long since pure red lead was supposed to be the only proper material. This lead putty is, however, according to Herr Keyfar, often carelessly and ignorantly made, so that it fails, sometimes to a dangerous extent, to do what is required of it. Properly, the cement for putting together steam pipes should be made with equal parts of pure red and white lead, thoroughly mixed and well kneaded with pure linseed oil which has been rendered drying by boiling with 10 per cent. of red lead. Workmen in steam fitting shops do not know much about the properties of oils, and often mix their putty with raw linseed oil or grease, or even kerosene. It is hardly necessary to say that coal oil is soon volatilized by the heat, leaving

the white and red lead in the form of powder. Grease is not much better, and raw linseed oil hardens slowly, and should not be employed. Where the materials are suitable the putty sets quickly, and becomes so hard that it can with difficulty be cut with a chisel. The mixture of red and white lead has certain advantages over either separately, which should be understood. Red lead alone gives a hard and quick setting cement, but the red lead putty is not very plastic, and does not cling well to the surfaces of the iron. White lead alone makes a plastic and adherent putty, but while red lead gives up a part of its oxygen to the oil, so that a red lead putty hardens all through, white lead does not yield oxygen, and a mass of white lead putty hardens only on the surface, remaining for a long time soft in the interior. A mixture of the two substances combines the advantages of both. In kneading the putty, care should be taken not to allow iron filings or bits of dust to get into it. Where the joint is not to be exposed to heat chalk may be added to the putty in quantities equal to that of the white lead. If the drying must be hastened, a little brown oxide of manganese, very finely ground, will help it. For hot joints, finely ground graphite, in quantity equal to the white lead, may be added, but the graphite cement does not set so quickly as the lead alone. The surfaces to be joined should be even, as left by the turning lathe or planer, but the putty will not stick well to a polished surface. Where the putty alone must support a severe pressure, as in the case of a flange joint in a steam pipe, it is best to strengthen it by inserting in the joint a piece of paper or felt, covered with putty on both sides, and if the joints are very rough, as in the case of flanges which have not been turned or planed, it may be best to mix some threads of hemp or flax with the putty, but care should be taken not to use too much. Where the joint is exposed to great heat no combustible substance, such as flax or hemp, is suitable, and the best way is to cut out a piece of wire gauze, spread it thickly over with putty, and lay in the joint. It is sometimes necessary to make steam tight joints in such a manner that they can be readily taken apart and replaced, as in the case of the man hole of a boiler, or the head of a cylinder. For making these joints the lead putty is unsuitable, as it becomes too hard to be easily removed, and it is best to employ felt or soft paper soaked with boiled linseed oil. If possible, sheets of such paper should be previously prepared by soaking with the oil and drying, and, when used, they should be cut to the proper shape, covered on both sides with boiled oil and laid in the joint.

HEATING NOTES.

H. GILBERT HART of Hart & Crouse, Utica, N. Y., has been making a few days stay in New York, the guest of W. M. Mackay, the manager of their steam and hot water department, at 236 Water street.

W. H. HARRIS of the Standard Radiator Company of Buffalo, N. Y., is spending a few days in New York, the guest of the American Radiator Company, at 94 Centre street.

C. S. GRAVES, the New York representative of the Model Heating Company, is showing at 305 Pearl street a No. 28 Novelty circulator for hot water heating. This is something new, having a square base, a rocking grate, a new front, rendering the flues more readily cleaned and some internal improvements that are said to greatly increase its efficiency.

SCRAP.

THE SHEET MILLS of the Laufman Tin Plate Company, Butler Junction, Pa., are running full time, but in the tinning department only half the usual number of men are employed owing to a falling off in orders for tin plates consequent on the financial depression and uncertainty. P. H. Laufman, the head of the concern, is reported as saying that jobbers who formerly ordered carloads are now buying small lots, or just enough to supply their immediate calls. He attributes the dullness largely to uncertainty in regard to the tariff.

THE EXPORTS of tin plates and sheets from Great Britain to the United States during the month of September show a further falling off in volume. British Board of Trade returns for the month give the amount as 13,789 tons, against 15,000 tons for August and 22,535 tons for the month of September, 1892. The respective values were: September, 1892, $1,429,080; September, 1893, $861,432. Total shipments to the United States for the first nine months of this year were 212,241 tons, as compared with 214,527 tons for the same period of 1892.

TEST OPERATIONS were carried out last week at the new plant of the New Castle Steel & Tin Plate Company, New Castle, Pa. The black plates made gave complete satisfaction, and were pronounced by experts equal in finish to any of foreign make. The tinning department will start up almost immediately.

THE WORKS of the United States Iron & Tin Plate Mfg. Company, at Demmler, Pa., manufacturers of tin and terne plate, are in full operation, the firm having a very active demand for their various brands of plate. A fact generally known to the trade, but which is worthy of mention here, is that to this concern belongs the distinctive title of being classed as the pioneer manufacturers of tin plate in this country. Away back in 1873 this firm engaged in the manufacture of tin and terne plate at their present location, but of course their plant was considerably smaller at that time than it is to-day. When the change was made in the tariff by which the duty on tin plate was considerably lowered they were compelled to abandon its manufacture and confine themselves exclusively to the production of iron and steel sheets, dripping and bread pans and other goods of a similar nature. The restoration of the duty on tin plate by the passage of the McKinley bill resulted in their spending over $100,000 in the remodeling and enlarging of their plant in order to engage again in the industry. The facilities possessed by this firm for the manufacture of tin and terne plate are second to none in the country, and are testified to by the fact that during the worst period of the business depression their tinning department was kept in constant operation, and nearly all the time to full capacity. Much of the success of this concern is due to the able efforts of W. C. Cronemeyer, chairman, who has labored unceasingly in the interests of the industry. This firm have for free distribution a pamphlet giving valuable information to users of tin plate, which will be forwarded to any address upon application.

A RECENT VISIT to the new plant of the New Castle Steel & Tin Plate Company, at New Castle, Pa., developed the fact that this concern have one of the most complete plants in every respect in the country for the manufacture of tin and terne plate. The buildings are all of iron and as nearly fire proof as could be made. The welfare of the employees was carefully looked after in the construction of the buildings, and they are so arranged that a very comfortable temperature can be maintained during the summer and winter months. The entire equipment is of the most modern design throughout, and will permit of the handling of both raw and finished material to the best possible advantage. The location of the plant is an admirable one, the concern having switch connections with three different lines of railroads. The plant of the Shenango Valley Steel Company lies just alongside, and this will enable the firm to purchase their billets at the very lowest market prices and at the same time insure a material saving in freight charges. As yet only black sheets for tinning purposes have been turned out, but in a short time the tinning department will be put in operation. It is the intention of the firm to make a full line of the different grades of tin and terne plate, and they will also be sellers of black sheets in the open market.

A BALTIMORE, MD., DISPATCH of October 26 announces that the Locust Point Iron & Steel Works Company of that city have passed into the hands of receivers. The appointment of receivers was made on the petition of the E. J. Codd Company and George W. P. Coates, the latter a stockholder in the concern, and he, together with Frank Ehlen, are the receivers. The company manufacture iron and steel sheets, and have for the past 18 months been extensively engaged in the production of tin plates, which, the directors state, has been a profitable branch of their business. The prevailing monetary stringency and uncertainty in regard to tariff legislation are given as the reasons for the firm's troubles. The capital of the company is $100,000, and the liabilities are said to be small. The works will probably be kept in operation.

A PRESS DISPATCH from Washington on Thursday says that the first draft of the tariff bill has been completed. There are various rumors as to the proposed changes in the metal schedule, one of them being to the effect that the duty on tin plate will be reduced to $1\frac{1}{10}$ cents. per pound.

A New Jersey photographer has devised a simple method of photographing a person in five different positions at once—that is to say, he obtains a picture which gives five views of the sitter in as many attitudes. This is accomplished by using as a background two plane mirrors, forming between them an angle of 45°, and placing the person at the junction. The usefulness of the device will be especially found in criminology.

The *Railway Age* mentions that recently two steamers carried away, within 24 hours, as much freight from Chicago as all the railway lines leading to the East in that time, notwithstanding that the latter have cut down their rates to the closest of margins.

The Center Blast Tuyere Cupola.*

BY THOMAS D. WEST, SHARPSVILLE, PA.

The economy that is possible if two or more rows of tuyeres could only be made to force the blast to the center of the cupola and at the right elevation, caused me two or three years ago to give thought to the subject and to desire to get nearer the theoretical figure than present cupolas were doing if it could be possible.

One plan after another suggested itself until the idea of a center blast came to me. Having two cupolas in our shop, I thought I would experiment with the smaller, which is 40 inches inside diameter.

The experiment in this small cupola resulted so favorably that we concluded to try the plan in our large cupola in connection with the outside tuyeres, which we did after the plan illustrated by the cut herein shown. Before starting in to use this bottom center blast tuyere, we were not safe in trying to do better than one to seven or eight in fuel, as our metal came all from pig iron and had to "come down hot." With the combination of the center blast and outside tuyeres we found we could obtain hot metal with one to ten or eleven, and I would state that the one to ten and eleven iron was often much hotter than the one to seven or eight melted with the old process, and it would often come so hot it would take considerable scrap to cool it off before it would be wise to pour the metal. To say it would be as hot as stove molders would often care to use it would probably be the best way to convey an idea of its heat, and it might be well to state that the metal would be hotter at the end than at the beginning of the heat. The cupola men liked to use the device, as it made the work of chipping out and daubing up the cupola so much easier than in the old system, for in fact there would often be very little of such work to do. In my experimenting there were several plans tried, but the one recommended later on is the best and last one I am using with this system. It cannot but be evident that with such a plan the blast is conveyed to the center of the cupola or body of fuel, where it should be to achieve the greatest results, and if the theoretical point in perfect combustion is ever to be reached it will be by some such system. Not only does this plan save fuel, but also the lining of cupolas, while the present methods or principles now used for accomplishing economy in fuel do so at a sacrifice to the lining; so much as to make it in many cases a question if there is any economy in using "upper tuyeres."

A is an outside tuyere box made of ¼-inch wrought boiler plate, so as to make it light for dropping purpose. It is bolted only to one half or section of the "drop doors." C is a hinged cover having a hole for the bar cap supporter D. At E is a one and one quarter hole stopped by a little pivot swinging valve, so that if through the peep hole B any leakage should be seen, this valve could be swung back to let the metal or refuse run out. It will be noticed that the tuyere box A is made of a taper, so that should slag iron or refuse drop down into it, it could be readily relieved. The cylinder at F is made of an inner and outer ring of ¼ inch boiler plate. The space G is filled with fire clay. H shows angle iron, of which there are four pieces, for the purpose of supporting the round iron rings I. These and the angle irons are for holding and preventing the bagging of the fire clay, which is daubed on over them to protect the cylinder F from the melting heat of the cupola. This clay would be put on after the cylinder is placed in position inside of the cupola, and dried by the burning up of the bed. It would be the better plan to have two cylinders, so as to have one all the time on hand for drying in an oven. One heat gave us trouble through lack of care when half through by the metal getting through the clay to the iron rings. K is a clay cap having a cast iron prickered casting, as shown at M. The clay or ganister used for forming this cap K and daubing over the cylinder F should be of the best quality. The 1½-inch bar shown at D is in two sections, so as to enable its being pulled out before "dropping the bottom."

In cases where cupolas stand high the bar might often be worked in one piece, In placing the cap K on the cylinder my first plan was to let it rest down upon it and then after the blast was on and the iron commenced to melt the jack screw R would be raised, thereby lifting, of course, the bar H and the cap K to make any width of opening at S for the admittance of the blast that would be thought wise. The raising of this cap up against the pressure of coke and iron gave us trouble at one heat through breaking off of the clay at the outer rim of the cap, so that after the cast was about two thirds over the heat in the cupola had melted the casting M so as to cause a leakage down into the tuyere. We then tried another plan by letting the cap rest on three pieces of fire brick, one of which is seen at X, as done in the 40-inch cupola; these being equally divided, the blast would have ample room to find space for entrance between the top of the cylinder F and the cap K, as at S. In order to prevent the blast from entering this tuyere ere the iron commenced melting we used a damper, as seen at Fig. 2, which would be placed up in the cylinder F at a point about level with H and which consisted of a jointed bar the same as seen at D, having at its end a round piece of ¼-inch boiler plate, as at O, having prickers riveted into it for the purpose of holding clay to keep the damper from getting hot and also bring the clay down when the damper would be removed or the blast allowed to enter the cupola. This arrangement, of course, did not require any jack screwing. We simply had the bar D protrude below the tuyere box cover G about 2 inches, so that a swinging catch attached to this cover supported the rod D, and in removing this damper we simply knocked the catch away and the damper fell down, bringing its clay with it. Of course, with this arrangement of damper, the center supports or guides P P for the bar D, when the raising plan was used, were removed. This plan was a decided improvement over raising the cap and worked all right. The reason for it not being desirable to admit the blast through the center tuyere ere the iron commenced to melt was, in the first place, to have the bottom outside tuyeres get the carbonic acid gas well started from the lower fuel before admitting oxygen to combine with the carbon oxide created in the fuel above the bottom tuyeres, upon the same principle that it is desirable to do so with upper outside tuyeres. In the second place, it greatly aids in preventing the tuyere hanging up when the bottom is dropped, with very large heats.

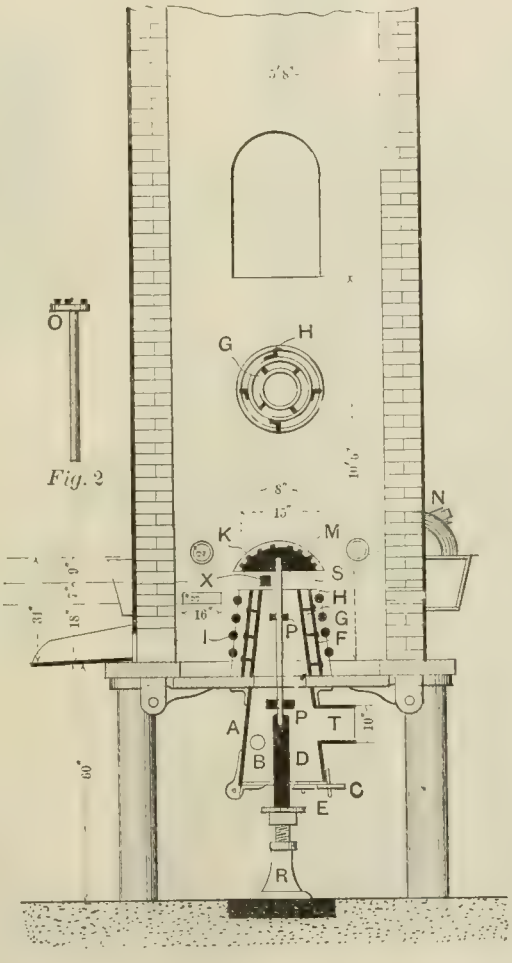

Fig. 2

THE WEST CENTER BLAST TUYERE.

The cap K, as shown, was made larger in diameter than the cylinder F, so as to prevent the dropping metal from falling or getting into the opening at S during the heat. It will be noticed that the point of entrance for blast at S is higher than the bottom outside tuyeres. This is done to achieve the end accomplished by upper outside tuyeres in admitting oxygen to combine with the carbonic oxide in turning it to carbonic acid gas, thereby making more complete combustion.

In making connections for the blast with the center tuyere box A, conditions will vary the plan to be adopted.

*From a paper read at the meeting, October 18, of the Western Foundrymen's Association.

The attachable pipe coming to this tuyere and connected at T should be an independent one coming directly from the main blast pipe, and not from any of the side tuyeres or wind boxes, and a damper should be arranged in this main side branch pipe so that the pressure of the center blast can be regulated independent of the outside blast. The cupola shown has 12 outside tuyeres, six of them being lower tuyeres 3 x 16 inches, and six of them upper tuyeres 2 inches in diameter. The width of opening for the center blast admitting of air was about 2½ inches. In "dropping the bottom" after very heavy heats we sometimes found that the center tuyere would hang up, but by a little rapping on its protruding end with bars it would come down, and leave a good "dump" or "bottom dropped cupola." In using this tuyere by itself or in combination with outside tuyeres it is essential in large heats to flux a cupola well and run the slag off. By letting slag remain in the cupola it readily chills around the tuyeres and thereby causes "bunging" or "hanging up," and it might be well also to state that the outside tuyeres should be kept well open so that the blast can find easy delivery to the end of the heat through them. At the start the blast should not pass through the center tuyere with any more force than necessary to counterbalance the inside wind pressure. The blast is delivered from a No. 9 Sturtevant fan.

If this system should be adopted in cupolas that are to run steady over ten hours, like those at steel works, I would like to hear of some one trying the cylinder F (instead of as here shown), having it constructed of all fire brick, every other course being tied with a thin plate of boiler or cast iron, the edges of which standing back, so as to be protected by a covering of clay. These rings should not be over ⅝ inch thickness. The idea is to make sure of the heat not causing any cracks to occur in the brick tuyere or burn the edges of the rings while the blast is on. By well tying the brick work or "breaking its courses" it might stand well without the use of the iron rings. I have tried an all fire clay cylinder tile baked in a fire brick kiln, but it did not prove a success, as it was cracked and gave us trouble from leakage. For ordinary cupola work, I know that with care and judgment the plan here illustrated, and having two cylinders as above suggested, could be made to work successfully, and all who try it will find they can save fuel and the cutting of their lining. The latter with some firms is a very costly affair. Of course, in starting in to try this system one is not expected at the very first heat to charge with a radical change in using less fuel, but gradually trying less every heat until they find by trial just how low they can get. At the start you can at least depend on reducing the bed in bulk whatever the bulk of your center tuyere may occupy, and between charges have 20 per cent. less fuel. I know that in our 68-inch cupola we reduced the bed after trials from 3000 to 2100 pounds, and in charges from 900 down to 500. The iron we place on the bed is 8000 pounds, and between charges 6000 pounds, and, as stated in first part of paper, our heats run from 50 to 70 tons. We are still experimenting in this line, but as business has been so dull for the last three months, there has been but little opportunity to go ahead and compute the results.

A remarkable coincidence in this experimenting is that after I had been laboring with the new system, thinking the idea was alone with myself, a letter came from the far North showing that another foundryman was likewise experimenting—Thomas H. Widdowson of Mankato, Minn., who wrote me on this subject after I had been at work upward of a year.

In the discussion Mr. Widdowson stated that in his experiments the melting was faster and hotter. Mr. West made the point that the use of the center tuyere allows of using a lighter blast, and added the following detail to those contained in the paper: "The cupola I used for my experiments was 44 inches in diameter and I put in upper tuyers, about four of them, about 10 inches above the lower tuyeres. I found in experimenting that when the blast was cut off you could hardly get near the charging door. The men in charging would throw their iron in and jump back. We opened the upper tuyeres and the flame would die down." Mr. Widdowson and Mr. Moore agreed that founders usually use too much blast.

The Morse Valve Reseating Machine.

The Leavitt Machine Company of Orange, Mass., make the valve reseating outfit shown in Fig. 1, which is used to reseat all flat and taper seated valves from 4 to 9 inches, while that shown in Fig. 2 takes the range of 9 to 12 inches. The

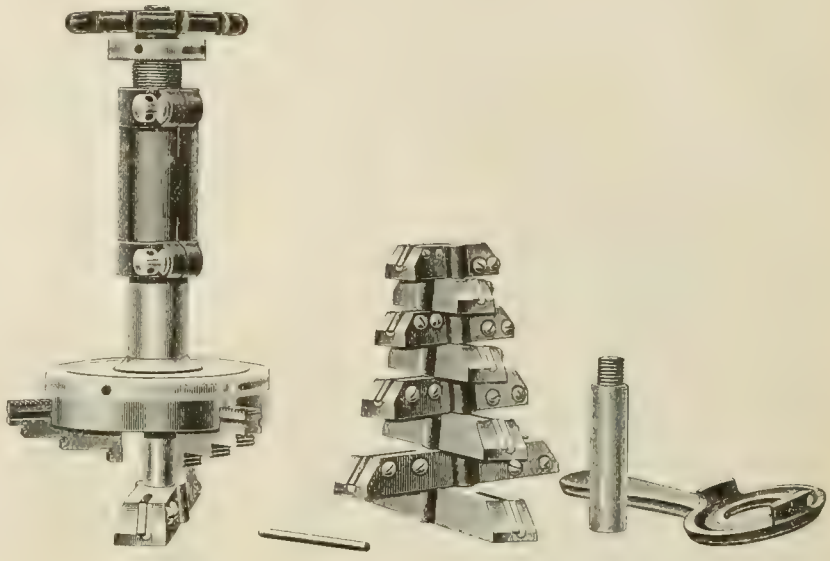

Fig. 1.

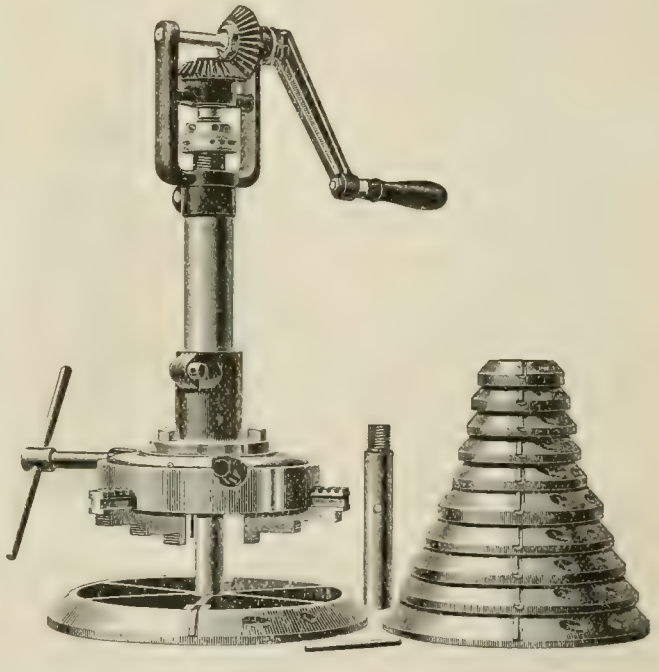

Fig. 2.

THE MORSE VALVE RESEATING MACHINE.

lower portion of the machine is provided with a chuck arranged to grip in the opening in the body of the valve and thus hold the device firmly in position. The lower end of the spindle carries the cutter, which is fed to the work by means of a screw having a knurled top, as shown in both engravings. The sleeve carrying the spindle can be clamped in any desired position in the chuck. The machine represented in Fig. 1 is operated by means of a hand wheel, the other being operated by a crank and beveled gears.

ROOFING AND CORNICE.

Instruction in Sheet Metal Work.

Numerous inquiries have been addressed to *The Metal Worker* from time to time in regard to trade schools where instruction is given in sheet metal pattern cutting. Diligent investigation has, however, failed to locate any institution where this branch of trade is taught. We are, therefore, glad to be able to announce that Charles R. Richards, director of the Department of Science and Technology in the Pratt Institute, Brooklyn, has authorized us to state that he is willing to arrange for the organization of a class in this trade in connection with the trade school of the institute, provided a sufficient number of candidates for instruction are forthcoming. We believe a sufficient demand for tuition in this important manual art does exist among the younger men of the roofing and cornice trade to justify Mr. Richards in forming a class, and trust that the opportunity may not be neglected. Mr. Richards will be glad to receive applications, personal or otherwise, at his office in the Pratt Institute, Ryerson street, between DeKalb and Willoughby avenues, Brooklyn, where he is usually to be found daily, except Saturday, from 9 a.m to 5 p. m., and on Monday, Wednesday and Friday evenings from 7.30 to 9 p.m.

Sheet Metal Lathing.

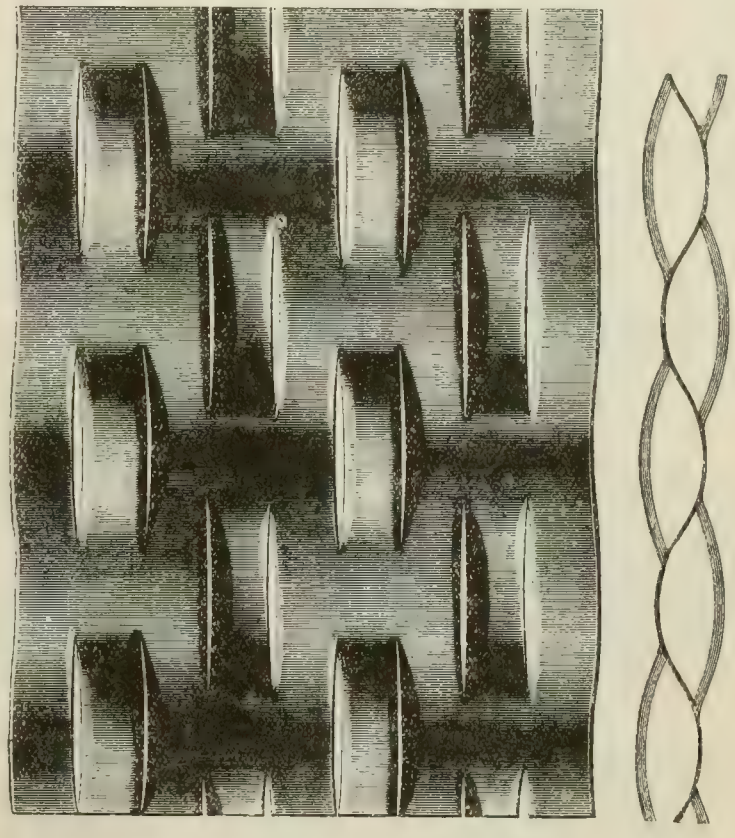
Metal lathing of a great variety of styles, beginning with small sheets of wire netting and going onward to complete sheets of metal with holes punched in them, has been used in this country for holding plaster to take the place of wooden lathing. The cut which accompanies this article shows a new form of metal lathing patented in England and manufactured by Hayward Bros. & Eckstein, Union street Borough, London, S. E., England. There are some peculiar features about this unlike anything which has heretofore been manufactured in this country. The nearest approach to this lathing is one in which bands have been punched down through flat spaces between small corrugations. It will be noticed that the edges of the projecting loops are turned upward or inward in such a way as to hold the mortar which is pressed down into it. This lathing is made in sheets, 6 x 2 feet, and it is said that a piece of plaster laid flat with 18 inches clear bearing easily supports 150 pounds in the center. It can be adapted to any form of boilers, pipes, &c. None of the metal is cut away, as will be seen by comparing the cross section with the plan. In England the cost is from 1¼ to 1½ pence per square foot, according to the character of the metal. The amount of mortar used in covering it is said to be less than that required for wood lathing, and that one coat less is necessary. Still another point which the manufacturers make is that the amount of time required for drying is considerably less.

FLASHINGS.

Gara, McGinley & Co., 13 South Seventeenth street, Philadelphia, Pa., publish a very interesting little pamphlet under the title of "House Smiths," which they are distributing to their friends in the roofing and sheet metal trades. The publication measures but 3½ x 6 inches, is bound in stiff board covers, and contains much to interest the house smith. The first four pages are arranged for serviceable memoranda. On two of the pages are lists of a variety of supplies, such as bathtubs, electric wiring, skylights, locksmiths', plumbers', roofers' and tinsmiths' work, &c. Opposite them are blank lines for the insertion of the name of the parties or firms to whom application should be made for work or supplies in the several departments. Some of the lines are filled up with the names of the publishers, one line, for example, reading: "For sheet metal work send to Gara, McGinley & Co., 13 South Seventeenth street." The latter pages contain "A Talk on the Roof," giving information about the construction and care of sheet metal roofs of different sorts. A feature of the book is a little brass chain attached to one corner with a brass eyelet for fastening to the wall.

The Cambridge Roofing Company, Cambridge, Ohio, have added numerous sheet metal specialties to their line of manufactures, which are principally iron and steel roofing, plain and corrugated. This company are now prepared to furnish eave trough, conductor pipe and all other material required to complete a metal roof.

Jacob P. Cresman, a tinsmith of 24 years' experience, has opened up a new tin shop at 137 West Main street, Norristown, Pa.



Sheet Metal Lathing.

The weight of a man is affected by the changes of the seasons. The prisoners in Hull Jail, says an exchange, were once weighed every day for a period of five years, and it was found that they increased regularly in weight from April to November, and decreased as regularly from November to March. The diet was the same all the year round, both in quantity and quality, and the temperature was kept even.

A heavy frost which visited the South at the beginning of last week caused severe injury to crops and vegetation in Tennessee, Louisiana and Mississippi. Cotton will, it is calculated, suffer to the extent of 15 to 20 per cent. of the crop.

World's Fair Awards.

Refrigerators and Hollow Ware.

Illinois—Chicago—Wickes Refrigerator Company, tile lined refrigerator room; Vienna Enamel Stamping Company, three awards, enameled steel ware, kitchen utensils, wainscotings; Belding Mfg. Company, household, grocers' and butchers' refrigerators; Paul Dalmicks, four awards, butchers' supplies, ice box, counter, block, meat sack; G. M. Shirk Mfg. Company, refrigerators, cabinets; Adams & Westlake, cans; D. R. Sperry & Co., Batavia, four awards, kettles, farm boilers, caldrons, drug mortars.

Indiana—Summit Refrigerator Company, Michigan City, refrigerators and sideboard refrigerators; Fred A. Wilke, Richmond, portable china kilns for firing decorated china and glass.

Ohio—Wagner Mfg. Company, Sidney, nickel plated cast iron ware.

Connecticut—Chapman Mfg. Company, Meriden, four awards, hardware specialties, silver, gold and nickel tea bells, sleigh and telephone bells, dog collars.

Wisconsin—Otto Zuietusche, Milwaukee, onyx and marble soda water fountain, sundry supplies; Wisconsin Refrigerator Company, Eau Claire, refrigerators and sideboard refrigerators; Jacob J. Volhath Mfg. Company, Sheboygan, enameled cast iron ware and sheet iron ware.

Michigan—Grand Rapids—Grand Rapids Refrigerator Company, refrigerators, sideboard refrigerators; John Matthews Company, refrigerators; Alaska Refrigerator Company, Muskegon, three awards, refrigera ors, ice chests, beer cooler; E. T. Barnum, Detroit, vases; Mrs. M. M. Harris, Detroit, refrigerator, the "M. M. Harris."

Pennsylvania—Griswold Mfg. Company, Erie, five awards, cast iron hollow ware, store furniture, house furnishing goods, cuspidors, post boxes; Charles Lippincott & Co., Philadelphia, soda water apparatus

Massachusetts—Boston—A. D. Puffer & Sons, soda water apparatus and all appliances; Smith & Anthony Stove Company, kettles; James W. Tufts, Chelsea, soda water apparatus and appurtenances; the Low Art Tile Company, art tile soda fountain, soda fountains; Paul J. Daemicke, Butcher Boy cooling room; Wolf, Sayer & Heller, butcher cooler; National Key Opening Can Company, key opening can.

Minnesota—The Hurd Mfg. Company, Duluth, refrigerators.

New York—Northern Refrigerator Company, refrigerators and all fixings; Iron Clad Mfg. Company, tinned, galvanized and enameled household or kitchenware, steel soda fountains, rotary ash sifters, utensils, cold handles, soda fountains, enameled sheet metal ware.

Maryland—Keen & Hagerty, Baltimore, tinned, stamped and japanned ware.

The following awards on plumbing and sanitary materials have been announced by the World's Fair Committee on Awards:

Illinois—Chicago—Lehner Johnson Hoyer Mfg. Company, plumbers' brass goods and house pumps; Norton Bros., water closets; Peck Bros. & Co., miscellaneous brass goods, brass railings and sanitary goods; Instantaneous Water Heating Company, instantaneous water heaters.

New York—New York City—Iron Clad Mfg. Company, riveted galvanized range boilers and welded galvanized range boilers; Stewart Ceramic Company, three awards, solid white crockery, stationary washtubs, bathtubs; Alberene Stone Company, alberene stone laundry tubs and sanitary and plumbing specialties.

Pennsylvania — Pittsburgh — Standard Mfg. Company, four awards, bathtubs, hollow ware, plumbers' ironware, sanitary goods; Dawes & Myler, New Brighton, bathtubs, plain and decorated laundry trays; McCambridge & Co., Philadelphia, brass materials for plumbers and porcelain water closets and lavatories.

Michigan—Detroit—Day Mfg. Company, bathtubs and heaters; Steel Bath Mfg. Company, steel clad bathtubs; Miss F. M. Goold, bathtub.

Massachusetts — Boston — Smith & Anthony Company, three awards, water closets, sinks and sanitary traps.

Connecticut — Waterbury—Randolph & Clowes, boilers and brass kettles.

Indiana—Indianapolis—Strong, Boyce & Co., water closets.

Ohio — Columbus — The Kilbourne & Jacobs Mfg. Company, wrought steel sinks.

Maine—Portland—E. M. Lang & Co., stick, drop and wire solder; Mosely Folding Bathtub Company, folding bathtubs, water heaters, separate and combined.

Foreign Countries.

Germany—Louis Wirtheim, Frankfurt, plumbers' supplies, asbestos cement and flat packings for joints of pipes, asbestos fiber and wicks for cocks and valves.

Austria — Vienna — Paul Dumont, bathtubs; L. Gutthmann, water closets.

British Guiana—Booker Bros., Georgetown, bath and vat, 600 gallons capacity of wallaba.

Sweden—Hoeganes Coal & Mining Company, The Sound, glazed earthenware pipes and tubs for sanitary purposes; Skronberge Coal & Clay Mfg. Company, Ekerly, salt glazed and other sanitary pipes.

Brazil—Canpantria Industrial, Rio de Janeiro, lead pipes.

Canada—S. C. Perkins, Ottawa, sink drop bath.

Japan — Hyogo — Awards for bamboo wares are given to T. Monishita, G. Matsuoka, M. Nakai, D. Nagata, S. Ohsashi and K. Toda.

New South Wales—W. T. Sinclair, Sydney, sanitary plumbing work.

A few exhibits in this group are not yet reported on and will be announced later.

Protection from Lightning.

(*Continued from page* 47, *September* 16.)

We now come to Lodge's book upon "Lightning Conductors and Lightning Guards," and shall get from it a more satisfactory understanding of his experiments and deductions. He believes that the current ideas on the character of the lightning discharge were not altogether correct, because the momentum of an electric current and the energy of an electrostatic charge had both been more or less overlooked. The application of the known fact of electrokinetic momentum revolutionized the treatment of certain phenomena. The old drain-pipe idea of conveying electricity gently from cloud to earth was thus proved fallacious, and the problem of protection became at the same time more complex and more interesting. His position, therefore, is not that lightning rods are useless, but that few or none of the present types are absolute and complete safeguards; and he believes it possible to so modify existing protective systems as to afford more certain protection. The problem is one, he very clearly shows, far removed from the old idea of conduction.

To day we know from the experiments of Hertz, Lodge and others that when an electric current flows steadily in one direction in a conductor its intensity is the same in all parts of the wire, but if it be of an oscillatory character—*i. e.*, a current reversing rapidly in direction—the interior of the conductor may carry far less than the surface carries.

All of which goes to prove the correctness of Snow Harris' opinion (and he probably studied the effects of lightning more exhaustively than any one else) that surface was more of a consideration in the form of a protector than solid section. In this matter of the form of a conductor we follow Lodge, and prefer the tape to the solid rod. Increase of surface diminishes impedance; and as impedance is probably at the bottom of side flashes and spittings, that conductor is to be preferred which offers less impedance, and hence tape appears to be preferable to rod. It is also more convenient, and it has also the advantage of being made either continuous or in very long lengths. The tape must be of dimensions sufficient to withstand melting or deflagration.

"Think now," says Lodge, "of a cloud and of the earth under it as forming the two coats of a Leyden jar, in the dielectric of which houses and people exist; we now have to consider what determines a discharge, and what happens when a discharge occurs. The maximum tension which air can stand is $\frac{1}{3}$ gramme weight per square centimeter. At whatever point the electric tension rises to this value, smash goes the air. The breakage need not amount to a flash, it must give way along a great length to cause a flash; if the break is only local, nothing more than a brush or fizz need be seen. But when a flash does occur it must be the weakest spot which gives way first—the place of maximum tension—and this is commonly on the smallest knob or surface which rears itself into the space between the dielectrics. If there be a number of small knobs or points, the glows and brushes become so numerous that the tension is greatly relieved and the whole of a moderate thunder cloud might be discharged in this way without the least violence. . . . But sometimes a flash will descend so quickly or it will have such a tremendous store of energy to get rid of that no points are sufficiently rapid for the work, and crash it all comes at once. One specially noteworthy case is when one cloud sparks into another and thence to the ground; or in general whenever electric strain is thrown quite suddenly upon a layer of air."

Thus, then, we begin to see that much will depend upon the character of the flash. There are many flashes, I believe, that the body could experience without very serious consequences; and there are many that will rive solid granite and shatter in splinters the heaviest masonry. With a kite in air during thunderstorms with a wire connection to the ground I have experienced sharp shocks with lightning flashes, which were perhaps side branches or minor spitting-off discharges.

The risk, then, will vary with the discharge, and this is influenced somewhat by locality, and therefore the methods of protection to be employed in the Mississippi Valley would be somewhat different in character from the methods appropriate for, say, the New England coast, the frequency of thunder storms in the one place compared with the other being about four to one. The character of the storm is also somewhat different. Then, again, the liability for places comparatively near is not the same. "If I urge on Glasgow manufacturers," said Sir William Thomson, "to put up lightning conductors they say that it is cheaper to insure." These manufacturers answered the man of science more wisely perhaps than they themselves knew. Thanks to the investigations of the Prussian Bureau of Statistics, we know now that in the main in thickly settled communities the risk is small. We can state with some certainty that there is but little need for the erection of expensive or elaborate lightning rods upon buildings standing among others in city blocks. We do not say that such buildings are never struck. As we have seen above, under some conditions "exposure" seems to have little to do with the determination of the path of discharge. The case is somewhat analogous to that of the trees and rocks upon a mountain side. However much they may determine the course of small streams and "trickles" down the mountain side, they are powerless to influence the course of an avalanche or landslide. Sometimes, there-

fore, such buildings are struck and severely injured (and as might be expected, with seemingly good protectors, do not entirely escape); but these cases are rare, and it may, we think, be safely set down that the rods upon city houses are not (as hitherto insisted upon by some) necessary. With country houses the conditions are different.

Our next question is: In flashes of ordinary intensity how much confidence may be placed in the protection afforded by a good conductor, rod or tape? Few questions have been so thoroughly discussed from a practical standpoint, and the verdict may be given in Sir William Thomson's words: "There is a very comfortable degree of security, if not of absolute safety, given to us by lightning conductors made according to orthodox rules."

If the reader is contemplating the erection of a lightning protector, these points may be of service to him:

1. Get a good iron or copper conductor of rod or tape form, preferably the latter. If copper, have it weigh about 6 ounces to the foot; if iron, about 2 pounds to the foot.

2. The nature of the locality will determine to a great degree the need of a rod. In some localities rods are imperative; in others, needless.

3. The very best ground you can get is, after all, for some flashes, none too good; therefore, do not imagine that you can overdo it in making a good ground. For most flashes ordinary "grounds" suffice, but the small resistance of even 1 ohm may be dangerous with an intense flash.

4. "If the conductor at any part of its course goes near water or gas mains it is best to connect it to them. Wherever one metal ramification approaches another it is best to connect them metallically. The neighborhood of small-bore fusible pipes and indoor gas pipes in general should be avoided."—*Lodge.*

5. The top of the rod should be plated, or in some way protected from corrosion and rust.

6. Independent grounds are preferable to water and gas mains.

7. Clusters of points or groups of two or three along the ridge rod are recommended.

8. Chain or link conductors are of little use.

9. Area of protection. Very little faith is to be placed in the so-called area of protection.

10. Indifference of lightning to the path of least resistence. Nearly every one who has written in late years has taken it for granted that lightning always follows the path of least resistance. This is not true. "It is simply hopeless to pretend to be able to make the lightning conductor so much the easier path, that all others are out of the question," says Lodge. This, however, requires modification. For the path will depend largely upon the character of the flash; and without doubt, for almost all flashes, a good lightning rod well earthed is the most appropriate path to earth.

11. Any part of a building, under certain conditions, may be struck, whether there is a protector on it or not. There are cases on record where edifices seemingly amply protected have been struck below the rods (not cases of defective connection), and it is now beginning to dawn upon us that (paradox of paradoxes) a building may be seriously damaged by lightning without having been struck at all. The Hotel de Ville at Brussels, perhaps the best protected building in the world against lightning, was damaged by fire caused by a small induced spark near escaping gas. During the thunderstorm some one flash started up "surgings" in a piece of metal not connected in any way with the protective train of metal "The building probably did not receive," says Dr. Lodge, "even a side flash, yet the induced surgings set up in it were so violent as to ignite some gas and cause a small fire." In other words, we had the condition of an "oscillator" in the cloud-flash earth and a "resonator" that responded with its little spark. In some experiments which we made last summer, simultaneously with some flashes, we got little sparks from a wire in the air.

12. So many people suffer so keenly from a kind of nervous alarm during thunderstorms that it is a great pleasure to be able to point out that the danger is vastly overestimated. "Heaven has more thunders to alarm than thunderbolts to punish," was the old irreverent way of putting it. One who lives to see lightning need not worry about the results.

13. The notion that lightning never strikes twice in the same place is erroneous. We have numerous cases disproving this.

14. If you are near a person who has been struck by lightning, go to work at once to try and restore consciousness. Try to stimulate the respiration and circulation, and do not cease in the effort to restore animation for at least one hour.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

A NUMBER OF CHURCH HEATING CONTRACTS have been awarded to Edward Dunn of 104 Market street, Newark, N. J. Among them are the St. Aloysius Church on Bowery street, Newark, where a horizontal tubular boiler was used. In the St. Leo's Church at Irvington an upright tubular boiler was used, and in the St. Nicholas Church and school at Passaic, N. J., a Mills steam boiler, made by the H. B. Smith Company, was used. The radiators in each case were those of the H. B. Smith Company.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until November 10, for the plumbing of the United States Court House, Post Office, &c. extension, at Dallas, Texas. Drawings and specifications may be obtained from the Supervising Architect at Washington, or at the office of the superintendent at Dallas.

H. C. AYER of Richford, Vt., has just completed the installation of a Boynton steam heating apparatus in the American House, in that place.

C. E. CHANNELL, Rutland, Vt., has received the contract for the plumbing on the engine houses at a cost of $849.50.

AT A RECENT MEETING of the Common Council of Newton, Mass., an order was passed appropriating $2900 for a new heating apparatus for the city hall.

THE SECRETARY of the Building Committee of Omaha, Neb., has been instructed to advertise for bids for sewerage, plumbing and gas fitting for the Long School.

THE CONTRACT for heating the new annex of the school building at Twelfth and Windsor streets, Reading, Pa., has been awarded to H. C. Geissler.

A STEAM HEATING PLANT is being erected in the Hotel Royal on Dundoff street, Carbondale, Pa.

NEW WATER CLOSETS are to be placed in the court house at Ottawa, Ontario, an order having been passed to that effect at a recent meeting of the Building Committee.

A LARGE STEAM HEATING BOILER has been placed in the basement of the J. Miller Thomas Building, at Wilmington, Del., and the building of the New Castle Insurance Company, next door, is to be heated by the same plant. The plant is said to have a capacity to heat several other buildings, and is looked upon as something of a novelty in that city.

B. H. HILLIAR of New London, Conn., has been awarded the contract for heating the new Odd Fellows' Home, at Groton, Conn. The Richmond sectional heater will be used, having been selected, we are informed, after a competition with several other heaters, which were carefully examined by the committee.

WALTER P. DUNN, 98 Market street, Newark, N. J., has recently completed the work of heating and plumbing in two houses at East Orange, N. J., for Dr. C. S. Stockton. Thatcher hot air furnaces were used for heating apparatus.

ONE OF THE HEATING CONTRACTS that is now attracting the attention of the trade is for a large factory building being put up by Tiffany & Co. of New York, at Woodside, a suburb of Newark, N. J.

THE E. BEST PLUMBING COMPANY of Quincy, Ill., have been awarded the contract for putting in the steam heating pipes and other work for the Frost Sewer Pipe Company at Macomb, Ill., at a reported price of $3000.

E. BAGGOT, 169 and 171 Adams street, Chicago, is to do the plumbing, gas fitting and sewerage in the residence of F. S. Johnston, Prairie avenue, near Twenty-second street.

J. J. WADE & SON, 298 Dearborn street, Chicago, have the contract for plumbing in the New York Life Insurance Building, La Salle and Monroe streets. The Wade sanitary fixtures are to be used throughout the building.

THE WALCOTT-HURLBUT COMPANY, 175 and 177 Lake street, Chicago, are to furnish Maelstrom syphon jet closets, enameled arm baths, Tennessee marble lavatories and other plumbing fixtures for the Lakeside Club House, Drexel boulevard and Forty-second street.

GEO. D. HOFFMAN, manager of the J. F. Pease Furnace Company, 82 Lake street, Chicago, has the following contracts on hand: First Presbyterian Church, Waukegan, Ill., steam heating, for which two horizontal tubular boilers will be required; residence of T. S. Fauntleroy, Lake Forest, Ill., Economy heater, combination of hot water and warm air; Edgewood Academy, Madison, Wis., steam heat, requiring two horizontal tube boilers and 4000 feet of radiation; Mrs. Burnap's flat building, 4212 Ellis avenue, Chicago, No. 10 Bronson steam boiler. American radiators are to be used for above contracts.

It is probable that New Haven, Conn., will spend $100,000 in repairing several of its bridges.

WORLD'S FAIR NOTES.

Geo. E. Nye

of 74 and 76 West Washington street, Chicago, makes an interesting exhibit at Column K 30. The Nye pump is of peculiar appearance, consisting of two rectangular chambers mounted on a tripod. These chambers are of cast iron. There are no pistons, but the pump is operated by the formation of a vacuum through the condensation of the exhaust steam. A small condensing chamber is placed in the rear of the two rectangular chambers. The parts are very simple, steam being admitted by a balanced automatic valve on the top of the chambers, while the suction and delivery ports are covered by four common claque values. But little floor space is occupied, and a very small amount of steam is used. One of the pumps shown in operation works admirably with the supply pipe valve almost closed. It works so smoothly that it requires no bolting down, and it will pump from 40 to 60 per cent. of sand without injury. The exhibit includes a pump with a capacity of 1000 gallons per minute, which is the largest kept in stock. Larger sizes are made on special orders, from patterns on hand.

The Deming Company

of Salem, Ohio, have a fine exhibit of steam and hand pumps at Column K 33, which has already been described in these columns. The display of hand and windmill pumps is worthy of notice in this connection. There are quite a number of exhibits of this character.

The Downie Pump Company

of New Brighton, Pa., make an exhibit at Column L 35 of pumps for deep wells. Their pumps are intended specially for artesian wells, but are adapted to any water service where the supply is obtained from wells. These pumps are shown in operation, and comprise double and single-acting for steam, belt or wind power.

The Hayes Pump & Planter Company

of Galva, Ill., make a very good display at Column L 34. Their specialty is double cylinder pumps for hand or power. These are shown in a variety of sizes, some being in operation. There is also an array of force and windmill pumps of different styles arranged attractively. The company manufacture three and six cylinder power pumps for service in pumping a large volume of water.

Sandwich Enterprise Company

of Sandwich, Ill., make an exhibit at Column K 35. The special feature of this exhibit is an aërating pump, which has but recently been brought out, for the purpose of purifying cistern water. It is an iron pitcher pump with the valves so arranged that they can be reversed by suitable levers. When reversed the pump works down instead of up and forces air into the cistern through the perforations in the lower part of the pipe. The reversing operation is almost instantaneous. The pump is shown in operation attached to a glass tank filled with water. Other pumps shown are windmill and force pumps in a variety of patterns.

Bucket Pump Company

of 441 Plum street, Cincinnati, also show purifying cistern pumps at Column K 29. One of these is in operation, with a dummy appropriately clad as a farmer's boy attached to the crank, so that he is constantly in motion, attracting much attention. The tank has glass sides to permit the aëration of the water to be seen. This pump has a series of buckets which conduct a supply of air into the water whenever the pump is at work.

H. Dickinson & Son

of Lowell, Lake County, Ind., exhibit another water purifying pump at Column L 34 This pump is composed of an endless chain, along which at regular intervals galvanized iron buckets are attached. Each of these cups is perforated at the bottom to allow the gradual escape of air from it as it goes bottom upward into the water. The bottom wheel is of such construction that it becomes an agitator also and assists in purifying the water. One of these is shown in operation in a glass inclosed tank.

The Rider Engine Company

of Walden, N. Y., have a very fine exhibit at Column K 36 of Rider and Ericsson hot air pumping engines. Many of these are in operation, the air being heated by gas jets. Some of them are used to force water to a considerable elevation. Familiar as these engines have now become in most sections of the country, the exhibit is constantly surrounded by groups of eager observers to whom the motive power is a deep mystery. The company have branch offices at 37 Dey street, New York, and 88 Lake street, Chicago.

The Detroit Lubricator Company

of Detroit, Mich., also have a very pretty display at M 25. They have erected a handsome booth, the front of which is inclosed by a railing made of pipe fittings and hot water valves, the latter being so arranged that the hand wheels make effective decorations. Five awards have been bestowed on this company, covering their locomotive and stationary lubricators, glass and brass oilers, low water alarms and hot water valves. A medal and diploma were awarded their locomotive lubricator.

Trimont Mfg. Company

of Roxbury, Mass., make an exhibit at Column M 31 of their Trimo wrenches. These wrenches are made with removable pipe jaws in a variety of sizes adapted to all classes of work. The Trimo combination wrench shown has double jaws, projecting on opposite sides, one set for plain work and the other for pipe.

The Brass & Iron Works Company

of Fostoria, Ohio, have a comprehensive exhibit at Column K 28. It covers a variety of tapping machines for tapping street mains, which are shown applied to pipes in position for work; a large number of well finished brass valves and couplings, and an array of special pipe fittings. These fittings are intended for use on iron pipe without cutting threads, and on lead pipe without the use of solder. The device is an ingenious one and accomplishes its purposes effectively. Another exhibit is a well drilling machine, with engine and tools complete, which stands ready to sink a well for natural gas, oil or water. There is also shown a line of Able's patent gate valves for water works service.

Crescent Lock Joint Stove Pipe.

The accompanying cuts represent Crescent lock joint stove pipe, introduced by Logan, Gregg & Co., Pittsburgh, Pa. One edge of the iron is grooved and pierced, as shown in Fig.

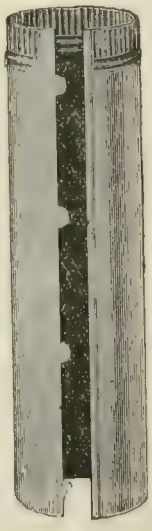


Fig. 1.—Showing Lugs and Groove.

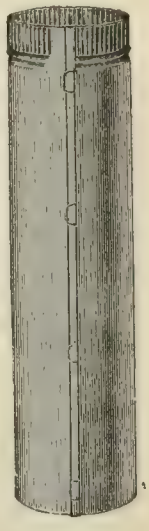

Fig. 2.—Lugs Turned Back.

Crescent Lock Joint Stove Pipe.

1, to receive the lugs formed on the other side. When joined the lugs are turned back, as in Fig. 2, holding firmly, it is stated, and making a perfectly smoke tight joint. The pipe is

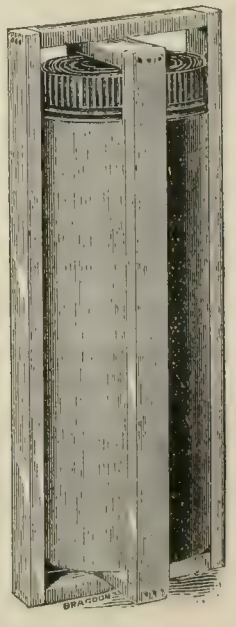

Fig. 3.—Manner of Crating Pipe.

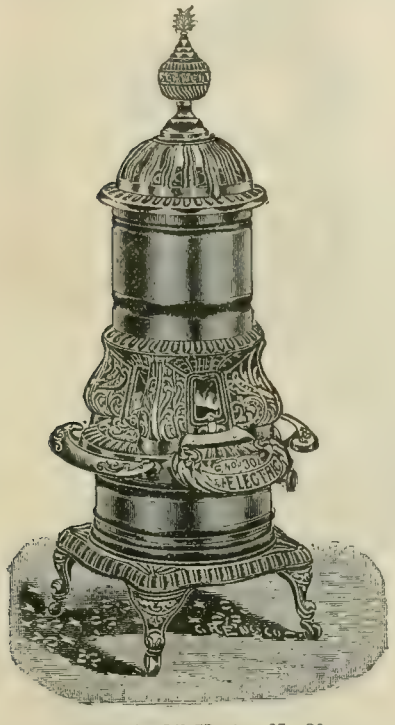
made in 4, 5, 6 and 7 inch sizes, packed as in Fig. 3, in crates of 25 joints, for shipment. The manufacturers state that they are having a large demand for the pipe wherever it has been introduced.

In a recent lecture Professor Unwin stated that compressed air transmission is practical up to at least 20 miles; 10,000 horse-power can be transmitted 30 miles in a 30-inch main at 132.3 pounds per square inch, with a loss of pressure of only 12 per cent.; the efficiency is 59 to 73 per cent. if the air is reheated, and 40 to 50 per cent. if it is used cold.

THE RETAIL STORE.

Electric Oil Heaters

The Electric Oil Stove Company of Homer, Mich., are using, in connection with the new designs of heating stoves, a burner which is claimed to effectually control the flame, while consuming the gases of combustion in such a way as to give a pure white light of great



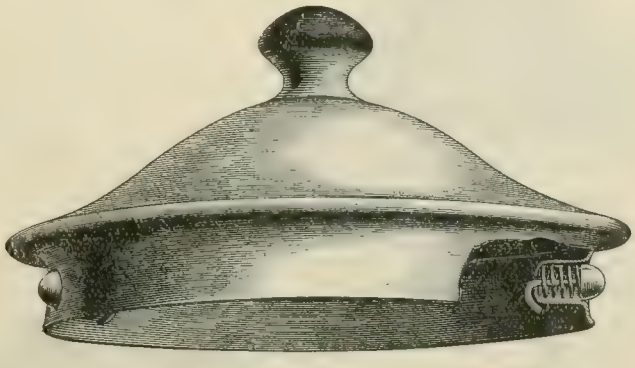
Electric Oil Heater No 30.

volume and intensity. The wick raiser, in combination with the rewicking attachment, is said to be strong and positive in its action, and that all weak points in its mechanism have been overcome. An interesting feature of the Electric oil heater is the water reservoir in the burner. The interior of the drum of the stove is arranged to arrest and retain the heat, making it a strong radiator, while four ventiduct flues exposed to the direct action of the fire create a constant circulation of hot air through the stove and aid in the uniform distribution of the heat. The oil tank, water reservoir, wick tube, &c., are made of rolled sheet brass. The capacity of the oil tank is about 1 gallon, the location being such that the cold air passes entirely around it, thus keeping the oil cool. An ornamental drop mica door gives easy access to the burner for lighting, without the necessity of tipping back the upper part of the stove. The castings are highly polished and nickeled, giving a brilliant effect. The stove here illustrated is known as the No. 30, and is claimed to have a heating capacity of from 2000 to 2500 cubic feet in cold weather. The diameter of the stove at the base is 16 inches and the hight 38 inches.

The company have also brought out what is known as their No. 5 Electric, designed to meet the call for a low priced oil heating stove which can be converted into a cooking stove when necessary. This is especially intended for heating sleeping rooms, conservatories, bathrooms, &c. The drum around the combustion chamber and also the radiating drum have double walls, forming a continuous flue for carrying the cold air around the oil tank, and then passing it into the interior of the radiating drum, and out at the top of the stove in a highly heated condition. By removing the radiating drum the stove is made available for cooking purposes. It is equipped with the improved Electric burner and uses a 9-inch circular wick of double thickness.

Cover with Springs.

Boas Brothers, 231–325 Greenwich street, New York, are using their patented springs on tea and coffee pot covers, in connection with their Adamant enameled ware, as illustrated herewith. The springs and knobs are made of brass to prevent rusting, the spring holding the knob against the inside of the rim of the pot with enough force to prevent the cover from falling off when pouring from the pot. There is no offset on the inside of the pot's rim, so the cover may be lifted off almost as easily as if the springs were not there.



Cover with Springs.

Champion Egg Opener.

The Champion egg opener is offered by the Magic Introduction Company, 321 Broadway, New York. The handles are loop shape, similar to scissors handles. The curved pieces which surround the egg are provided with sharp teeth, so as to cut off the top of the egg shell. The opener is designed for table use, to obviate the unpleasant results that accompany opening soft boiled eggs with a knife or spoon ; also for use in the kitchen, by which the contents of the egg are exposed while yet in the shell, thus avoiding the spoiling of a bowl full of good eggs by dropping a bad one into them. The openers are made in nickel and silver plate, embossed, the silver plated ones being put up in satin lined cases.

HALL BROTHERS of Lincoln, Neb., have recently filed articles of incorporation with the Secretary of State under the name of the Hall Bros. Company, the business of the concern dating from October 16. The incorporators are H. J. Hall, Charles Hall, J. E Hall and J. L. Baxter, and the capital stock of the company $10,000. The business will consist of the sale of stoves, ranges, furnaces, &c.

A Road Skate.

A writer in the *Ironmonger* says: A rather formidable competitor of the cycle has made its appearance in the Midlands in the shape of a pneumatic road skate. It has lately been seen in the streets of Birmingham, and, judging from the admiration it excites, is not unlikely to find its way soon into all parts of the country. The invention, which was patented a short time ago by a Scotch firm, is evidently derived from the old roller skate of skating rink celebrity; but, whereas the ordinary roller skate has four wheels, the pneumatic skate has only two, placed in line at either extremity of the skate. The wheels are rather larger than those of the roller skate, and, instead of solid rubber, are covered with pneumatic tires. The patentees claim for them that one can skate over ordinary turnpike roads with them the same as on ice and at even greater speed, while at the same time they will easily ascend and descend hills. Six or seven miles an hour, however, is the maximum speed attempted in the streets of Birmingham, and that only on smooth roads. One obvious advantage of the pneumatic skate over the pneumatic cycle is that punctured tires may be readily replaced, as the skater may carry surplus tires, or even reserve wheels ready fitted, in his overcoat pocket.

THE SUDDEN DEATH of Charles W. Cotchett, who represented the Peck, Stow & Wilcox Company to the trade of this city and vicinity, occurred October 18, and is appropriately announced by the company. They speak of him as a young man of sterling intergrity, faithful to their interests, beloved by his associates and popular with their customers. The funeral services, October 20, from his late residence, were attended by the New York managers and employees in a body, the store having been closed for that purpose.

Oil and Gas Heaters.

The accompanying cuts represent three styles of a line of oil and gas heaters manufactured by the Manhattan Brass Company, 44 Murray street, New York, and 506 Masonic Temple Building, Chicago. Fig. 1 shows the No. 40 Star heater, which is made entirely of brass, with the exception of a Russia iron drum and aluminum top or cover. The base is nickel plated, of attractive design, with central draft burner and large wick. The wicking arrangement is simple, the wick being slipped over a cylinder, which expands at the top as the cylinder is turned down, and is thus held in place by teeth, without the aid of bands or tying. The wick is raised or lowered by turning the thumb screw either above or below the base. By turning the small projecting knob in the oil reservoir funnel, which is opposite the wick raiser, a register is opened, and into this funnel the oil is poured when filling. An indicator in the center of the funnel shows the amount of oil in the reservoir, whether full, half full or empty, enabling one to see at a glance when the reservoir needs replenishing with oil. The drum is held in position on the rim by a loose hinge and spring; in lighting the heater the spring is pulled back and the drum is tipped backward. The rim is perforated at the bottom, and the drum has perforations at the top as well as in the sides. When it is desired to heat anything at the top of the drum, or to have the heat ascend, the aluminum top is taken off, leaving a flat surface. The point is made that the movable top, being made of aluminum, will not discolor. The manufacturers claim that there is no disagreeable odor from these brass heaters, that 1 gallon of kerosene will heat a room 8 to 12 hours, and that the heaters may conveniently be carried from place to place. The heater is made with three other styles of bases besides the one shown, one of these bases being square. Bases are furnished in brass finish, nickel and all brass; also with brass drum. The Hygienic heater, shown in Fig. 2, besides embodying the advantages of the Star heater, has a water tank to moisten the atmosphere. The tank surrounds the burner and is designed to hold enough water to keep up evaporation until the oil tank needs replenishing. The deflector, which in Fig. 2 is being held in the hand, has perforations at the inner edge through which the vapor passes as it rises from the heated water. Thus rising close to the flame, the moisture is thrown out into the room. The No. 48 heater weighs 12 pounds, is 33 inches high and has a drum 9 inches in diameter. The drum and movable top of the gas heater in Fig 4 are the same as used on the oil heaters. It is claimed that the gas burner is so constructed that the gas is superheated before being burned, in this way utilizing the gas to better advantage than in the ordinary burner.

Fig. 1.—No. 40 Star Heater

Fig. 2.—No. 48 Hygienic Heater.

Fig. 3.—Drum for Hygienic Heater.

Fig. 4.—Gas Heater.

Twenty vessels and 54 lives was the total loss on the great lakes during the furious storm which swept over them last week. The value of property lost is estimated at over $700,000.

STOVE TRADE NOTES.

The World's Fair Awards.

The work of the World's Fair judges having practically been completed, announcements are now appearing of the various exhibits that have secured awards of medals or diplomas. Many stove merchants will doubtless wonder why it happens that the leading stove companies, a number of whom made exhibits at the fair, have not received awards. Their customers also may wonder why so many apparently insignificant articles have won medals and diplomas while most artistic and scientifically designed stoves have been wholly overlooked. The fact may be forgotten by this time, but in July last we published an important statement bearing on this particular question.

For reasons best known to themselves the following concerns at that time withdrew their exhibits from competition for premiums or awards: Rathbone, Sard & Co., Peninsular Stove Company, Buck's Stove and Range Company, the Michigan Stove Company, the Fuller-Warren Company, Cribben, Sexton & Co., Chicago Stove Works, Wm. Resor & Co., Orr, Painter & Co., the Collins & Burgie Company, Abendroth Brothers, the Thomas, Roberts, Stevenson Company, Co-operative Foundry Company of Rochester, Wm. Miller Range & Furnace Company, Estate of P. D. Beckwith, Richardson & Boynton Co., the Wilcox Water Heater Company. This list covers a very large majority of the stove companies who made exhibits. They had the option of either permitting their goods to enter into competition with others in the same line or of withdrawing them and they preferred to take the latter course.

The same policy was pursued by very many exhibitors in other lines, who either did not value the medals and diplomas to be given, or were not willing to trust to the decision of judges who might not be experts competent to decide as to the special merits of the articles in which these exhibitors were interested, although competent to pass upon other matters coming under their jurisdiction. In some cases the mass of exhibitors from certain foreign countries withdrew exhibits from inspection for awards without regard to the classes in which they had been thrown.

There is nothing singular, therefore, about the action taken by these stove manufacturers. They could have permitted their stoves to be judged if they wished to do so, but they exercised their right as exhibitors in withdrawing their goods, and consequently no medals, no diplomas, no awards of any kind.

Air Filters for Furnace Supply.

BY L. M. W.

The amount of dirt that finds its way into a house through the air supply to a furnace has been found a serious matter in many cases. Sometimes it is pure and simple dirt that has been taken up and brought in by the air current and deposited on the furniture and carpets. The sharp fine grit may destroy the polish on furniture, at other times it may be blown against and deposited on pictures, ceilings, cornice or frescoing, which soon need to be restored at a considerable expense. While this is true of dust or dirt, a much more lamentable effect is noticed from the soot laden air of some soft coal burning cities. With the increasing elegance of homes the question of disposing of this destroyer becomes more important and will demand more attention in the future than it has in the past. At present the ruin it effects is endured largely because to the average mind no remedy seems applicable to the trouble. A simple air filtering device, however, has been used with results that are sufficiently satisfactory to warrant a description of its construction. An enlargement is made in the cold air box for a space of from 4 to 6 feet, according to its dimensions, so as to double its capacity. For example, if the box was 15 x 30 inches it should be enlarged to 30 x 30 inches for a space of 5 feet, as shown in Fig. 1. About midway of the 5-foot space on one side there should be a door 3 feet wide and the other dimension the full size of the box. This is to permit the insertion and the removal of a wooden frame to which the filter is attached. The frame is of the full dimensions of the box and long enough to just go through the door snugly. Strips 1 inch square should be fastened to the top and bottom of the box, running across it, to hold the frame in its proper place, particularly when the enlargement is made on an upright portion of the box. This frame, Fig. 2, is to receive the filtering material, which should be any loose woven cheap material, preferably cheese cloth. At each end of the frame and on each side holes are bored about 3 inches apart to receive a ⅜-inch rod, over which the cloth is stretched. The cloth is woven

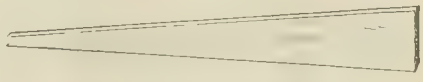


Fig. 3.—Air Filter Wedge.

Air Filter for Furnace Supply —Fig. 1.—Vertical Section Taken Lengthwise.

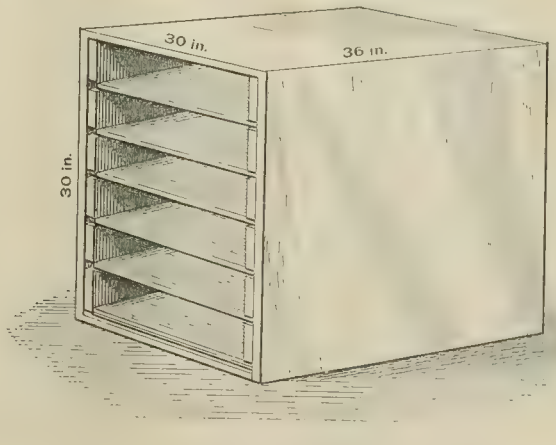

Fig. 2.—Frame for Filter with Cloth Stretched.

over the rods in a zigzag fashion and the ends secured by nailing a narrow strip over them and to the frame. In order to prevent the air from passing by the edges of the cloth wedge shape strips, shown in Fig. 3, must be provided to insert in the spaces between the cloth on both sides of it and at each side of the frame. It will take several yards of cloth to make such a filter. After the first cloth is stretched it is easy to put in another, by sewing the new material to the end of the old cloth and simply pulling it through the rods after the wedges have been removed. The more fre quently the cloth is renewed the cleaner the air will be. In dry, windy weather dust accumulates very quickly, and is liable to be deposited in the filter, whether it is placed horizontally or vertically, in such quantities as to close a large portion of the cloth. It is highly important that the cloths shall not remain so long in use as to become clogged and reduce the air supply to an extent that the furnace is stifled and overheated, when it will render poor service, waste fuel, and some part may be destroyed as the result. Such a possibility can be avoided by closely watching the cloth. Cloths that have remained in use a month have in some cases done excellent service, and shown that their use is highly beneficial, but have also shown by their condition that they should have been renewed much sooner. The excellent work the filter does, however, overbalances the watchfulness and little labor necessary for its renewal, while the cost of the cloth is insignificant. The enlargement of the air box is to provide an air chamber on both sides of the filter and to enable the use of a filter with an expanse of surface so large as not to materially obstruct the air current. When used in this form, and the cloth frequently renewed, much benefit has been derived from the freedom from dust which it insures. A modification of this filtering device could be used in connection with indirect steam and hot water heating stacks that would not only purify the air, but would likewise prevent the accumulation of dust on the heating surface, which impairs its efficiency.

A New Trade-Mark.

We present herewith an illustration of the new trade-mark of A. Weiskittel & Son of Baltimore, Md., which they say has been adopted for their general line of gas stoves. This information comes to us on a new letter head containing the trade-mark and motto "Most Com plete Plant in the World," and on an engraving of a handsome oven door at the left are the words, "Iron Founders, Brass Founders, Brass Finishers and Nickel Platers." At the right is the firm name, above which are the words, "Established 1850," and below the statement that they manufacture fine stoves, ranges and fire place heaters. The letter states that they believe they are the first manufacturers of gas stoves to adopt a trade-mark of which they will make a specialty in advertising their gas stoves. During the last year they have made extensive improvements in their plant, among them being the addition of a brass foundry and complete brass finishing department. It contains all the latest tools and machines for the manufacture of gas cocks and other fittings belonging to gas goods. The company also state that at present their plant is running full time, a considerable demand existing for their gas heating stoves and other goods.

Future of the Hot Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

FUEL ECONOMY.

One of the first questions asked by the prospective purchaser of a hot air furnace is "How much fuel will it take to heat my house with your furnace?" and the aforesaid and prospective purchaser expects to receive a definite reply without considering the fact that it is impossible for any one to predict the amount of fuel a furnace in any particular house will burn unless he knows in advance not only the conditions which affect the working of the furnace, the character of the building and nature of the smoke flue to which the furnace is to be attached, but also the general climatic surroundings of the house.

Notwithstanding the fact that no dealer can safely guarantee the consumption of fuel by any particular furnace in any particular place, a great many dealers have given guarantees upon the fuel to be burnt and have suffered in consequence. No two furnaces, though placed in buildings of the same size, standing side by side, will perform their work in exactly the same way with the locations of the furnace and the conditions apparently identical.

Why this should be so no one has yet been able to determine. It is possible that one solution of the problem would be that no two houses can be built exactly the same, that one building may be exposed a little bit more than another immediately adjoining the same. Also, the fit of the windows and doors may be different in different houses, and thus affect the heating of the same.

If one could know in advance exactly the circumstances and conditions of each and every job a dealer might estimate very closely the consumption of fuel, and yet this consumption of fuel would be modified very greatly by the management of the furnace itself, and also by the character of the occupants of the building to be heated.

Thus, owing to the uncertainty of estimating closely the fuel consumption of furnaces, the makers of furnaces have given to their heaters a varying capacity, which allows for considerable leeway in the capacity of furnaces in question, and leaves to the dealer the matter of the selection of the size to be used in the different houses in which he installs heating apparatus.

The fuel consumption or fuel economy of furnaces depends also very largely upon the selection of the proper size for the house in question. In many cases it has been found advisable to use large size furnaces in houses of moderate size when the exposures are very bad or the location where very high winds from the north or northwest prevail during the winter months.

COMPARATIVE FUEL CONSUMPTION.

A dealer is frequently asked, when figuring on heating a building with a hot air furnace, to state to the owner whether or not his heating apparatus will consume more or less fuel than will the steam or hot water plant which is being advocated by some other contractor, and many dealers are at a loss to estimate the comparative fuel consumption of the different systems of heating now before the people.

The experience of heating contractors and engineers in heating dwellings of fair size, say from 25,000 to 40,000 cubic feet, is that the consumption of fuel by the hot air furnace is no greater on the average than with hot water or steam, or with either of these systems in combination with hot air.

If this statement can be relied upon, and it has been attested to by the experience of many, the hot air furnace really stands foremost, for the reason that in almost every furnace job the supply of air comes wholly from without and this air is taken into the furnace at a temperature from 60° to 100° below the temperature at which it is sent into the rooms above, and this is a performance that certainly is remarkable and calls for a very high degree of economy on the part of the heater.

On the surface it would appear that steam and hot water would have a decided advantage over hot air, and the same is true of buildings of large size, but for dwellings of moderate size it can be steadily asserted that the hot air furnace will sppply air at as low a cost for fuel as any other system on the market.

(To be continued.)

A New Trade-Mark.

DeHaven & Co., Limited, Pittsburgh, Pa., are offering to the trade a new open front parlor stove, which they have named the Perfect Cinderella Franklin. This stove is referred to as having patent automatic blower, draw center basket grate, and is fully embellished with nickel and tile. Its qualities for heating purposes are also emphasized, and the statement is made that the defects common to Franklin

stoves have been removed. It is made in three sizes, Nos. 12, 14 and 16, and full information concerning it will be furnished by the firm upon application.

Fluxes.*

Fluxes is the name or term applied to a substance which imparts igneous fluidity to metals when in a molten state, and has the power to separate metals contained in metallic ores from the non-metallic substance with which they are found in combination, and also to separate from metals, when in a fluid state, any impurities they may contain. Fluxes are also used for the purpose of making a fluid slag in furnaces to absorb the non-metallic residue from metals or ores and ash of the fuel and removing them from the furnace to prevent clogging and keep the furnace in good working order. The materials used as fluxes for the various metals consist of mineral, metallic and chemical substances found suitable for separating metals from their ores and cleansing them of impurities, and are numerous and varied in nature and composition. But this evening we shall only consider those employed in the production of iron and the melting of iron for foundry work. The mineral substances employed for this purpose are numerous, but they consist principally of the carbonate of lime in its various forms, the principal one of which is limestone.

Foundrymen long ago conceived the idea of using limestone as a cupola flux. In many foundries it is the practice to use a few shovels or a few riddles of finely broken limestone in the cupola on the last charge of iron, or distributed through the heat a few handfuls to each charge of iron. The object in using limestone in this way is not to produce a slag to be drawn from the cupola, but to make a clean dump and a brittle slag or cinder in the cupola that can be easily broken down and chipped from the lining when making up a cupola for a heat. Limestone used in this way does not produce a sufficient quantity of slag to absorb the dirt from the iron and ash of the fuel and keep the cupola open and working free, but rather tends to cause bridging and to reduce the melting capacity of the cupola. The making of a brittle cinder in a cupola by the use of limestone depends to a great extent upon the quality of the stone. The results obtained from the use of limestone in small quantities in a cupola are so uncertain that I do not think they justify a foundryman in using it.

The tendency of slag or cinder in a cupola is to chill and adhere to the lining just over the tuyeres and prevent the proper working of the furnace. So great is this tendency to bridge that a small cupola will not melt properly for more than two hours and a large one for more than three hours. To overcome this tendency to clog and bridge foundry men in many cases have adopted the blast furnace plan of using a large percentage of limestone as a flux in their cupolas and tapping slag.

When a large percentage of limestone is charged it forms a fluid slag. This slag settles through the stock to the bottom of the cupola, and in its descent absorbs the ash of the fuel and dirt or sand from the iron and carries them to the bottom of the cupola, where the slag and dirt it contains may be drawn off and the cupola kept in good melting order and in blast for days at a time.

The amount of limestone required per ton of iron to produce a fluid slag depends upon the quality of the stone, the ash of the fuel and the condition of the iron to be melted. It is the custom in some foundries where the sprues and gates amount to from 30 to 40 per cent. of the heat to melt them without milling to remove the sand, and to use enough limestone in the cupola to produce a sufficient quantity of slag to absorb and carry out of the cupola the sand adhering to them. In this case a larger percentage of limestone is required than would be required if the sprues and gates were milled and only clean iron melted. Poor fuel also requires a greater amount of slag to absorb the ash than good fuel, and a lean limestone must be used in larger quantities than a stone rich in lime. The quantity required to produce a fluid slag amounts to from 25 to 100 pounds per ton of iron melted. The weight of slag drawn from a cupola when the sprues and gates are not milled and the cupola is kept in blast for a number of hours is about one-third greater than the weight of limestone used. When the sprues and gates are milled the weight of the slag is about equal to the weight of the limestone. When the cupola is only run for a short time and slag only drawn during the latter part of a heat the weight of slag is less than the weight of the limestone. The slag drawn from a cupola has been found by chemical analysis to contain from 4 to 7 per cent. of combined iron and numerous small particles of shot iron mechanically locked up in the slag, which cannot be recovered except at a greater cost than the value of the iron. In a number of tests made in the same cupola to ascertain the percentage of iron lost in melting when the cupola was slagged and when it was not slagged, I found the loss of iron to be from 3 to 4 per cent. greater when the cupola was slagged.

Effect of Flux Upon Iron.—Many of the limestones and other mineral substances employed as cupola fluxes contain more or less finely divided oxides, silicates, &c., in combination with earthy materials. The conjoined effect upon iron of these diffused impurities in a cupola is to prevent the metal from running clean in the mold or making sharp, sound castings, and the tensile and transverse strength is frequently impaired by them. The tendency of the cupola furnace is to clog and bridge over the tuyeres, and concentrate the blast upon the iron through a small opening in the center and injure its quality. If by the free use of limestone we prevent bridging and keep the furnace working open and free we avoid injuring the iron in melting by the concentration of a strong blast upon it. The effect, therefore, of limestone in a cupola is not to improve the quality of iron, but to prevent its deterioration in melting.

The Action of Fluxes on Linings — Limestone and other minerals employed as fluxes frequently contain impurities which enter into combination with the lining material of a furnace and render it fusible. This fact was fully illustrated at the foundry of John D. Johnson & Co., Hainesport, N. J., a few weeks ago. The cupola front had been put in with new molding sand for a long time and no flux used in the cupola. The sand made an excellent front that resisted the action of the heat and molten iron upon it. As the heats enlarged it became necessary to use flux and top slag to run off the heat. Oyster shells were used and produced a slag that flowed freely from the slag hole and had no effect upon the sand in the front. When the supply of shells became exhausted a limestone was used in place of them. Trouble then began with the front. It was melted by the flux into a thick tough slag that settled down and closed up the tap hole, and the iron could only be drawn by cutting away a large portion of the front to enlarge the tap hole. Mr. Johnson called at my office to learn what could be done to keep the tap hole open. I advised that the front material be changed and a mixture of fire clay and sharp sand be used instead of molding sand. This was done and there was no further trouble in keeping the tap hole open and in good order to run off the heat. This serves to illustrate the effect of fluxes upon lining material.

From the various qualities of cupola brick and lining material now in the market a lining may be selected that will resist the action of almost any flux or slag, and foundrymen may select a flux to suit the lining or a lining to suit the flux, whichever they find it to be the most profitable in their locality.

How to Slag a Cupola.—Foundrymen sometimes experience trouble in slagging their cupolas. This is largely due to lack of knowledge in charging the limestone and drawing the slag, for any cupola can be slagged if properly worked. To draw slag from a cupola a sufficient quantity of limestone or other slag producing material must be charged in the cupola with the iron to make a fluid slag. The exact amount required can only be learned by experimenting with the fluxing material used, but is generally from 50 to 60 pounds of good limestone per ton of iron when the remelt is not milled. The limestone is generally charged on top of the iron, and is put in with each charge after the melter begins using it. No limestone is used with the iron on the bed or first few charges of iron. In small cupolas limestone is generally charged with the second or third charge of iron. In large cupolas, when the charges of iron are light, six or eight charges, or generally about one-sixth of the heat, are charged without limestone. This is the way limestone is used when the cupola is run in the ordinary way for a few hours. When the cupola is run for some special work the limestone is charged in a number of different ways.

The slag is drawn from the cupola through an opening known as the slag hole. This opening is made through the casing and lining under the lower level of the tuyeres, and at a point in the cupola where it will be out of the way in removing iron from the spout and convenient for removing the slag. The hight the slag hole is placed above the sand bottom depends upon how the iron is drawn from the cupola. When it is desired to hold iron in a cupola until a sufficient quantity is melted to fill a large ladle the slag hole is placed high, and when the iron is drawn as fast as melted the slag hole is placed low.

When a slag hole is placed high slag can only be drawn as the cupola fills up with iron and raises it to the slag hole. When the iron is withdrawn from the cupola the slag falls, and the slag hole is closed with a bod to prevent the escape of the blast.

When the iron is withdrawn from a cupola as fast as melted the slag hole is placed low, and when opened it is permitted to remain open through the remainder of the heat. This is the best way of drawing slag from a cupola, for the flow of the slag is regulated by the amount of slag in the cupola, and if the

*Paper read by Dr. Edward Kirk at the October meeting of the Foundrymen's Association held in Philadelphia.

hole is not made too large there is no escape of blast. The slag in the bottom of a cupola takes up impurities from the fuel and iron, and if permitted to remain in the cupola for too long a time it may become so thick that it will not flow from the slag hole; or it may be filled with impurities, become overheated, boil up and fill the tuyeres with slag, and when boiling it will not flow from the cupola through a small slag hole. The time for drawing slag from a cupola is, therefore, a matter of great importance. The slag hole is generally opened in from half an hour to an hour after the cupola begins to melt, and when placed low is permitted to remain open through the remainder of the heat. When placed so high that slag can only be drawn when the cupola fills up with molten iron it should be opened as soon as the slag begins to rise and closed as soon as it falls below the opening.

Does it Pay to Slag a Cupola?—Nothing is gained by slagging a cupola when the sprues and gates are milled and the heat can be melted successfully in the cupola without slagging. But a great saving in labor and wear and tear of machinery can be effected in many foundries by melting the sprues and gates with the sand on, and slagging the cupola to carry the sand out and keep the cupola working free. A cupola cannot be made to melt iron faster by slagging than it can without slagging, but it can be kept in blast and in good melting condition for a greater length of time and a much larger amount of iron melted by slagging. Foundrymen who find their cupolas temporarily too small to melt the quantity of iron required for their work can overcome the difficulty by slagging the cupola and keeping it in blast for a greater length of time. In endeavoring to make an estimate of the cost of slagging a cupola I found that the cost of limestone in different localities varied from 50 cents to $3 per ton. The amount used varied from 25 to 100 pounds per ton of iron melted. The amount of slag drawn varied from 25 to 100 pounds of iron. The iron combined with the slag varied from 4 to 7 per cent. With the wide differences in the cost and quality of limestone used and the difference in the quantity of slag drawn and percentage of iron it contained, I found it impossible to make an estimate that would be of any practical value to foundrymen. Such an estimate must be made at each foundry to be of any practical value.

Oyster, clam and other shells are frequently used as a flux in place of limestone in localities where they can be procured at a less cost than limestone. The shells are charged in the same way as limestone and in about the same proportions to the iron. They may be used in place of limestone, either in large or small quantities, and have about the same effect upon the iron and cupola as limestone. When used in large quantities they produce a fluid slag that keeps the cupola working free and flows freely from the slag hole, carrying with it the refuse of melting that clogs a cupola.

Marble is another of the carbonates of lime and the spalls or chippings from marble quarries or works are quite extensively used in some localities as a cupola flux.

There are a number of other minerals such as fluorspar, feldspar, quartz rock and numerous chemical compounds that are used as cupola fluxes, but I will leave these for consideration at some future time.

The Baxter Stove Company

of Mansfield, Ohio, send us a pamphlet in a robin's-egg blue cover, with embossed design and gilt letters, which is the twenty sixth annual catalogue and devoted to the Baxter Banner stoves and Monarch vapor and gas stoves. This combination of coal, vapor and gas goods under one cover is a new departure with them, although they state that early in the season this catalogue will be supplemented by a special one of oil and vapor goods. The pamphlet contains 158 pages, the first being devoted to an illustrated title page, the pricipal feature of which is the Superb Banner, a handsome square parlor heater for 1893. Then follow portraits of the members of the company, an engraving of the plant and next their trade-mark. After the preface follows the line of goods, the Banner range taking the leading place, followed by the Pacific Banner, the new Grand Banner, which is shown by half-tone engravings; the Royal Banner and the Premium Banner range. The Majestic Banner is a brand new wood range, which is claimed to be first class in every particular and has all the Baxter specialties of balanced oven door, patent covers and centers, patent removable bottom oven plates, and is ornamented in the latest and most artistic design. The oven door has an extra large nickel panel with art tile and a ventilated oven door handle. An ornamental high shelf and white enamel reservoir are other features. The Majestic Banner cook has all the original features of the Majestic Banner range, and is also furnished with reservoir and low closet. The Favorite Banner is a new medium priced wood cook made with reservoir and with reservoir and closet. These are followed by the Welcome Banner, Windsor with elevated oven, and Success, completing the line of cook stoves shown. The Banner Franklin leads their line of heating goods, followed by the Brilliant Banner for coal or gas, materially improved for 1893. Of the Superb Banner, which occupies the central place in the engraving at the front, they say: "This is the most beautiful stove we make." These are followed by the Windsor Banner, Floral Banner and Model Banner heating goods, and the Genial Banner, which is an entirely new and beautiful parlor stove, mounted with a Russia finished steel jacket. A line of box and Todd wood stoves follows, the Banner High Shelf No. 1 being entirely new. These goods are followed by the Monarch gasoline ranges and cook stoves. Some are cabinet ranges and others rest on skeleton frames. Of the Monarch new method they say substantial improvements will be made, shown in their catalogue specially devoted to these goods, which will be issued later on. With reference to their Monarch gas stoves they state that they have made a special department in their factory equipped for the manufacture of these goods, recognizing that gas is to be the fuel of the future. Only a portion of the line of gas stoves is shown here.

ODD PLATES.

The Majestic Mfg. Company, St. Louis, Mo., are enjoying a heavy run of orders for their steel plate and malleable iron family ranges and have been compelled to increase their manufacturing facilities accordingly. They are at present turning out 54 complete ranges daily, and find these not sufficient to meet the demands of the trade. The increase in the manufacturing facilities will enable them to increase their output 25 per cent.

Among recently authorized corporations in Illinois, a license has been granted to the Converse Heating Company, at Chicago, capital stock $10,000, to manufacture and deal in heating apparatus and appliances, cooking and culinary utensils; incorporators, Lyman P. Converse, George K. Harrington and W. P. Craig.

Walker & Kepler of 531 Chestnut street, Philadelphia, the general agents of the Carpenter Electric Heating Mfg. Company, have issued an illustrated 16 page catalogue under the title "Cooking and Heating by Electricity." The catalogue covers a line of cooking utensils having electricity applied directly to each article. The line covers coffee and tea pots, stew pans, tea kettles, broilers and toasters, chafing dishes, pancake griddles, skillets, baking ovens and disk heaters. The different articles are well illustrated, and illustrations are also given of electrically heated curling tongs, heaters, sad and polishing irons, hat irons, goose irons, glue pots and sealing wax heaters. The latter pages of the catalogue are devoted to a house and office radiator and an atmospheric heater. The goods are all described as being adapted for use on any electric light wire in domestic use.

Robert Campbell, the New York agent of the Abram Cox Stove Company of Philadelphia, is making some substantial improvements to his showroom at 305 Pearl street. A fine exhibit is made of the Novelty line of hot air furnaces.

The death of G. G. Hallett, at his residence in New York, removes a man who was well known to the stove trade throughout the country.

The Michigan Stove Company are furnishing their customers with neat water proof signs, which are to be tacked in conspicuous places "around town." These signs have a bright blue ground, while the lettering stands out in white. The company's trade-mark is a conspicuous part of the sign.

The Union Stove Works, 70 Beekman street, New York, announce to the trade by a circular that they have just added to their extensive line of Commander furnaces a new No. 54 portable, with new steel or cast iron radiator and slicing, shaking and draw center grate. The No. 54 is designed for heating large buildings which require a hot air furnace of more than ordinary power. It can be furnished when necessary with legs to raise it 4 inches above the floor, in order that the air supply may be taken from the room in which it is set. They give the grate surface as 25 inches in diameter and the fire surface as 29½ inches, and claim for it a heating capacity of 12 to 14 rooms, or about 70,000 cubic feet.

Henry N. Clark, 103 105 Blackstone street, Boston, Mass., favors us with a copy of the catalogue which he has issued relative to stove, range and furnace repairs. Attention is also directed to stove dealers' supplies of all kinds, as well as to price-lists of hollow ware, sinks and other goods likely to interest the trade. The catalogue is made up of 176 pages, of which something over 60 are devoted to lists of stoves for which repairs can be supplied. In offering this catalogue to the trade Mr. Clark directs special attention to the large and extensive variety of repairs,

(Continued on Page 63.)

TRADE REPORT.

The Iron Market.

The certainty that the purchasing clause of the Sherman bill will be repealed unconditionally has revived hope, and is received with satisfaction. Some authorities in the Iron trade expect an increased volume of orders and a more cheerful tone. Others believe that repeal now has simply saved us from additional disasters. It is probable that a good effect may be produced in another direction. There is evidence that during the protracted period of doubt over the fate of the silver question sales of Steel were made at very low prices for delivery very far into next year. Now that this danger is over a more conservative course may be followed.

Another question will come to the front which is expected to influence adversely developments in the Iron trade. There are many clear headed men engaged in the business who are convinced that nothing so radical in the way of tariff revision will be formulated by Congress that it will hurt the industry. A large majority of earnest and sincere persons, however, do believe that any change in the present rates of duty will do quick and lasting harm. Until it is known what those changes are to be their effect cannot be measured.

This broad statement may be made, so far as this winter's business is concerned, that no cut in rates likely to be passed will enable a buyer to purchase at lower prices than those now prevailing through the influence of fierce domestic competition at a time of unparalleled depression. As for the reflex action upon the Iron trade of disastrous effects upon other national industries, the case may be entirely different. It is remote, however, and should not affect perceptibly business which is pending or must come out for early settlement.

A little more work has come out lately in many directions, but it is far from being enough to put even a semblance of backbone into sellers.

Pig Iron.—In the New York market buyers are taking Iron only for immediate requirements, and the market continues very dull. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

The Philadelphia market is described as dull, listless and apathetic. Consumers appear to be absolutely indifferent in regard to the future course of the market. All they care to do is to provide for current requirements, leaving the future to take care of itself. Consequently, sellers find it impossible to make much headway on such a market, and are therefore taking such business as they can get at current quotations, or as near to it as may be. This in the aggregate is very trifling compared with any similar period during the past three or four years, notwithstanding the fact that prices are at the lowest ever known. Sales are mostly at about the following quotations for Philadelphia or nearby deliveries, with occasional sales of round lots at 25¢ @ 50¢ less money: $13 @ $13.50, delivered, for No. 2 Foundry, and $14 @ $14.50 for No. 1. Southern Irons can be had at less money, several lots having changed hands at $11.50 @ $11.75, with a fair chance that orders could be placed at the same figures for good sized lots and prompt settlements.

The business of the past week in the Chicago Pig Iron market has been of an irregular character. Some houses have been so fortunate as to capture a few good orders. One of these was for 1000 tons of local Coke and another for 500 tons. Business, however, generally has been confined to carload orders, and even these have by no means been numerous. Quotations are as follows, for cash:

Lake Superior Charcoal	$16.00 @	$16.50
Local Coke Foundry, No. 1	13.50 @	14.00
Local Coke Foundry, No. 2	12.75 @	13.00
Local Coke Foundry, No. 3	12.25 @	12.75
Local Scotch	14.00 @	14.50
Ohio Strong Softeners No. 1	15.50 @	16.00
Southern Silvery, No. 1	@	14.50
Southern Silvery, No. 2	@	14.00
Southern Coke, No. 2	12.10 @	12.60
Southern Coke, No. 3	11 6 @	11.85
Southern, No. 1, Soft	12.35 @	12.60
Southern, No. 2, Soft	11.85 @	12.10
Tennessee Charcoal, No. 1	16.00 @	16.50
Alabama Car Wheel	18.50 @	18.75
Hocking Valley, No. 1	15 25 @	16.00
Jackson County Silvery	16.00 @	17.00

There has been no change in the condition of Pig Iron in the Pittsburgh district since our last report. Some Iron is being sold right along, but in small lots ranging from 100 to 500 tons. If the present degree of activity among the mills is maintained, and there is no increase in production of Iron, it is not improbable that consumption may catch up with production within a short time, and when this has been attained there will undoubtedly be a better outlook for the Pig Iron trade. We repeat quotations of last week, as follows:

No. 1 Foundry	$12.50 @	$13.00,	cash
No. 2 Foundry	11.50 @	12.00	"

Southern Pig Iron markets show no improvement. There has been little more than a current jobbing demand in this district, running from single carloads up to 200 tons for immediate shipment, but no buying for forward delivery, although the indications are that Pig Iron could be obtained at the rates now current for any delivery during the next four months. The occasional offering of some calamity Iron at prices less than the cost of production, although not in first hands, tends to keep up the demoralization of the market and to prevent any recuperation. While the offerings of Southern Iron are not large or urgent, it is not difficult to obtain a sufficient quantity to meet the requirements of the market, for the demand from the East is smaller than it has been. There is scarcely any demand for Charcoal Iron. Quotations are as follows:

Southern Coke, No. 1	$12.75 @	$13.00
Southern Coke No. 2	10.75 @	11.00
Southern Coke No. 3	10.25 @	10.50
Ohio Soft Stone Coal, No. 1	15.50 @	16.00
Ohio Soft Stone Coal, No. 2	14.50 @	14.75
Lake Superior Coke No. 1	15.00 @	15.25
Lake Superior Coke No. 2	14.00 @	14.25
Hanging Rock Charcoal, No. 1	18.50 @	19.00
Hanging Rock Charcoal, No. 2	17.50 @	18.00
Tennessee Charcoal, No. 1	14.00 @	14.25
Tennessee Charcoal, No. 2	13.00 @	13.25
Standard Southern Car Wheel	17.75 @	18.00
Lake Superior Car Wheel and Malleable	17.00 @	17.25

Metal Market.

Pig Tin.—As far as recorded, the speculative dealings have been on a moderate scale and sentiment in the speculative direction seems to be exceedingly tame. Thus far this month less than 100 tons of Tin have been imported. According to most calculations nearly or quite 1000 tons have been turned out from first hands. The statistical position would thus appear to have undergone a further change for the better. It is the plain fact, however, that prices have averaged a shade lower, and that the movement of prices is rather inconsistent with the apparent relation of supply and demand, making altogether a peculiar market. Prices for deliveries this month and next have receded to 20 75¢ and December delivery commands little, if anything, more than 0.10¢ premium, despite estimates of a reduction of at least 1500 tons in spot stocks during the next six weeks. The best bids at the close for current and next month delivery were 20.70¢. There were sellers at 20.75¢ for October and 20.80¢ for November delivery at the close, with jobbing quantities offered at corresponding rates. The demand from consumers is fair, and jobbers' prices for small lots remain unchanged.

Copper.—Nothing has transpired in the way of new export or home trade movement that reflects any decided

change in the condition of the market. Certain it is that fresh purchases have been on a moderate scale and that buyers are extremely indifferent, since deliveries on old contracts satisfy current wants to no small extent, while the offering affords something more than purely circumstantial evidence that the supply keeps fully abreast with the demand. A good showing is made in export statistics and the foreign markets have stiffened somewhat in the face of that fact, but Copper can be purchased as cheaply at present as at any previous time this month. Thus 9¾¢ has become a common selling price for Lake Superior Ingot, while business is said to have been effected *sub rosa* at 9 70¢, regular terms, and at even less net cash terms, prompt shipment; about 250,000 lb were sold. With other varieties the experience has been somewhat similar, Electrolytic selling at 9¼¢ @ 9⅜¢ and common casting stock at 9⅛¢ @ 9¼¢, according to brand. The current demand embraces little beyond quantities needed for present requirements. Jobbers' orders are reported as moderate in size, but recent inquiries show that more interest is being taken in Ingot Copper than has been the case of late months. Retail prices for small quantities are mentioned generally at the level of former quotations.

Sheet Copper.—A rather more active movement is noted in the demand for Cornice Copper, some comparatively good sized orders having been placed during the past week. Inquiries have also increased in number, and it is believed that, with any reasonable encouragement, a good business may develop before the end of the year, as many shops are now in shape and waiting for material from which to work up their spring goods. Stocks in the hands of consumers are very small indeed, but they would, it is thought, be generally replenished with any lifting of the present dullness in trade.

Pig Lead.—Nearly if not quite 1500 tons of common domestic have been sold at 3.30¢, delivered here or at common point during the balance of the year. The greater portion was taken by consumers, and not a little went from a prominent firm that purchased 1000 tons or more some time ago when values seemed to have been at a low ebb. Reports have had circulation that mining operations were checked to a greater or less extent by water difficulties; but latest accounts go to show that Idaho and other producers having modern machinery more than hold their own, and that several are in a position to work profitably at present prices, or, say, 3¢ @ 3.05¢ in East St. Louis. Bids for substantial sized lots were raised late in the week to 3.35¢, at which price 100 tons were sold for cash and prompt shipment. The retail consumptive demand is of a very restricted character. Jobbers' prices for small lots of American Pig are quoted at 4⅛¢ @ 4¼¢ ℔ lb.

Lead Pipe and Sheet.—Manufactured Lead continues in very slow sale. New York prices for Pipe and Sheet, although unchanged, per list, are inclined to weaken in face of the poor demand now existing.

Spelter.—There are faint signs that the market for this metal has reached hard pan. The most conspicuous of these is the fact that there are numerous orders for certain Western brands at 3.50¢, delivered here, for export account. It is learned also that the product of several smelters for the balance of the year has been sold up, and that bids of 3.55¢ have been refused in more instances than one. Any price under 3.60¢ for other than inferior brands seems to be exceptional at the moment, and there is not a great deal offered at that. Prices for small quantities of Western Spelter rule about 1¢ in advance of the wholesale rate. Retail quotations are given at 4¼¢ @ 4⅜¢.

Tin Plates.—Coke Plates have continued to be the most active stocks in the market, although sales in this line have fallen off somewhat, as compared with those of the past few weeks. Prices for both spot stocks and future deliveries have weakened slightly from those established a week ago. The season for canners' orders is now approaching a close, and their requirements have been generally filled; consequently the activity in Cokes will naturally abate. The market for Bright Charcoal and Terne Plates shows a fitful and irregular movement, although some jobbers speak of receiving a very fair volume of orders of moderate dimensions from day to day. The truth is that stocks in the hands of consumers and the smaller retailers are of the narrowest description, and their current needs create a moderate demand in the retail market, which serves to keep it from anything approaching stagnation. A prominent Tin Plate merchant of New York, who has recently returned from a Western tour, mentions an absolute lack of any stocks of Plates in the various localities visited by him. Purchasers, he says, expressed their intention of buying nothing in that line beyond what they require from week to week, until they have some assurance of the course of currency and tariff legislation. The same reasons militate against the business of wholesale merchants and importers of Tin Plates. Shipments from the other side are very light, and interest in futures continues small, nor, in the opinion of authorities in the trade, is any material revival likely to take place until the future of the tariff on Tin Plates is settled. General prices show no radical change from last week.

Sheet Iron.—Galvanized Sheets continue in good demand, and as no material increase in the output of this material has taken place or is in prospect, a scarcity of Galvanized Iron is being felt in some quarters. The mills now in operation have no stocks on hand and are generally a week or so behind their orders. The complaint is made by producers that at the current prices there is little or no profit in the manufacture of Galvanized Sheets, and unless better rates can be obtained no encouragement exists for any of the idle mills to start up again. Indeed, it is freely mentioned in the trade that it pays many manufacturers better to let their machinery stand idle, for at the present price of labor running expenses narrowly approach, if they do not entirely swallow up, receipts. Some good inquiries have been noted for Galvanized Corrugated Iron for the export trade; but under existing circumstances little business in that line can be anticipated, all the efforts of manufacturers being devoted to filling domestic orders. Any considerable increase suddenly arising in the demand for Galvanized Sheets would find the mills in poor shape to satisfy it. The market for Black Iron is quiet; but mills are reported as busy, with but moderate stocks in hand, therefore there must be a fair business doing directly with the consumers.

Chicago Report.

Scrap.—Although trade cannot be called active, there is now some movement in all kinds of Old Material except Steel. Consumers generally are only buying to cover their daily wants, and will not anticipate the future. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$8.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3 25	....
Turnings	4 00	....
Horseshoes	9.00	....
Copper Bottoms	....	5 ¢

Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2¼¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	2¼¢

Anthracite.—Trade is very brisk, and the shortage of the local stock is decidedly marked. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40

St. Joseph, Mo.	9.05	9.30
Leavenworth, Kan.	9.05	9.30
Omaha, Neb.	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

CONDITION OF THE

Hardware Trade.

ORDERS continue comparatively small and cover in most cases assortments simply for the replenishing of stock, seasonable goods having also a prominent place. Anticipating a quiet trade for the next two or three months, the large wholesale houses are buying very sparingly, preferring to let their stocks become considerably depleted rather than be obliged to carry over a considerable quantity of goods. They are also giving continued attention to the matter of credits, and are exceedingly careful in this regard, and disposed to restrict the time which accounts are permitted to run, limiting the transactions largely to a cash basis. In order to dispose of the stock on hand there is also a tendency on the jobbers' part toward cut prices on a good many lines, and more or less irregularity is thus caused. Prices, however, are pretty well maintained, and while there are cases in which manufacturers would undoubtedly accept lower prices on attractive orders, there has been on the whole a remarkable steadiness in values. Collections are unquestionably better, but a good deal of complaint is still made on this score. There is no reason to doubt that business during the past month or two has been seriously injured by the delay in the repeal of the Sherman bill, but it is expected that early action in this direction will have a beneficial effect on the general condition of trade.

Advices from Chicago.—The Shelf Hardware trade is in about the same condition as reported last week. The volume of business shows a decided falling off from its condition during the first half of October. Merchants throughout the Northwest have evidently filled up on season goods, and orders now coming in are only for small lots of Hardware, merely to cover present requirements. Stocks are reported by salesmen to be extremely light in every direction, but merchants are still disinclined to buy anything more than they must get for their immediate trade. The outlook is quite discouraging for the jobbing trade here for the balance of the year. Economies are being instituted so as to reduce expenses as much as possible to correspond with the shrinkage in business. The prices on Hardware generally are remarkably steady considering the circumstances. Tin and Tinware are especially noticeable in this respect, which is perhaps due to everybody carrying very light stocks. Heavy Hardware is in a somewhat better condition than Shelf Hardware, owing to the continued good trade in the iron and steel departments. The other departments, however, are quiet, as wagon and carriage makers are still buying very lightly.

Notes on Prices.

Wire Nails.—The volume of business is rather light, and comparatively few of the mills are running on full time. There have been some inquiries in regard to quotations on especially large lots, and it is understood that low figures have thus been developed. The market on the whole is represented by $1.30 for carload lots at mill, this figure being readily obtainable, though some manufacturers quote a slightly higher price.

Advices from Chicago.—The trade in Wire Nails tapered off during the past week, the early part having been fairly active, but it has as yet not relapsed into complete stagnation, as there are some inquiries from large buyers for considerable quantities which are expected to lead to further business. Prices have receded on factory lots and some sales were made as low as $1.32½, Chicago, although $1.35 to $1.40 are now considered fair quotations. Jobbers have recently had an improved business in Wire Nails and have taken a great many orders, but usually for small quantities. Their regular price from stock is $1.50, but this is shaded by some houses.

Cut Nails.—There has been little change in the Cut Nail market since our last review. The quotation of $1 base is regularly and quite firmly adhered to. There is evidence of a disposition on the part of the mills to obtain a slight advance, but it is not attended with much success. The volume of business is not sufficient to justify the running of the mills to their full capacity, and at the present time considerably less than the usual quantity of Nails are being made in the Wheeling district, and the Eastern mills seem to be doing a somewhat larger proportion of the business than usual. The New York price for small lots from store is $1.20 to $1.30.

Advices from Chicago.—The trade in Cut Steel Nails has been for some time moving in spurts, being fairly active for a few days and followed by a period of dullness. The net result, however, is such as to keep the local factories steadily at work. A change has recently been noted in the character of this trade which seems to have some significance. A great deal more business is now being done in Finishing, Casing and Clinch Nails, which was a branch of the trade that for a considerable period seemed to have been completely monopolized by Wire Nails. The Cut Nail manufacturers are hoping that this may prove that a reaction has taken place, but would like to see some further demonstrations before allowing themselves to derive very much encouragement. Prices are maintained at $1.20 to $1.25, Chicago, for factory lots. Small lots from stock are held at $1.30.

Barb Wire.—The Barb Wire market is stagnant and in an unsettled condition. Prices are decidedly in buyers' favor, and with the small volume of business doing are uneven and irregular. We quote Galvanized Four-Point at mill on a basis of $2.25 to $2.30. Painted being held at 40 cents less, but concessions from these figures are obtainable.

Advices from Chicago.—Manufacturers report only a moderate trade. This is derived in a large measure from direct connection with the retail merchants. It is difficult to obtain quotations as trade is now going, as prices made depend entirely on circumstances. Manufacturers of ordinary Galvanized Barb Wire are selling at $2.40, but this is shaded. Jobbers continue to quote small lots from stock at $2.55, but say that their trade in this line is practically dead.

Cream City Flour Bin and Sifter.—This article is put on the market by the Geuder & Paeschke Mfg. Company, Milwaukee, Wis., and was described in a recent issue. It is sold from the following list, which is subject to a discount of 50 per cent. to the trade:

25	50	100 pounds.
$34.00	$42.00	$54.00 per doz.

Automatic Steam Coffee Cooker.—This Cooker was described in our issue of October 14, and is put on the market by Wilmot Castle & Co., Rochester, N. Y. It is sold to the trade from the following list, which is subject to a discount of 40 per cent.:

2-qt. heavy tin,	$1.50	nickeled pots,	$2.00
3 " " "	1.75	" "	2 50
5 " " "	2.50	" "	3.50

Cereal Kettles for use in connection with the above steamers are sold at 20, 25 and 30 cents respectively.

The Arnold Automatic Steam Cooker, put on the market by the same concern, is sold to the trade from the following list, which is subject also to a discount of 40 per cent.:

No. 0, Two quarts,	1	compartment,	$1.50
No. 1, One gallon,	1	"	2.25
No. 2, Two gallons,	2	compartments,	2.75
No. 3, Three gallons,	2	"	3.50
No. 3, Three gallons,	3	"	3.75
No. 4, Four gallons,	3	"	4.50
No. 5, Five gallons,	3	"	5.00
No. 5, Five " oval,	3	"	6.00

Glass.—Since our last report the Glass market has been declared an open one by the National Window Glass Company; that is, the agreement among American manufacturers to sell Glass at only fixed prices has been abandoned. The Glass factories will start up when and as they please, so it will be a free

fight and no favor. The National Window Glass Company did not give up their charter, but for the present will not influence the manufacturers nor the trade. The wage question has not yet been definitely settled, but indications are that an agreement will be reached in a short time. It is estimated that 75 per cent. of the factories will be started up in the near future, but it remains to be seen how large a proportion of those starting can continue running, with light demand, accumulating stocks and low prices. Former quotations are still being adhered to, as no new Glass can be got on the market under three or four weeks, by which time the fall demand will practically be over. In Plate Glass there is little doing. Imported Glass is being sold in a small way, as the market continues lifeless.

Old Metals.—A very fair demand has sprung up for Scrap Iron, although values do not show any improvement so far. The market for Old Metals of other descriptions continues tame at unchanged prices. Quotations for New York delivery are about as follows:

Heavy Copper	₩ lb	6¾¢
Light and Tinned Copper	₩ lb	6¼¢
Heavy Brass	₩ lb	5¼¢
Light Brass	₩ lb	4½¢
Lead	₩ lb	3¢
Tea Lead	₩ lb	2½¢
Zinc	₩ lb	2½¢
No. 1 Pewter	₩ lb	14¢
No. 2 Pewter	₩ lb	6¢
Wrought Scrap Iron ₩ gross ton	$10.50 @	$11.50
Heavy Cast Scrap ₩ gross ton	11.00 @	12.00
Stove Plate Scrap ₩ gross ton	7.00 @	8.00
Burnt Iron (delivered at mill) ₩ gross ton	6.00 @	7.00

Old Rags, Paper, &c.—A rather better demand is noted for Paper stock, but prices remain at about the level of last week. Quotations in the New York market rule as follows:

No. 1 White Rags	₩ lb	3¼ @	3½
No. 2 White Rags	₩ lb	2¼ @	2½¢
Mixed Rags	₩ lb		3¼¢
Blues and 3ds	₩ lb	1 @	1¼¢
Hard Sized White Shavings	₩ lb		2¼¢
No. 1 White Book Shavings	₩ lb	2 @	2⅛¢
No. 2 White Book Shavings	₩ lb	1 @	1⅝¢
Light Book Shavings	₩ lb		¾¢
No. 1 Mixed Shavings	₩ lb		1¼¢
No. 2 Mixed Shavings	₩ lb		½¢
No. 1 Printed Books	₩ lb	1 @	1¼¢

Hemp Twine	₩ lb		2¼¢
Manila Rope	₩ lb		2½¢
Jute Rope	₩ lb	1½ @	1¾¢
Mixed Rope	₩ lb	¾ @	⅞¢

Old Rubber.—The market is featureless and dull. The following quotations represent approximately prices for New York delivery:

Car Springs, ton lots, ₩ lb.		@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ₩ lb.		@	.03
Rubber shoes, less than carloads, ₩ lb	0.02¼	@	.03⅛
Large Hose, ₩ ton		@	9.00
White Wringer Rolls, ₩ lb.		@	.04¼
White Syringes, ₩ lb.		@	.05

Trade Notes.

A DEFECTIVE FLUE caused a fire in the tin and house furnishing store of R G Seaward, Petersburg, Va, on October 20. The loss incurred was about $2500.

THE AMERICAN SHEET IRON WORKS of Phillipsburg, N. J., will, it is said, resume operations this week. About 100 hands are employed at these works.

E. T. BARNUM, Wire works, of Detroit, Mich., has just received an award upon Steel Prison Jail Cells or Lockups and grocers' Cheese Safes, as well as upon his general exhibit at the World's Fair.

THE WORKS of F. E. Myers & Brother, Ashland, Ohio, manufacturers of Pumps of various kinds, are now in operation, with a larger capacity for production of Pumps than ever before. Some additions have recently been made to their equipment, among which is included a new 15 ton Colliau cupola in their foundry, and the refitting of the cleaning room with considerable modern machinery.

THE CAMBRIDGE IRON & STEEL COMPANY, Cambridge, Ohio, are operating three of their four sheet mills and are adding another pot to their galvanizing shop. This plant is equipped with the Bayliss patent pots manufactured by Davis & Co., Wolverhampton, England. It is claimed that this system effects a great saving of labor, as the sheets are carried automatically from the pickling vats through the metal pots to the shipping department. Another claim is perfect distribution of metal over the surface of the sheets, all parts being coated evenly. This department is under charge of Thos. E. Cook, formerly of Saginaw, Mich.

OPERATIONS at the large plant of the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, are now being conducted as follows: In the Ætna department all of the bar mills and two sheet mills are in operation. In the Standard department everything is on in full, including the galvanizing and corrugating departments. This leaves but four sheet mills in the Ætna department as the only idle parts of the plant. This firm announce that they are prepared to fill orders for their different lines of manufacture promptly, and expect to keep those portions of the plant now running in full operation.

THE CHAPMAN VALVE MFG. COMPANY of Boston, with works located at Indian Orchard, Mass., report a very busy season; not only have the works run to their fullest capacity with their full quota of employees, but the increasing demand has made it necessary to run many nights to keep abreast with the orders. The reason for this business activity during the general depression is owing to the fact that the demand has been for specialties that this company make. Since the increasing importance of using steam under high pressure, Jason Giles, the company's general manager, conceived the idea of making a gate valve with a removable bronze seat, which should be especially adapted for high steam pressure. Such a valve was made and patented by him March 18, 1890, and afterward assigned to the Chapman Valve Mfg. Company. About all of the largest electric light and power plants in this country are equipped with Chapman valves. Another specialty, the increasing demand for which has contributed to the company's activity during the present season is the indicator valve, which was also patented by Mr. Giles. The demand has been very large and from all sections of the country, and although the company have increased their capacity very largely this season in erecting a brick building 234 feet long by 50 feet wide, yet at this time every department is crowded to its utmost and still they are unable to keep up with the constantly increasing demand, and already have booked orders which will keep the present force of upward of 300 employees busy during the entire winter season and until spring trade opens.

AMONG THE NEW MANUFACTURING PLANTS recently completed in Brooklyn is that of Schlessinger, Weissner & Co., at Eighth street and Third avenue. It is a substantial six-story brick building 100 feet square, and well lighted. A foundry 40 x 60 feet is built close beside it. This plant was erected for the purpose of manufacturing iron bedsteads and bent steel furniture. At the present time they are said to be busily engaged with orders.

GEO. A. OHL, Newark, N. J., has been making a visit to the World's Fair and is now visiting the trade on his way home, in the interest of his specialties in sheet metal working machinery.

JOHN DAVIES, Eleventh street and Second avenue, Brooklyn, N. Y., in making 983 castings for the Dale Tile Mfg. Company, consisting of frames and tiles, only lost two castings, or less than 600 pounds in a total of nearly 90 tons. This is an exceptional experience in foundry practice.

F. A. KLAINE & Co., Cincinnati, whose advertisement appears elsewhere, call attention to the fact that the Omaha and Chancellor Cook Stoves, patterns of which have been recently purchased from the Chamberlain Stove Company, have now been on the market for upward of 49 years, which is a phenomenal record.

THE QUINCY ELBOW MFG COMPANY of Quincy, Ill., send us a little pamphlet of pocket size, in which attention is directed to the Monarch elbows which they manufacture. The merits of these goods are set forth in an entertaining style, illustrations of a more or less humorous character being scattered through the pages. The front cover represents an interior view, showing the usual experience of a man who attempts to put up or take down a stove pipe without the use of the Monarch elbow, while the fourth page of the cover is embellished with a view of another interior, in which the "brownies" are connecting a kitchen range with the chimney by means of joints of pipes and Monarch elbows. The two pictures speak for themselves and very effectively make the point which the manufacturers intend.

E. T. BARNUM, Detroit, Mich.: Wire and Iron good. Catalogue No. 570, 120 pages, is accompanied by a discount sheet and illustrates with prices and descriptions a very comprehensive line of goods. It is remarked in an introduction that the book has been compiled with the view of showing a general line of the Wire and Iron goods manufactured, and while very complete, it embraces a class of goods covering so large a field that it is possible to illustrate but a comparatively few designs of the different lines.

C. M. MCCLUNG & Co., Knoxville, Tenn. Hardware, Stoves and Tinware. Their Stove catalogue No. 4 illustrates,

with prices, Ranges, Cook Stoves, Heating Stoves, Laundry, Parlor Lamp Stove, Grates, Hollow Ware, Stove Trimmings, Fire Sets, Stove Boards, Coal Vases, Iron Roofing, Freezers, Coolers, Wooden Ware, Galvanized Iron Ware, Tinware, Japanned Ware, Agate Ware, Cane Mills, Evaporators, &c.

THE SEDGWICK BROS COMPANY, Richmond, Ind.: Wire Netting, Fences and Gates, Sedgwick's Wire Stretcher, Summer Houses, Lawn Furniture, &c. Their catalogue contains illustrations, descriptions and prices of Stretcher, Farm Fencing, Lawn Fencing, Pickets, Gates, Netting, Self Opening Gate, Fencing for cemetery lots, &c.

LEGGETT & BROTHER, New York: Questions Answered, and Hints on Home Decoration, an illustrated pamphlet devoted to descriptions of and an explanation of the manner of using the firm's Varnish Stains, Enamels, Floor Paints, Gold Paint, Bath Enamel, Glass Paints, Varnishes, Liquid White Glue, Liquid Polish and Furniture Polish. The pamphlet contains no prices, and is designed to go into the hands of consumers.

The Breitting Metal Ware Mfg. Co.

The Breitting Metal Ware Mfg. Company, corner Huron and Sedgwick streets, Chicago, have recently erected their own factory and have largely increased their manufacturing facilities by the introduction of new and improved machinery. They are, therefore, better prepared than ever to meet the requirements of the trade. The goods they manufacture comprise hot water and coffee urns, cuspidors, scoops and bar specialties, to which they have just added Browne's lamp heating stove, a new construction, patented May 30, 1893. Charles Breitting, manager of the company, devotes his entire attention to the manufacturing department. Having had 25 years' experience in the production of metal goods, his connection with the company insures good workmanship and reliability. Adolph Hartmann is president and Gustav Stieglitz is secretary. A handsomely illustrated catalogue has just been issued describing the Excelsior, Lilly, Tally-Ho, Columbia and Mikado hot water urns. The Columbia has an extra tumbler warmer round the urn. These urns can be fitted with the company's automatic arrangement by which only a pint of water is heated at a time, almost instantaneously, and when drawn off a fresh supply of water enters, thus avoiding the heating of several gallons of water in bulk, which requires considerable time. The Champion tea and coffee urn is a new urn, just brought out this year, for the use of hotels, dining rooms, coffee houses, &c. The coffee and milk jars of this urn are of cast iron, porcelain lined, and also porcelain covered on the outside, so that no metal is brought in direct contact with coffee or milk. The bottoms are arranged to completely drain the jars. There are numerous other good features about this urn, and it is stated that the coffee made in it will retain its aroma and flavor 24 hours without deterioration. The company claim to be the only manufacturers of such goods in Chicago. Other articles illustrated are the Alaska water cooler, of heavy brass, with galvanized iron reservoirs, wine coolers, lemonade shakers, bottle caps, soda water glass holders, twine boxes, trays, &c.; also a hot water bed warmer, nickel plated, which retains heat for 12 hours.

Stove Trade Notes.

(*Continued from page* 58.)

as well as stove dealers' supplies, and states that additions are constantly being made to the stock, so that it is impossible to publish a list which will be complete for any length of time. For the purpose of facilitating the ordering of repairs a diagram is given showing the different parts of a range with their correct names. In the arrangement of the matter the name of the stove is first given, following which is that of the manufacturer. The catalogue is neatly bound in stiff paper covers, embellished with a gilt side title.

A 12 PAGE CIRCULAR, dated October, 1893, comes from the Wrought Iron Range Company of St. Louis, Mo., and Toronto, Canada, who are the sole manufacturers of the Home Comfort steel ranges and hot air furnaces. This circular treats of hotel and restaurant goods. The first two pages show the main plant at St. Louis and the branch factory in Canada. Farrell's patent steam oyster pans and the Manhattan oyster cooker are two articles shown for restaurant use, followed by gas waffle stoves, saloon lunch tables, an oyster steamer and cooker, Home Comfort urn. Another page shows the mammoth Home Comfort steel hotel range. Round steam roasting ovens for roasting meats, soup stock pots, both round and square, are noted, and the last page is devoted to enumerating an extensive and varied line of hotel kitchen utensils.

EDWIN A. JACKSON & BROTHER, 50 Beekman street, New York, are sending to the trade some seasonable circulars, printed on yellow enameled paper, containing half tone engravings of fire sets, spark guards, fenders and lanterns of ornamental iron work. A second circular relates to andirons, spark guards, mantel protectors and the Jackson patent ash trap.

THE WILLIAM CLENDENNING CO., Montreal, have been incorporated to take over the business of Wm. Clendinneng & Sons, manufacturers of stoves, ranges, iron pipes, castings, &c.

H. R. CHAMBERS AND FRANK POWERS, traveling salesmen in the Eastern States for the Phillips & Clark Stove Company of Geneva and Troy, N. Y., left the latter city Tuesday afternoon for Chicago to visit the World's Columbian Exposition. All the office clerks and salesmen of the concern in both cities have been given the opportunity to visit the fair at the expense of the company.

AERONAUTICS is a new monthly publication which is the outgrowth of the recent International Conference on Aerial Navigation. It is published by the *American Engineer and Railroad Journal*, 47 Cedar street, New York, whose editor is the well known engineer, M. N. Forney. Those who believe in the future possibilities of flight will find it a useful aid in their study.

The New York and New Jersey Bridge bill was passed by the House last week, after amendment so as to require the expenditure of $1,000,000 per year after the first year, and that the work shall be completed within ten years. J. H. Swan of the Bridge Company, whose plan has been approved, is quoted as stating that almost all the railroads running into Jersey City have signed an agreement with his company to use one bridge and station, which will be built at Forty-second street, New York, between Broadway and Seventh avenue. The only great road that has not yet joined the agreement is the Pennsylvania, and its adhesion is promised when a guarantee of the actual building of the bridge and station is given.

MANUFACTURING.

Hardware.

Landers, Frary & Clark, New Britain, Conn., are now running their cutlery works four days a week instead of three, but business in the other departments of the plant is duller, so that there is a shut down of three days per week.

The Hinkle & Gaither Mfg. Company, Laurel, Md., manufacturers of agricultural implements, have nearly completed repairs to their buildings, and have all their machinery ready for operation. They will employ at the start about 50 men.

The Penn Hardware Company, Reading, Pa., have resumed operations.

The Crystal Mica Company's plant, at Warren, N. H., which has been idle through the summer, has started up and is running on full time.

The G. S. Foos Company, Springfield, Ohio, have disposed of their business to John Spencer and George O. Leedle, late treasurer of the company, who will incorporate a new organization to assume control November 1, when the manufacture of all kinds of wringers, lawn mowers, &c., will be continued. Ample capital and increased modern facilities will be provided. Mr. Spencer is referred to as a thoroughly practical and experienced mechanic.

The Rock Island Plow Works, Rock Island, Ill., resumed operations on the 16th inst. after a two-months shut down. About 250 men, less than half the usual force, are employed. The company have made a reduction of 10 per cent. in wages, and have shortened the working day for the present, so that the men work eight instead of ten hours.

The new warehouse of the Hatch Cutlery Works, South Milwaukee, Wis., was damaged by fire a short time since to the extent of $300, a loss which is fully covered by insurance. The warehouse was used for storing grindstones and unfinished shears.

Foster Brothers' Knife Works, at Oswego Falls, N. Y., were slightly damaged by fire on the 17th inst. The fire is supposed to have originated from smoldering sparks in the emery room. The prompt action of the fire department prevented what might have been a serious conflagration. The works are again in running order.

The Seabury Gun Company have been incorporated, with a capital of $300,000. The company will manufacture arms of all descriptions in New York City. The incorporators are E. H. Litchfield, J. B. Grosvenor, H. Wallis and others.

The Scranton Axle Works, Scranton, Pa., have resumed operations after a brief suspension, which was rendered necessary in order to make needed repairs. Important improvements in the works are contemplated which will increase their output.

The Belmont Nail Works, Wheeling, W. Va., a part of the Wheeling Iron & Steel Company, started up on the 16th inst., after an idleness of five months and partial idleness of a year. They are giving employment to over 500 men.

The Gleeson Wire Cloth Mfg. Company have filed a certificate of incorporation in the Hudson County Clerk's office in Jersey City, N. J. The company propose to establish a factory at Harrison, N. J., for manufacturing wires of various patterns. The company will begin business with a capital of $15,000. The incorporators are John Martin Moore of Kearney, George F. Wilson, Martin Desmond and Thomas F. Bulger of Harrison, N. J., and Francis A. Harris of Waterbury, Conn.

During the summer months extensive improvements and additions were made to the wire nail factory of the New Castle Wire Nail Company, at New Castle, Pa., whereby the capacity has been considerably increased. The plant of this concern is now in full operation and is turning out an average of 3200 kegs of wire nails every day. Since the initial establishment of this plant at New Castle it has been found necessary to increase the capacity from time to time in order that the firm could turn out their product as fast as wanted by the trade, and at this time their nails are sold in every part of the United States where wire nails are used.

The Standard Wire Company, New Castle, Pa., manufacturers of wire mats, report an excellent demand for their goods, and are operating their works to full capacity. Although this concern have been established but a short time, they have already built up quite a large trade, and propose in a short time to take up the manufacture of tree guards and other wire goods. The firm recently made a shipment of two of their flexible wire mats which measured 47½ feet in length and 6 feet in width. They have also received in the last few days a third order for a mat of this size, and are making shipments of the smaller sizes right along.

The Standard Horse Shoe Company, South Wareham, Mass., for whom Leeds, Robinson & Co., 4 Liberty street, Boston, are general agents, report that all their machines are being run full time. Improvements are going on at their plant, and additional new machines will be installed as soon as received from the makers. Their shoes are made from old horseshoes, insuring quality, and John Wike is patentee of the machines used and superintendent of the works.

E. T. Barnum, wire works, of Detroit, Mich., has just received an award upon steel prison jail cells or lockups and grocers' cheese safes, as well as upon his general exhibit at the World's Fair.

Miscellaneous.

The Providence Steam Engine Company are building two additional engines, each of 1100 horse-power, for the Union Company (electric railway) of Providence. These will be coupled direct to the dynamos. This company have made provision for engines and boilers of 7000 horse-power.

The plant of the Indianapolis, Ind., Steel Roofing Company has been damaged $3000 by fire.

It is now thought that the Litchfield Car Works of Litchfield, Ill., which have been casting about for some time for a suitable location for a new plant, will settle at Memphis, Tenn.

The C. & C. Electric Company's branch office in Philadelphia is now at 633 Arch street, in that city.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

Two first-class SLATERS and one CORNICE MAKER. C Rabe, corner Ferry and Water streets, Hudson, N. Y. Oct. 28

NICKEL PLATER, for stove work exclusively, to do the plating and oversee the polishing; state experience, wages expected, and reference. "Ohio," Box 1028, office of *The Metal Worker*, 96-102 Reade street, New York City. Oct. 28

Filtration of Sewage and Drinking Water.

The increasing interest in as well as the importance of sewage disposal and the proper purification of drinking water is well evidenced by some of the recent papers and reports upon the subject. The greatest contamination of town and city water supply usually occurs when this supply is taken from or near a river which either intentionally or otherwise receives the sewage of communities higher up the stream. That the water in such a river can actually be rendered harmless and not a transmitter of disease has been very conclusively proved by extended experiments upon the part of the Massachusetts State Board of Health. Carefully collected data have shown that where there is the usual municipal water supply the organic matter, representing the polluting agent, is present in the proportion of, say, 2 parts in 1000 in the discharged sewage. As about one-half of this proportion is mineral matter and practically harmless, it is evident that the problem presented in sewage filtration is to remove only this 1 part in 1000. Of course, when sewage of this composition is discharged into a flowing stream of even moderate size the proportionate presence of the polluting elements is vastly decreased. Dilution, however, is not the remedy; the death-dealing organism must be absolutely destroyed or removed. Even the river Elbe, with all its volume of waters, could not annihilate the cholera germs which from a Russian settlement were carried down to the water supply of Hamburg.

Sand Filtration.

The efforts of the Massachusetts Board of Health have been largely devoted to a study of the effects of various grades of sand arranged in banks for intermittent filtration upon the waters of a sewage polluted river. Their investigations have served to emphatically confirm the results of other investigators to the effect that, by a proper arrangement of settling basins and sand filters, water polluted to the degree of ordinary sewage may be rendered practically harmless. That such a simple and comparatively inexpensive means can be introduced for the purification of drinking water on a large scale is a strong reason why no community should allow its residents to be exposed to the dangers incident to the ordinary system of water supply. The efficiency of sand as a filter for injurious organic matter is most clearly shown in the case of certain sewage farms, where the liquid, diluted sewage is delivered in large quantities upon the absorbent earth of the farm. It is said that the water, filtering downward through the sandy subsoil of the sewage farms of Berlin, becomes as pure as any spring water when it reaches the sandy trenches which surround the large and successfully managed sewage farms of that city. The time is not far distant when the discharge of sewage into flowing streams which serve as water supplies to other communities will be absolutely prohibited by law, and when Boards of Health or similarly constituted bodies shall have full authority to approve or reject proposed sources of water supply for towns and cities.

Economy in Gas.

An item printed in a recent issue is suggestive of possible economies in gas used for illumination, and, in fact, the use of all other illuminants. The item recounted experiments to determine the effect of color upon the number of lighted candles needed to obtain equal illumination in rooms finished with different colors. In respect to it a correspondent writes that believing experiments with so many different lights—the smallest number named being 15 candles, and the largest number 100—would not give as good a practical indication of possible savings in domestic illumination as experiments performed with only one or two lights, or about what is customary in moderate sized rooms in dwellings, he repeated the experiments in two different rooms of the same size, one papered with very dark redish-brown paper and the other with a pattern the general tone of which is a light buff with small gilt figures.

Experiments with Gas.

He used 5-foot burners, situated alike in each room, regulating the burners so that he could read the same kind of print with equal ease at a distance of 12 feet from the lights, and measuring the gas burned in four different experiments in each room by an ordinary dry meter. He states that he found the results even more favorable than was indicated in the item alluded to, in which 87 candles for brown paper and 60 for pale yellow were required for equal illumination. In the brown room he burned, during four experiments of three hours each, 98.4 feet of gas, and in the yellow room 62.2 feet. This is a close verification of the accuracy of the original experiments with candles; and it shows that in selecting wall paper a consideration of its effect upon gas bills—probably very little thought of in general—would be wise for those who wish to study household economy.

The Outlook.

A study of the causes which have led to the prolonged business depression possesses interest chiefly because their correct appreciation will enable business men to observe the signs of a return to a normal condition. We believe that it is quite generally acknowleged that the distrust on the part of foreign holders of securities as to the inability of our Government to continue the monthly purchase of silver safely was the first impetus on the downward path. When the financial cyclone struck first our banks and then our business and manufacturing community, consumption was proceeding at a normal rate. The condition of the money market cut off all those enterprises of a public character which depend upon the marketing of new issues. The iron industry was among the first to feel the effect. A second effect was to lead to the cessation of all repair work on our railroads, which induced the canceling of old orders and held back any new work. Simultaneously the frequent failures brought about a very cautious method of operations among large traders. The rapid decline in prices induced buyers all over the country to purchase from hand to mouth, since they were convinced that every successive purchase could be made at lower and lower figures.

The wholesale suspension of work threw out of employment many thousands of men, while the mass of the industrial population had to submit to reductions in wages. Enforced economy reduced consumption of the staples, and the retail trade which was last to feel the effects of the panic began to suffer severely.

The recovery must be along the line traversed in the downward path. One of the troubles which has been at the root of the evil has been cleared away. Money is as plentiful as it ever has been. But it will take a long time before it galvanizes commerce and in-

dustry with renewed life. There are elements in the situation which make moneyed men still cautious. It takes time before a capitalist grows tired of having his money unproductive, before the eagerness for better interest overcomes the fear for the safety of the principal. The wage earner who has been forced to draw on his hoard of savings, or has run into debt, does not become a liberal buyer as soon as his income is restored to its usual amount. In other words, consumption rallies only slowly from the check which it has been subjected to, and that holds true as well for the requirements of great undertakings as for the necessities of the mass of the working people.

A good deal of stress is laid by merchants upon the fact that stocks of all classes of manufactured goods in the hands of the traders and jobbers who are nearest to the consumer are lighter than ever before. It must be conceded that that is an important element in the situation. But it is not likely to have much influence upon prices, so long as the buyers know that there is a very large reserve manufacturing capacity. At the present rate of consumption there must be considerable swelling of trade before manufacturers are sufficiently confident of future orders to hold back for better figures. Another point which aids in retarding recovery is that a period of sinking prices causes buyers to adhere to a policy of purchasing in small amounts and withholding orders as long as possible. It is true that this ultimately creates a very rapid upward movement, which in the past has culminated in historic "booms." There are those who see in the present situation all the elements of such a phenomenal rise, but with the tariff question looming up as a very disturbing factor there is no prospect of any marked advance in any quarter in the near future.

Manual training is about to be introduced into the public schools of Brooklyn, a sum of $10,000 having been appropriated to this object by the Board of Education. This will defray the expenses of the first experiment in this direction, which will be in the shape of a manual school to be established in the Boys' High School, where the rudimentary principles of several trades will be taught to lads recommended by the principals of the schools.

The mysterious purchase by a New York commission house, within the past few days, of the new American built steamer "El Cid" of the Morgan line and her alteration into an armed cruiser, together with the acquisition by the same parties of some $200,000 worth of arms, has given rise to much speculation as to the destination of the purchases. The general conviction is, however, that the Brazilian Government are the principals in the transaction. Later reports have it that Ericsson's submarine torpedo boat "Destroyer" and the swift steam yacht "Feiseen" have also been secured for the same quarter, as well as "El Rio," sister vessel to "El Cid."

The Old Time Tin Shop.

BY FOSSIL.

In the days long departed when manufacturing was in its infancy, when every community had its quota of mechanics whose product was absorbed by local consumption, there were tinners and tin shops which were little like those that have succeeded them, except that the use of a like material gave a like name. The old shop and the old workman were for a specific and rather limited purpose, to wit: Assortment work; or the turning of tin plate into the various domestic utensils which housekeeping called for. We will not go back to the ante-machine times, but will name some now common which then were not often found in the average shop: Circular shears, double seaming, beading, crimping, forming and the more modern machines; but the raising block and hammers, also hand wedges and hollow punches, were hardly ever missing. Iron stakes were then, as now, an important part of the plant, and were increased in number and varied in form as necessity prompted invention. Every piece of everything manufactured was cut to a pattern, consequently they (the patterns) were numerous and hung on much of the available wall space.

Let us imagine ourselves at work in the old shop and about to commence a lot of milk pans. First of all we lay on the bench a pile of 10 x 14 sheets from the IX box, and by giving them singly a peculiar handling select the number required, all of uniform gauge. Then followed consecutively the marking out by pattern, usually on alternate sheets, which were then secured so as to be cut out double. The sections or "pieces" next go to the "folder" or "French horse." Don't know why so called! A style of machine now obsolete, which had two levers and required six motions to turn an edge. After this the pan maker straddles a wood former and bends the pieces to proper curves—locking of seams, wiring, burring, marking out of bottoms with compasses, cutting every part with bench shears, double seaming with mallet and stake and soldering. We remember that it took 22 operations in the old shop to convert the tin plate into a finished pan, and yet a day's work was quite a pile. All concave forms, like covers and tea kettle breasts, were made with the raising block and hammer, for stamping presses were not as yet. Economy of stock was desirable, and every available scrap was used. Among the rudimentary articles in whose making apprentices cut and burned their fingers were whistles, half-pint cups and pepper boxes. Those were the halcyon days of tin peddlers, whose carts went to and fro in the land exchanging "Tin pots, tin pans, tin nutmeg graters, tin cooking kettles for your fish and 'taters," for any commodities which their Yankee cuteness could turn into currency at a profit.

Many a treasure was found by the peddler's small boy among the junk that "Pop brought in;" curious things in old metals, including toy cannon, and much to be coveted among the rags. One of our peddlers found a copper wash basin in possession of an old maid, who fancied that the use of it was causing her to lose her youthful bloom. He told her the metal was very deleterious, and kindly (?) exchanged a new tin basin for the old hand-made without seam, and a little cash to "boot." The injurious copper was used in the shop sink for 20 years after for the ablutions of dirty tinkers.

It was said of the peddlers that they either carried or would furnish to order any article of merchandise, which assertion was indorsed by two yarns which are ancient, like our topic. One of the itinerant merchants being obliged to "put up" for the night at a country tavern agreed to pay his bill with any tinware that the landlord should choose. The demand of the host, who was of long and lanky build, was for a pair of tin pantaloons, and the peddler produced a pair of candle molds as the nearest to a fit that he had. Another, looking up trade in a Southern State, hailed a plantation house, on whose portico some young people were sitting, with "Want any tinware to-day?" "Have you got any tin side saddles?" responded a lady wit of the party. "I don't carry any in my cart," said the peddler, "but can furnish 'em to order. I'll take your measure and bring you a nice one, warranted to fit, if you like."

Domestic Electric Heating Facilities

Some of the London electrical supply firms are reported to be taking practical steps toward enabling the general public to enjoy the advantages of electric heating in their homes. They are not only lending out electric cooking stoves to customers, but are prepared, says an exchange, to supply a separate meter and charge half rates for cooking, which they can afford to do, inasmuch as the consumption takes place during the day, when the dynamos must generate electricity, and when there is little demand for lighting purposes. Besides these ovens there are breakfast cookers, in which eggs and bacon may be cooked on the breakfast table; electric plate warmers, which are being ordered for London clubs, for they can be kept in the dining room without any offensive smell; electric foot warmers, hot plates, stew pans, kettles, flatirons, ornamental screens, which act as radiators of heat and warm a room; electric curling iron heaters for ladies and electric shaving pots for gentlemen.

Herr G. Wegner, a goldsmith of Berlin, recommends for soldering aluminum and its alloys a flux made of 80 parts of stearic acid, 10 parts of zinc chloride and 10 parts of chloride of tin. An ordinary soft solder can be used, but one of 80 parts of tin and 20 parts of zinc is recommended. The pieces of metal should be cleaned sand dampened with the flux, and the solder then applied in the usual way.

A delegation of merchants and carriers doing business with Venezuela, Colombia and Hayti interviewed the President, at Washington, on Saturday, with the object of obtaining a suspension of the policy of retaliation against those republics.

Japan claims to have the swiftest cruiser afloat, in the "Yoshino," lately built for the Japanese navy by Armstrongs. The vessel, which is 350 feet long and of 4000 tons displacement, is said to have made an average speed, with and against tide, of 23 knots an hour.

THE LETTER BOX.

What Use is a Trap Well?

From F. A. H., *Southampton, L. I.* —Will you kindly inform me through *The Metal Worker* what benefit can be derived from the following fixtures required by a set of specifications? "Put a 4-inch trap in running line with clean out and foot vent. Tap the 4-inch trap on the house side of the seal and put in a 1½-inch Cudell trap with the inlet end 1 inch above the seal of the 4-inch trap. Build a trap well and grade it so that it will empty into the Cudell trap. The drain from the cellar and two ice boxes to empty into the well." What I want to know is, where should this well be located? How big should it be? What benefit can be derived from it?

Answer.—The location of such a well will be governed by the grade of the cellar and the location of the ice boxes, as it is built to receive their drainage. The Cudell trap is probably used with the intention of providing a seal mechanically should the water seal fail through evaporation. In size the well need not necessarily be large to answer its requirements, 6 inches or more in depth and of sufficient dimensions, whether round or square, to be readily cleaned. Its use is first to receive the drainage and next to facilitate the cleansing of the cellar with water. The trap connection is to prevent the escape of sewer gases.

Asbestos Furnace Cement.

From L. R. B., *West Branch, Mich* —I wish to ascertain what is to be mixed with dry asbestos to make a cement for furnace work. I was informed that water was the proper liquid to use with asbestos for forming a cement that would set. The experiment was tried, and the result was the water would evaporate and leave the asbestos dry and crumbly.

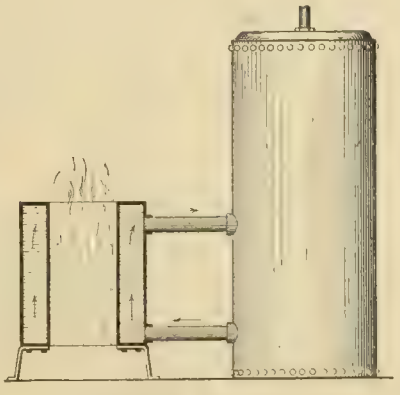
Answer.—It is supposed our correspondent desires a cement for packing the joints about a heating furnace, and while a cement might be made by combining fire clay with asbestos and mixing with water, it is recommended that asbestos furnace cement be used, which is an article especially prepared for the purpose.

Flat Tops for Furnaces.

From W. M. S, *Binghamton, N. Y.* —I notice that furnacemen have much trouble in making flat tops for furnaces, especially if they are large, the difficulty being to keep the hoop in shape so as to get the size. The method I employ is easy and correct. I first get the circumference of the top hoop and from that the corresponding diameter. If, for instance, the circumference is 16 feet 9 inches the diameter will be 5 feet 4 inches. I turn off a ¼ inch edge on my hoop, the diameter secured being 5 feet 5 inches, the correct size. This rule is also applicable in putting bottoms on large cans.

An Antique Water Heater.

From C., *Connecticut.*—Among the antique water heaters was one which seems to remain in principle alone, the construction having been superseded by later inventions. With the object of inquiring if your older readers remember making or using such a heater, and to give a pointer which may be useful to the younger, I give herewith an illustration which will explain itself. It consists of a double cylinder or annular chamber made to fit like a chimney over an oil lamp or stove. The flame will heat the water in the side tank with which the heating cylinder is connected by pipe for circulation, and cooking may be done at the top of the heating cylinder.



An Antique Water Heater.

Pattern for Ship's Ventilator.

From W. J. T., *Philadelphia.*—I would like to see a method published in *The Metal Worker* for obtaining the patterns for a ship's ventilator. The diameter of small end being known, is there any rule for obtaining the diameter of large end?

Answer.—Articles regarding the obtaining of patterns for a ship's ventilator were published in *The Metal Worker* of August 22, 1891, and July 8, 1893, and to these our correspondent is referred. Regarding the second question, we are not aware that any particular rule is in use among the mechanics for obtaining the relative areas of the ends of a ventilator. If any of our readers employ such a rule we should be pleased to learn of it for publication in *The Metal Worker.*

Cleaning Foundry Windows.

From M. W. H., *Cleveland, Ohio.*—In answer to the query in *The Metal Worker* for a method of cleaning foundry windows, they can be thoroughly cleaned if they are washed with strong aqua ammonia and pumice stone, then allowed to dry and polished with a cloth. Two applications may be required to remove all of the rust.

"Necessity" Pipe Union.

From C. W. B., *Fresno, Cal.*—In your issue of October 14 appears the article from "J. W.," "Necessity Pipe Union." Doubtless the idea was original with him, but a similar joint has been in use in California for the past 20 years to my knowledge. We do not use the expander, but cut the running thread long enough to take on a lock nut ahead of the socket. After the socket has been drawn off, in place we wrap a string of hemp or other packing around the pipe and against the socket, then back the lock nut against it. This makes a permanent joint and is the only union joint, in our humble opinion, except right and left couplings, which cannot always be put in for lack of room in which to spread the pipes.

Making Solder.

From J. W. C., *Fillmore, Y. N.*—Will some of the practical readers of *The Metal Worker* tell me how to make solder? I have tried to make it but it don't look as bright as that which I have bought. It looks frosty and when it gets cold holes come in. I cast it in sheet iron molds.

Note.—Doubtless some of our readers can give this correspondent some valuable hints from their experience in making solder. In the meantime we would suggest that by melting his lead first and then putting in the tin, and being careful to stir it thoroughly and keep it continually stirred as he pours it off, he will be more likely to get an even mixture of tin and lead. The proportion that he uses depends upon the fineness of the solder that he desires, half lead and half tin being looked upon as an excellent standard. For some work a larger percentage of tin is used. In other cases more lead than tin is used, but we think that good tinners think that the finest solder works enough better to pay for the difference in cost by the time it saves.

Carrying Water Over a Hill.

From E. A. W., *Vermont.*—If a ½-inch lead pipe were laid from a spring over a hill 39 feet above it and then down to an outlet 77 feet below the top of the hill, could the water be made to run through it? I ask this question as there are several different opinions as to whether the water can be brought over the hill.

Note.—Accompanying our correspondent's letter is a diagram showing a pipe running from a spring over a hill 37½ feet high, then down a slight depression and then over a second hill 1½

feet above the first one, or 39 feet altogether above the level of the spring. Then the pipe descends 77 feet. We presume our correspondent's question really is whether the water can be syphoned over, or drawn by a pump at the outlet end. This, however, is impossible, as a perfect vacuum in the pipe would not raise the water over either of the hills. The maximum hight to which the water could be raised by vacuum is 34 feet, while in practice it is probably somewhat less. It would be necessary, therefore, to pump the water over. By forcing it from the spring side of the hill the water can be driven to any elevation, depending upon the amount of power exerted. It cannot, however, be made to run by syphonic action.

Laying Cast Iron Water Pipe.

From J. H. F., *Pennsylvania.*—A question arises to day which I would like to have the readers of *The Metal Worker* answer. In laying a 12-inch cast iron pipe to conduct water to a town from a dam which is probably 200 feet above the town, which is the proper way to lay the pipe, with the bell end next to the dam or fountain head, or with the bell end next to the outlet? I have been informed that an authority decided some time ago that it made no difference, while I am of the opinion that it makes a great difference, which way the pipe is laid.

The Dragon as an Ornamentation.

From E. G. L., *Texas.*—Will you please answer through *The Metal Worker* why the dragon is used so much recently as an ornament on houses?

Note.—This question is a good deal out of *The Metal Worker* line, and we must be excused from replying to it as an expert in architectural ornamentation. The dragon, as is well known, is a common ornament in China. Exactly what function it fulfills or what it typifies we do not know, but we are quite sure it is of very universal application in the Flowery Kingdom. The fact that the Chinese have come to the Pacific Coast and have spread over the West of late years may, in some way, be an explanation of the introduction of the dragon into architectural ornamentation.

Water Back and Boiler Connection.

From C. J. P., *New York.*—To make further suggestions to "G. E. M." of New Hampshire, whose trouble with a range boiler was explained in *The Metal Worker* of October 14, would say that if he will elevate his boiler in its present location so that the top of the boiler will be slightly above the door casing, shown in the illustration, he can run the return from the water back up over the top of the door and connect it at the top of the boiler, when it will work satisfactorily. The cold water pipe from the boiler to the water back may be run under the door, as shown in the cut, without disadvantage. In running the pipes care should be taken to have all the bends made with long easy curves, and to support them with a sufficient number of lead tacks to prevent sagging. The connection at the top of the boiler would have to be made with the hot water service pipe, as it is hardly probable that the opening on the side of the boiler could be raised so as to be above the top of the door. If the connection was made at the top of the boiler the opening on the side would have to be closed with a cap. If "G. E. M." follows out this plan he will experience no difficulty in getting hot water and a free circulation.

Momentum and Work.

In *The Metal Worker* of October 21 in a note to a letter about rivet hammers, we spoke of a 1-pound hammer traveling 2 feet a second delivering the same blow as a 2 pound hammer striking with a velocity of 1 foot a second. A correspondent calls attention to the fact that while this is true as a measure of the momentum of the blow it is not correct as showing the comparison between the work (used in a mechanical sense) of the two blows, the relative quantities of work that moving bodies perform being found by multiplying their weights by the squares of their velocities. From that point of view the lighter hammer would deliver double the blow of the heavier one.

The Progress of Cooking By Gas.

The following extracts are from a paper read before the North of Ireland Association of Gas Managers, and published in the *London Gas World.* The writer says:

The first authentic record I can find of the use of gas for cooking was 43 years ago, in 1850, when there was a somewhat remarkable scene witnessed in the ancient city of Exeter. In the center of a large crowd, the object of a good deal of jeering ridicule, stood a French *chef.* The Royal Agricultural Society was holding its annual meeting in Exeter, and this French *chef* had been engaged to superintend the cooking of the banquet.

He tells us that he determined to signalize the occasion by serving a new disb, viz., "A Baron and Saddleback of Beef *à la* Magna Charta," weighing 535 pounds, or close upon 5 hundredweight. To roast such a joint at one time was a difficult thing to do, on account of the immense fire required; and former attempts, it seems, had not always been successful. A crowd gathered, in expectation of seeing a large bonfire lighted; but to every one's surprise, all that was visible was an oven 6 feet 6 inches by 3 feet 3 inches, constructed roughly with a few bricks and a few sheets of iron. Into this temporary oven were introduced 216 very small jets of gas, through pipes ⅛ inch diameter. The onlookers were incredulous, saying it was impossible so enormous a joint could be roasted by such means. But after eight hours' roasting it was found to be thoroughly cooked, at a cost (in those days of dear gas) of less than 5 shillings; and it was carried on the shoulders of eight men through the streets of Exeter, preceded by a band playing "The Roast Beef of Old England," and followed by a crowd of some thousands. The hero of this animated scene was Alexis Soyer, probably the greatest master of the culinary art ever sent to our shores by France. Soyer was *chef* to the Reform Club of London, and superintended all the great banquets of his day. Soyer tells us, speaking nearly half a century ago, that he "knew well the power and efficacy of gas for cooking."

In the following year (1851), at the Great Exhibition in London, a patent gas cooking oven was exhibited by Alexander Graham of Glasgow. This oven was fitted with luminous jets inside—the gas issuing from three small needle holes in each burner, while an iron boiling ring on the top was provided with similar jets bored with four holes instead of three. As yet the bunsen burner had not been used. Mr. Graham was a well-known and highly respected hotel proprietor and *restaurateur* in Glasgow; and a number of his *confrères* in his city and neighborhood were induced to follow his example in the use of gas for roasting. Mr. Graham made and sold a limited number of cookers for hotels and restaurants, but as yet the use of gas ovens for domestic purposes was practically unknown. About this period we find that gas cookers, made by various makers, appeared in London, Birmingham, Leicester, &c.

Very strong prejudices had to be encountered and overcome before gas obtained anything like a popular hold on the ordinary consumer, and thoroughly established itself as an indispensable auxiliary in every first-class kitchen. The average cook, who, with perfect equanimity exposed a chop or a steak to the fumes of a coke or coal fire, shuddered at the thought of a joint being exposed to the same fuel in a purified state as received from the gas works.

About this time the value of gas as a fuel was brought to public notice by hiring out gas cookers at a small rental by the gas companies, who then looked on the electric light as a great rival.

At the same time, the leading medical journal, the *Lancet*, began to advocate the use of gas for cooking and heating; and this helped very materially the extended use of gas for these purposes.

In 1882 a very valuable contribution was made to the subject by Dr. Stevenson Macadam. By careful and prolonged experiment with the cookers of three leading makers, Dr. Macadam arrived at some very important and definite conclusions. One of these was that the cooking of meat in the gas oven yielded a larger return of cooked meat than in the coal oven. It was found (and this has since been amply demonstrated by other experiments) that while a joint cooked in the coal oven lost 40 per cent. of its weight in the process of cooking, the same joint would lose only 25 per cent. of its weight in the gas oven. "To a large extent," says Dr. Macadam, "the difference of 15 per cent. is due to the meat being constantly surrounded by an aqueous vapor derived from the combustion of the gas. The influence of this moist atmosphere not only kept the meat more moist, but hindered the escape and the evaporation of the juices; retaining the osmazome or flavoring matter, so that the meat, when properly done, is more juicy and more palatable, and yet free from those alkaloidal bodies produced during the confined cooking of meat in the coal oven, which are more or less hurtful, and even poisonous." Dr. Macadam further pointed out that the meat, being more juicy, is also more easily digested. This testimony on the part of so high an authority tended to dispel the remaining prejudices against gas cookery, and very soon rapid strides were made in the direction of improved construction of gas stoves, and in the number of corporations and companies who hired them to their consumers.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

THOMAS WEATHERED'S SONS, 244 Canal street, New York, recently closed the contract for heating a double residence in New York, which they claim is one of the largest hot water jobs in the city. It will require two of their No. 6 double dome boilers and 47 radiators.

L. H. FREEDMAN of New Haven, Conn., is to build an $8000 residence, which will be heated by steam.

J. W. BEER has just completed the installation of a steam heating apparatus in the Episcopal rectory at Plainville, Conn.

THE DAVENPORT STEAM HEATING COMPANY of Davenport, Ohio, have a contract for heating and plumbing the new school house in that city.

THE CONTRACT for putting in the heating apparatus in the Capital Fire Insurance Company's new block, on School street, Concord, N. H., has been awarded to Lee Bros.

CHAS. J. GOULD has the contract for heating the Congregational Church and new vestry, at Plymouth, N. H., and is putting in the Richardson & Boynton Company's Perfect hot air furnaces.

THE PENN ENGINEERING COMPANY of Philadelphia, Pa., have been awarded a contract for the installation of a steam heating plant in the new building being erected by N. Snellingberg & Co., clothiers, at Twelfth and Market streets of that city.

W. KILT of Ottawa, Canada, has been awarded a contract for making sanitary improvements in the new county court house at a reported price of $1150, with the proviso that the work must be completed by December 15.

DANIEL W. WILSON of New Bedford, Mass., has been awarded the contract at $981.23 for heating No. 8 engine house of the fire department. A direct steam system will be used.

R. S. BRIGHAM has bought out the tin business of H. B. Daus of West Concord, Vt. His past experience fits him to continue the business which he has purchased.

A. F. COLBURN is having a larger heating apparatus put into his residence, at Bradford, N. H., by Mullican & Davis of Wells River, N. H.

N. & J. N. VAN DEUSEN, who have been carrying on the business of tinsmithing and plumbing at Stockbridge for about half a century, have been awarded the contract for plumbing the country residence of Charles E. Butler, and are working on several other buildings in the same city.

WORK HAS BEEN COMMENCED on the new sanitarium at Lowell Island, Mass. A heating plant and some plumbing fixtures will be required.

PROPOSALS will be invited shortly for the heating apparatus in the new Government building at Danville, Ill.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, have the contract for steam heating and electric lighting in the Grand View Hotel, formerly Leland Hotel, Michigan avenue and Jackson street. The double pipe high pressure system is to be removed and an improved single pressure system substituted. A horizontal tubular boiler will be used in connection with about 23,000 feet of radiation.

EGLEHART & KREBS, Chicago agents for the Superior line of furnaces for warm air and hot water, are placing the Superior furnaces in the following residences in Chicago and vicinity: H. B. Mathews, Jr., 32 Clarkson court; Geo. Fairweather, 363 West Indiana street; Mrs. Mary Bush, 377 Loomis street, and Samuel Lanyon, South Waukegan, Ill.

FLASHINGS.

THE T. NEW ROOFING & MFG. COMPANY of New York City were incorporated on October 27, to carry on the business of the T. New Roofing Company in the manufacture of roofing and water tight construction. The capital of the concern is $200,000, and the directors, Tobias New, Lewis W. Harrington and Merritt L. Pike of New York City.

WE HAVE RECEIVED from the Penn Iron Roofing & Corrugating Company, Limited, Philadelphia, Pa., supplemental sheets for insertion in their art catalogue. One of the separate pages give illustrations of plain reeded ceiling sheets, of which six styles are shown, being oval reeded $\frac{1}{4}$, $\frac{3}{8}$ and $\frac{5}{8}$ inch centers; diamond reeded $\frac{3}{16}$ and $\frac{5}{8}$ inch centers, and half oval reeded 3 inch centers. Another page shows special shallow panel ceiling plates made up in panels of different sizes, one large illustration showing the plates in various combinations. The third sheet shows the body plates of rock faced metal covering, also beaded mortar line rock faced metal covering. The fourth sheet shows various center and molding combinations, giving handsome effects, one side of the page carrying a large illustration of combinations in body and cover. The half-tone engravings are printed on fine paper, bringing out all their delicate shades and ornamentations.

THE ÆTNA STANDARD IRON & STEEL COMPANY, Bridgeport, Ohio, have published a serviceable pamphlet descriptive of their manufactures. The iron and steel products of this concern cover an extensive line, including iron and steel bars, rails, angles, tees, channels, miscellaneous shapes, sheets and plates. Also what is of especial interest to our readers, corrugated, galvanized and roofing sheets. The first page of the pamphlet gives information relative to bar iron, then corrugated and other forms of roofing are referred to. It is mentioned that the list of prices and weights was omitted from the catalogue as a change in both will be necessary on or before January 1 to make them in accord with the United States standard gauge for black sheets. Several pages are given up to sections of angle iron, showing dimensions and shapes. Other tabulated information is contained in the pamphlet, which will be found of interest throughout. At the close are a number of blank pages for memoranda.

THE NEW YORK METAL CEILING COMPANY have recently moved to new quarters at 614 West Twenty first street, New York. Here they have greatly enlarged facilities, their building occupying a space of 100 x 150 feet, and several new pieces of sheet metal working machinery have been added to their plant, among which are two drop presses. A portion of the building is partitioned off for a lacquer and drying room, they making a specialty of colored lacquer work for side walls as well as ceilings. They are distributing a 50 page catalogue, with half-tone engravings showing their different patterns of metal ceilings, corrugated, embossed and stamped in various designs, with cornices, faiences and moldings. Various designs of sunken embossed and flat embossed panels for side walls, as well as centerpieces for ceilings, are shown. Wainscoting, borders, coves and friezes are illustrated in a variety of designs adapted to the panel work. Several pages are devoted to half-tones of finished ceilings in different buildings, one page showing how a wainscoting can be applied to a stairway with handsome effect. Another page is devoted to general information, giving questions and answers that will prove useful to all who are interested in this subject. It is stated that their goods are used by carpenters, decorators and tinners.

THE AMERICAN ROOFING COMPANY, St. Louis and Cincinnati, report a gradual improvement in the demand for roofing iron and supplies. Their Pacific Coast trade is keeping up with last year, and they expect to pass last year's record for that locality before this year is out.

C. FREES & SON, Thirteenth and Callowhill streets, Philadelphia, have recently been installing some new sheet metal working machinery manufactured by George A. Ohl & Co. of Newark, N. J.

LYLES & MILLS, 231 William street, New York, have recently added to their plant of sheet metal working machinery one of the Miner & Peck Mfg. Company's of New Haven, Conn., patent drop lifters and hammer and anvil. The drop lifting apparatus weighs about 2000 pounds; the hammer weighs 1200 pounds and the anvil 9000 pounds. The face of the anvil is so arranged that large and small dies can be used, according to the design and size of the panel being worked.

N. A. HALDEMAN & Co. of Philadelphia, manufacturers of steel and iron roofing and awnings, now have an office in New York at 136 Liberty street, under the management of G. M. Maicas.

H. S. NORTHROP, manufacturer of sheet metal ceilings, cornices and ornamental work, at 38 Rose street, New York, has recently put sheet metal ceilings in churches at Housatonic, Mass.; Atherton, Mass., and Canajoharie, N. Y.; also in the Odd Fellows' Hall at Woonsocket, R. I., and a number of private residences. The use of metal ceilings in private residences is growing.

Crop failures and the large migration of farmers to the newly opened Cherokee strip are said to have almost depopulated a section of Southwestern Kansas. The secretary of the State Senate reports that in six counties at least the general exodus has been sufficient to disentitle them to representation in the Legislature.

The Irrigation Convention, lately in session at Los Angeles, Cal., is likely to give considerable impetus to the irrigation movement in the West, where nearly 300,000,000 acres of land might be made productive and populous by the general adoption of such a system. Congress will be urged to take up the matter at as early a date as possible.

PLUMBING and GAS FITTING.

Dissatisfied New York Plumbers.

Suit has been brought against the Examining Board of Plumbers, appointed under the new plumbing law in New York City, by Thomas J. Kelly, who claims to have been damaged to the extent of $10,000 in his business. It is a test case in the Supreme Court before Judge Barrett, and is intended to contest the constitutionality of the law. To further this end 75 plumbers recently held a meeting and organized the Employing Plumbers' Protective Association, with Thomas J. Kelly, president; James Cantwell, secretary, and John Kelly as treasurer. It is stated that the object of the association is to effect, if possible, the repeal of Chapter 602 of the laws of 1892, the claim being made that the Examining Board have refused to grant licenses to competent plumbers.

There are in New York a number of men carrying on the plumbing business who are not themselves practical plumbers, or capable of passing an examination, who have yet done their work satisfactorily by employing competent help. Under the law such men, not being able to take out licenses through their inability to pass examinations, are cut off from doing work that requires a permit from the department, although in the past some of these men have been enrolled as licensed plumbers and their work has been accepted by the inspectors. The master plumbers admit that some provision should be made to meet such cases, and some of the men who are withheld from doing plumbing work by the new law look upon its provisions in the main as tending to the public good. While the result of the suit and the new association is not likely to end in the repeal of the law, it is not impossible that some amendments to its provisions may be made.

The Syphon Eduction Grease Trap.

The Walcott-Hurlbut Company, 175 and 177 Lake street, Chicago, are putting on the market the Syphon Eduction grease trap, which is herewith illustrated. This trap is designed to take the place of catch basins, which must be regularly cleaned or the sewer will be clogged. The grease trap, on the other hand, cleans itself. It can be placed under the floor in private residences, but it is preferably located in the cellar, as shown in Fig. 1, thus giving the grease a better opportunity to cool before being washed out of the trap. The grease congeals and forms on the surface of the water in the trap, and is broken into small pieces upon the discharge of the automatic flush tank, which has no movable parts and is not liable to get out of order. Upon the action of the tank the grease trap is entirely emptied, the cold grease being carried out by the rush of water, and is thus prevented from adhering to the sides of the sewer pipe, which is washed free of all deposits. As more water is provided in the flush tank than is required to clean out the trap, the sewer pipe is thoroughly flushed, which makes it possible to use a back water trap without danger of its becoming clogged. The traps are made in three sizes, as follows: No. 1, shown in Fig. 2, for hotels, 4-inch outlet and 40-gallon flush tank. No. 2, Fig. 3, for residences, 4-inch outlet and 20-gallon flush tank. No. 3, shown in Fig. 4, to be placed under sink, 2-inch outlet and 5-gallon flush tank.

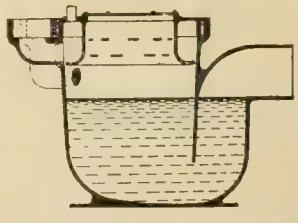

Fig. 3.—Section through Trap No. 2.

THE SYPHON EDUCTION GREASE TRAP.

New York Licensed Plumbers.

Previous to the enactment, by the State of New York, of the law known as Chapter 602, there were 960 licensed plumbers in New York City. The total number of the plumbers carrying on business in the city at the present time is not definitely known, but it is supposed to be something over 1000. Up to the present time 852 applications have been made for examination. Of this number 565 have taken out certificates, 51 certificates are ready to be given to the applicants on their demand, 101 papers are under consideration previous to the certificates being awarded and 68 unexamined applicants' names are on the list for examination, while 77 applications have been rejected. A large number, though not all, to whom certificates have been issued have applied to George Hackett for licenses and have filed the necessary bond. From this it will be seen that only a trifle over 50 per cent. of the plumbers in New York have complied with the letter of the law, though, doubtless, they are doing odd jobs. Some have experienced difficulty when they have applied for a permit to do work without having taken out the license, and in every case a license has been taken out after such an experience has been had.

SIGMUND OESTREICHER, City Engineer of Aachen, Germany, was a recent visitor at the Department of Public Buildings in New York City. The

object was to learn something of the plumbing system and regulations adopted in this country. He expressed his surprise at the advanced character of the work required. Henry D. Dickinson of the Bureau of Plumbing and Ventilation not only presented him with a set of regulations under which the New York plumbers work, but also a set of plans showing how the work is done in a modern New York residence.

The Dandy Clean Out.

We show in the accompanying illustration the Dandy clean out, which is being manufactured by Thomas Hyde, Albany, N. Y. The device is very simple and needs but a word of explanation. The brass cap shown screws directly into the opening, making, it is claimed, a perfectly tight joint without

The Dandy Clean Out.

the use of packing. The size of the opening is the same as that in the pipe. The clean outs are made in 2, 3, 4, 5 and 6 inches, both standard and extra heavy.

TRAPS AND VENTS.

BREWSTER & DRAPER of Northampton, Mass., are completing the plumbing in the Foote Block and have just begun the plumbing in the new residence for Miss Marie Warner.

D. J. HARRINGTON & Co. of St. Paul, Minn., recently had their plumbing establishment damaged by fire to the extent of $250.

AN ORDER was recently passed by the Common Council of Boston, Mass., to have the school committee examine into the sanitary condition of the school house in the Dorchester district and report at the next meeting.

GEORGE BURCHMORE, a gasfitter 76 years of age, recently died at his home at Malden, Mass.

AT A RECENT MEETING of the journeymen plumbers, at Newport, R. I., a new union was formed, with a membership of 22, with John P. Steel for president, John Cassidy and Joseph M. Brown vice-presidents, Michael F. Kelly and John J. Murphy for secretaries, Michael J. Sullivan for treasurer, H. B. Murphy and Thomas A. Kelly for sentries. The new union will shortly give a social entertainment.

WILLIAM ROSS has recently started a plumbing shop at Billings, Mon.

THE QUESTION as to what constitutes a practical plumber has arisen in Waltham, Mass., and the City Solicitor has been called on to decide. This was brought about by the recent appointment of an inspector of plumbing.

THE DISCHARGE of the inspector of plumbing practically closes plumbing work in Denver, Col. The new health ordinance provides that a job of plumbing must be approved by the inspector before the plumber can collect his bill. A committee representing the Master Plumbers' Association waited on the City Attorney to ascertain if some kind of relief cannot be afforded.

THE UPPER BODY of the city government of Springfield, Mass., recently made and passed a new plumbing ordinance of 19 sections, which will hereafter govern all plumbing work done in that city.

THE DETROIT *Free Press* states that the house to house inspection of the plumbing fixtures and sanitary condition of property in that city has ceased and has been a failure in both a political and sanitary sense, owing to the inspectors being appointed as a political reward rather than for their fitness for the work and the fact that the funds gave out earlier than was desirable.

A PRETTY CEREMONY at the Harlem Presbyterian Church was the marriage of Miss Emilie E. Young to Lloyd Rowan Wilson. The bride was given away by her father, Wm. Young, a plumber at Third avenue and Sixty-fifth street, New York.

HE rushed in and inquired:
"Are you a gas fitter?"
"I am."
"Then I wish you would come and look at my gas. It has fits."—*Exchange.*

THE MASTER PLUMBERS of Utica, N. Y., recently held a meeting in the Arcade Building and had as their guest vice president John Mitchell of the National Association of Master Plumbers.

AMONG the revised rules and regulations passed by the examining and supervising board of plumbers and plumbing of Utica, N. Y., is a rule which provides that "no privy vault or cesspools for sewerage shall be constructed on any premises situated on any street where connection can be made with a public sewer and the city water in the side street." Clerk George St. Ledger and Inspector David McKeough are located in an office in the city hall attending promptly to the duties of their respective positions.

A WRITER in an exchange reports that the condition of the plumbers in Portland, Maine, has been greatly benefited by ordinances regulating the methods for doing work and requiring the registration of workmen and inspection of all jobs in that city, claiming that this is partly due to the City Inspector, H. W. Straw, being a practical plumber.

HENRY D. DICKINSON of the Bureau of Plumbing and Ventilation of the Department of Public Buildings of New York City recently made a visit to his old home in England. This is Mr. Dickinson's first trip abroad for 22 years, and from what he saw on the other side he does not hesitate to praise the plumbing as done according to the New York regulations.

THE SMITH & ANTHONY COMPANY, manufacturers of the Sanitas plumbing specialties, 219 Lake street, Chicago, are setting up a full line of Sanitas closets on one side of their salesrooms.

SCRAP.

THE ISLAND OF TASMANIA produced in the year 1892-93 5006 tons of tin, valued at £2,000,000.

THE VALUE of the tin produced in New South Wales, Australia, last year was $734,371, as compared with $642,818 in 1891; the largest annual production since 1880 having been $2,700,000 in 1881.

NOTICE IS ISSUED to the trade under date of November 1 by Mortimer H. Cort, agent, 9 Burling slip, New York, that he has started in business as an importer and dealer in Tin Plates, Pig Tin, Sheet Iron, Zinc, &c. Mr. Cort has been connected for over 17 years with the firm of N. L. Cort & Co., and is well-known to the metal trade.

THE CINCINNATI CORRUGATING COMPANY of Piqua, Ohio, have been awarded a premium for their Piqua brand of terne roofing plate at the World's Columbian Exposition.

The State Pardon Board of Pennsylvania, in session at Harrisburg last week, refused to recommend executive clemency to Hugh F. Dempsey, ex-master workman of District 3, Knights of Labor, and Robert Beatty, convicted for participation in the Homestead poisoning cases and now undergoing sentence in the Riverside Penitentiary.

Coastwise traffic between New York and Southern ports has shown a large increase during the past week or two, a number of extra steam vessels having been put on to meet the demand for freight. Provisions and dry goods compose to a large extent the cargoes going south, while cotton fills the north bound steamers. An unusually large amount of cotton is now in this city awaiting shipment to Europe.

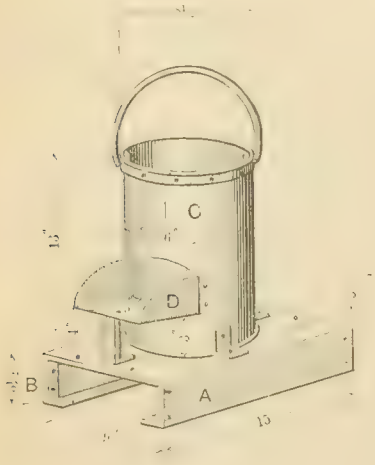
The new United States gunboat "Machias" returned to the Brooklyn Navy Yard from her final trial at the end of last week. The trial trip extended a distance of about 360 miles, and the "Machias" was kept under persistent headway for 48 consecutive hours, being put through a searching inspection in every detail. The Board of Inspection reported her as acceptable, and the vessel was accordingly accepted by the Government. She will probably be ordered to the China Station shortly.

The Standard Oil Company have just received what is probably the finest oil barge ever built. It was constructed at Roach's shipyard, Chester, Pa., and is built of steel throughout. The vessel has a molded length of 248 feet, beam 37 feet and depth 19 feet, and possesses a carrying capacity of 760,000 gallons in bulk, with a gross tonnage of 1599. She is schooner rigged and carries four masts.

THE TIN SHOP.

Roofers' or Tinners' Fire Pot.

From W. N.—For the benefit of roofers or tinners, who always require a fire pot for soldering purposes, I submit a perspective view of a fire pot two dozen of which were made during the winter months for use when our busy season begins. The fire pots were made of No. 20 best bloom black sheet iron of the dimensions shown in Fig. 1. Fig. 2 is a sectional view, showing the method of seaming the round bottom on to the body of the fire pot, and riveting the bottom to the base. The following will make clear how the fire pot is constructed. After the base A, shown in Fig. 1, is formed place and rivet the angle B, which is made of light brace iron, at each end of base, using the band iron with which the sheet iron is packed. After the braces are riveted on, run the bottom, shown at A in Fig. 2, through the turning machine until an upright edge or flange is obtained. Now rivet the bottom on to the base, as shown in Fig. 2. Next lay out the pattern of the body C, Fig. 1, cutting out the opening into which the soldering irons are placed before forming up on the rollers. After the body C is rolled up and riveted, a band iron ring of the same material as before mentioned is placed and riveted on the upper top edge of the body. Now form a handle of ¼-inch gutter rod, and punch a hole of the required size on either side of the body, as shown, through which to secure the handle.



Roofers' or Tinners' Fire Pot.—Fig. 1—Finished View, with Dimensions.

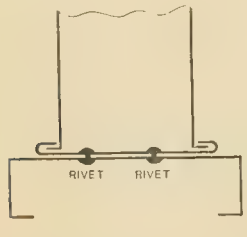


Fig. 2.—Sectional View through Bottom.

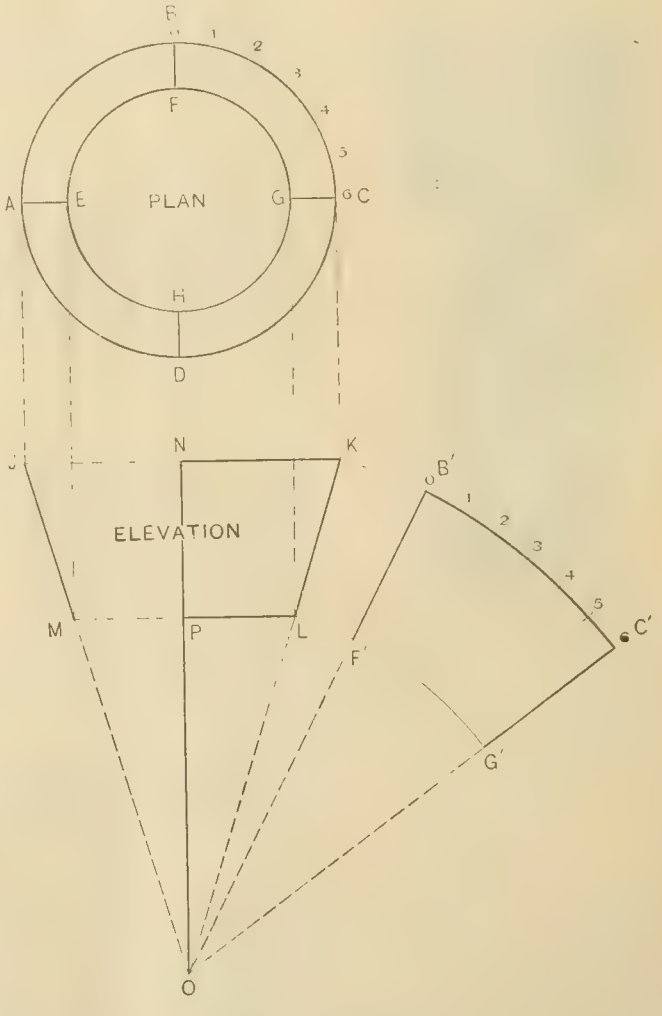
Then form up the lip D, Fig. 1, allowing flanges for riveting on to the body. Place the body in its proper position on top of the flanged bottom and seam, as shown at A in Fig. 2. It will be shown that the lip D, Fig. 1, is raised higher in the front than at the body; this is done so as to keep the soldering iron or hot coal from dropping out when moving the fire pot from place to place. An angle is riveted to the lip and to the base A, as shown in Fig. 1. This angle helps to sustain the lip and keeps it from breaking off when the soldering irons are placed on it. The small angles on either side of the pot and at the rear are riveted in place, and give strength and stiffness to the entire fire pot. In practice two sizes are used, the large size, as shown in Fig. 1, for heating heavy soldering irons, and the next size, whose base is 7½ x 12 inches and the rest of the pot made in proportion, is used for heating smaller irons for soldering upright seams. In case the fire pot is left at the building over night it should always be placed upside down, so that in case of rain no water will settle at the bottom of the pot, which would in time rust it out.

Pattern for Flaring Article.

From F. J., *Rochester, N. Y.*—In the accompanying diagram let A B C D represent the bottom and E F G H the top of a flaring article, which is also represented in elevation by J K L M. By extending the sides J M and K L until they meet at O, J K O represents the cone of which J K L M is a frustum. If through the elevation we draw the center line N O, N P will give the straight hight of the article, as M J or L K gives the slant hight. We will suppose the article is to be made in four pieces, one of which is shown by B C F G of plan. Divide B C into any convenient number of parts, as shown by the small figures. From O as center, with O K as radius, strike the arc B′ C′, extending it indefinitely. From the same center, with O L as radius, strike the arc F′ G′. With the straight edge placed at O and B′ draw a line across the two arcs, as shown by B′ F′. From B′ on B′ C′ space off a stretchout of B C of plan, as indicated by the small figures. From the last division (6) draw a line toward the center O, as shown by C′ G′. Then B′ C′ G′ F′ is

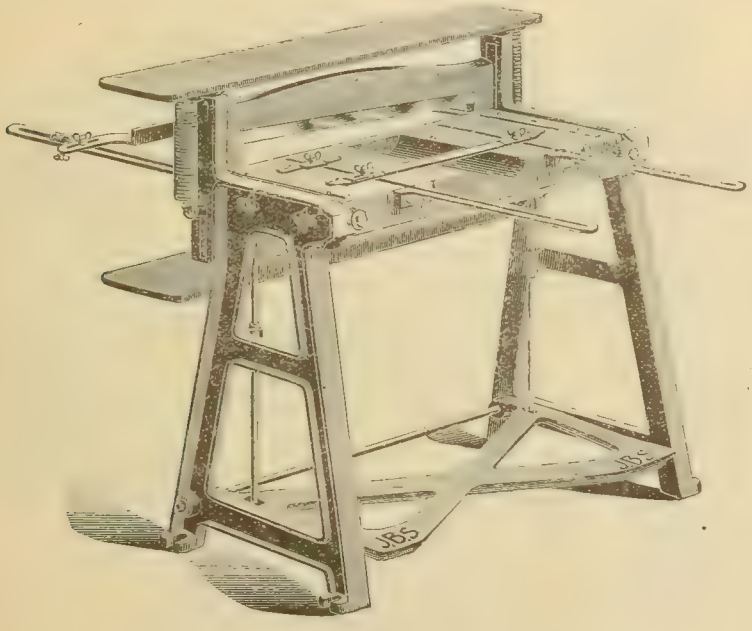


Pattern for Flaring Article.

the pattern for part of article shown on plan by B C G F. Much of the drawing shown in the illustration can be dispensed with in practice. The dimensions of the article being known, draw the right angle O N K Make N K equal to the half diameter of large end and N P the straight hight of article. Draw P L parallel with N K and from P on P L set off the half diameter of small end and draw K L, extending it until it intersects the center line N O. The pattern is then to be obtained as previously described.

New Squaring Shear.

The accompanying engraving shows a new tinners' squaring shear just brought out by Jacob Brombacher's Sons, 30 Cliff street, New York, the special features of which will be readily understood by a brief description. The bed, it will be seen, is securely held between the legs, cast in single pieces,



New Squaring Shear.

a feature of construction that is radically different from that of the old machine made by this concern, in which two pieces were employed connected to the bed by bolts. Again, the head or upper cutters of the shear in the new tool travel in solid gibs, instead of gibs made up of parts and held together by screws. The rigidity of the machine is increased beyond what is secured in the construction already named, by the rod which connects the legs at the bottom and which serves as a pivot for the treadle. This construction is also an improvement over the old plan of having the treadle swing on pins cast as integral parts of it. The adjustments of the bed are also to be noted. The bed is controlled by set screws in the front of the upper part of the legs. These are provided with jamb nuts so arranged as to hold the bed in whatever position desired. This is likewise an improvement over the old plan of moving it by the screw in one direction and hammering in the other whenever a change is needed. The front extension arms are put on with two bolts and the parts surfaced so as to make a smooth travel for the guides. The capacity of the shear is to cut a little over 30 inches between the right angle gauges. Two shelves are provided, one above the blade and one below, each of which is put on by means of dovetail brackets. The new machine is described as strong and powerful and, at the same time, is easy working, cutting smoothly with a minimum of strength exerted by the operator. The design of the machine has been carefully considered, the manufacturers say, and while no feature of strength has been sacrificed there is nothing superfluous about it.

The Evolution of the Nail.

The first nails produced in the United States were made by hand, and Fisher Ames of Massachusetts, in a speech made before Congress in 1789, when it was proposed to put a duty of a cent a pound upon all imported spikes, nails, tacks and brads, in order to foster the home product, said of this industry: "It has become common for the country people in Massachusetts to erect small forges in their chimney corners, and in winter and on evenings when little other work can be done, great quantities of nails are made, even by children. These people take the rod iron of the merchant and return him the nails; and in consequence of this easy mode of barter, the manufacture is prodigiously great. This business might be prosecuted in a similar manner in every State exerting equal industry."

In August, 1797, Samuel Briggs of Philadelphia, in connection with his son, is said to have received the first patent for a nail making machine ever issued by the United States, but as at about the same time several inventions for manufacturing nails were made by various persons in different parts of the country, it is still a somewhat disputed point to whom the credit of absolute priority is due.

In 1817 the device known as the Blanchard machine, an invention of Thomas Blanchard and others of Boston, was successfully demonstrated in practical use, and the patent sold to a company for the comparatively small sum of $5000. This Blanchard machine was intended particularly for small nails, brads and tacks, and is the basis of the inventions which are in use to-day.

It is a curious contrast presented by the contemplation of a family engaged at odd hours in their home laboriously shaping nails by hand a century ago and the product of a single day of any one of the many nail and tack factories in States which were then an unknown wilderness, or inhabited by wild animals and wilder Indians.

Fifty millions of small nails and tacks is the daily output of several of these factories, weighing in the aggregate a dozen tons or more, and distributed in all the markets of the world. A single machine is capable of cutting and heading over 15,000 tacks an hour, and shoe nails are cut at the rate of 2000 a minute.

It is not many years since it was the custom in many wholesale houses to keep the boys employed in idle moments picking up and straightening out stray nails which had been removed from packing cases The wire nail, which in its present form is a comparatively recent invention, has from its convenience and lesser cost so completely superseded the finishing nail and patent cut brad that there is little demand for these one time favorites.

New Publications.

PLUMBING, DRAINAGE, WATER SUPPLY AND HOT WATER FITTING. By John Smeaton, C.E., M.S.A., R.P., &c., Examiner to the Worshipful Plumbers' Company. Published by E. & F. N. Spon; 250 pages. Price, $3.

Any work on the subject of plumbing is sure to find ready acceptance. The wants of the American plumber, however, are yet to be met, for there is no adequate work telling him of his trade as practiced in the United States. The most elaborate books at the present time are of English authorship, and they relate to English practice, which may be very well in some particulars, and possibly is superior to American practice in certain minor points. Nevertheless, it is the style of work done in a foreign country, and therefore it is not of great practical benefit to the plumber here. The expert who has mastered all the elements of his trade can read a foreign work to advantage and learn where improvements can be carried out in the methods he is used to. The learner, however, would simply be confused by mixing up his information. It is much to be regretted that the technical literature does not supply a work on this most important subject; but until such a work is forthcoming plumbers will do well to get all the good they can out of the literature that is in existence. The work before us is a good book of its kind, and in it there is not a little that will be of interest and profit to the American reader. To give a rough sketch of its contents, the first 48 pages are given up to the subject of drainage, from which the American reader can gather suggestions both of what to follow and what to avoid, without, however, gaining the instructions particularly applicable to his own work. External plumbing is then considered, and includes the extensive line of work with which the plumber here has nothing to do—that is, the laying of lead roofs. The next 60 pages deal with house plumbing and water supply, which is strictly the business of the American plumber. Twenty pages more are given up to ornamental lead work. The practice in heating varies, perhaps, more than the practice of plumbing between the two countries. Nevertheless, the 40 closing pages of the work, which are devoted to the subject of heating, will be of interest to the plumber, who is awakening to the fact that he can, to advantage, add to his business the department of steam and hot water heating.

The Sague Galvanizing Machine.

Samuel A. Sague, vice-president of the Britton Iron & Steel Company of Cleveland, has invented a galvanizing machine which is in operation at the mill in question. The machine galvanizes 3000 sheets per turn of ten hours at a labor cost of $6.30 per day, the force being two men and a boy. In the ordinary dipping pot process the daily product is 800 to 1000 sheets at a labor cost of $10.25 for a crew of seven men and one boy. There is also some saving in acid and a lessened consumption of spelter.

The object of Mr. Sague's invention is to substitute continuous galvanizing for the ordinary process, which is described as follows:

The sheets or plates, as received from the rolling mills, in all cases, are first immersed in what is called a "pickling bath" which is composed of sulphuric acid heated in any suitable manner, the object of thus pickling the sheets or plates being to clean the same—that is, to remove scales and dirt that may be adhering to the surface of the sheets or plates. The action of the sulphuric acid, however, produces a spongy and irregular surface, the original smooth surface of the sheets or plates being destroyed. After pickling, the sheets or plates are washed in a tank of water; thence taken and laid upon a table and scraped by hand. Workmen, by means of hand scrapers, remove dirt and scales that still adhere to the sheets or plates. The work last referred to is not only necessarily slow and laborious, but it is almost impossible to thus satisfactorily remove all impurities and foreign substances from the surface of the sheets.

Next the surfaces of the sheets or plates are prepared for the zinc or spelter coating by immersing the sheets or plates in a tank supplied with muriatic acid, resulting in the formation of a flux upon the surfaces of the sheets or plates to enable the zinc or spelter to adhere thereto more closely and serving also to still further and more thoroughly clean the sheets or plates.

The sheets or plates undergoing treatment must be thoroughly cleaned preparatory to their immersion in the zinc or spelter bath. From the muriatic acid bath the sheets or plates are loaded on an iron car and conveyed to a kiln, where the sheets or plates are thoroughly dried. When dried the sheets or plates are ready for the zinc or spelter bath. This loading and unloading of the sheets or plates and their transportation to and from the kiln also requires much labor and time. The sheets or plates are next, with a longitudinal edge lowermost and in batches, immersed or dipped in the zinc or spelter bath. A tank or pot, as it is technically called, is filled with melted spelter or zinc, which is kept liquid by coke fires constantly burning around the tank or pot, the zinc or spelter bath being protected in any suitable manner to prevent oxidation of the molten metal, and sal ammoniac or a suitable flux being employed to give the coated sheet or plate a brighter appearance. Workmen handle the sheets or plates by means of tongs.

The treatment of the sheets or plates by the means just described is not only objectionable in that it is exceedingly slow and laborious, but the sheets or plates are not coated with uniformity. Some sheets or plates remain in the bath longer than others, and consequently the coating of the different sheets or plates of a bath varies in thickness. Then again, in withdrawing the sheets or plates from the bath it is impossible, by the means just described, to withdraw them at a uniform speed, and the sheets or plates are very liable to be jerked. This irregularity in the withdrawal of the sheets or plates from the bath causes the spelter to adhere to the sheets or plates unevenly and in patches, resulting in a waste of zinc or spelter, which is the more costly metal. Since the sheets or plates are placed in the tank lengthwise on edge, in withdrawing the same from the bath the molten metal coating of the sheets or plates necessarily gravitates to the lowermost longitudinal edges of the sheets or plates, resulting in an objectionable increase in thickness in the coating along these edges. After being coated with zinc or spelter the sheets or plates are wiped by hand, usually by means of canvas. The sheets or plates are lastly run singly through calendering rolls, for the purpose of straightening and smoothing them and putting them in good condition for shipment.

The continuous process which Mr. Sague uses in his machine pursues a more rational course. The accompanying engraving shows the apparatus designed. Mr. Sague pickles the sheet of iron or steel as heretofore and places it upon a table, A, at one end of the apparatus. From table A the sheet is fed to cold rolls, B, located in the required proximity to the delivering end of the table A and being of any suitable construction. Table A declines somewhat toward rolls B to facilitate the feeding of the sheet, water being discharged upon the rolls by means of the perforated pipe W to keep them clean. The effect of powerful cold rolling under water, after pickling the sheet or plate, is pronounced of vast importance by Mr. Sague, not only entirely removing the irregularities in the surfaces of the sheet, which irregularities are the result of the action of the pickling acid, but rendering the surfaces of the sheet or plate beautifully smooth and crushing and washing away all impurities and foreign substances. Rolls B deliver the sheet to the muriatic acid coating vat C. At the receiving end and ex-

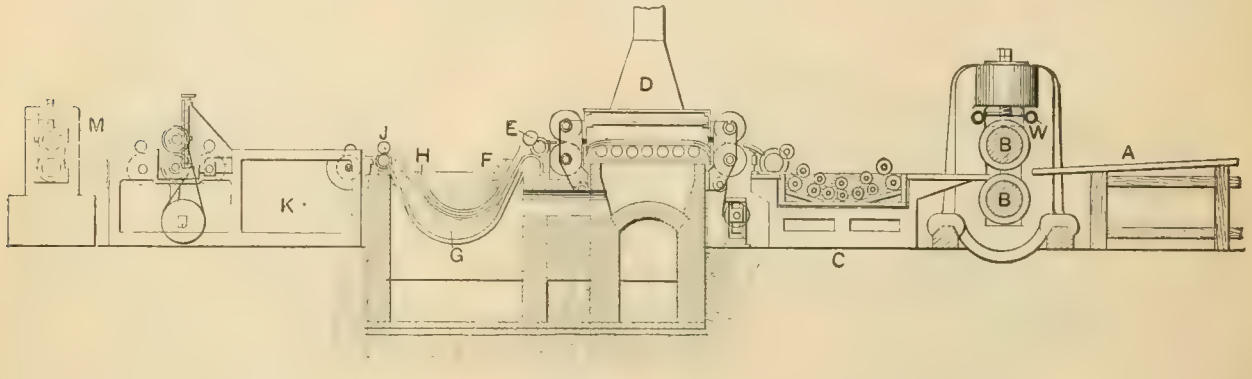


Fig. 1.—Elevation.

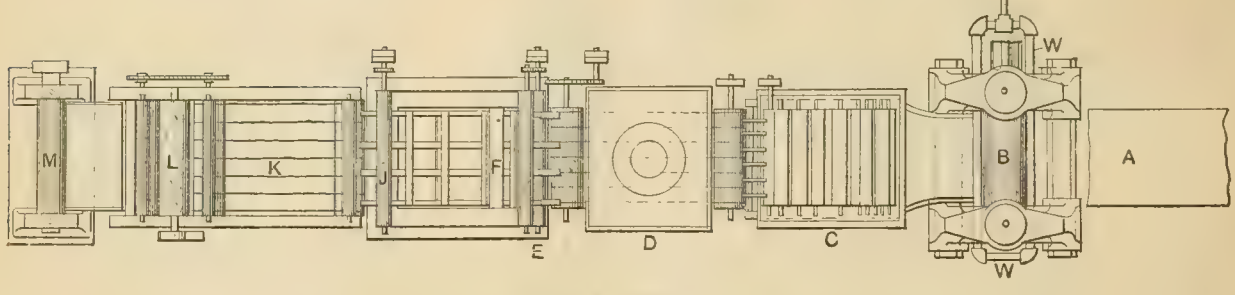

Fig. 2.—Plan.

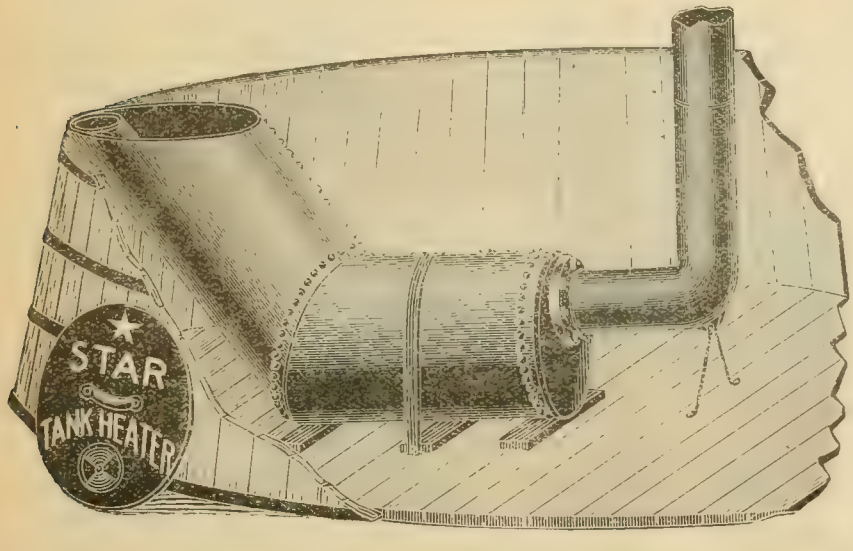
THE SAGUE SHEET GALVANIZING MACHINE.

tending transversely of vat C are located a pair of suitable rolls adapted to receive the sheet from the rolls B, and the sides of the vat afford bearing for the trunnions of a series of guide rolls. At the delivering end of vat C are located suitable wringer or wiper rolls. The sheet is thus fed endwise through the muriatic acid bath between the upper and lower guide rolls to wringer or wiper rolls, whence the sheet or plate is fed between rolls to and through the drying chamber of a furnace, D. A pair of rolls is provided at the delivering end of the drying chamber of the furnace, from which the sheet passes to guide rolls E and is thence conducted through a suitable flux in box F into and through the zinc or spelter in the so-called "galvanizing" pot G. The sheet or plate is guided in its passage through the spelter bath by a pair of curved and parallel open frames, H.

Rolls, J, carry the sheet on to endless chains, K, that lead it to the brushing machine L, where the sheet is brushed clean. It is then fed to calendering rolls, M, that are adapted to smooth and finish the sheet or plate, and deliver it in proper condition for shipment.

The products of combustion from the furnace which is used to melt the zinc are conducted under the drying chamber, in order to utilize the waste heat.



The Star Steel Tank Heater.

The Star Steel Tank Heater.

An illustration is presented herewith of a tank heater which has been brought out by Hunt, Helm & Ferris of Harvard, Ill. As will be seen from the cut, it is a stove made of heavy boiler steel which is intended to be placed in the tank to be heated and is almost entirely under the water. It is intended to burn any kind of fuel—hard or soft coal, wood, chips or cobs—can be set in any tank without cutting the tank and the ashes can be taken up at any time without disturbing the fire. Being made of wrought metal exclusively, it is not liable to be broken in shipping, nor to crack or break when in use.

Statistics of the coal production of the United States for the year 1892, just issued by the Geological Survey, showed that 179,000,000 tons were put out last year, valued at the mines at $207,566,381. Of this amount Pennsylvania furnished 99,000,000 tons, or more than one-half.

Patent and Trade-Mark Laws.

A committee of the Patent and Trade-Mark Congress, having had the subject of formulating resolutions before them, reported as follows:

One of the rules under which auxiliary congresses are held is that no resolutions shall be passed relating to controverted matters. We have, therefore, confined those here presented to such matters as seemed to us to have the consensus of all of the opinions which have been heretofore expressed, without attempting to cover many of the valuable suggestions made.

Resolved, By this congress, assembled under the auspices of the World's Congress Auxiliary of the World's Columbian Exposition, for the purpose of considering inventions and trade-marks, and the various systems and laws relating thereto:

1. That for the purpose of encouraging improvements in the useful arts; the development of new industries; and to make it an object for inventors or licensed manufacturers to practically put inventions into operation, a sufficient protection should be given to them to warrant such an undertaking.

2. That as steam and electricity have brought all civilized nations near to each other, some practically uniform international system of granting patents should be adopted under which all of the patents of these several nations may be issued.

3. That some international system for repatenting or registering patents should be adopted by the several nations granting them, whereby patents granted in one country may be made effective in each of the others without burdensome fees, taxes or annuities.

4. That a requirement of working or of putting the invention into use within a stated time is an onerous condition which leads to the non-patenting and to a consequent non-use of inventions which require extensive plants or machinery, and that it is a condition which retards the introduction of inventions in the countries requiring it.

5. That all patents should for their duration be independent of patents for the same invention in other countries and be granted for the same term as that allowed by law for patents in the country granting them, and with no further restrictions than that the applications therefor be limited to the time fixed for applications by citizens and the date of grant antedating that of the oldest prior patent.

6. That a trade-mark valid in one country should be valid the world over to the first user, except only when antagonistic to local laws as to good morals.

7. That priority in the matter of trade-marks should be referred to the time of the commencement of a continuous user, and not to the date of a registration.

8. That a mark connected with a false indication of origin should be considered contrary to good morals.

9. That a committee of five be appointed by the president of this congress charged with the duty of bringing these resolutions before the Congress of the United states and the legislatures of other countries, as well as any future conference under the convention for the Protection of Industrial Property concluded at Paris, March 20, 1883, and to take such steps as they shall deem proper to perpetuate this congress as a body for the amelioration of patent and trade-mark laws in their international relations; that this committee have power to fill vacancies and to add to their number members from each country desiring to aid in these enterprises. L. L. Bond, J. M. Thacher, James Buchanan, R. J. Gatling, Francis Forbes, committee.

The committee also reported the following as proposed by Dr. Carl Pieper of Germany: That the culpability of dishonest competition should be universally established and efficiently enforced on the wide field of industrial property. This was also adopted.

We take the following from the *Railway Age* because it has a much wider application than to railroads alone: "A certain president was saying the other day that popularity among his employees was one of the worst traits that a railway official could have. It was always, he said, expensive to the road in the long run, and when a man came to be too well liked it was time he went to some other road. There is a good deal of shrewd truth in the remark, however unkind and illiberal it may sound. There is a kind of popularity which degenerates into familiarity and slapping on the back, and that, if it does not breed contempt, is certain sooner or later to injure the discipline of the road. Popularity which is won at the expense of respect is a dangerous attribute for any man who has to keep control of others; and even worse is that popularity which an official sometimes gains at the expense of his own superiors and of the other officers of his road. As soon as a division superintendent or an assistant of any kind stoops to win popularity among his subordinates at the expense of his chief, it is time he was got rid of. Perhaps the chief may deserve it and ought to be got rid of, too. But the other should go first."

Petroleum has been discovered in Susquehanna County, Pa. The Standard Oil Company are leasing all the land possible and will proceed with the boring of wells immediately.

THE RETAIL STORE.

Streeter's Mincing Knives.

N. R. Streeter & Co., Groton, N. Y., are putting a line of mincing knives on the market, as herewith shown. The handles are cast iron with detachable nickel plated blades. The blades are of fine steel so that they can be sharpened,

Fig. 1.—Streeter's No. 10 Mincing Knife.

and are made in skeleton shape to prevent clogging. Fig. 1 represents the one-bladed knife, the blade being held securely by a screw passing through the plates on both sides. In the Duplex knife, Fig. 2, the blades are held in position by a square shouldered bolt with a thumb screw. The blades of the Sensible knife, Fig. 3, are held by a heavy bent wire hook with a nut on the top. The knives, Figs. 2 and 3, have lugs or grooves to prevent the blades from turning and to assist in holding them rigidly in position. Thus the blades can be easily removed for sharpening or cleaning. The durability and attractiveness of the goods are features emphasized by the manufacturers; also the low price at which the knives can be sold, the Sensible, Fig. 3 for instance, being designed to retail for 25 cents each.

Horseshoe Rack.

We are indebted to Murphy, Maclay & Co., Great Falls, Mon., for a description of the Horseshoe rack

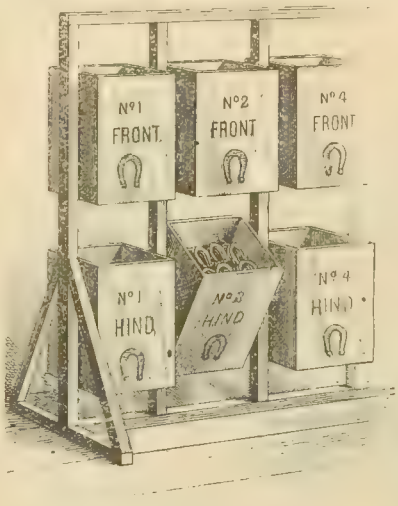


Fig. 1.—Horseshoe Rack.

shown in the accompanying illustrations, Figs. 1 and 2. The rack consists, it will be observed, of an arrangement of boxes, 12 x 12, 18 inches deep, which are suspended in a frame, as shown in Fig. 1. The construction of the boxes and dimensions are shown in Fig. 2. The boxes have on the sides a ¾-inch hole bored a little above their center, with wrought washers screwed against the sides to serve as bearings. A corresponding hole is bored in the uprights and a machine bolt used as an axle. Each box will hold about 125 pounds of Shoes. By tilting the boxes it is easy to get at Shoes for customers and also to replenish the boxes from stock. A sample of the Shoes kept in each box is fastened to the outside, with a printed designation of the kind and size of Shoe. The extreme hight of the frame is 4 feet 2 inches, and the frame is made of sufficient length to accommodate the required number of boxes. Murphy, Maclay & Co. use 32 boxes, which accommodate the three kinds of Shoes they carry. These boxes are divided among four frames, two of which have eight boxes each, one ten boxes, and one six boxes. They are located in the warehouse adjoining the store.

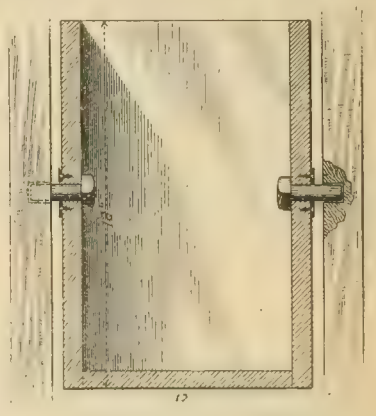

Fig. 2.—Size and Construction of Boxes.

Fig. 2.—Duplex Mincing Knife.

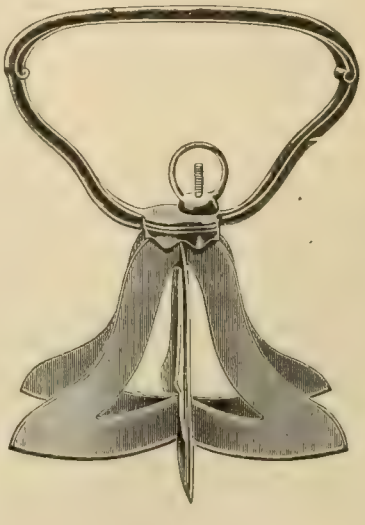

Fig. 3.—Sensible Mincing Knife.

Solid Steel Putty Knife.

The accompanying cut represents a solid steel putty knife, put on the market by Charles J. Healy, 106 Chambers street, New York. The knife is forged from a solid piece of steel, resulting in a handle and blade in one piece. The handle is embossed, and the whole knife nickel plated. A feature of the knife is the low price at which it is supplied to the trade, selling as it does at $1 per dozen.

Solid Steel Putty Knife.

How to Keep the Store Neat and Clean.

BY WALTER EIKEL.

That depends on the store—will be an answer which naturally forces itself upon one, when he considers the diversity of store buildings. Where the store means simply a salesroom, with samples only of large goods, and small quantities of shelf goods, the matter of neatness is not nearly as difficult as it is in a store where a single room represents salesroom, office and warehouse combined.

It is absolutely impossible to even imagine a perfectly clean Hardware store. There must be a corner, or a room, and often a number of corners or rooms, where unsightly and dirty things can be stored. Dirt is simply a question of distribution.

Neatness and cleanness mean not so much the absence of dust and dirt as the distribution of these unavoidable evils. When a portion of a store building is devoted only to the display of goods it is not a very difficult matter to keep this portion of the store perfectly neat and clean. Of course, goods will be left on ledges and in improper places during a rush of custom, but a clerk or clerks with an eye for neatness will soon find an otherwise unoccupied moment in which to remedy these irregularities.

INCLINED TO SLOVENLINESS.

"To have a place for everything, and everything in its place," is the great desideratum. This will only be reached when each individual is held responsible for a certain portion of the store, and when clerks who are by nature inclined to slovenliness (and there are such) are forced to be neat in their persons as well as in their surroundings, because a person slovenly dressed, standing behind the counter, will completely counteract the beneficial influence of a neat-looking store on a customer. Of course, it goes without saying that cleanness and neatness are a great attractive feature in a store Unhappily, many Hardware stores are so unclean and disorderly that ladies are afraid to enter them. In such stores goods are usually covered with dust: bright goods are to a greater or less extent corroded, often through careless sprinkling, all of which detracts from the selling qualities of the goods. It is a well-known fact that whoever buys goods wants them to be new, and wants them to look new. Even such people as will leave a new Axe in the open yard during a rainy night will not be satisfied to buy an Axe with a rust spot on it.

A SPRINKLING POT.

It is necessary to have a "general cleaning up" of the store once a day. This should commence on opening the store in the morning. It should be made an inflexible rule that all goods should be in their proper places before closing in the evening. By this the accidental sprinkling of water on goods left on the floor during the day will have been avoided. Much importance attaches to the use and abuse of a sprinkling pot. It is a very easy matter to spray a few drops of water into a Nail bin now and then, or on the base of counters and the legs of Stoves; but each drop will count, and will detract from the general appearance of the store. Even in so insignificant a matter as sprinkling it is necessary to use care and judgment. Of sweeping and dusting, the same may be said. It is impossible that these daily cleanings should be anything more than superficial. To make the cleanness of the store as nearly perfect as possible, it is necessary that on each day, after the general cleaning, and during leisure moments, a small portion of the stock be cleaned thoroughly. To do this, goods must be moved from their places and replaced after thorough cleaning. It is very disgusting for a would-be purchaser to have a cloud of dust blown into his face from the top of a bird cage which is being taken from its hook, and where it had hung unmoved since its arrival in the store.

SHOW WINDOWS.

Show windows (and showcases also, to a more limited extent) should contain samples only, so that it is not ordinarily necessary to remove part of a display to supply a customer. When it is unavoidable to thus "rob" a show window, the missing article should be immediately replaced, since nothing is less attractive than a show window with empty spaces in it. Better have no show window than to have one that is not absolutely neat and clean at all times.

CUSTOMERS SEE TOO MUCH.

New goods should in all cases be unpacked and marked as far away from the interference of customers as possible, preferably in the warehouse, and should be stored as quickly as circumstances will permit. It is very undesirable to have customers see too much of the inside workings of your business. It is therefore a necessity to have a place set apart for the storage of goods pending delivery, or the arrival of invoices, for unpacking and marking. Odd goods, such as samples of articles not in stock, should not be allowed to accumulate in any one place, but should rather be distributed among other similar articles. This will greatly increase the chance of selling, and thus removing them. Never should imperfect goods be allowed to lay about, least of all such as have been returned for imperfections. Broken articles should be either repaired at once, or, when that cannot be done, they should be removed, since all imperfect goods discredit perfect ones of the same kind. Next in importance to the buying and selecting of goods is the keeping of them neat and clean.

Streeter's Pot Scraper.

The cut herewith shown represents a pot scraper put on the market by N. R. Streeter & Co., Groton, N. Y. It consists of a nickel plated steel blade with a sharpened rounded edge, the blade being attached to a nickel plated metal handle. A combined pot chain and scraper also is made by the same company, in which a pot chain is hung to the blade of a scraper, similar in shape to the one shown in the cut. In operation the scraper blade is put on the pot chain for scouring, or the scraper may be used by itself. This arrangement obviates the necessity of the hand coming in contact with the pot chain when cleaning pots, kettles, &c.

Streeter's Pot Scraper.

STOVE TRADE NOTES.

Future of the Hot Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

USING PIPES OF THE PROPER SIZE.

Steam and hot water men point with pride to the fact that within the past 10 years both steam and hot water heating have been reduced to a science, and that statistical matter pertaining to every branch of the business is at hand to guide the contractor and engineer in his work, and that very little is left at the present time to either theory or experiment in these forms of modern heating.

On the other hand they point out the fact that hot air heating in the past has been carried out on the "cut and try" plan and that no improvement has been inaugurated in the furnace business which would tend to reduce that form of heating to a science. To a certain extent the claim of the hot water and steam men is well founded, but at the present time they must not overlook the fact that a movement is at hand by which the furnace dealer is being supplied with reliable data of various kinds in regard to hot air heating, which data are the result of long experience in furnace heating and which if followed will leave to the furnace dealer little room for error. It will also eliminate very largely haphazard plans of doing furnace work in vogue in many parts of the country until within a comparatively few years.

Tables have been prepared and are accessible to the furnace dealer by which the capacities of various sized pipes, both round and square, are given, whether said pipes are figured in perpendicular position or as connections from furnace to boxes with the ordinary elevations of such pipes. Tables have also been prepared giving the sizes of registers in common use in hot air work, together with their equivalents in round or leader pipes, also their equivalents in square or riser pipes, as well as the number of cubic feet of space on first, second and third floors, which these registers with their equivalent round or square pipes will heat in the latitude of New York or Chicago. With such a table in the possession of the furnace dealer it would seem that very much better work could and would be done in the future than in the past.

One very frequent mistake that has been made in the past, both in the installation of furnaces and of the concealed hot air or riser pipes, is the failure to use both furnace and pipes that are large enough to supply sufficient air for heating the buildings in question. Owing to the partitions being formed of ordinary 2 x 4-inch studding, dressed down to about 3¾ inches, it has been necessary to make furnace pipes narrow enough to admit of their being placed in these partitions, although good judgment on the part of the owner and dealer would lead to the furrowing out of the partitions carrying the hot air to the upper floors.

In the judgment of the best furnace engineers the ordinary furnace pipe when placed in the partitions referred to fails to deliver sufficient air to heat large rooms on the upper floor, and, in fact, while the ordinary 4 x 12 or 4 x 14 stack is made to heat chambers and rooms of fair size, this is accomplished only by delivery to said rooms of air in small volumes heated to a very high degree of temperature. This is contrary to both the theory and practice of good hot air heating, which should be done not by "hot" air in small quantities, but by warm air in large quantities.

It is interesting to note, in the orders sent for furnace pipes by dealers throughout the country, the wide difference of sizes used for the same work. I have noticed that dealers who frequently order a large size register for heating some large room, which register would have ample capacity for heating the room referred to, but the capacity of the register would be reduced to nearly one-half by the use of a leader pipe not over half of the capacity of the register to which it led. Also, stacks 4 x 10 will be placed in partitions for heating rooms of good size, and while this size of pipe is totally inadequate for the requirements of the case, the round or leader pipes connecting with said stack would be probably 10 inches, or about the proper size of pipe for the room, but whose capacity would be nullified in large part by the small stack to which it was connected.

In the experience of many house owners rooms on the second floor are inadequately heated in extremely cold weather, even when the furnace is at a white heat and the air coming up through the registers at a very high degree of temperature, and the solution is of course very plain, as a sufficient volume of heated air cannot be introduced into the apartment to properly heat the same. Architects in many of the large cities have been looking of late into the question of proper pipes for the partition walls, and in more than one case, in the city of Chicago, architects, in drawing plans, are specifying the size of concealed pipes, and are providing partitions large enough to carry said pipes, and are doing this for the reason of the complaints from clients of theirs of inadequacy of the pipes that have been used in their houses.

In supplying these larger pipes the architects have had occasion to refer to the tables referred to in another portion of this article, and wherever pipes of the proper size have been used together with a furnace of ample capacity the architect has found that his clients were very much better satisfied. This move is certainly a beneficial one to the trade at large, and dealers everywhere would find it to their interest to co-operate with their local architect in seeing that plans provided by said architect specify distinctly the sizes of the concealed pipes, knowing that the result would be better work in the community, which would in turn lead to a larger demand for furnaces and directly affect the future of the hot air furnaces.

(To be continued.)

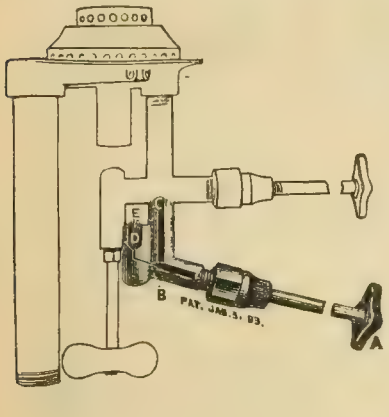
The New York Stove Trade.

Owing to the disposition to let the manufacturer carry the stock, a few chilly days in the early part of October brought an avalanche of orders to all the stove founders and jobbers, and at the same time a rush at the store of every dealer, which was due to the patrons of the local dealers being equally backward in placing their orders. The warm days that followed up this period were looked on alike by both the dealer and the larger houses as a positive advantage to the trade generally, for without them it would have been impossible to satisfy all the demands made upon them. This period, however, has lasted until a desire for a sharp cold snap is again expressed from both quarters. A feature of this year's trade that is manifest to all is the large demand for repairs, some foundry houses claiming that they are already behind on parts needed for goods that have been sold in large quantities in the past, and the smaller dealer finds that more of his time is occupied in making repairs to apparatus already in use than in putting in new apparatus. The sales of new goods, however, have not fallen to any discouraging extent behind the business of last year, and there is good reason to expect that large sales will still be made when the winter opens up with its full force. The stock first ordered by many of the dealers has been exhausted in supplying their first demands and has not been replaced. The few cold days in the early part of this week created a decided activity among shippers and made a material reduction in some of the stocks.

Attachment for Gasoline Stoves.

Borzell & Bardsley of 1925 Germantown avenue, Philadelphia, Pa., are putting on the market a starting attachment for gasoline stoves, as shown in the accompanying illustration. The attachment is adapted to any style of gasoline burner requiring to be heated to start the formation of gas. Its use is intended to do away with the open cup found on burners of the common class of gasoline stoves, and to which there is objection on the part of housekeepers, owing to the blaze incidental to lighting. It is also designed to act as a supplementary burner, keeping its principal primed with gas for instant lighting. In construction the attachment consists of a continuation of the feed pipe to the gas outlet to a point below, as will be seen by reference to the illustration. The oil passes around the original spindle, through pipe C to point D, and is prevented by the valve A from going further. By opening the valve A

the oil passes through cup D and saturates an asbestos packing, E, contained in same. In operation, a match applied to the tip of the packing E will create a blaze sufficient to convert the oil at the needle point into gas, which naturally forces the oil back through the burner; and the oil passing through the asbestos burns for about the same length of time as the oil in the ordinary cup. The upper valve is then opened to allow gas to pass through the spindle hole, the



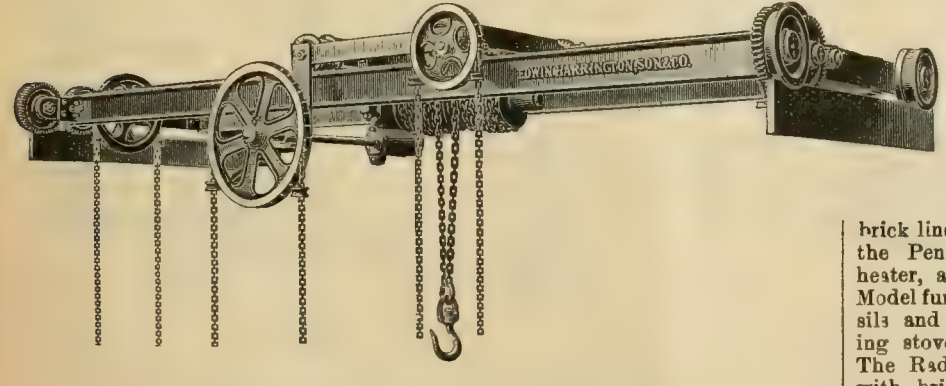
Attachment for Gasoline Stoves.

burner lighted and the valve A turned off entirely. It is claimed that in the event of the flame of the supplementary burner blowing out the oil will not leak or run, for the reason that the feed is so small that the first drop of oil would evaporate before the second could come down. When the stove is out of use for short intervals only, the supplementary burner may be kept burning and the stove is ready for immediate lighting.

The Harrington Special Foundry Crane.

Edwin Harrington, Son & Co. (incorporated) of Philadelphia have designed a crane especially adapted for use in stove foundries and other places where fine work is required. For the lifting of copes or molds the ordinary chain and sprocket wheel hoist is claimed to be unsuitable, as, no matter how carefully it is made, a chain running over a sprocket wheel will, as each link leaves its pocket, jar the load, which generally results in a cracking of the sand and a breaking down of the mold.

This crane was designed with a view to obviate this difficulty. It will be noticed, by reference to the engraving, that the sprocket wheels of the hoist have been replaced by a drum having right and left spiral grooves, in order to insure the hanging of the hook continuously over the same point. A sure and steady movement, without jumping or jarring, is in this way secured, the chain winding and unwinding with the regularity of a rope on a windlass, and allowing a cope to be lifted and lowered without danger of the sand sifting out or the mold breaking down. The internal gears of the hoist are operated by means of a shaft extended far enough beyond the beam of the bridge to prevent the chain from interfering with the load; this also enables the operator to stand at a respectful distance from a pot of metal. The crane is operated by geared wheels throughout, and the shaft, which is placed inside of the beam to save room, moves the crane by pinions and intermediate gears, all of which are furnished with roller bearings, producing easy movement.



THE HARRINGTON SPECIAL FOUNDRY CRANE.

The Mount Penn Stove Works

of Reading, Pa., have just issued a 104-page catalogue of their goods. It is of convenient size, printed on a fine quality of calendered paper, and bound in stiff paper covers, with illuminated side title. A view of their works, with special notices and suggestions regarding the making out of orders, are to be found in the opening pages. The New Royal Esther range, which is first considered, has been redressed for this season's trade, and presents a very handsome appearance. It is shown in four styles. The Majesty range, in two styles, appears next, followed by the New Queen Esther, recently redressed, in five styles, including a new one, which is shown with shut end attached to a boiler and which has been designed for the purpose of using an extra large water front, in connection with a circulating boiler, where an unusual supply of hot water is required. Next in order are Domestic, New Guardian, Osceola and Olivet ranges, the latter having been redressed since last season. Then follow the Oriental, Ornate, Delight, Onoko, Itasca, Raven, Robin, Ringgold and Grange or Albion ranges. The Penn Elmo is a new range, made either as a five-hole or six-hole stove, as required, and is adapted for use with a hot air attachment. It has the duplex grate or a plain flat grate, and enters the market as a reliable, low priced range. A page is devoted to pipe shelves, and prominence is accorded to a new pipe shelf, 28 inches long by 11 wide, and extending front over the top of the range 16 inches high in the clear. A hot air attachment for carrying unused heat from a range to an upper room is illustrated and described, and the announcement made that the attachment is now adapted to all the leading ranges made at these works A few pages are devoted to cook stoves and show the Automatic, New Albion, Famous and Panama cook stoves. In heaters the Penn Diamond occupies the place of honor. This is a new square parlor stove and double heater, and embodies the very latest ideas in heater construction. It was described in a recent issue of *The Metal Worker*, when its leading points were briefly mentioned. The Penn Royal double heater, Penn Grand single and double heaters and the Penn Rose small double heater are shown, also the Penn Fairy single stove and double heater, a new and handsome low priced small square parlor stove, with straight draft, full reversible flue and Ransom duplex grate, nickel plated swing top, tile plates, feet, skirting, foot rails and name plate, ornamental urn and tile. Penn Franklin stoves and fire place heaters take up some half dozen pages, followed by the Penn Jewel fire place heater, a new heater made in one size but having frames made in two sizes and three styles, square top, circular top and with elliptical corners, the latter for French mantels. It has a center discharge grate, fire brick lining, damper in smoke pipe collar, and a fire pot 12 inches diameter inside of brick lining. Other heaters shown are the Lulu, Vida, Medal, Artist, Fales, Dora, Lillie, Royal Essex, Dandy, Pansy, Ethel and Penn Ruby; the Penn Hero, a new high grade cylinder stove and surface burner with sliding feed door, hinged lower illuminating doors, sliding top and extra large base; the Penn Hope, a new sheet iron stove with extra large base, and the Penn Hope double heater with sliding register in top. The line of globe and egg stoves includes the Daisy, a new globe stove with expanded lower fire pot, consequently increased grate surface; the Charm, a new and improved square base globe stove with expanded lower fire pot, mica door and dumping and shaking grate, and the Magic, a new cheap egg stove with expanded lower fire pot, nickel foot rail, hinge pins, panels and ornament, polished edge, square base and dumping and shaking grate, and adapted to conversion into a self feeding stove by the addition of a magazine. The closing pages are occupied by the Monday, a new laundry stove with brick lined cylinder and revolving top; the Penn Tropic, single and double heater, a farmer's boiler, Radiant and Model furnaces, hollow ware, stove utensils and repairs, directions for operating stoves and remarks on chimneys. The Radiant furnaces are now made with brick linings, and the line of Model furnaces has been augmented by the addition of No. 248, an extra large size with a grate diameter of 26 inches. The catalogue is well indexed, and stubs have been placed in the binding to allow of the easy insertion of supplements.

A PLEASING INNOVATION in electric heating is shown in the office of A. L. Canfield, 284 Pearl street, New York, where an incandescent electric lamp and globe are placed inside of a Beaver Franklin, sending forth a cheerful glow and bright illumination. Mr. Canfield

reports a satisfactory business for the Danville Stove Mfg. Company, but can still fill orders for the popular new things which the company have brought out this year.

New Factory of Quick Meal Stove Company.

The Quick Meal Stove Company, St. Louis, Mo., have experienced considerable difficulty during the past season in making enough goods to keep ahead of their orders, and at one time it looked as if they would be hopelessly behind, notwithstanding their large capacity. As their business has steadily grown since its inception in 1882, they feel justified in anticipating their wants for the season of 1894. To be able to fully meet the requirements of their patrons they have decided to make an addition to their factory. The necessary plans were drawn, and about two months ago they commenced the erection of the building, which, when completed, will occupy a lot 60 x 150 feet. The structure is built of pressed brick with stone trimmings and is four stories in hight. The first floor, as represented in Fig. 1 of the cuts, will be utilized as a repair shop, and also warehouse for storing tin plates, sheet steel, bar iron, &c., while the second floor, the plan of which is shown in Fig. 2, will contain the offices and large vaults, gas stove mounting shop and work benches, together with emery wheels, drill presses and lathes. The third and fourth floors will be for the exclusive manufacture of ovens and ware for the Quick Meal stoves. The structure is built on the slow combustion plan throughout, which, in addition to a lower rate of insurance, gives them ceilings at least a foot higher than if built on the old plan, thus affording additional light and air. The ceiling is also better finished, as, instead of the clumsy looking joists, nothing but the solid 14 x 14 inch beams are used, and all the beams, flooring, &c., are dressed lumber. With 4 inch floors they have a building which is exceedingly strong, and particularly adapted to their line of manufacture. Immediately over the main entrance appears the well-known trade-mark cut in red sandstone, the work being done by a well-known sculptor. The trade mark consists of a young chicken just emerging from its shell, and as he emerges he proceeds to make a quick meal of a mosquito which, unluckily for the mosquito, happens to be in the vicinity. Immediately below the trade-mark are the letters Q. M., also cut in red sandstone. They have arranged their shipping facilities so that they will be able to load their wagons with practically no second handling of the goods, thus enabling them to ship more promptly. The building when completed will give them a capacity of 100,000 stoves a year, without pushing the plant, and

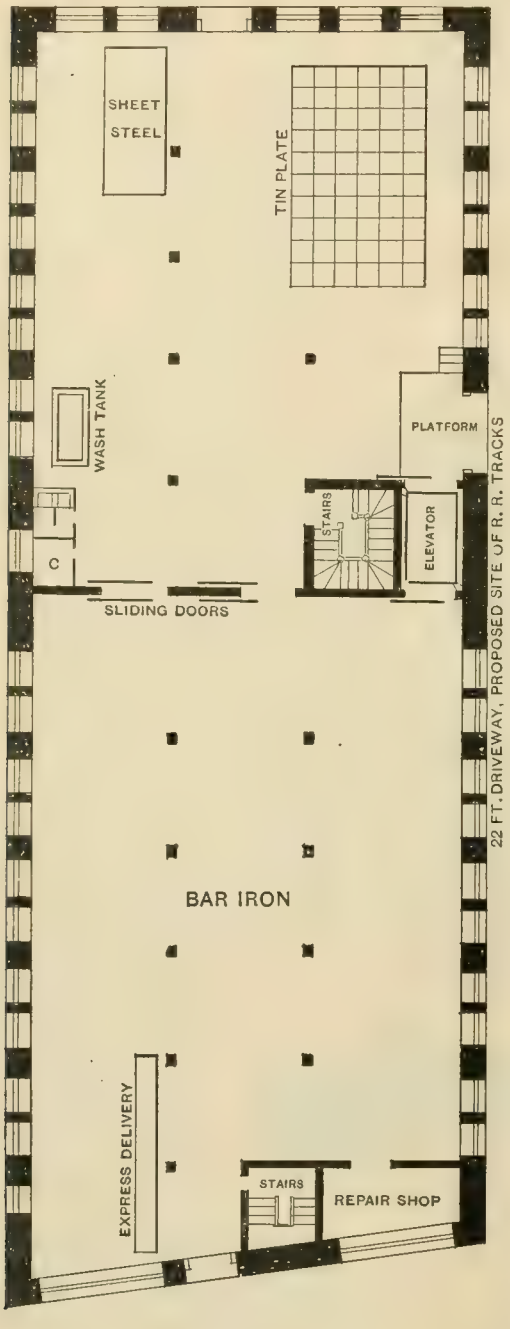


Fig. 1.—First Floor.

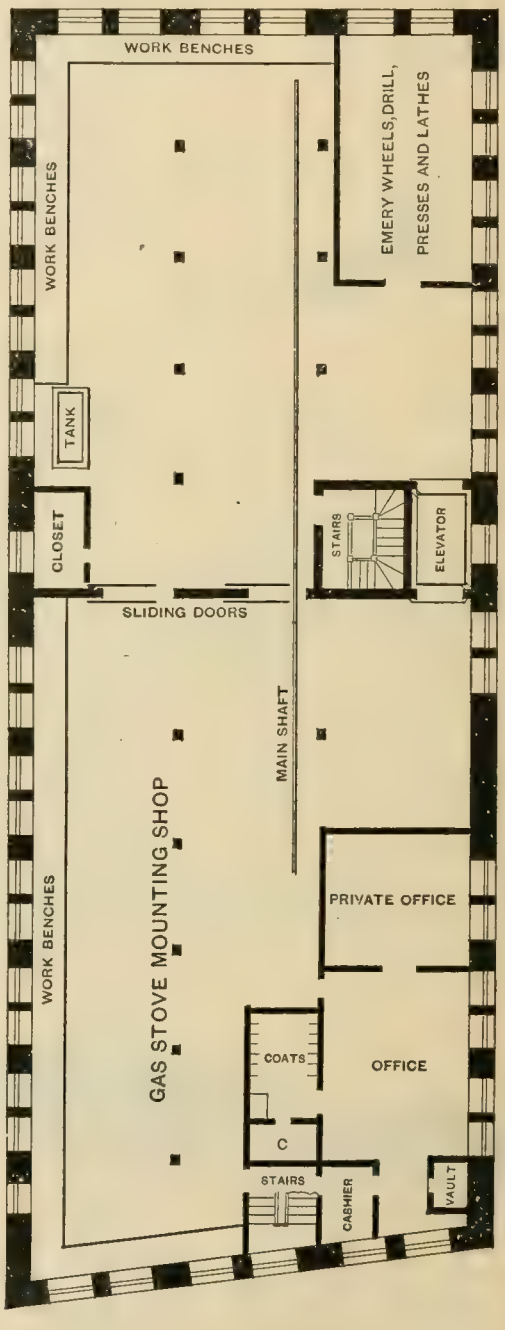

Fig. 2.—Second Floor.

NEW FACTORY OF QUICK MEAL STOVE COMPANY, ST. LOUIS, MO.

when it is taken into consideration that they sold 71,316 stoves during the present year, this capacity will be none too great for their next season's trade.

Henry Charles Burgie.

Henry Charles Burgie, one of the oldest stove manufacturers in the West, died at 7 o'clock, on the evening of the 27th ult., of paralysis, at his home, 3639 Grand Boulevard, Chicago. Since last May Mr. Burgie had been in poor health. He was suffering with heart disease, and while a very sick man he was not confined to his bed. Three weeks ago he had a stroke of paralysis, followed by another on the day before his death, from which he never rallied.

Mr. Burgie was born in Wilmington, Del., 63 years ago. In 1849 he went West and for a time lived in Milwaukee. He finally settled in Chicago in 1851 and established himself in the stove business, forming the firm of Burgie & Brown. In 1853 the partnership was dissolved, Mr. Brown withdrawing. Then a copartnership was formed under the firm name of Collins & Burgie. Mr. Burgie retired from business last year, having amassed a considerable fortune. He leaves a widow but no children.

Thus passes away the surviving partner of the old firm of Collins & Burgie, Mr. Collins having preceded Mr. Burgie in his departure from earth only about two years. They were associated in business for nearly 40 years, and during the whole of that time were almost inseparable out of as well as during business hours. So lovable were both characters, and so highly esteemed were they in their business relations, as well as by their employees, that they were frequently referred to as the Brothers Cheerybee, those admirable creations of the rich fancy of Dickens. The world does not contain so many thoroughly agreeable personalities that two such deaths will not fail to make a deep impression on all who knew them.

A Few Minutes with Rathbone, Sard & Co.

Rathbone, Sard & Co.'s foundry at Aurora, Ill., which has been running full time during October to meet the increased demand for stoves, has made a record for melting iron which is noteworthy. There is a 6-foot cupola in this foundry, built on the company's own lines and of their design throughout, in which on several different days 40 tons of iron were run off in two hours. It was not merely a spurt, which could not be repeated, but, as stated above, was done on several days. This record is believed to be unsurpassed by that of any other cupola of equal size in any stove foundry.

The company are now very busy filling orders, but trade has come so late this year that they expect the result of the season's business will be considerably under that of 1892, which, however, was an unusually prosperous year. They are now distributing illustrated circulars calling attention to some special lines of goods. One circular treats of Acorn ranges and cook stoves for burning wood only, the line comprising six and four hole ranges and three styles of cooks. Another refers to Acorn soft coal ranges and cook stoves, showing a larger line, consisting of two six-hole and two four-hole ranges and four cooks, covering all grades. A third circular covers soft coal heating stoves, in which the company have won marked success this year with their new Acorn radiator. This is practically an oak stove, built perfectly air tight, but having an ornamental open work case surrounding the inner stove, leaving an air space about 2 inches all round, properly arranged for hot air circulation. The excellent heating qualities of an oak stove are thus secured without the unsightliness of discoloration from the heat. The stove outwardly is of square shape, beautifully finished, decorated in nickel and suited in every respect for parlor use. Other soft coal heaters are the Acorn Oak, Glen Oak and Western Acorn. The fourth circular handles hard coal base burners, of which the company make a very extensive line, consisting of the Art Westminster, the Acorn Art Parlor, the Royal Acorn, the Princess Acorn, the Acorn Square Parlor in A and B series, the Avenue base burner with revertible flues or with direct draft, the Victor and the round base burner Hudson.

During the World's Fair the company distributed 100,000 of their Columbus Acorn souvenir. This is a hollow wooden acorn containing a bullet, susceptible of being rolled into such a position as to make the acorn stand on its point, in imitation of the Columbus egg. Another souvenir was an illustrated poem narrating how Columbus discovered the acorn.

G. G. Hallett.

We have the following additional particulars of the life of G. G. Hallett, whose death was noted in our columns last week. He was very prominent in the stove trade of the city, and was noted for his affable manner and genial disposition. He began his business career 35 years ago, at the corner of Water and Fulton streets, in a small cellar, and through the intervention of an old friend branched out to more pretentious quarters at 233 Water street, where he was very prosperous. After a few years, finding more room necessary, he secured the commodious store at 236 Water street, where success still followed him. He was known extensively in all parts of the world and shipping circles for his Standard ship cabooses called the Hallett. About a year ago he was stricken with a lingering illness, during which time he was tenderly watched by his wife. In her loss the trade sincerly extend their sympathies.

The funeral was very largely attended by many of the veterans, also a great many of the younger men of the trade, one and all having been very closely associated with him in business. The interment was in Greenwood.

ODD PLATES.

The Manhattan Brass Company of New York City are the assignees of a patent for a lamp stove, granted a short time ago to Thomas Hipwell of Long Island City. The invention is especially adapted to that class of lamps which are used for heating purposes and in which there is surrounding the flame, and rising above it, a heating drum provided with openings. For the purpose of preventing the heat radiating from the flame and drum down upon the floor or upon the reservoir containing the oil, the inventor makes use of a water vessel around the flame and forming the base of the heating drum itself. This is so placed as to intercept the rays of heat which may be radiated downward toward the floor, while at the same time it keeps the base of the drum cool and allows the vapor arising from the water to moisten the atmosphere of the room.

Hull, Grippen & Co, 310-312 Third avenue, New York, are running 60 men to meet the demands made upon them to put heating apparatus and stoves in order. Hull's patent hot air furnace comes in for a generous share of patronage where a new heater is required.

The John C. Jewett Mfg. Company of Buffalo, N. Y., have been assigned a patent for a vapor burner granted October 10 to William J. D. Mast of the place named. The invention relates to a vapor burner for alcohol or similar lamps, more particularly, however, to burners of this kind which are provided with auxiliary wicks for starting the vaporization of the alcohol, and a device for extinguishing the flame in the auxiliary wick. A central wick tube is provided at its upper end with a flanged cap, and below the flange with a number of perforations for the escape of the vapor. Surrounding the main wick tube below these perforations is an auxiliary wick and a vertical movable extinguishing tube, which is so placed as to bear with its upper end against the flanged cap. In using the lamp the extinguishing tube is lowered by means or its operating shaft into such a position that its upper end is below the upper end of the auxiliary wick. The latter is then lighted, which heats the perforated enlargement of the main wick tube, and the alcohol or other fluid employed is vaporized. The vapor issuing from the perforations of the main wick tube is next ignited, after which the flame from the auxiliary wick may be extinguished, as the heat produced by the burning vapor is sufficient to continue the vaporization of the fluid. The arrangement of parts is such that the auxiliary flame, or it and the main flame, may be readily extinguished by simply turning the operating shaft in the proper direction to raise the extinguishing tube.

The Rochester Radiator Company, State and Furnace streets, Rochester, N. Y., have recently taken possession of a new factory building, where they enjoy great facilities for meeting the growing demands of their business. They have added new machinery and augmented their force, so that they are now in a position to promptly meet the demands of their customers. In referring to the Rochester radiator which they manufacture they state that the system of getting directly over the current with the many cross tubes has been demonstrated to be the true one, instead of depending upon literal radiation. The construction is said to be purely scientific and commends itself to practical men who have examined it.

Southerd Robertson & Co, Peck slip and Water street, New York, are having a run on their Flag cylinder and Columbus square stoves, as a result of the cold snap.

Bridgeford & Co. of Louisville, Ky., recently had a fire in their stove warehouse that caused a loss of about $65,000, with insurance nearly covering this amount.

The New Beauty combined oil heating and cooking stove is the subject of a four-page circular, which reaches us from the Troy Oil Stove Company, Troy, N. Y. The stove is provided with central draft, the air passing up through the tank between each burner, keeping the oil cool and giving, it is

claimed, better combustion than would otherwise result. The No. 30 stove is provided with three 5-inch wicks and the No. 10 with two 4-inch wicks. The stove is well made in all its parts, and is treated with nickel plate in an attractive manner.

The Raymond & Campbell Mfg. Company of Middletown, Pa., are this season putting on the market some handsome additions to their already large line of heaters and ranges. The new heaters comprise the Perfect Franklin, an open front stove to burn hard or soft coal; the Perfect, a square heater in three sizes, and the Art Perfect, a square heater, with full reversible flue, 15 inch cylinder, full nickel base, rail, bracket and panel, and ornamental nickeled top. The ranges consist of the Grand Perfect, 1893 pattern, constructed with solid skirting, large fire box, right or left hand ovens, 18 x 20 x 13 and 20 x 22 x 14, and attractive and ornamental in appearance, and the Model Perfect, 1893 pattern, a box base range of the same size as the Grand Perfect, resembling it in appearance, but having an ash pit front. Repairs for either one of these ranges will fit the other. This, it is claimed, will be an advantage to dealers which cannot fail to be appreciated. Both have hot air attachments for heating upper rooms and have duplex grates, but their construction is such as to allow of the use of basket grates, or flat shaking and dumping grates, if required. The company are also introducing the New Capital, 1893, a redressing of the 1890 pattern, which has enjoyed an extended sale and popularity. This range has a new design of foot and solid skirting. It has also a changeable collar which can be taken off and attached to the back part, so that when required the smoke pipe may be run directly back into the flue. The company are very busy in their boiler department, the growing popularity of the Sun boiler keeping this department running at its fullest capacity. They have just made an addition to their boiler erection shop, 30 x 78, which has somewhat relieved the pressure upon space which they were experiencing, and now gives them a convenient and well lighted shop, 178 x 30.

A press dispatch from Lincoln, Neb., under recent date, is to the effect that the foundry of the Lincoln Stove & Furnace Company of that place was visited by fire and the structure entirely consumed. The building, we understand, was owned by the State, but the company will suffer considerable loss through the destruction of product and machinery.

Sam S. Utter decorated his five-story warehouse, 113 Beekman street, New York, with bunting, in honor of the repeal of the Silver bill. There were thrown to the breeze over 100 white streamers, each having upon it a miniature game cock. Mr. Utter will also celebrate the event in a social way by giving a dinner to 100 or more of his friends at the Mansion House, Brooklyn. As a result of the repeal of the Silver bill by Congress Sam expects a general revival in business, and he has his warehouse filled with stoves to supply the rush of orders.

The Smith & Anthony Company, Boston, Mass., took seven medals at the World's Fair, receiving an award for each article exhibited.

John F. Mills, treasurer of Abendroth Brothers, 109 Beekman street, has returned to New York after an absence of three weeks, spent in visiting the trade in the Western cities. He also spent some time in enjoying the beauties of the World's Fair, at Chicago.

Reports from Chattanooga Tenn., are to the effect that the Chattanooga Stove Works, which shut down the latter part of August, will soon resume operations. Manager Farrington reports that the greater portion of the stock on hand at the time of the shut down has been sold, and that as the demand for grates is heavy it will be necessary to soon resume operations.

An announcement in red ink states that five medals have been awarded by the World's Columbian Exposition on the Boston heater furnace, Boston heater combination, Magee Grand range, Kitchener double oven range and the Ideal open grate.

We are in receipt of a recent copy of the Dallas *News* of Dallas, Texas, containing an account of the visit of a number of Mystic Shriners of Galveston, Texas, to the Dallas Fair. The party were in charge of Sam Shannon, a representative of the Excelsior Mfg. Company, St. Louis, and as one of them put it, "it is not necessary for me to say any thing further than that Sam Shannon had us in charge." Mr. Shannon is one of the best known salesmen in the Southwest, and has been traveling in Texas for a number of years. His friends are legion, and during the parade of the Shriners they endeavored to have him ride the camel, but his excuse was that he had been humping himself pretty lively during the past two months in the interest of his company. Sam claims that the reason a camel can go two weeks without food is that, when a camel does eat, his food is prepared on a Charter Oak stove.

The Excelsior Mfg. Company, St. Louis, Mo., favor us with a clipping from the Columbus *Index*, printed at Columbus, Miss., and referring to the Charter Oak stove in a manner that does credit to the advertiser, who in this case is W. L. Kemp, agent at Columbus, Miss., for the Excelsior Mfg. Company. There is, it is admitted, a great deal of money wasted in newspaper advertising, but in this case if the advertisement does not pay for itself it should not be charged to the advertisement, the make up of which is especially attractive.

L. S. Brown of the Springfield Facing Company, Springfield, Mass., returned a short time ago from the World's Fair, and while there secured for his company the entire graphite exhibits of Ceylon and New South Wales. It is said that these were the largest and finest exhibits of the material named ever made in this country.

Forster Bros, proprietors of the Central Stove Works, Lebanon, Pa., are about putting their goods on the market. They have been busy since last spring getting their works into shape, with the result that they start up with a well equipped plant. Their works are situated close to two railways and a spur of the Cornwall & Lebanon Railroad passes the door of their shipping room. The main building contains four stories with five floors. The ground floor is fitted up as a machine and finishing shop and contains the engine room and business office. The second floor is the fitting department and pattern shop, while the third, fourth and fifth are reserved for storage. The molding shop is a new building, situated in the rear of the main building, 66 x 60 feet, well lighted and arranged. Their products will cover a line of stoves and heaters. They have redressed and remodeled a number of patterns obtained from the National Stove Works, Peekskill, N. Y., and are bringing out some new designs in single and double heaters. They state that they will enter the market with 12 ranges in four styles, 12 styles of globe stoves in six sizes and nine styles of square heaters in four sizes. These goods will form the nucleus of a line which they state will be fully up to the requirements of the times.

Isaac A. Sheppard & Co. of Philadelphia, Pa., and Baltimore, Md., are sending out a four-page supplement to their catalogue, descriptive of the Fidelity fire place heaters lately placed on the market by them. The heaters are made of cast iron throughout, are mounted in the best manner and have nickel base strips, foot rails, name plates, hoods, knobs and hinge pins. They have heavy fire pots, draw center grates, inside magazine covers, brick linings above fire pots, dust flues and cast iron ash pans. The frames are either highly nickeled or finished in Berlin black. They are designed to heat two rooms situate one over the other. When required to burn both hard and soft coal they are furnished without magazines, coal being supplied through the sliding fire doors. The illustrations in the supplement are of extra large size and do ample justice to the handsome designs of the heaters.

The Peninsular Stove Company's Works, at Detroit, Mich., narrowly escaped destruction by fire last Tuesday night, but the damage done was not so severe as reported in press dispatches. The fire destroyed what was known as the old mill building, in which were located the company's nickel plating, steel range and furnace departments. The manufacturing, however, will not be interfered with in any way by the fire, for the nickel work will be finished in another building, and the trade can be assured of the usual promptness in filling orders.

Casper S. Francis, a prominent resident of the Schuylkill Valley, died at his home at Spring City, Pa., on November 1, at the age of 82 years. Mr. Francis was the leading spirit for many years in different iron and other enterprises. In 1860 he entered the stove foundry firm of Smith, Francis & Wells, afterward joining that of Francis, Buckwalter & Co. In 1878 he became connected with the Francis Mfg. Company, and at the time of his death he was president of the National Bank of Spring City. He leaves a wife and two daughters. Mr. Francis was much respected in the entire Schuylkill Valley, where he possessed a large influence.

The furnace of the Tonawanda Iron & Steel Company, at Tonawanda, N. Y., will go into blast on the 13th inst.

The Bethlehem Iron Company, Bethlehem, Pa., have shipped a conning tower weighing 17 tons to the Norfolk Navy Yard for the gunboat "Amphitrite."

James A. Potter, late of the Potter & Atherton Machine Company, Pawtucket, R. I., has sailed for England, where he will enter into business in Accrington.

TRADE REPORT.

The Iron Market.

The West, which has been the leader in the decline during the greater part of this year, seems destined to take the first steps toward improvement. The low prices made have evidently attracted a good deal of business from outside quarters, and the result is that the volume of orders has increased. Thus far this has not resulted in any hardening of prices, but has had only a negative effect in stopping a further giving way.

Foundry Pig in all markets is still very dull, but there are indications that a little more work is in sight. Within the next week contracts will be let for 9000 tons of Cast Iron Pipe at Philadelphia, and for 6000 tons at Waterbury. To judge from recent sales, prices promise to be low. A small lot was sold in New York recently at $19.40, delivered in the streets, and in Detroit low prices were also made. We understand, also, that about a dozen city pumping plants are being bid on, the aggregate value being about $500,000.

How changed the financial situation is, is shown by an incident which happened a day or two ago. A firm received two checks from iron manufacturers, both anticipating payment by deducting 23 and 51 days' interest respectively.

Current business in New York is light and the market is without any strengthening tendency. The last sales of Charcoal Warrant Iron, covering 200 tons, went at a shade over $9, buyer to pay storage, which makes it equivalent to about $10. The previous sales at $3 and $1 were made in the absence of any members of the Iron trade at the Real Estate Exchange. Arrangements have now been made to conduct such sales at the Metal Exchange. We quote Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13.25 @ $14.25 for No. 1; $12.25 @ $13.25 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

From Philadelphia it is reported that, notwithstanding extremely low prices, and a surprisingly small production compared with that during the past three or four years, there is plenty of Iron, and decidedly more pressure to sell than there is to buy. This condition of affairs cannot, it is believed, last very much longer, but as the same time it is as hard to move buyers as ever it was. Prices are not quotably lower, but they are irregular, and in spots easier, particularly when there is a pressure to realize, or when spot cash or something near to it seems to be in sight. Business is mostly in small lots at prices varying from $13.75 to $14.25, delivered, for No. 1 Foundry, $13 to $13.50 for No. 2, and $12 to $12.50 for Standard Mill Irons, and for Southern No. 3 as low as $11.25 @ $11.50 has been accepted.

No improvement is noticed in the Chicago Pig Iron market. The only line in which there has been an increased business is in Lake Superior Charcoal. It is believed that within the past two or three weeks a considerable quantity of Charcoal Iron has been placed with large consumers at low prices. The only transactions which have come to light are two of 1000 tons each for delivery in this vicinity at about $15.25, on which the terms of payment run until the middle of next summer, although the Iron is to be delivered immediately. Coke Iron is quiet, only one sale of any size being reported, which was 500 tons of Soft Southern. Even the carload business is not any more active than it has been Inquiries are light. Quotations are now as follows for cash :

Lake Superior Charcoal	$15.25 @	$16.00
Local Coke Foundry, No. 1	13.50 @	14.00
Local Coke Foundry, No. 2	12.75 @	13.00
Local Coke Foundry, No. 3	12.25 @	12.75
Local Scotch	14.00 @	14.50
Ohio Strong Softeners No. 1	15.50 @	16.00
Southern Silvery, No. 1	@	14.50
Southern Silvery, No. 2	@	14.00
Southern Coke, No. 2	12.10 @	12.35
Southern Coke, No. 3	11 35 @	11.60
Southern, No. 1, Soft	12.10 @	12.35
Southern, No. 2, Soft	11.35 @	11.60
Tennessee Charcoal, No. 1	16.00 @	16.50
Alabama Car Wheel	18.50 @	18.75
Jackson County Silvery	16 50 @	17.00
Other Ohio Silvery	15 00 @	15.50

Inquiries were more plentiful during the week in the Pittsburgh district, with the result that a fair amount of Pig Iron has changed hands. Several more furnaces are reported to have started into operation, or as being on the point of doing so. Quotations are given as follows, for cash :

No. 1 Foundry	$12 50 @	$13.00, cash
No. 2 Foundry	11.50 @	12.00 "

While there has been little, if any, increase in the volume of business during the week in the Southern Pig Iron markets, there is a more confident undertone to the market. Increased inquiry for forward delivery is noted, and also less disposition on the part of furnaces to accept orders for delivery after January, except at an advance. The Iron Pipe works continue to be the largest melters of Iron, and but for them there would have been in the recent past a nearer approach to stagnation in the trade. Collections have decidedly improved and now there is little complaint of backwardness except on the part of chronic lame ducks. Quotations are as follows :

Southern Coke, No. 1	$12.75 @	$13.00
Southern Coke No. 2	10.75 @	11.00
Southern Coke No. 3	10.25 @	10.50
Ohio Soft Stone Coal, No. 1	15.50 @	16.00
Ohio Soft Stone Coal, No. 2	14.50 @	14.75
Lake Superior Coke No. 1	15.00 @	15.25
Lake Superior Coke No. 2	14.00 @	14.25
Hanging Rock Charcoal, No. 1	18.50 @	19.00
Hanging Rock Charcoal, No. 2	17.50 @	18.00
Tennessee Charcoal, No. 1	14.00 @	14.25
Tennessee Charcoal, No. 2	13.00 @	13.25
Standard Southern Car Wheel	17.75 @	18.00
Lake Superior Car Wheel and Malleable	17.00 @	17.25

Metal Market.

Pig Tin —In the price of Straits Tin there has been a decline during the past week of about ¼¢ ℔ lb. Spot stock went at as low as 20 45¢ on Metal Exchange contracts and quite as cheaply at private sale. A month ago the spot price was 21¢, bid. In the interval there has been more or less buying to "average down," with the expectation that the restriction of importations by the McKinley duty should naturally turn the tide by November 1. The speculation, however, has proved to be one of those frequent experiences wherein buyers found it easy to purchase goods, but difficult to realize profits. Steadily declining prices in London, due chiefly to heavy shipments of Tin thence from the primary sources of supply, have doubtless had a certain unfavorable bearing, but lack of local support and absence of outside speculative demand leaves the principal holders at some disadvantage. Apropos of the movement from the Straits, it is worthy of note that 1850 tons were sent to Great Britain and 200 tons to the Continent during the last half of October, and that the total shipments for the month were 3500 tons, against 3225 tons during October last year. This would indicate that the excess in European supply more than balances the decrease in American stocks. The stock in the United States, exclusive of Pacific Coast ports, is, according to the Metal Exchange data, down to 3635 tons, against 6710 tons on August 1. Prices were firmer at the close, with 20.60¢ bid for current month delivery, 20.65¢ for November and 20.75¢ @ 20.80¢ for later deliveries. Retail business is of fair proportions, prices for small quantities remaining steady and unchanged.

Copper. There have been heavy exports of Copper to Europe, and home consumers have purchased moderate quantities of Ingot through

local sales agents and brokers, the aggregate of which, while problematical, seems to have been sufficient, in connection with exports on previous orders and on consignment, to prevent really burdensome accumulation of stock in first hands. The movement has sufficed to steady values a trifle. Further than that, however, it has had no particular influence aside from holding speculative offers of futures in check for the time being, since all indications are that there will be quite enough Copper to go around during the balance of the year. Lake Superior was offered in some quarters at 9¼¢, although the leading producers quote ⅛¢ @ ¼¢ above that price. On Electrolytic the range is 9¼¢ @ 9⅜¢, and common casting stock is 9⅛¢ @ 9⅜¢, according to brand, delivery, &c. Prices for small lots are unchanged per list; and a fair average jobbing movement is noted, with rather more active inquiry from consumers both for Ingot and Sheet Copper.

Pig Lead.—Under speculative manipulation the price for common domestic Lead was raised to 3.50¢ for November and slightly higher for more distant future deliveries. Lead came out and speculative buyers at the advance went out. Prices eased off, as a matter of course, and very few contracts changed hands at the decline. Meanwhile some business was effected quietly at 3.40¢ outside of the speculative circle and the latter price fairly reflected market value at the close for carload or large lots deliverable during the next 30 days. Consumers have been very indifferent buyers of late, and their best bids are considerably below those made by speculators. At the end of the week actual Lead was on sale at 3.40¢, prompt shipment, in the face of speculative bids of higher prices for distant future deliveries. Jobbers' prices for small lots of Pig Lead have weakened somewhat, being now marked down ⅛¢ ℔ lb lower than last week. Manufactured Lead of all kinds continues in poor demand, but there has been no change in the New York list price for Pipes and Sheets.

Spelter.—The higher range of value established last week has been fully maintained, and surface indications are that sellers have gained some further slight advantage. In any event 3.60¢ @ 3.65¢ stand as close quotations on ordinary Western brands in carload or larger lots, and some few sales were reported at those figures. Dealings in this quarter have been on a rather small scale, however, and the demand at present is rather slow. For small lots of ordinary Western Spelter dealers' price is 4¼¢ @ 4⅜¢ ℔ lb. Special brands of refined Spelter command an advance of 3¢ @ 4¢. The orders and inquiries for these qualities are reported to have been more numerous during the past two weeks than for the whole of the previous six months.

Antimony.—Only a moderate business is passing, and the market shows no decided change in any particular. On moderate retail quantities the quotations are about 11¢ for Cookson's and 10¼¢ @ 10½¢ for Hallett's.

Tin Plates.—The Tin Plate market presents no distinctly new features. Although somewhat irregular, the demand for Cokes for both prompt and future delivery has been fairly active, and enough business has resulted to impart a tone of firmness, especially in certain lines of which the stock is becoming very attenuated. Bright Charcoals and Ternes have also met with fair sale, chiefly in small lots. In a few instances, where assortments are poor, prices rule a shade higher, but otherwise quotations vary hardly at all from those presented last week. Stocks of imported Plates are dwindling rapidly, and by all accounts future shipments from abroad are not likely to be much heavier than they have been in recent weeks. Importers and jobbers will not take the risk of being caught with weighty stocks should tariff changes come sooner than expected and alter existing conditions in the market for foreign Plates to any considerable extent. Consequently, dealers will not lay in more goods than they have a reasonable certainty of being able to dispose of within a limited time. Domestic production of Plates, more particularly in the line of Ternes, keeps up well, and as manufacturers are not known to be carrying any heavy stocks of American Plates, it is reasonable to infer that the consumption is keeping fair pace with the output. As a matter of fact, the demand for special brands of domestic Ternes has in more than one instance outstripped the capacity of production. In some quarters these Plates appear to have entirely superseded the foreign article.

A special cable dispatch from London to *The Iron Age*, dated November 1, reported that Tin Plate prices are that market were still rather irregular, and some business had been done on a considerable decline from late quotations. Demand is reported as chiefly for moderate quantities of ordinary Coke, and for special sizes. Stocks at Swansea had increased somewhat and were estimated at 236,000 boxes. Liverpool quotations were as follows:

IC Charcoal, Alloway grade	12/9 @ 13/3
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12
IC Coke, B. V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	11/3 @ 11/6

Sheet Iron.—A better feeling is noted in the market for Black Iron, beyond the fairly active business that is passing directly between the mills and consumers. Jobbers report that inquiries are more frequent, particularly since the first of the month, and that orders received are for larger lots than has been the case for some time. Prices are fairly steady, and it is thought that any further movement in them will be an upward one. Galvanized Iron continues in good demand, consumption being believed to be at least on a par with production, if it does not exceed it.

Chicago Report.

Scrap.—Dealers are handling more Old Material now than at any time since June, and yet the volume of business can only be called moderate. Steel Scrap, however, is in no demand whatever. Old Rubber is booming, having advanced 50 per cent. the past two weeks. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5 50	....
No. 2, such as Shovels, Hoes, &c.	4.00	....
Old Boilers—whole (Iron)	4 00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5 00	....
Cast Borings	3 25	....
Turnings	4 00	....
Horseshoes	8 00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	3½¢

Anthracite.—Dealers report a continued heavy demand and very light stocks in yards in this locality. Much coal is being forwarded by all rail routes direct from the mines, but there is much complaint about slow deliveries. Colorado Coal prices have been reduced to Missouri River points. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9 05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8 85

WE LEARN that the Iron Clad Mfg. Company, 22 Cliff street, New York, have been awarded premiums at the World's Fair on every line of goods that they exhibited, the principal specialties being Iron Clad Enameled Ironware, Galvanized Range Boilers, riveted and welded, Tinned and Galvanized Household or Kitchen Utensils, Steel Soda Water Fountains, &c.

CONDITION OF THE

Hardware Trade.

OCTOBER BUSINESS was on the whole somewhat disappointing, having failed to come up to the more sanguine expectations of many in the trade. The month opened well, with an evident increase in the volume of business, but this increased demand fell off, and the trade of the month as a whole was only moderate, covering in nearly all cases such goods only as were imperatively required. The delay in repealing the purchasing clause of the Sherman bill is generally regarded as the cause of not a little of the curtailment of business, and now that repeal may be regarded as consummated it is anticipated that there will be the return of a more confident feeling, which will be followed, it is hoped, by a steady improvement. The business of the past month was thus considerably less than that of the average October, and fell still further behind that of last year, which was especially good. A similar comparison might be made between the four months of the current half year and the corresponding time of other years. A somewhat extended inquiry among manufacturers in regard to the way in which the business of July, August and September of this year compares with last year develops a wide diversity, all, however, agreeing that this year there has been a very material falling off in the volume of trade. Some manufacturers refer to this year's business in the three months mentioned as being about half of last year's, and in a few cases this year's proportion is still smaller. Other manufacturers advise us that their business this year is as much as 70 or 75 per cent. of last year's, but so large a proportion is not reported by any considerable number. An average figure for the business of Hardware manufacturers during July, August and September of this year, as compared with the same months of 1892, would be probably not far from 60 or 65 per cent. The amount of business of different manufacturers naturally varies largely with the character of the goods and the class of trade to whom their goods are principally sold. It is the general experience of manufacturers who sell the bulk of their goods to a few large houses that the falling off in this year's trade has been exceptionally heavy, while those who sell to a larger number of customers, including the retail trade and the smaller jobbers, have had a business more nearly normal.

There is little to report in regard to prices except the somewhat lower figures which are ruling on Wire and Cut Nails and Barb Wire, as referred to more fully in the following columns. The tone of the market, however, is not so strong as it has been, and in other lines concessions are made more freely. Some of the leading jobbing houses are also cutting prices with a view to effecting sales and thus lightening their at present not over heavy stock. Some manufacturers, also with a view to securing orders, are yielding somewhat in the matter of prices, but on the whole a conservative disposition prevails among manufacturers and prevents them from seeking business at unprofitable prices. A reduction in the price of raw material in some lines, with lower wages, enables them, however, to produce some goods at a slightly diminished cost. The production of goods in nearly all lines is largely curtailed, manufacturers avoiding the accumulation of stocks, and throughout the country, in the hands of both the wholesale and retail trade, stocks are unquestionably much lighter than usual. When the demand for goods is again vigorous there will probably be difficulty in obtaining them. Much less complaint is made of late in regard to collections, and the financial condition appears to be constantly improving.

Advices from Chicago.—Shelf Hardware jobbers report their trade very dull. The demand for season goods is over for the time, and orders now being received are for general Hardware, but in only very small lots. The country merchants are buying merely what they are absolutely compelled to take, and are keeping their stocks as low as possible. They report that they are cutting down their credits as much as they can, and keeping themselves in good financial shape for what they fear is a period of decided dullness. Jobbers here are inclined to the opinion that the coming two months will be productive of very little business in Shelf Hardware. A great deal more is doing in Heavy Hardware, but mainly in the line of Iron and Steel to the implement manufacturers. The wagon and carriage builders are still doing very little or nothing.

Notes on Prices.

Wire Nails.—The past week has developed lower prices on Wire Nails and the market is now represented by $1.25 base for carload lots at mill, but orders for large lots can be placed at $1.20. The aggregate of business has been fairly large, a good many of the trade purchasing for the replenishing of their stocks and most of the mills running, though not to their full capacity. A large sale is reported in the West at a figure somewhat below $1.20, but it is understood to have been for a lot exceptionally large for these times.

Advices from Chicago.—The Wire Nail manufacturers report a continued flow of orders. Inquiries are coming in from a fresh lot of buyers from time to time, showing that the belief generally prevails that this is a good time to stock up, with prices down to the lowest point on record. Quotations are based on $1.32½, Chicago, for largest lots from factory, and $1.40 to $1.45 for single carloads. Small lots from stock are quoted in a regular way at $1.50, but prices show a weakening tendency and good buyers can shade this rate.

Barb Wire.—The Barb Wire market is in an unsettled condition and prices are lower and weak. The market is perhaps fairly represented by the quotation of $2.15 for carload lots of Four-Point Galvanized at mill, but sales have been made at a lower figure. Some manufacturers are, however, holding at a somewhat higher price. The demand is light.

Advices from Chicago.—The Barb Wire trade seems to be getting lighter. Manufacturers talk discouragingly about the present condition of business and prospects for the winter. The factories in operation are running only on part time and even then seem to be overstocking the market. Ordinary Galvanized Barb Wire is quoted from factory $2.40 to $2.50, while 10 cents advance is asked on less than carloads. Jobbers report their trade very quiet, but quote small lots from stock at $2.55.

Cut Nails.—The weakness developed in the Wire Nail market naturally has its effect on Cut Nails, and prices are not as high or as steady as for the past week or two. The market is represented by the quotation of 95 cents to $1 basis for carload lots at mill, but sales have been made at somewhat lower figures. The production of the mills is considerably diminished, and in the East is probably not over 60 per cent. of the capacity of the mills. The New York price for small lots from store is $1.20 to $1.25.

Advices from Chicago.—The Cut Steel Nail manufacturers are doing a better trade than at any previous time this fall. Orders are coming in quite freely for carload lots and meanwhile specifications are being received in better shape from those having time contracts. Prices are unchanged at $1.20 to $1.25, while small lots from stock are still selling at $1.30.

Champion Egg Opener.—The Champion Egg Opener is put on the market by the Magic Introduction Company, 321 Broadway, New York. The device is sold to the trade at the following net prices:

	Per dozen.
Nickel plated, handsomely embossed	$2.00
Silver plated, in satin lined case	4.50

Crescent Lock Joint Stove Pipe.—This Pipe was illustrated in our last issue as put on the market by Logan, Gregg & Co., Pittsburgh, Pa., by whom it is sold to the trade at the following prices:

4-inch	$2.50	6-inch	$3.00
5-inch	2 75	7-inch	3.25

Solid Steel Putty Knife.—This article is put on the market by Chas.

J. Healy, 106 Chambers street, New York, and is sold to the trade at $1 per dozen. The Knife is nickel plated, with embossed handle.

Plumbers' Self Clamping Tacks.—Evory Mfg. Company, 21 and 23 Ann street, New York, are putting these goods on the market. The Tacks are sold to the trade from the following list, which is subject to a discount of 20 and 10 per cent. on the plain and galvanized and 20 per cent. on the nickel plated, the prices given being per 100:

Regular Pattern.

	P. I.	Galv.	N. P.
For ⅜ and ½ inch Pipe	$9.00	$10.00	$15.50
For ⅝ and ¾ inch Pipe	10.00	11.00	16.50

For ⅜ to ½ inch Pipe	$7.00	$8.00.....
For ⅝ to ¾ " "	8.00	9.00.. .....

Glass.—In round numbers there is a capacity for the manufacture of Window Glass in this country equivalent to 1800 pots. Of these about 10 per cent., or 182 pots, are reported as now in operation. It is understood that the Workmen's Wage Committee are willing to sign an agreement for the coming fire upon the same basis as last year's scale; and are, in addition, willing to submit to a reduction equivalent to the reduction in tariff on Glass should the tariff be revised. Indiana and Pittsburgh manufacturers demand a reduction from last year's scale, and are unwilling to accede to the workmen's terms. There are no printed quotations on Glass, but a fair factory price for Window Glass in car lots is probably 85 and 5 per cent. discount for Single, and 85 and 10 per cent. discount for Double, with freight allowance. Special assortments made up by manufacturers could probably be bought for spot cash in car lots at 85 and 20 per cent. discount. Imported Window Glass is sold at from 75 and 10 and 5 to 80 and 5 per cent. discount. In Plate Glass the price depends entirely upon assortment, and prices from jobbers range from 50 and 10 and 7½ to 60 and 5 per cent. discount. Trade in all lines of Glass is quiet, with little of encouragement for the future.

Old Metals.—The market for Old Metals, other than Scrap Iron, shows no variation in the dullness which has been its characteristic feature during the past few months. Prices contine low and purchases very moderate in volume; nothing being done beyond what is absolutely necessary for bare requirements. There is a fair business doing in Scrap Iron, the demand being, however, chiefly for small lots for immediate delivery. Prices are irregular, depending largely on pressure to sell. Holders of Old Material look for improvement in the near future. Meanwhile the following quotations represent about the prices ruling in New York:

Heavy Copper	℔ lb 6¾¢
Light and Tinned Copper	℔ lb 6¼¢
Heavy Brass	℔ lb 5¼¢
Light Brass	℔ lb 4½¢
Lead	℔ lb 3¢
Tea Lead	℔ lb 2½¢
Zinc	℔ lb 2½¢
No. 1 Pewter	℔ lb 14¢
No. 2 Pewter	℔ lb 6¢
Wrought Scrap Iron....℔ gross ton	$9.00 @ $10.00
Heavy Cast Scrap.....℔ gross ton	9.00 @ 10.00
Stove Plate Scrap.....℔ gross ton	.... @ 5.60
Burnt Iron (delivered at mill) ℔ gross ton	.... @ 4.00

Old Rags, Paper, &c.—This material shows but little activity. The market for Paper Stock continues a waiting one, Eastern mills being still as a rule running on conservative lines, and being fairly well stocked up. Western Paper mills are, however, busy, and the expectation is that those in this quarter of the country will resume their normal activity so soon as a general revival of business justifies any increased output of Paper. Prices show little change from the level of the past few weeks; the following quotations being those now ruling in the New York market:

No. 1 White Rags	℔ lb 3¼ @ 3½
No. 2 White Rags	℔ lb 2¼ @ 2½¢
Mixed Rags	℔ lb ¾¢
Blues and 3ds	℔ lb 1 @ 1¼¢
Hard Sized White Shavings	℔ lb 2¼ @ 2½¢
No.1 White Book Shavings	℔ lb 2 @ 2⅛¢
No.2 White Book Shavings	℔ lb 1 @ 1⅛¢
Light Book Shavings	℔ lb ¾¢
No. 1 Mixed Shavings.	℔ lb ¾ @ 1 ¢
No. 2 Mixed Shavings	℔ lb ½ @ ¾¢
No. 1 Printed Books	℔ lb 1 @ 1¼¢
Ordinary Mixed Books	℔ lb ½ @ ¾¢
Newspapers	℔ lb 3-5¢
No. 1 Manila Paper	℔ lb ⅞ @ 1 ¢
No. 2 Manila Paper	℔ lb ⅝ @ ¾¢
Bogus Paper	℔ lb ½¢
Common Paper	℔ lb ¾ @ ½¢
Straw Chips	℔ lb ½ @ ⅝¢
Binders' Clippings	℔ lb ½ @ ⅝¢
Jute Butts	℔ lb 1½ @ 1⅝¢
No. 1 Jute Bagging	℔ lb 1 @ 1¼¢
Mixed Bagging	℔ lb ¾ @ 1 ¢
No. 2 Bagging	℔ lb ½ @ ¾¢
Hemp Twine	℔ lb 2½¢
Manila Rope	℔ lb 2½¢
Jute Rope	℔ lb 1½ @ 1¾¢
Mixed Rope	℔ lb ¾ @ ⅞¢

Old Rubber.—A very narrow market exists for this material, the following being about the prices paid for Old Rubber—New York delivery:

Car Springs, ton lots, ℔ lb.	.... @ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	.... @ .03
Rubber shoes, less than carloads, ℔ lb	0.02¼ @ .03⅛
Large Hose, ℔ ton	.... @ 9.00
White Wringer Rolls, ℔ lb.	.... @ .04¼
White Syringes, ℔ lb.	.... @ .05

SEWER PIPE manufacturers of the Ohio Valley will, it is stated, form a combination.

Trade Notes.

MARTIN-BING COMPANY were incorporated at Albany, N. Y., this week, with a capital of $16,000, to sell Glass and Tinware at Tarrytown, N. Y. The directors are Geo. H. Martin, Robert A. Patterson and August Bing of Tarrytown.

THE GILBERT & BENNETT MFG. COMPANY, 44 Cliff street, New York, and 148 Lake street, Chicago: Three catalogues—Nos. 125, 126 and 127. The first is devoted to Screens for coal, sand, gravel, &c., Wire Cloth, Coal Dealers' Supplies and Wire Goods. A great variety of Screens is shown for use in handling coal, covering Car Screens, Yard Screens, Pocket or Shute Screens, House Screens, &c. Among these are some new constructions, specially designed to meet particular requirements. The Wire Goods shown in this catalogue consist of Fencing, Poultry Netting, Stove and Grate Guards &c. The second catalogue is entitled "Fencing and Netting," and covers these subjects thoroughly, including ornamental gates and tools for erecting, fastening and stretching Wire Fencing and Netting. The third catalogue covers Wire Goods in general, such as Flower Stands, Spark Guards, Corn Poppers, Rat Traps, Wire Cloth, Window Guards, Counter and Desk Railing, Stable Fittings, &c. All are profusely illustrated.

NICOL & Co., 55 West Washington street, Chicago: High Art Hair Tools, Hardware specialties, &c. In a catalogue, No. 17, devoted to Hair Tools illustrations, descriptions and prices are given of Nicol's Curling Iron Heater, Ætna Curling Iron Heater, and of the following Curling Irons: Cute, Moustache, Columbia, Queen, French, Favorite, Silver Tipped, Grace Darling, and Cape May; also of Electric Comb Curlers, Cape May Adjustable Wave or Crimping Iron, Lillian Russell silver tipped Crimping Iron and Cape May Pinching Iron. Catalogue No. 18 is devoted to Broom Holders, Twine Boxes, Paper Bag Holders, Wagon Jacks, Bill Files, Showcard Holders, Mail Boxes, House Numbers, Lemon Squeezers, Tourist Lamp Stove, Nut Cracks, Flag Holders, &c.

THE ELMIRA STAMPING & PAPER COMPANY Elmira, N. Y., make a specialty of Ithaca red rosin sized Sheathing Paper, put up in rolls of 500, 800 and 1000 square feet. They emphasize the point that this Paper is especially desirable for sheathing purposes.

THE CHICAGO HARDWARE SPECIALTY CO., 147 and 149 Lake street, Chicago, are handling a number of novelties in the Hardware line. Among these is the Standard Stove Mat, made of asbestos, and intended for use on oil, gas or gasoline stoves, to place directly over the flame and thus keep food from burning while cooking. It is claimed that articles which usually require constant attention and stirring to keep them from burning can be cooked without stirring by the use of this Mat. They also sell the Spery combination Grater and Slicer, illustrated in these columns some time since. They further handle the Sunol Express, which is a Tricycle with a box about 28 inches square fastened in the rear to carry merchandise. The rider sits on a Bicycle saddle on a center post and operates Bicycle pedals which propel the machine by suitable gearing connecting with the rear wheels. The machine is fitted with ball bearings and is otherwise well and durably made.

CHICAGO BRASS COMPANY, 76 Monroe street, Chicago, with rolling mill and factories at Kenosha, Wis., confine their business to the rolling of Sheet Metals and the manufacture of Organ Reeds. They advise us that they notice an encouraging increase in orders during the past few weeks.

REED & PRINCE, Worcester, Mass., manufacturers of Rivets, Burrs and Stove Bolts, have just completed a new building adjoining their old plant. The addition is built of brick 175 x 40 feet, five stories and an L, for engine and boiler rooms. The manufacture of Wood Screws, a new departure for Reed & Prince, will be begun at once.

AT A RECENT meeting of the creditors of the Youngstown Stamping Company, held in Youngstown, Ohio, who were forced into the hands of a receiver by reason of the failure of Robert L. Walker, an examination of the property was made and entire satisfaction was expressed at the manner in which operations are being conducted under the supervision of W. C. Hine, receiver. The concern are now filling large orders for oil cans and other of their products for Eastern shipment.

THE DALLAS STAMPING COMPANY, Dallas, Texas, have suffered a loss of $10,000 by fire.

GEORGE E. MERRY of the firm of Merry & Clark, Tin Plate and Metal importers, 535 West Fifteenth street, New York, has been visiting the World's Fair, where he gave particular attention to inspection of sheet metal and metal products. He was absent about two weeks and brought back with him several souvenirs.

THE BUFFALO HEATING & VENTILATING COMPANY have recently been incorporated, with a capital of $5000, for the purpose of manufacturing heating and ventilating apparatus. The directors are William F. Wendt, Henry W. Wendt and Louis F. Borchard.

HEATING NOTES.

BARKER BROTHERS, 2 Kilburn court, Newport, R. I., distribute a small illustrated pamphlet respecting the Richmond heater for steam or hot water, which they install. General and sectional views are shown of this well-known apparatus and at the close of the pamphlet are a number of testimonials from Newport householders, and references.

ON EXECUTIONS of $1270 the sheriff recently held a sale to dispose of the steam fitters' supply business of the E. E. Weymouth Company, at 484 Pearl street, New York.

THE W. H. PAGE BOILER COMPANY of Norwich, Conn., have opened an office at 484 Pearl street, New York, and carry a full sample line of the Volunteer and All Right steam and hot water boilers.

SOME OF THE MASTER STEAM FITTERS in New York report a lack of good fitters and an oversupply of helpers. The trade is busily engaged in attending the emergency cases that always rush in at the last minute, and some skilled labor could be used at this time with advantage.

THE RICHMOND SECTIONAL BOILERS will be used in the following contracts: C. M. Bailey of Rochester, N. Y., will use one in the Roman Catholic parsonage at that place; Barlow & Bailey, Plymouth, Mass., will use one for heating the Universalist Church in their town; William L. Seeley's new business block at Goshen, N. Y., will be heated by a Richmond Sectional set up by Swenton, Van Etten & Co. of Port Jervis, N. Y. A No. 55 Victor boiler is being used to heat the National Bank Building at Newburg, N. Y., by George T. Barnes of that city.

"THE GEE-WHIZ SEE HER CIR-KER-LATE" book of the Model Heating Company of New York, which was circulated so freely in the past, is now being circulated with a number of testimonials from those who have used the heater. Under the head of "Boiled Down," a number of short, expressive sentences are accompanied by the signatures of several prominent men.

W. G. FLEMING has been erecting, at Fond du Lac, Wis., a steam heating apparatus for the Northwestern Railroad by which the company will keep their cars heated during the night. A 2½-inch pipe is run from the plant to the side track where the cars are stalled. The pipe is laid down about 5 feet below the surface of the ground and is incased in sand surrounded by a wooden trough, having a dimension of 8 x 8 inches, to guard against the loss of heat during its transmission from the boiler to the cars. A similar plant is to be erected at Fort Howard for the same purpose.

THE AMERICAN RADIATOR COMPANY, 111 and 113 Lake street, Chicago, are distributing as an advertising device a paper *fac-simile* of the official ribbon given by the World's Columbian Exposition to those exhibitors whose goods have been awarded a premium. The ribbon is blue, with gold lettering. The company were awarded a premium on their radiators. The method they have taken to advise the trade of the honors won is ingenious and undoubtedly effective.

THE GURNEY HOT WATER HEATER COMPANY, 163 Franklin street, Boston, Mass., issue a postal card carrying an acrostic advertisement, the initial letters spelling the well-known name "Gurney," while the lines that they begin indicate the reasons why the Gurney hot water heaters and radiators should be used.

The bill to grant an American register to foreign built vessels has been favorably reported to the House by the Committee on Merchant Marine. The bill will probably secure the early consideration of Congress.

The Chicago, Milwaukee & St. Paul Railroad is now testing a 12-wheel passenger engine recently built under a guarantee by the Rhode Island Locomotive Works of Providence. Although in all there are 12 wheels, the machine is of ten-wheel type, six of these being drivers of unusual size for this class of locomotives—6 feet 6 inches in diameter. The total length of engine and tender is over 63 feet, the wheel base is 50 feet 6¾ inches, the driving wheel base is 13½ feet, the total weight in working order is 150,000 pounds; the weight of the tender is 75,000 pounds, the weight on the drivers is 90,000 pounds, the cylinders are 21 and 31 inches in diameter by 26 inches stroke, the heating surface covers 1788 square feet, the steel boiler has 272 tubes, the fuel capacity of the tender is 6 tons and the tank holds 4000 gallons.

MANUFACTURING.

Machinery.

The Lebanon Boiler, Foundry & Machine Company of Lebanon, Pa., successors to I. Pott & Co., are making a specialty of furnace barrows, and are meeting with much encouragement in this line. Their regular line includes boilers, engines, pumps, tanks, stacks, bells, troughs, kettles and stable fittings. They are fitting up a large brick building near their works as a machine shop and expect to have it running very shortly. This will materially increase their capacity.

A new firm, W. J. & W. E. Davison, have commenced business at 226 North Fourth street, Philadelphia, as manufacturers' agents. They will, among other lines, push the sale of Prouty's wire valve wheel.

The Harrisburg Boiler & Mfg. Company of Harrisburg, Pa., have recently shipped a 75 horse-power water tube boiler to the Fayetteville Water Works, Fayetteville, N. C.

Geo. W. Fifield, Lowell, Mass., manufacturer of engine lathes, is erecting a new steel covered shop 250 x 60 feet, with two L's, each 120 x 60 feet. The new building will be connected with the main line of the Boston & Maine Railroad by a side track.

Hereafter all machines made by the Egan Company of Cincinnati, Ohio, builders of wood working machinery, will have placed upon them a number commencing from 50,000 and then onward, so that when repairs are ordered the mere mention of the number of the machine brings forward its pattern and class, for a complete record is made of every machine that goes out.

The cast iron pipe foundries of R. D. Wood & Co., whose headquarters are at 400 Chestnut street, Philadelphia, with foundries at Millville, Florence and Camden, N. J., have been kept running steadily through the summer, the company having experienced practically no dropping off in the volume of trade until the present month. They have, however, shared with competitors the generally prevailing low prices.

The D. E. Whiton Machine Company of New London, Conn., manufacturers of gear cutters, centering machines, lathe and drill chucks, are at present running their plant four days per week, making two-thirds time with about their regular force. They do not regard the immediate outlook for business in their particular lines as very promising.

The Common Sense Engine Works of Muncie, Ind., which went into the hands of receivers some time since, will probably start up at an early date. It is stated that the stockholders and the creditors have compromised their claims, and that under the new arrangement G. Campbell Janney will be president, J. C. Johnson, vice-president, James R. Sprankle, secretary and treasurer, and Benj. F. Howell, general manager. When running to full capacity the plant employs about 200 men. It is stated that a number of good sized orders are on the books, and it is believed that the works can be successfully operated and placed on a paying basis.

The foundry of William Tod & Co., at Youngstown, Ohio, has closed down on account of lack of orders and the general depression in business. There is a probability also, it is stated, that the machine shop will close down entirely if the present conditions of trade continue.

The Ball & Wood Engine Company of Elizabeth, N. J., whose works have been running only five days a week, have resumed on full time.

The J. I. Case Threshing Machine Company of Racine, Wis., are further increasing their capacity by the erection of a new molding shop. The structure will be in the shape of two L's, 210 x 80 feet and 84 x 80 feet respectively. It will be of brick, with an iron truss roof having a span of 80 feet. Two cupolas, capable of melting 50 tons a day, will be furnished by the Detroit Foundry Equipment Company. There will be seven steel cranes, electrically driven, the same medium furnishing power to run 800 incandescent and 14 arc lights and four motors on the hoisting derrick. In every respect this new department will be in keeping with the model establishment of which it will be a part.

The machine shop of the Anderson Foundry & Machine Works, at Anderson, Ind., has been closed. The foundry and pattern department are still running with only small forces.

The Skinner Chuck Company of New Britain, Conn., have equipped their plant with additional new machinery for the manufacture of their New Model drill chuck and new improved planer chuck and face plate jaws. The company have been awarded patents on two of these, and the slight improvement in business already noted leads them to hope that the demand will soon keep them fully occupied.

The Mechanical Boiler Cleaner Company of Montclair, N. J. have been incorporated, with a capital stock of $100,000, for the manufacture of a mechanical appliance for cleansing boilers.

The plant of the Springfield Emery Wheel Company has been removed from the corner of Howard avenue and Spruce street to the corner of Water street and South avenue, Bridgeport, Conn. The present location is nearer the business center of the city, while the shipping facilities are much better than the old location afforded. The company have had enough business to keep their works going all the time and have several good orders on hand at the present time. They have recently put a new dynamo brush grinder on the market which is meeting with universal approval, while their specialty, emery wheel machinery, is being constantly improved.

The Lane & Bodley Company of Cincinnati, Ohio, are operating their plant nine hours a day with about three-eighths of their usual force of men. While the amount of business transacted is less than usually at this time, the company are seizing the opportunity to make improvements in their products, so as to be ready for the demand which they anticipate will come at an early date.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

A man who thoroughly understands GALVANIZING in all its branches; wages A1. Henry Smith, office of *The Metal Worker*, Rooms 22-24 Pickering Building, Cincinnati, Ohio. Nov. 4

A first-class TINNER; one who can do all kinds of roofing and guttering and understands something about bench work, such as making stone trimmings, competent to do all kinds of repairs in the shop; must be sober, steady and reliable. M. J. Williams, 313 Main street, Baton Rouge, La. Nov. 4

A first class, sober and industrious PLUMBER who is a mechanic; can give steady work to right man; state wages and experience. "J. O. B.," office of *The Metal Worker*, 96-102 Reade street, New York. Nov. 4

A first-class TINSMITH who can furnish some capital to manufacture coolers; write for particulars. H. W. Gazley, 138 Groton avenue, Cortland, N. Y. Nov. 4

WOOD PATTERN MAKER, first-class on stove patterns, by first of December. Sarnia Stove Company, Sarnia, Ont., Canada. Nov. 4

A first-class STOVE MOUNTER; a good, steady job for a careful and neat mounter. A. Weiskittel & Son, Baltimore, Md. Nov. 4

Two first-class SLATERS and one CORNICE MAKER. C Rabe, corner Ferry and Water streets, Hudson, N. Y. Oct. 28

NICKEL PLATER, for stove work exclusively, to do the plating and oversee the polishing; state experience, wages expected, and reference. "Ohio," Box 1028, office of *The Metal Worker*, 96-102 Reade street, New York City. Oct. 28

Two good, temperate, reliable men with some knowledge of plumbing, roofing, furnace work and jobbing; good wages; steady job for the winter. Tulley & Davis, Lowville, N. Y. Oct. 28

A man who is acquainted with the steam heating trade to act as SALESMAN for the Reversible radiator; something new; big thing for right party. Address for particulars, O. A. Hayford, 50 Belmont avenue, Jersey City, N. J. Oct. 28

First class TINSMITH and GENERAL JOBBER; strictly sober; state wages wanted. E. Powers, Frankfort, Ky. Oct. 28

SALESMAN to carry as a side line specialty in hardware and house furnishings; commissions liberal. J. C. Wood, 219 North Douglass street, Indianapolis, Ind. Oct. 28

By a representative hot air furnace manufacturing company located in central New York State, a young man to take sole charge of retail department in estimating and selling hot air furnaces in their city and suburbs; must have had experience and understand the duties of such a position; good salary position for the right man; prefer unmarried man; must give good reference as to habits; must be temperate. "W.," office of *The Metal Worker*, 96-102 Reade street, New York City. Oct. 28

SITUATIONS WANTED.

By an experienced traveling man, traveling in Pennsylvania, Ohio, Indiana, Michigan and Illinois, a good line to sell on commission to general hardware and stove dealers. "A. B. C., No. 114," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

By a PLUMBER and GAS FITTER, who can also do a good job at steam and hot water fitting. "Plumber," 45 Warner street, Gloucester, Mass. Nov. 4

BOOKKEEPER, thoroughly competent young man, desires position with wholesale house. "S.," Room 9, third floor, 104 West Fourth street, Williamsport, Pa. Nov. 4

By a METAL PATTERN MAKER of 20 years' experience in locks, builders' and general hardware, iron toys and novelties; competent to take charge of pattern room. "A. H. L.," 315 State street, Bridgeport, Conn Nov. 4

As PLUMBER and STEAM, GAS and HOT WATER FITTER; 11 years' experience; can also do good tin work; situation preferred in Southern California, Mexico or the Southern States. "M. E. M.," Box 83, Unionville, N. Y. Nov. 4

By a japanner, as FOREMAN with some first-class house in the West; understands all branches of japan business on tin, iron, wood and soft metals with one coat, also all kinds of lacquers and shades to stand the press, and all shades of colors in rubber for lithographing plates to stand the press. "Japanner," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

As FOREMAN in manufactory making hardware specialties, by man with six years' experience in charge of the manufacture of freezers, toys, fruit presses, tin work, &c.; best of reference. "Edwards," Box 195, Little Valley, N. Y. Nov. 4

TINSMITH, married, wants permanent job; 20 years' experience in tin, copper, brass and sheet iron; stoves, furnaces, roofing and general jobbing; country preferred. "Tinsmith," 338 Twenty-second street, Brooklyn, N. Y. Nov. 4

A steady job by a PLUMBER who can do steam and gas fitting and estimate on plans; A1 reference. P. O. Box 1195, Morristown, N. J. Nov. 4

A young TINNER of three years' experience in hardware, stove and tin store and shop wants steady job as general man; have worked on tinware, roofing and spouting; best of habits and reference. "J. H. B.," care of T. J. Reece & Co., Walkerton, Ind. Nov 4

At once, by a strictly sober and reliable young man as an all around TIN and SHEET IRON WORKER; 11 years' experience at the business; both inside and outside work; also furnace work; a first-class slate roofer and general jobber. "L.," 27 West Holiday street, Newark, Ohio. Nov. 4

By a first-class PLUMBER; one who is a good tinsmith; have had charge of shop, sober and steady; good reference. "Plumber," 40 Clark street, Burlington, Vt. Nov. 4

By a young Englishman who has had four years' experience at plumbing and some knowledge of tin roofing; position desired where he could be under instruction for a year or two. "W. M.," 324 Goodwin street, Paterson, N. J Nov. 4

By a WOOD PATTERN MAKER and CARVER in stove works; competent to make drawings; good reference given. "Pattern Maker," 685½ Mineral street, Milwaukee, Wis. Nov. 4

By a first-class TINNER; experienced on assortment, jobbing, roofing, guttering and furnace work; 25 years' experience. John Corbett, Paxton, Ill. Nov. 4

By a first-class TINSMITH, in the city or country; single. "K.," care of John Klein, 616 Fulton street, Elizabeth, N. J. Nov. 4

FOUNDRY FOREMAN of long experience desires a position where ability and faithful services will be appreciated; good record; distance no object. "Good Record," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

On or off the road, by a thoroughly experienced stove, range, tinware and house furnishing goods SALESMAN; 12 years' experience; good reference from former employers. J. B. Smith, care of Bridgeford & Co., Louisville, Ky. Oct. 28

By a first-class stove PATTERN MAKER who can do any fine pattern work; also fine designing; can take work home if necessary. O. A. Jensen, 779 South Washtenaw avenue, Chicago, Ill. Oct. 28

As TINNER or HARDWARE CLERK; can do anything in the tinware line; strictly temperate and steady. P. O. Box 124, Akron, Ohio. Oct. 28

As PLUMBER, by young man, a graduate of the New York Trade School; has worked at trade one year; a good lead worker; best of references. "Plumber," Box 39, Moundsville, W. Va. Oct. 28

A middle-aged man would like a position as FOREMAN of stove foundry; I have had 20 years' experience as foreman, having handled from 50 to 100 men to good advantage; can furnish the very best references; will work for very reasonable salary. Jno. Ziegler, 139 Brown street, Dayton, Ohio. Oct. 28

By a TINSMITH and GENERAL JOBBER; good hand on roofing, ranges and furnaces; some knowledge of plumbing; city or country. "Tinsmith," care Mrs. Glener, 223 Christie street, New York. Oct. 28

To represent a factory or first-class jobbing house on the road in the West, by a thoroughly experienced nail, iron, steel, carriage and heavy hardware SALESMAN with over ten years' experience; wide acquaintance with factories and dealers from Mississippi River to Pacific Coast; unexceptional references; age 34. "W. S. B.," 76 Archer street, Denver, Col. Oct. 28

As TINSMITH and ROOFER. Herman Landasburg, 292 Delancey street, New York. Oct. 28

By a TINNER and CORNICE MAKER who can do general jobbing; some knowledge of plumbing. John J. Glass, Evansville, Ind. Oct. 28

I wish to obtain a position to travel for a good stove foundry; would make an immediate engagement, or for next year; my connection with the trade is well known and would enable me to do good work in New York, Pennsylvania, Ohio, New England or the South or elsewhere; over 20 years' in the trade. "A. J. S.," P. O. Box 126 Wickford, R. I. Oct. 28

By a METAL PATTERN MAKER who has worked in the best pattern shops in the country; can file and fit and do any kind of pattern work; an honest worker. J. M. Devore, 11 Delevan street, Auburn, N. Y. Oct. 28

By a first class SPINNER and IRON WORKER; 22 years' experience; can do wiring, beading and trimming. Charles Seider, 263 Floyd street, Brooklyn, N. Y. Oct. 28

By a WOOD and METAL PATTERN MAKER who is also a first-class wood turner and molder; can run almost any machine; generally handy. Madison Vorce, 15 Wood street, Auburn, N. Y. Oct. 28

As all around TINNER; have had 15 years' experience; can do all kinds of tin work inside and out of shop; am married man, sober and industrious; can come well recommended. H P. Powers, Auburn, Ind. Oct. 28

By a good all around TINNER in some country town; steady job preferred. C. R. Kramer, Avondale, Muncie, Ind. Oct. 28

As PLATER in general job shop or bicycle factory, by a man of 14 years' experience in polishing and plating departments; understands making and keeping silver, nickel and copper solutions, also brass and silver oxidizing; can furnish best of refereuces. H. L. Church, 159 West Washington street, Indianapolis, Ind. Oct. 28

I would like to correspond with good reliable parties who are desirous of being represented in tin plate and plumbing supplies in New York, Pennsylvania or New England States on salary or commission and expenses. Box 85, Richburg, N. Y. Oct. 28

Warming Workshops.

A leading English journal devoted to engineering asserts—presumably of English workshops — that to warm them "is so difficult and costly" that many proprietors avow "the thing is not to be thought of." This, to an American reader accustomed to see comfortably warmed shops and factories, will seem very strange. American workmen, asked to perform work that of itself is not sufficient to keep them comfortably warm through active exercise, would be apt to make things warm for the proprietor. As what are called "*engineering workshops*," or what Americans would call "*machine shops*," were especially considered in the assertion referred to, it is possible that each of such shops not heated wastes enough steam through its exhaust to keep it warm enough without other expense for fuel; and that thus the cost of warming could be reduced to deterioration and interest on the cost of the necessary apparatus for the purpose, amounting annually to a very small sum.

Heating by Exhaust Steam.

Where non-condensing engines of considerable power are used for driving machinery there is rarely any serious obstacle to utilizing the exhaust steam for heating. This is now done successfully not only in shops, but also in large office buildings, the exhaust from elevator, pumps and engines driving the dynamos for electric lighting being used as far as it will go for heating the building, and the piping being so arranged that a part may receive the exhaust, while the remainder may take live steam. There is economy in this system not only of fuel, but of water also, as the drip from the portion heated by exhaust steam may be brought back and pumped or trapped back into the boiler, a further advantage being that with water which deposits scale its use over and over prevents rapid scaling, and the boiler may be run a much longer time without cleaning. These advantages are annually increasing the number of installments for heating by exhaust steam, all the needed appliances therefor having been produced and listed in catalogues of steam fitters' supplies.

The Man and the Machine.

There was a former time when an issue was made in the minds of working people principally in the form of "Men *vs.* Machines," and a labor saving invention was believed to be entirely antagonistic to the interests of manual labor. In mechanical processes especially brains were popularly considered a less important factor than muscle, and men clung to primitive ways because they were old, and, to their limited views, satisfactory. Happily, that time of obstinate ignorance is past, the prejudice against machines has largely abated, and the trials of inventors have taken a different form. It is probable that the triumphs of steam have so settled opposition that its competitor and possible successor, electricity, will have less to contend against. We have learned that the man and the machine are not in opposition, but are both important factors in the world of industry.

The Teaching of Machinery.

We would call attention to what may be termed the teaching of machinery, meaning the attempt to learn from its operations, if possible, a way of working which the artisan may copy to advantage. The machine, while it is on duty, so to speak, attends strictly to business, carrying on processes of construction assigned to it, whether simple or complex, in a consecutive, orderly and perhaps monotonous manner. We do not imply that the man should be a mere automaton, but that the head and the hands should both be interested. If the labor is such that the hands do it nearly independently, the head may be seeking a method of helping them. In this manner inventions are generated and the machine is made which does the work faster and better than it was previously done. In those constructive operations where the machine has not replaced the man, experience has taught that the doing of the right thing at the right time, or "machine fashion," is productive of the best results. The discipline of soldiers, which is largely effective in producing a reliable fighting machine which moves at the will of a controlling mind, is illustrative of that attention to routine and detail which the young mechanic will find a good rule to work by. The machine has come to stay, and the man must adapt himself to it, learning the lesson that undivided attention to the work in hand, with a systematic progression from start to finish, will make him successful both as a man and a machine.

The Greatness of the Fair.

It is interesting and to some extent amusing to read what various writers have to say regarding the results of the Chicago Exposition. The magnitude of that enterprise in its every aspect has been an incentive to grandiloquent speech whenever the topic has come up for discussion. It has inspired lofty utterances from those gifted in that way, and a whole tribe of followers has sprung up who vie with each other in attributing to the fair almost revolutionary influences in the arts and sciences. A curious feature about this whole performance is that the most fervid prophecies regarding the influences of certain classes of exhibits are made by people who have no practical knowledge on the subject which they assume to discuss and about which they philosophize in airy abstractions. There is no doubt that in the matter of architecture American taste has been greatly cultivated by the beauty and originality displayed in the exposition buildings and many of the State and foreign buildings. The effect of this may be seen in the future, although it is questionable whether the severe plainness of the large structures now becoming such a conspicuous feature of our leading cities is not much better suited to this utilitarian era than the florid creations of ages long past.

What it Taught.

In the matter of exhibits, however, conclusions are not so easily drawn. Never before was such a magnificent array of productions of every character brought together. While in some lines the very best was shown, this was not the case in every line. Many famous manufacturers, whose reputation is world wide, were wholly unrepresented, while their competitors shone in their absence with inferior goods. How, then, in these lines, some of which have been singled out for special praise, could the progress of the art be specifically noted and a pace set for the world to follow hereafter? It was a great show, and Chicago has won imperishable glory for the grand scale on which it was projected and the triumphant success with which the details were worked out. A great many people were given an opportunity to see more than they could have hoped to see if they were to live to the age of Methuselah with every facility for travel in their power. Perhaps invention has been stimulated and imaginative faculties have thus been quickened in a way that will be felt potently by this nation and the world in the years to come. But the fair nevertheless was a commercial enterprise, expected to be of practical benefit to the locality in which it was held, and all other considerations and influences, charming as they may be, are but secondary and subsidiary. In the light of the heroic struggle forced on the business men of Chicago to make their great enterprise a success, and in view of the narrow escape from serious dangers which might have financially wrecked them, the real lesson of the fair is that other projectors of World's Fairs must not base them on such a prodigious scale. There is but one Chicago.

Sheet Mill Progress.—I.

BY A. BEARD, CAMBRIDGE, OHIO.

Unlike other branches of the iron and steel industry, there has been no record of radical or noticeable changes in the method of rolling iron and steel sheets until recent years. In the manufacture of bars, structural shapes, plates, &c., the three high, universal or Belgian and reversible mills have almost entirely taken the place of old style two high rolls, but no one has to this date been intrepid enough to spend any very large amount of time or money in an attempt to revolutionize the old established process of making light sheets. Many improvements have been made in the manner of producing a high finish, and in a marked degree the quantity produced has been materially increased in mills devoted to the manufacture of sheets of ordinary finish, but so far as the initial process is concerned the sheet rolling industry occupies nearly the same position which it did 50 years ago. The inventions of Bessemer, Siemens and others have assisted progress in sheet mill practice and have provided means in the shape of steel billets and sheet bars for the production of sheets of first-class quality at about the same cost for which common sheets were formerly produced. Sheet mill managers have, however, combined their ideas with those of machinists and foundrymen, and as a result remarkable changes have been made in the construction of machinery.

English Practice.

Before referring to these changes in detail it is necessary to review briefly the causes leading to them. For this purpose a drawing is presented herewith to illustrate the method so long employed in English sheet mills. In English mills, Fig. 1, a stand of bar rolls is attached to each sheet mill on the outer end, and all pile rolling is done on these rolls. Muck bar piles, made sufficiently heavy to make two sheet bars of the required weight to produce sheets of a specified thickness, are charged into the pile furnace, averaging 15 to the heat. They are then passed through the bar rolls, and when drawn to the proper length are cut into two pieces at bar shears, which are operated by means of a small pair of pinions attached to the wabblers on outer end of bar rolls. On the lower pinion a lug is cast, upon which the long arm of the shear works. When cut to length, with the usual allowance for trimming after the sheets are finished, these bars are given two passes through the sand rolls, after which they are taken to the chilled rolls and are reduced to about No. 18. To accomplish this two sheets are rolled together. This completes the first part of the process, all being done without reheating. At this stage sheets are termed "singles." To still further reduce the thickness three sheets are placed together, and, after being reheated, are passed through the chilled rolls for the second time. This product is called "doubles." When sheets No. 26 to 30 gauge are required, the pack of three sheets is opened, the sides meeting each other are reversed and doubled, afterward placed in the reheating furnace for the third time, and again passed through the chilled rolls. When this work is completed sheets of No. 26 or 27 gauge are called "lattens," and lighter than this "extra lattens." Prices paid for labor are regulated on this basis. After the rolling is finished the packs are taken to jaw shears and the edges trimmed. When sheets are made of iron there is a cut of 1 inch or more taken from the edges, as the sides of the pack crack when rolled; but steel sheets preserve a more even edge, and the amount required for trimming does not exceed ½ to ¾ inch on each side of the pack. When the trimming is completed the sheets are annealed in the reheating furnace, and when cold are ready for shipment. Box annealing, or "close annealing," as the process is termed in England, is not a common practice. Fully three fourths of the sheets produced are annealed in an open furnace where the flame is allowed to come into direct contact with the surface of the sheets, the result being scale raising, red edges, burnt corners and a generally uneven appearance.*

American Practice.

In American practice all light sheets are box annealed, being placed on cast iron carriers upon which the sheets are piled, then covered with a cast or wrought iron lid, made air tight by piling sand around the bottom. This carrier and box are then drawn into the annealing furnace and heat applied. By using this method scale is not raised on the sheets—they are smooth, flat and of even color. It appears strange, from an American point of view, that the young English ironmasters do not avail themselves of this method, as it gives so much superior appearance to the sheets, but they are content to do as their predecessors did before them, a commendable trait except when competition is brisk and modern advantages necessary to success. In the matter of utilization of waste heat and the employment of power the English are very careful. Fuel is expensive. It will be noticed that a vertical boiler is attached to the sheet mill, Fig. 1. This boiler has one large central flue and two cross flues near the top. It is auxiliary to the steam plant of the establishment. The power of the engine is always used to its greatest capacity. To illustrate this, note that the jaw shear is operated by a long connecting rod attached to an eccentric on the main shaft.

It is a noteworthy fact that while importations of English sheets of iron and steel have decreased with the erection of American mills, English manufacturers make frequent purchases of American highly finished sheets for use as locomotive jackets, for lagging purposes, gas stoves and other uses where a fine appearance is required.

Labor in English and American Mills.

Comparisons of wages earned by English and American workmen have been made so often and prostituted to such base political purposes that the writer has not the assurance to present figures on this matter, but this article would not be complete without a comparison of the amount of labor performed in English and American sheet mills respectively. In English mills the crews work 12 hours each and do all the work they can in that time, taking only short intervals for meals. They commence with muck bar piles and do their own annealing. During 24 hours about 16,000 pounds of finished sheets are produced by two crews consisting of the following men:

Rollers	2
Roughers	2
Catchers	2
Furnacemen	2
Helpers	2
Prilers	2
Shearmen (using jaw shears)	2
Markers	2
Scrap Boys	2
Total	18

Compared with this, American crews only work eight hours. They commence with sheet bars already prepared for them on an independent bar mill and have no annealing to do. There are three shifts during 24 hours, which produce about 19,000 pounds of finished sheets sheared ready for the annealer. To accomplish this work the following men are employed:

Rollers	3
Roughers	3
Catchers	3
Heaters	3
Pair heaters	3
Matchers	3
Doublers	3
Shearman (using squaring shears)	1
Hold up	1
Opener	1
Scrap boy	1
Total	25

The shearman and his helpers are allowed to shear for three shifts. They work about eight hours. From this statement it will be seen that the Englishmen have much the hardest time of it for about two-thirds as much money for their work. An English mill only turns out 16,000 pounds of product to 19,000 pounds in an American mill, but it takes seven more men to do the work in America. Having discussed the method of making sheets and the result obtained in England, it is in order to notice the means used for the purpose and compare with those now employed to produce the increased product and at the same time reduce the risk of breakage and consequent stoppage to a minimum. English and American sheet mills were similar 20 years ago excepting that Americans never aspired to the luxury of a stand of bar rolls for each mill. This being the case the old "housing," "housen" or holster as it is variously called in different localities will serve to illustrate old time machinery of both countries.

The piece of machinery represented in Fig. 2 is not as antiquated as a sheet mill man might imagine upon just looking at it. It is only 20 years old, being designed in 1873 for a sheet mill now in operation. It was reinforced at its weak points in 1885 and since that time has been reordered no less than seven times to replace broken ones. All orders being from the same mill. This housing weighs about 11,000 pounds. It is what is commonly known as flat-footed. In the evolution of sheet-mill machinery this old style housing and its dovetailed bed plate are dying hard. It is not until the executor or sheriff offers this kind of machinery for sale that the massive modern housing with its V-shaped bed plate and solid masonry takes its place. The pattern of the old style housing is still in possession of a prominent firm of iron founders at Pittsburgh. It was used as late as last year and is almost a counterpart of a piece of machinery manufactured by a well-known Staffordshire, England, concern for 50 years past. The rolls used in housings of this design are 20 inches in diameter, necks 15 inches in diameter and the wabbler 11¾ inches at

* Box annealing is a common method in English and Welsh tin mills. This article refers only to mills making light sheets for galvanizing, roofing and general manufacturing purposes.

its largest part. To illustrate the difference in the strength of these rolls a sketch showing the relative sizes of the wabblers on the old style rolls and the modern 24-inch rolls is shown in Figs. 3*a* and 3*b*.

Chilled rolls, 20 inches diameter, for light sheet mills have long been considered all that was required in the way of strength in English mills, and some manufacturers in this country use rolls of that size to this day, but it is probably because they have their old housings and want to make the last penny out of the old machinery and not because they do not acknowledge the benefits derived from using heavier machinery.

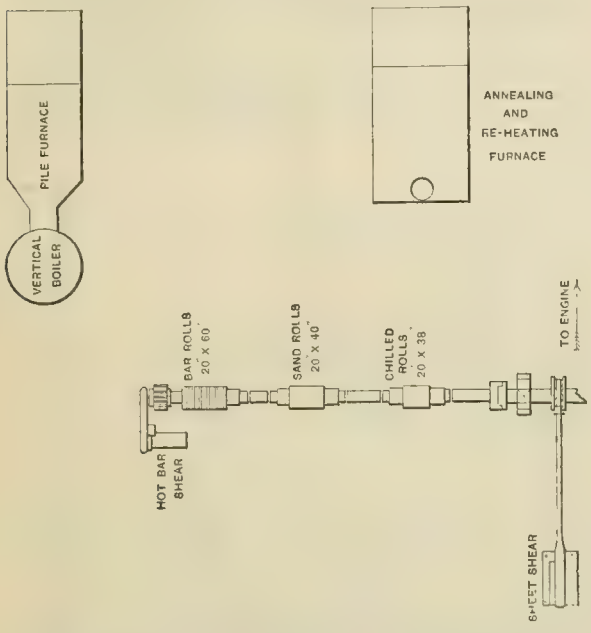

Fig. 1.—Plan of English Sheet Mill, 20-Inch Rolls. —Weight of Housings, 11,000 Pounds.

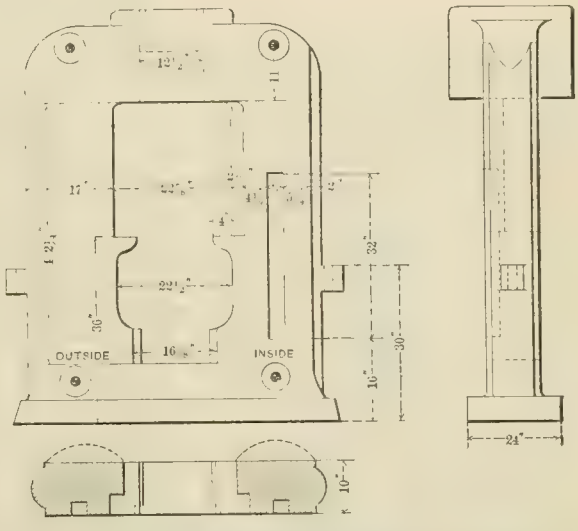

Fig. 2.—Old Style Housings, Designed 1873.—Weight, 11,000 Pounds.

SHEET MILL PROGRESS.

Heavier Machinery.

The main object of American sheet-mill men appears to have been to produce the largest quantity possible and so construct the machinery that breakages become exceptions instead of a rule. A great deal has been accomplished in this direction and the means employed are worthy of notice. The illustration, Fig. 4, of an American sheet mill plant shows many points of economy. Furnaces are all set near to the railroad coal track, so that coal is unloaded directly to the bins at the sides of the furnaces. Under the coal bin shutes a narrow gauge track is laid, to convey sheet bars from the bar shears to the pair furnaces. The large and small engines are placed near together, so that only one man is needed to attend them. The small engine operates two pairs of shears, runs the machinery to raise annealing boxes and also runs the roll lathe. The annealing furnaces are near to the shears, and no material has to be handled twice. The process is progressive, from the billet furnace to the warehouse. All that has to be brought back is scrap from the sheet shears to the scrap furnace. A plant of this description would turn out 35 to 40 tons per day of sheets, from No. 18 to 30 gauge, various widths, from 20 to 36 inches.

When the agreement made between rolling mill proprietors and the Amalgamated Association of Iron and Steel Workers, increasing 8 hours' work from 105 to 135 pairs of double sheet, came into force many mill managers found that their machinery would not stand the strain. Rollers "rushed their mills," breakages came fast, and managers grew furious. As a result the output was in many instances limited to the old standard, but in many mills the diameter of sheet rolls was changed from 22 to 24 inches and the mills were then equal to the work. As a result of increased output all rolling mill builders had to make patterns for heavier machinery. The housings have been increased in size, also the rolls. A mill recently built in the Mahoning Valley was constructed in such a heavy manner that the roll trains weighed fully one half more than a roll train constructed for a similar purpose 20 years ago—viz.: rolling light sheets from No. 18 to No. 30. The housings in this mill, illustrated herewith, Fig. 5, weighed 23,000 pounds and the bed plate 1000 pounds to the foot of roll train. The mill is running successfully and if a breakage occurs it will be a matter of much surprise. Of course, chilled rolls will break as they always have done, for no one has yet found a preventive. There is fame and fortune for the man who fathoms this unexplained mystery and devises means to keep chilled sheet rolls from breaking at an unexpected moment.

If translated reports are correct, Bohemia is ahead of the United States in the uses to which steel rolls are put. In American practice cast steel rolls have long been used in bar mills, and for rolling rails, channels, I-beams and other structural shapes, but the Bohemians are credited with having used steel rolls successfully in the manufacture of sheets. An order was placed with a Chicago concern some time ago for a pair of sheet rolls to be made of steel, but for some reason or other it was never filled. Can it be that herein lies a substitute for cast iron chilled rolls of every day use, that treacherous piece of machinery, the constant and unexplained breakage of which is the bane of sheet mill managers' lives? Is there no way of hardening the surface of a steel roll so as to make it impervious to scale marks, so that it will retain a smooth surface when in use, equal, if not superior to the surface of a chilled iron roll? It has been stated that steel rolls become pitted when used, that scale adheres to them, and that they are not suitable for obtaining a fine finish on a large area. If this purpose can be accomplished, and the

common theory regarding steel rolls be proved incorrect, then chilled roll makers will lose a profitable business which only years of successful practice makes profitable, and the steel sheet roll will furnish managers with a serviceable and unbreakable piece of rolling mill machinery, and it is quite probable that one-third of the sheet rolls now made will supply the demand. Strange things have happened in the mechanical world. Why not this?

The Breaking of Rolls.

To explain more fully the trouble which sheet manufacturers who use the hot finish process have to contend with, and the exigencies which have to be allowed for in their cost accounts, a drawing is presented herewith to illustrate the degree of expansion and contraction to which sheet rolls are subjected during ordinary treatment.

The dark lines in the drawing show the shape of the rolls when heated, and dotted lines indicate the shape of rolls after they are dressed in a roll lathe ready for work, and while the roll is cold before work is commenced. The concave in these two rolls amounts to about $\frac{1}{64}$ and $\frac{1}{128}$ inch = 0.0234375. It varies according to the class of work to be performed. If wide sheets are to be rolled—*i. e.*, nearly the width of the body of the roll—the concave is made in a lesser degree than if sheets of narrow widths are to be rolled, as narrow widths will "puff up" or expand the rolls near their center quicker than wide sheets, which distribute the heat more generally throughout the body of the rolls. In the manner of turning or dressing sheet rolls custom varies; some roll turners turn one roll straight and put all the concave in the other, while others divide it between the two rolls. This seems to be a matter of opinion the correct view of which has never, if properly demonstrated, been made public.

In ordinary sheet mill practice the rolls expand after the third or fourth heat until they are nearly straight. Good rollers exercise the utmost care in starting up their mills, and endeavor to avoid breakage through warming up too rapidly, particularly in cold or frosty weather, and they will continue at all times during their work to exercise care, avoiding extremes in the rise and fall of the temperature of their rolls and giving the screw pressure in accordance with conditions, but in spite of all this care the best of rollers meet with mishaps, a report like that of a carbine is heard, the pack buckles in the rolls and the roller realizes that he has "cracked one," to use a rolling mill expression.

Probably there is not a sheet roller living to-day who has ever told how he broke a roll, and if there is common cause for it the secret is well kept. Theory has, however, provided many causes, and reasons are given which

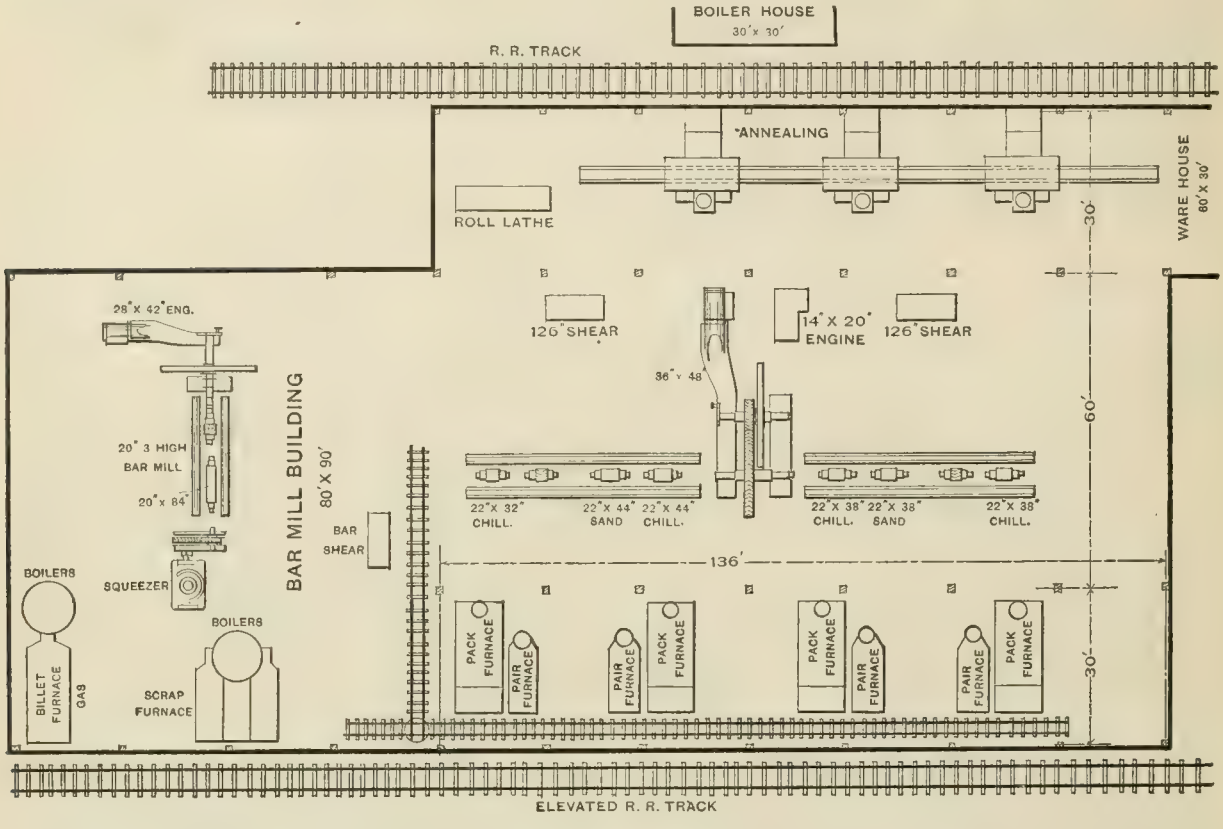

Fig. 4.—Plan of Modern American Sheet Mill.—Beard Design.—Capacity, 35 to 40 Tons per Day, No. 18 to 30 Gauge, 20 Inches to 36 Inches Width.

SHEET MILL PROGRESS.

are worth consideration. Rapid expansion and excessive screw pressure are undoubtedly the two principal causes of sheet roll breaking. Upon those two causes all others rest except those attributable to machinery which is out of line, or culpable negligence, such as rolling bars not properly heated, &c. A modern sheet roll 24 inches diameter, of solid cast iron, is a massive looking affair to an outsider, and it seems incredible that they will break through their center without a moment's warning, nevertheless it is a fact. It is a trouble with which sheet mills the world over have to contend, and the proprietors are looking for a man who can find a remedy or a substitute. A cooling tube through the center has been tried without effect, and brasses having a current of water running through them were supposed to be a step toward greater safety, but rolls

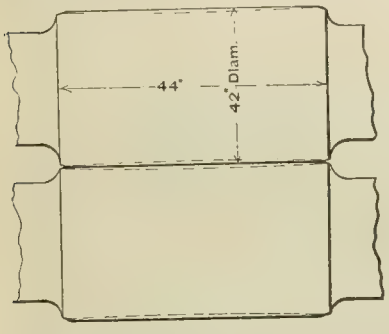

Fig. 5a.—Black Lines Show Shaping of Rolls when Hot and Expanded.—Dotted Lines Give Exaggerated View of Shape of Rolls when Cold and Contracted.

Fig. 5b.—Center of Roll, Open Grain.—Lines Show Chill, Varying from 5/8 Inch to 3/4 Inch.

SHEET MILL PROGRESS.

keep on breaking, and managers seem to have become somewhat reconciled to the no-cure theory and they devote their energy to preventing such misfortunes by training their men to exercise great care, keeping the rolls free from cold drafts of air, keeping the roll train in line, and such precautions. If a substitute is to be found it looks as though some outsider must furnish it. Can steel foundrymen do it? The writer does not say they cannot; the question is asked, not for curiosity, but for information.

The natural life of a sheet roll under ordinary wear and tear, average depth of chill, is about eight months. It is liable to be broken at any time during that period. A guaranteed life of that length would be well worth the price at which chilled rolls are now sold and a big premium attached.

A trade school connected with the Church of St. Augustine, Boston, was opened last week by Bishop Lawrence of Massachusetts. The school is intended for the instruction of American boys in various crafts in order to fit them to enter the field of skilled labor advantageously. In the course of his address at the opening Bishop Lawrence said: "This school is to sustain in this democratic country the dignity of labor. No man, however rich, has a right to live without labor. This school is also to emphasize the fact that just as much brains are needed to make a good carpenter as a good business man. It takes brains to make a box. Until our public school system is adapted to trade schools, they have got to be developed by individual philanthropy. It is not only in teaching how to make boxes, &c., that this school will achieve its full purpose, but to prove the need of trade schools as a part of our public school system."

The World's Fair Awards.

There seems to be a good deal of misapprehension concerning the World's Fair awards, which is encouraged for selfish purposes by some. A Chicago newspaper explains the system as follows:

"At most former international expositions the prize medal system has obtained. Advocates of the system followed here in Chicago say the prize medal system is faulty in that it disregards elements of excellence. Under that system an exhibit may receive a medal, yet be an inferior article. A maker of poor chocolate might receive the highest award because other chocolate makers had not made exhibits. In such a case the medal would be no guaranty of the high quality of the chocolate—merely an evidence that it was the best brand of chocolate shown; and it might be the only one shown. Under the system governing the award of medals and diplomas at the World's Fair, the several elements of excellence are all noted. For instance, a judge of furniture examines a chair. He considers that chair, not in comparison with other chairs on exhibition, but as a single chair apart from all other chairs. He notes its form, the quality of material used in its construction, the workmanship, and the character of the finish. If it be up to the standard, it receives a medal and a diploma. In the diploma the several points of excellence are set down minutely. That chair may not be the best chair in the world, but it must be a good chair, else it would not receive a medal. Its good points are all enumerated in the diploma. A medal or a diploma from the World's Columbian Exposition is, therefore, a guaranty that the exhibit which receives a medal has high merit. Only one medal goes to any exhibit, but the number of diplomas under that one medal may be indefinitely large. For instance, a watchmaker would receive only one medal for his exhibit, but he might receive a diploma for his gold watches, his silver watches, his ladies' watches, his gentlemen's watches, his hunting-cased watches and his open-faced watches.

"Under this system of awards the examination of the exhibits to determine those entitled to medals and diplomas was done by individual judges. This point also caused some friction early in the summer. The foreign exhibitors wanted to follow the European plan of having awards determined by jurors. Under the European plan, the jury on agriculture would determine all the awards for wheat, oats, tobacco, beer, condensed milk, coffee, Peruvian bark and linseed oil. At the World's Fair an expert judged each class of exhibits. A disinterested expert on wheat judged wheat, and so on through the list."

As we understand it a number of exhibits were assigned from time to time to each juror of a certain section. He made his report, which was submitted to the whole jury, of that section, and was accepted or rejected by it. There have been no "highest awards," or "first prizes," in the sense that it is usually understood. The medals are all of equal value, but the diplomas, which are based on the report of the jury, are worded in a widely different manner. They may make mention of specially meritorious points on which other diplomas given to competing goods are silent. It is the matter contained in the diploma which ranks the award.

Railway Building in 1893.

In spite of the financial stringency and general business depression of the past few months, the work of railway construction has gone on uninterruptedly in 42 of the 48 States and Territories of the Union. The *Railway Age* calculates that 2040 miles of track were laid in the first nine months of this year on a total of 182 lines, over 1000 miles having been constructed since July 1, when the panic was at its hight. There is in sight, besides, sufficient unfinished work to make the total length of new track for 1893 at least 3000 miles, but it is hardly likely, considering the number of enterprises that have been temporarily posponed by the monetary stringency, that the total for the year will much exceed 2500 miles. Yet under the extraordinarily unfavorable conditions that have prevailed of late months, this showing will be anything but a bad one. The only wonder is that construction did not altogether cease, and the fact of this substantial addition having been made to the railway facilities of the country under such adverse circumstances shows the urgency of the existing demand for additional steam transportation facilities. The only States which have not secured new tracks during the year are Vermont, Connecticut, Delaware, Maryland, Nevada and the Indian Territory.

Many in the trade will be glad to know that Webster R. Walkley of the Peck, Stow & Wilcox Company, 29 Chambers street, New York, was elected on Tuesday alderman of the city of Brooklyn, which is to be congratulated on having a man of his character and caliber in this responsible position.

Some natives of Central Africa have found a novel use for old tin cans and the tin linings of packing cases. According to a recent French official report from that region the Adamawa natives are buying up the material, which they cut up and make into saddle ornaments and rude bracelets and rings. The *Galaduna*, or Minister of War, has been seen to take the linings immediately cases have been opened, in order to have them made into plates for covering his horses to protect them from arrows. Block tin is also imported into Adamawa and made into jewelry, which is said to be highly prized.

The demand for lamps is reported as growing in China, especially for the better class of goods with metal reservoirs and improved burners. Japan is supplying the country with the cheaper qualities of lamps to a considerable extent.

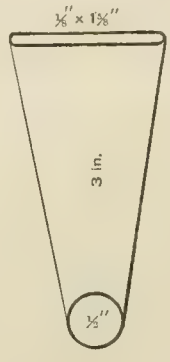
THE LETTER BOX.

Partition Flues.

From P. F., *Baltimore.*—If partition flues in furnace work are faulty who is to blame for the same, or, what is more to the point, let me ask how shall the fault in the flues be corrected? By partition flues I mean those rectangular hot air flues that run up between the studding in lath and plastered partitions, and which have come into such common use in recent years. Round flues are generally conceded to be the best shape for the purpose. Hence a 2 x 8, a 3 x 10 or a 4 x 12 flue naturally suffers in comparison. It takes but a moment's calculation to show how inadequate small rectangular flues are to carry a sufficient quantity of air to warm a given room. A round flue of diameter corresponding to the greater dimension of the rectangular flue has a capacity, in comparison with a rectangular flue, that would delight every common sense observer. The round flue would deliver a larger quantity of air at a lower temperature, consequently would not run the furnace so hard, would not wear it out so fast, and it would not consume so much fuel. Many houses are to be found—in fact, handsome residences—that are not comfortable even in mild winter weather, because their entire source of heat is a jet of superheated air thrown out from the register in the side of the room. It is not equal to overcoming the cooling effect of the bay window, nor does it add enough to the air of the room to warm the furniture and other objects. The presence of these small flues is a great injury to the furnace business. Failing utterly to heat, the furnace is condemned, or, if the fault is discovered and the blame put where it belongs, few householders are willing to go to the trouble and expense of a complete overhauling on account of these flues, and therefore they resort to some other system or means of heating. The builder and architect as a rule refuse to listen to the furnaceman, or if they do listen to him it is only to hear him out and then say: "If you don't want to work to the specifications don't bid on the job. Other men are willing to do the work without interposing conditions such as you are talking about." It may also be suggested that the house is being built for sale, and not to be occupied by the owner, and therefore it is not necessary to enter into these fine points. It becomes true, then, that the man who is to finally own and occupy the house will be compelled to invest a considerable amount of money in putting in a larger furnace than is provided by the builder, or else tearing out the flues and rebuilding them.

Bunsen Burners.

From P. B. S., *St. Louis.*—While talking with a gas engineer recently some Bunsen burners were exhibited that were used by a French manufacturer and great claims were made for their efficiency based on the flame surface exposed, which is double the usual amount. Ordinarily Bunsen burners are cylindrical in form throughout, and a ½-inch cylinder has an area of about ⅛ square inch and presents a flame surface but slightly in excess of its circumference, or about 1⅝ inches. The hight varies, but about 3 inches is an average. The burner exhibited was shaped as shown in the illustration, being ½ inch in diameter at the bottom and 3 inches high, tapering from a circle at the bottom to a slot ⅛ inch wide and about 1⅝ inches long at the top. This gives a flame surface of over 3 inches, or about double what is exposed by a cylinder



Bunsen Burners.

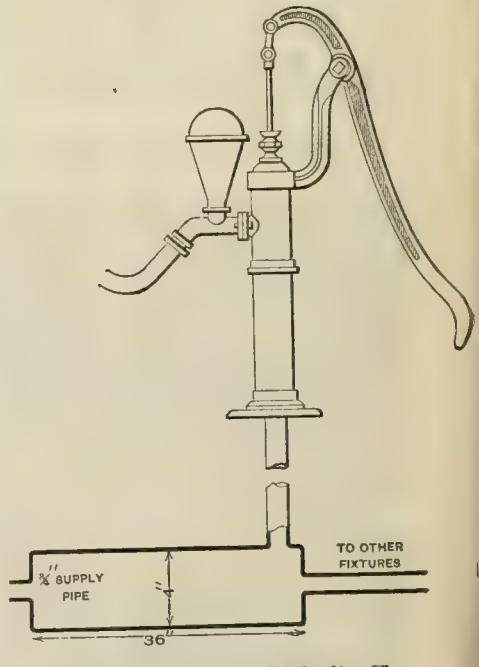
of the same area and using the same quantity of gas. A better mixture of the air and gas seemed to be secured and the flame burned with a nearer transparent blue. An iron rod of the same diameter placed over a burner of each construction was heated much quicker over the oblong burner, though the flame was not so high. The oblong burner seemed more delicate in operation and required more precise adjustment, for when the quantity of air was reduced too much the flame became red, yellow or white. When burning at the best efficiency it seemed more susceptible to the influence of a small increase of air and would light back to the gas supply with greater facility than the circular burner. However, the advantages are claimed to greatly exceed those of a circular burner and no difficulty is experienced in their use by those who have tried them.

A Remedy for Noisy Boilers.

From L. D. N., *Washington, D. C.*—In visiting the kitchens of several private houses recently I have been very much struck by the number of cases (owing to the improper setting of the boiler, the undue size of the water back or some other adequate cause) in which the boiler makes a tremendous noise — rattling and rumbling. It seems to me that this is a defect that could be easily overcome if the manufacturers and plumbers would give some little heed to it, and there is no doubt that it would be very much appreciated by the average householder, the terrific racket in his kitchen being more than an ordinary nuisance. The number of cases, however, where the pipes connecting the water back and boiler are sagged or run so as to form traps is very great, and the size of the pipes is often very small. I would like to get the opinion of the readers of *The Metal Worker* on this interesting topic, and in the first place I want to know what is the objection to setting the boiler above the water back so that the bottom of the boiler would be higher than the top of the water back? In that way there can be an easy incline for both of the pipes. Another question I have to ask of the manufacturers and plumbers, who are interested in such work, is what object is gained by making the circulating pipe so small? What harm is there in using 2 or 2½ inch pipe? Will it not, in fact, give a much better job? It will reduce the friction in the pipes and ought, I think, to give better results in heating the water. The extra cost for the larger size of such a short length of pipe would not be very great and the customer would in many cases be glad to pay the difference if he were assured of a better supply of hot water and more especially if it would assist in reducing the noise. The second is a point for the plumber to consider, after the manufacturer has made arrangements for connections of the larger size, but the first point—namely, the hight and size of the boiler—comes entirely within the province of the manufacturer. A shorter boiler of larger diameter would furthermore have a less radiating surface to the volume of water. The public are growing very critical of work, and imperfections that were put up with ten years ago must now be overcome or serious complaints will follow.

Overcoming a Pump Difficulty.

From L. M. W., *Delaware, Ohio.*—In using a pump on the supply pipe from the water main, to fill a tank to feed



Overcoming a Pump Difficulty.

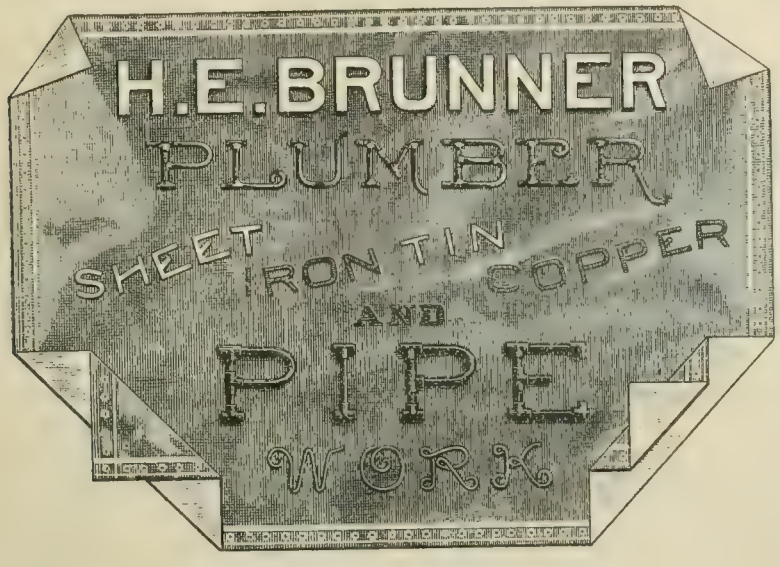
fixtures that the pressure from the main was not strong enough to reach, I have had some trouble. The pump would act as if the supply was short, and only throw a small quantity of water at each stroke, though taps on a level with the pump supply showed a good flow. After trying various expedients a reservoir on the supply pipe, as shown in the sketch, was found a perfect remedy.

PLUMBING and GAS FITTING.

A Noteworthy Sign.

We have an entertaining letter from H. E. Brunner, Haywards, Cal., from which we quote as follows:

"The cut of G. E. Meyer & Son's window display sign in *The Metal Worker* of October 7 prompts me to send a photograph of one I constructed during slack times last winter, thinking some of my brother chips might have idle time on their hands and would like to do similar work, for the sign I send has certainly attracted very considerable attention locally. The description in brief is as follows: The name is made of sheet zinc ½ inch deep, polished edges, invisible joints and scroll burnished faces. The word 'plumber' is made of lead rods with wiped joints, thus representing that craft, and the words 'sheet,' 'iron,' 'tin,' 'copper' and 'and' are made of galvanized iron, Russia iron, tin, copper and brass respectively, cut out of sheet, flat and burnished. The word 'pipe' is of ⅛-inch pipe and fittings. The word 'work' is made of blued steel, brass, copper and tinned wire. The whole is mounted on a background of zinc oxidized with acids and with lines and spots cut in the margin with emery flour, the corners being folded, showing portions of the polished reverse side of the plate. The letters are fastened by means of small brass strips, soldered to them and clinched to the plate."



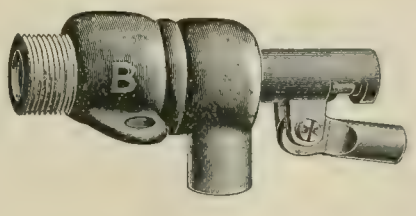
A Noteworthy Sign.

The photograph sent by our correspondent is of the sign resting on top of a barrel and supported by the designer, whose face shows above it. It was our first wish to reproduce the whole photograph by a process engraving, so that we might show the sign and its manufacturer together, but, unfortunately, the lettering on the sign showed so faintly in the photograph that it would have been all blurred in printing, and we were forced, to our regret, to adopt another style of engraving. We cannot forbear quoting the latter part of our correspondent's letter, which bears upon this subject, though we do not think it would find general indorsement if the photograph had been reproduced. The letter closes as follows:

"The mug surmounting the sign in the photograph might not be considered a good ad. in some localities, but some of my neighbors claim to have used it with success in ridding their premises of rats and other vermin."

Birkery High Pressure Ball Cock.

The accompanying engraving represents the Birkery high pressure ball cock, manufactured by the Birkery Mfg. Company, Hartford, Conn., and which was patented last year. It is a balanced ball cock constructed to provide a simple and cheap cock, having a valve which is so balanced as to open gradually with and shut easily against the pressure of the water, whereby a large port may be employed and the cock used under high pressure. The operation of this device is described as follows: When the water in the tank rises to the predetermined level, the float and its lever pushes in the spindle and closes the valve. This movement is aided by the pressure of the water upon the piston, which is forced into the chamber. Air enters and escapes back of the piston through a small outlet, as will any water that may leak past. This construction permits the use of a large port with a correspondingly large valve, which is adjusted to prevent singing or hammering, as the piston aids in the operation of closing. A large valve, it is said, may be seated firmly against the flow of high pressure without the use of a large float.



Birkery High Pressure Ball Cock.

The Inventor of Gas Lighting.

William Fletcher of London, in an article in the *Engineering Magazine*, gives the following entertaining account of the inventor of gas lighting:

Amid the bustle and confusion of these high-pressure times, we, who are reaping the innumerable benefits which have been dearly bought and handed down to us by our predecessors, seldom stop to think of those who have rendered such services in the past. Yet there are hundreds of souls who have lived and labored, leaving the works of a useful career as their eternal legacy, whose biographies can never be written; and the names even of these worthies will never be known. Such has been the fate of men who have lived in the past, and such is likely to be the lot of many who are living at the present time. Among those who are doing the greatest service, and in return receive the smallest amount of recognition, we think the faithful assistants of our great engineers claim a place. Some writer has said: "Many engineers owe their reputation to the unacknowledged skill of the assistants whom they had the good fortune to enlist."

The name of James Watt has been honored without limit, which has our approval, but we must bear in mind that Watt was always surrounded with clever assistants, and we believe that very much of the fame and wealth that fell to his lot was largely owing to the excellent coadjutors who rendered energetic and valuable services during the whole of his business career. The foremost place in that honorable rank we must assign to William Murdock, who for upward of half a century was Watt's most skillful and esteemed assistant. Watt has had numerous biographers; Murdock has not one. He is one of the many patriarchs of mechanical engineering whose services have never been adequately recognized. Not only is Murdock's ingenuity nowadays rarely mentioned in connection with Watt's carear, but some of this clever assistant's inventions have recently been erroneously attributed to Watt.

In order to celebrate the centenary of the invention of gas lighting, and to help in some measure to place W. Murdock in his true position among the illustrious inventors and engineers of the past, we may make a rapid survey of his leading inventions, allowing his experiments in gas lighting to claim our chief attention. It has often been predicted that this system of illumination is doomed to give place to its more brilliant rival, the electric light, but in spite of these prophecies gas lighting appears to be holding its own; while the manufacture of coal gas is cer-

tainly on the increase, owing to its almost universal adoption for cooking and household heating purposes, to say nothing of the enormous consumption of gas by the thousands of gas engines that are used for all manner of industries.

William Murdock was born at Bellow Mill, near Old Cumnock, Ayrshire, Scotland, in 1754. His father carried on the business of miller and millwright, and also occupied a farm on the estate of the Boswell family of Auchinleck, by whom he was much esteemed for his integrity and ingenuity.

During Murdock's earliest years he worked with his father, under whose tuition he quickly obtained a considerable amount of technical knowledge, and gained a reputation for intelligence and skill of no ordinary kind. The father and son between them constructed a wooden horse worked by mechanical power, on which young Murdock traveled about for miles around the neighborhood of his native place, to the amazement of the inhabitants. Before Murdock was 20 years of age he designed and erected a handsome bridge over the river Nith, in Dumfriesshire, which still exists. As he was anxious to improve his position, and to become something more than a country mason and mechanic, he left Scotland in 1777 with the intention of seeking work from Boulton & Watt, at Soho. Upon his arrival in Birmingham he obtained an interview with Wm. Boulton, who gave him no encouragement, telling him they had no vacancy, as trade was slack. As Boulton was bidding the shabbily dressed and foot sore millwright good speed to some other shop he was struck with the peculiar appearance of the hat Murdock wore, and suddenly called him back and asked what it was made of.

"Timmer, sir," said Murdock modestly.

"Do you mean to say it is made of wood?"

"Deed it is, sir."

"How was it made?"

"I just turned it in the lathie."

"But it is oval, man, and the lathe turns things round."

"Aweel! I just gar'd the lathie anither gait to please me, and made me one."

This was sufficient proof that Murdock was a mechanic of no mean skill. He was put upon a trial job in the Soho works, and quickly displayed his capabilities as a workman, which led to his engagement for two years at the rate of 15 shillings a week. He commenced as an ordinary workman, but his diligence, sobriety and skill soon led to his promotion, and it was not long before he became Boulton & Watt's most trusted co-worker and adviser in all their important mechanical undertakings. When Murdock entered the Soho firm Watt was well nigh overwhelmed with the difficulties of getting his steam pumping engines into practical use; the worry and the vexations of the breakdowns in the machinery, Watt said, "would soon knock him up altogether." Murdock was appointed to superintend the erection and undertake the general charge of their engines in Cornwall, and he quickly overcame the difficulties that were more than Watt could manage.

Murdock traveled from mine to mine and often worked for long periods without rest and little food. His devotion to the work pleased Watt; his open countenance and friendly disposition, combined with his anxiety to please, soon made him very popular with the mine owners. Notwithstanding the long hours and incessant night work, occasioned by the superintendence of the engines under his charge, he found time to construct the beautifully simple model locomotive that we are so familiar with, which doubtless was the first successful road engine ever made in England. Watt had often talked of making a steam carriage, which would have been an abortion, with its condensing apparatus, wooden boiler and sun and planet motion. Murdock, with rare ability, discarded these cumbersome details and produced the high pressure engine. The first experiment was made in Murdock's house at Redruth in 1784, when the little model hauled a wagon around the room, the single wheel, placed in front of the engine, fixed in such a position as to enable it to run in a circle. The model had been continually in the possession of the Murdock family when, in 1833, it was purchased by Messrs. Richard and George Tangye. It is now in the Birmingham Art Gallery, and is still in good working order, although over 100 years old, and when under steam is capable of attaining a speed of 6 to 8 miles an hour.* This little carriage was made with Murdock's own hands, which makes it exceedingly interesting to engineers.

In the year 1798 Murdock returned to take up his permanent residence at Soho. "His energies to further the interest and celebrity of this establishment were not used in vain, for they assisted, in no slight degree, in procuring for it a name celebrated throughout the civilized world. His time there was so completely occupied by his mechanical pursuits that he devoted no time to recreation. The rising sun often found him, after a night passed in incessant labor, still at the anvil or lathe, for with his own hands he would make those articles he could not trust to unskilled ones." Among his inventions we may enumerate the following: 1, An apparatus for boring cylinders; 2, a new method of forming steam jacketed cylinders; 3, the sun and planet motion used on Watt's engines for procuring a continued rotative motion from a reciprocating engine, without the intervention of a crank; 4, the double D slide valve and other valves used on Watt's engines; 5, a rotary engine, one of which continued in use for 30 years and worked well; 6, the locomotive engine already referred to; 7, a patented method of boring stone pipes for water; 8, a lift worked by compressed air; 9, the cast iron cement so extensively used in the old days; 10, the oscillating engine.

Murdock is still better known to the public, and most deservedly so, by his invention of applying the light of gas from coal to economic uses. For the first experiment Murdock procured a kettle, which he placed on a fire in his workshop, after filling it with small coal. The spout of the kettle had a perforated thimble on the end, through which the gas issued, giving a good flame when lighted. Many experiments on a larger scale were carried out, and eventually Murdock's house and offices, at Redruth, were lighted with coal gas, made in an iron retort and conveyed in pipes to the different rooms of his house, where it was burned at proper apertures or burners. This appears to have been the first application of gas for useful purposes, although the gas had been discovered and obtained both naturally and artificially more than half a century before. "Murdock had a gas lantern in regular use for the purpose of lighting himself home at night across the moors from the mining engines that he was erecting to his house at Redruth. The lantern was formed by filling a bladder with gas, and fixing a jet to the mouthpiece of the bladder, which was attached to the bottom of a glass lantern, with the bladder hanging underneath. After various experiments, by which he proved the economy and convenience of the light so obtained compared with that from oils, resinous or animal substances, he perfected his apparatus and made a public exhibition of it by lighting up the front of Boulton & Watt's works, at Soho, on the occasion of the general illumination for the peace of Amiens in 1802." This brilliant illumination was received with immense enthusiasm. Watt would have nothing to do with any patents relating to gas, hence Murdock derived no advantage from the extended use of the new system of lighting beyond the honor of having invented it. Two large cotton mills in Manchester were fitted up with gas in 1805, and another mill in Leeds soon afterward. It became necessary to enlarge the Soho works to make room for the manufacture of the gas making apparatus. Murdock published a paper describing the advantages of the new light in 1808, for which the Royal Society presented him with their large Rumford gold medal. The retort first employed by Murdock was made of cast iron of a cylindrical form, placed vertically in a common portable furnace. The inconvenience of removing the coke from the vertical retort led to the adoption of a horizontal cylinder. These retorts were also made of cast iron, from 12 to 20 inches diameter, and from 3 to 7 feet in length. The form of retorts used at the cotton mills of Phillip & Lees was similar to that first mentioned, but larger in size, and a cage was adopted to facilitate the discharge of the coke; this cage was let down into the retort previously to charging it with coal, and was afterward lifted out by means of a small crane, when the process of distillation was completed, bringing out with it the whole of the coke. Murdock tried a retort having an opening at each end, but this was found to cost more, and he adhered ultimately to the simple horizontal retort, which came into general use, and continued so, with little alteration in principle, up to recent times.

As soon as it was proposed to light the streets with the new method, the idea was ridiculed by Sir Humphry Davy, who asked if the dome of St. Paul's would be used as a gasometer! Sir Walter Scott made clever jokes about those who proposed "to send light through the streets in pipes" and to light London "by smoke," though he was glad enough, not long afterward, to make his house at Abbotsford light and cheerful on wintry nights by the use of that very "smoke." Wollaston, a well known man of science, declared "that they might as well attempt to light London with a slice from the moon." *

When the House of Commons was first lighted by gas the architect imagined that the gas ran on fire through the pipes, and therefore insisted on the pipes being placed several inches from the wall, for fear of the building taking fire; we are also told that "the members might be observed touching the pipes with their gloved hands, and wondering why they did not feel warm." In 1814 Westminster Bridge was first lighted with gas; Glasgow was lighted in 1817, Liverpool and Dublin in 1818, and Birmingham not until 1826. "So completely was Murdock absorbed at all times with the subject in hand, that he was regardless of everything else. When in London explaining the nature of his substitute for isinglass, he occupied very handsome apartments; he, however, little respected the splendor of

* "One and All," by Richard Tangye.

* "Invention and Industry," Dr. Smiles.

his drawing room, and proceeded with his experiments quite unconscious of the mischief he was doing. One morning his landlady, calling to receive his orders, was horrified to see her magnificent paper hangings covered with wet fish skins hung up to dry, and he was caught in the act of pinning up a cod's skin to undergo the same process. He and his fish skins were at once thrown out of the house into the street."* During the erection of an apparatus for heating the water for the baths at Leamington Murdock met with a severe accident; a heavy cast iron plate fell upon his leg and crushed it; he never completely recovered from the effects of the accident, but as soon as able he was at work at the Soho factory again.

Although Watt ignored the use of steam as applied to navigation, Murdock and the younger members of the firm took up the question, and devoted themselves to the manufacture of engines for steamboats with success. Dr. Smiles says: "In the midst of these repeated inventions and experiments Murdock was becoming an old man; yet he never ceased to take an interest in the works at Soho. At length his faculties experienced a gradual decay, and he died peacefully at his house at Sycamore Hill, on November 13, 1839, in his eighty-fifth year. He was buried near the remains of Boulton and Watt, and a bust by Chantrey served to perpetuate the remembrance of his manly and intelligent countenance."

Water Test for Plumbing.

From P., *New York.*—Of all the methods which have been devised for testing plumbing work, that which calls for filling the pipes with water from the lowest point to the roof, is probably the most satisfactory for new work. If what is known as "extra heavy pipes" are used there is no difficulty in making tests under a head of from 60 to 70 feet. This method is easy, both for the plumber and for the inspector. It is straightforward, calls for no special apparatus if properly conducted, and has the advantage of showing defects, not only at a glance, but also in a manner which is beyond controversy. If a small defect, like a sand hole, is discovered, a little salt in the water and a day or two of time will cause such leaks to close by rusting.

The disadvantages of a water test are that it cannot be applied in cold weather or when the pipes are chilled so as to cause the water to freeze when let into them. For men of small means the purchase of a sufficient number of plugs to stop all openings is a serious matter. This, however, in small buildings, and in towns where there is not sufficient demand to make the plugs a paying investment, can be readily overcome. In some parts of New York City it is the universal practice, after roughly testing the iron pipes and before sending for the inspector, to put in the lead work, and then, by soldering up the lead openings, to close the pipes entirely without the necessity for using the plugs. This method of testing has a very material advantage over the use of plugs. There is no danger of blowing out anywhere and deluging the house with water. There is an additional advantage, that a large portion of the lead work is tested, and the character of the ferrules and the ferrule joints is assured. At the present time ferrule joints and the ferrules themselves are the most imperfect parts of a plumbing system. The brass used in the ferrules is of the poorest character, and pin holes occur so frequently as to be a source of great anxiety.

* "Murdock's Inventions," Buckle.

The water test has practical advantages in showing cracks in the pipes and in the hubs. In almost any other test the detection of the cracked hub is extremely difficult. It is no small advantage, in making tests by means of water, that leaks show themselves to the eye in such a way that it is almost impossible to overlook them. Water runs down the pipe, leaving a dark stain, and, even where the pipe is hidden, the water follows down to the lowest points, and, by overflowing at joints or bends, always discloses any important defects. Along the seashore, in damp or rainy weather, the sweating of the pipes is, of course, a disadvantage, but rainy weather does not usually last long enough to make this a matter of great inconvenience.

TRAPS AND VENTS.

THE FOLLOWING PLUMBERS recently passed the examination before the City Board of Los Angeles, Cal., and were awarded certificates: George Meline, J. H. Varley, E. L. Baker, A. C. McDonald, William Martin, E. A. Campbell and J. H. Cummins.

C. A. AGGETT AND R. CHERRY, plumbers, of Montreal, Canada, have registered notice of the dissolution of their partnership.

THE CITY COUNCIL of Alexandria, Va., recently passed an act providing that plumbers, on opening streets, should deposit a fee of from $2 to $10 to insure the repairing of the streets, and any balance after the cost of repaving is deducted will be returned at the end of 90 days.

E. C. MERRILL, 168 Second avenue, Pittsburgh, Pa., issues a pamphlet illustrating and describing the thermostat of his manufacture. The pamphlet gives facts and figures on the combustion of natural gas in coal burning furnaces, and also shows cuts of various gas burners. Among other goods noted are a bath water heater and a porcelain lined water heater. The several articles are illustrated and briefly described.

IT IS CLAIMED that all the plumbers of St. Joseph, Mo., have at last been taken into the association.

WE ARE IN RECEIPT of the illustrated catalogue and price-list of the Iona Mfg. Company, 336 Congress street, Boston, Mass. The goods shown include lamp sockets, switches of various kinds, cut outs, insulating joints, the Iona gas lighting burner, gongs, watchmen's time registers, &c. All the articles are neatly illustrated and described and accompanied by price-lists.

THOMAS HYDE of Albany, a practical plumber and inventor of a number of plumbing specialties, recently spent a few days in New York visiting the trade.

HARRY L. MCKOWN, recently of the firm of Adams & McKown, has opened up a plumbing establishment for himself at the corner of South and Market streets, Wheeling, W. Va.

LAST SATURDAY AFTERNOON three tin roofers employed by John Regan of 152 Franklin street, and some steam fitters and plumbers employed by Blake & Williams, 188 Wooster street, New York, embarked in a boat 20 feet long for New York from Hoffman Island, where they were engaged in doing some work on a Government contract. Ordinarily the boat carried eight passengers, but on this afternoon 22 men anxious to get home crowded into it. As a result the boat was upset and ten men were drowned.

RANDOLPH & CLOWES of Waterbury, Conn., are making considerable improvements in their plant in many directions. They have recently established a department for the manufacture of plumbers' materials and supplies. They are using for this purpose a portion of the buildings which have remained unused heretofore since the time of Brown & Bros. This department has only been started this year. They have facilities for the turning out of new patterns and designs for such things as lavatory legs and brackets. Their operations in this direction are facilitated by their having in their mill departments which furnish brazed tubing of the newest designs and moldings. They have recently taken out a patent in connection with this department for a plumbers' ferrule, of which, although on the market for a very short space of time, they are already making large sales.

IN DISCUSSING the condition of the times a New York street car conductor recently remarked that he never knew that there was so many plumbers till lack of work had forced them to drive cars.

THE REGULAR SEMI-MONTHLY MEETING of the New York Master Plumbers was not held last Tuesday night, owing to the election and the members being out doing their duty.

M. E. FREE has bought out the plumbing business of W. H. Spellman, at Omaha, Neb.

DR. RICHARDSON has bought the Masse Block, at Batavia, N. Y., and will put in a complete plumbing system.

WILLIAM O'DONNELL is erecting a building on Broadway, Ware, Mass., which he will use as a plumbing shop.

FRED ADEE, corner Beekman and Cliff streets, New York, displays the Duplex, his newest water closet, attractively in his show window.

FLASHINGS.

A. NORTHROP & Co., Pittsburgh, Pa., report that they have done considerable business this season in metal ceilings, especially some fine work for churches and business blocks. By attractive designs with contrasting borders and molding they not only furnish a handsome ceiling, but cover all joints. Among work recently finished in which their goods were used is the ceiling in the State Normal School at Geneseo, N. Y.; Presbyterian Church, at Tidioute; Methodist Church at Milford, Mass.; Catholic Church, Lenox, Mass., and Evangelical Church, Holton, Kan. They are sending out "A Dodger" with half-tone engravings of work for which they have furnished the material.

A FOREIGN EXCHANGE reports that at the Eskbank Iron & Steel Works, near Lithgow, New South Wales, Australia, plates and sheets ranging from ⅛ inch to 30 wire gauge in thickness up to 4½ feet in width and of any length, are now for the first time in the history of the country being produced. Corrugated sheets, tarred or galvanized, of a high quality, are also being largely produced at these works. This is a notable innovation, as Australia has been hitherto a large importer of sheet iron and steel for building and other purposes.

HENRY B. TODD has sold his manufacturing business at Meriden, Conn., to Proudman Bros. of that place, who will in the future supply the trade with the goods formerly made by him, including the Yankee Eave Trough Hangers, Giant Metal Cutter and Meriden Cutting Nippers.

WORLD'S FAIR NOTES.

The Columbian Museum.

The Columbian Museum, to which a slight allusion has been made above, is a contemplated outgrowth of the fair. Its projectors have secured a charter of incorporation and hope to retain the Fine Arts Building in Jackson Park as the home of the museum and a memorial of the great exposition. This building is strictly fire proof, being constructed of brick and steel, the only perishable feature being an outer coating of staff, which can be renewed from time to time as it needs repairs or else can be replaced by something more durable. Valuable collections of a greatly varied kind have already been secured for it. Many of the exhibits are of such a character that their owners would prefer to give them away, although costing large sums of money, if they knew that they would be cared for or would serve a useful purpose. For some time there was doubt about the project succeeding, as it was seen that it would be expensive, and the city authorities had no power to assume such a burden. But last week Marshall Field, the merchant prince, whose fame has grown with Chicago's growth, made a gift of $1,000,000, on condition that the incorporators raise $500,000 more in cash and secure the donation of $2,000,000 in exposition stock. This stock has a prospective value now of 15 to 20 cents on the $1, owing to the very favorable turn in the affairs of the Exposition within the last two months. So many holders of stock have already given it to the museum, and so many citizens of Chicago have subscribed cash in addition, that Mr Field's contribution is almost as good as clinched. Now that the museum project is in such excellent working order, the work of soliciting gifts for collections of various kinds by technical schools and other institutions have been in great measure abandoned, on the ground that it is better for the general good to have one great collection in such a museum than a number of fragmentary ones.

A Woman's Memorial Building.

So much was accomplished by women in showing the special aptitude of the sex in connection with World's Fair matters that efforts are being made to continue the work thus begun. Potter Palmer of Chicago, whose wife was the brilliant president of the Board of Lady Managers, has donated $200,000 toward the erection of a building in some suitable location in that city. This is another of the many permanent influences growing out of the great forces exerted in the building up of the fair, and is made possible through the munificent endowment of one of Chicago's public spirited citizens.

The Passing of the Fair.

Those who counted on being able to supplement in November the partial sight-seeing previously done have been grievously disappointed. Exhibitors are too eager to get away, and, of course, exposition officials are anxious to accommodate them. Tracks now disfigure the grounds, while the interior of the buildings has been a scene of confusion since November 1, which has only been intensified every succeeding day. Some buildings are already half deserted, the work of removal being more quickly accomplished than had been deemed possible. Very shortly the deserted buildings will be all that is left of the glories of the fair and then the work of destruction will begin on them.

Summing Up the Attendance.

The World's Fair period extended over 183 days, of which 179 were open days, the exceptions being the four Sundays, May 7, 14, 21 and July 23, when the gates were closed to the public and open only to those whose passes denoted they had business in the grounds. Of the 183 days 27 fell on Monday, for Monday opened and closed the fair, while each of the other days showed up 26 times on the World's Fair calendar. Thursday was the popular day, although Monday and Saturday pressed it hard. But Monday's popularity, as shown by the attendance, was not fairly won, for Chicago day, with its 716,881 paid admissions, came on Monday, and it brought Monday's average up.

The daily attendance reports show that 3,621,358 people paid to get into the fair on 27 Mondays, or an average of 134,124; the 26 Tuesdays were chosen by 3,395,308 people, or an average of 130,588; the 26 Wednesdays by 3,208,310, or an average of 123,396; the 26 Thursdays by 3,581,047, or an average of 137,732; the 26 Fridays by 2,875,379, or an average of 110,591; the 26 Saturdays by 3,576,975, or an average of 137,575, and the 22 open Sundays by 1,216 865, or an average of 55,312. The total Sunday attendance did not equal any of the last three weeks' attendance, and the average Sunday attendance was slightly more than one-half Friday's average, the poorest show day of the week. The smallest attendance came Friday, May 5, when 10,791 people paid to pass through the gates. The ten best days were as follows:

October 9—Chicago day	716,881
October 10—North Dakota day	309,294
October 11—Connecticut day	209,277
October 19—Ordinary day	305,961
October 21—Manhattan day	298,928
October 18—Ordinary day	292,458
July 4—Independence day	283,273
October 12—Italian day	275,217
October 17—Ordinary day	267,483
October 27—Coal, grain and lumber	254,763

There were 92 days when the attendance rose above 100,000; 53 days when it passed 150,000; 25 days when it went ahead of 200,000; 11 days when it passed 250,000; four days when it was over 300,000, and one day when it was above 700,000.

The attendance by months does not vary except by moving forward and upward in an accelerated degree. May's attendance was 1,050,037; June, 2,675,113; July, 2,760,263; August, 3,515,493; September, 4,659 871; October, 6 816 435. Total, 21,477,212, of whom 1,253,938 were children.

The total attendance, including passes, was 27,529,400. During the Fair 40,000 monthly and 39,840 full term photographic passes were issued. These, with the complimentary cards, workmen's tickets, trip passes and return checks, were used to the number of 6,052,188. Of this total 1,703 428 represents the return checks, giving a net total of passes of 4,348,760.

The Ferris Wheel.

The Ferris wheel paid $120,000 into the treasury of the exposition since September 9. The Ferris wheel is to the Columbian Exposition what the Eiffel tower was to the Paris exhibition. It typifies the ascendency of American genius on the Plaisance. From June 21 to October 26 the total number of passengers carried was 1,560,000. By a contract with the Exposition Company the Ferris wheel concessionnaires were not required to pay any percentage of their earnings to the exposition until they had taken in $300,000, if the wheel should cost that much, or whatever the actual cost was, if less. The wheel cost about $382,000. From June 21 to September 9 was required to reach the $300,000 mark, and since that date 50 per cent. of the gate receipts have gone into the coffers of the Exposition Company. The greatest number of passengers carried on any one day was 38,750, the number of tickets sold on October 10. Chicago Day is next in line with 35,000 passengers. The number of people who rode on the wheel July 4 was 14,000. The average daily number of tickets sold during July and August was about 9000. About the middle of September the number of passengers increased, and since then the daily average has been considerably over 20,000. No announcement has as yet been made by the management of the removal of the wheel. By the contract the removal of the wheel is not required before May 1, 1894.

Fresh Air and Heat.

One of the strongest recommendations for heating a building by an inflow of warmed air is that the air already in a building must get out to make room for it. Even if no special provision is made to get the air out, the fact that the building is warm shows conclusively that it has been disposed of or the warm air could not get in to raise the temperature to a comfortable point. Any plan that provides good ventilation economically is commendable, and the following is a step in the right direction :

A plan of heating mills has been introduced by which heated air is delivered from a large fan into flues in the walls, registers from each flue delivering the air into the different rooms, this air being heated by the waste gases from the boiler. The products of combustion pass from the boilers through economizers for heating the feed water, next through a regenerator for reheating the steam exhausted from the high pressure cylinder, and on its way to the low pressure cylinder, and then passes through air pipes, where it heats the cold air for heating the buildings, then passes to the chimney. If heated air is not wanted, but only cool air for ventilation, the gases from the boiler are turned by a damper into the chimney without entering the heater; and if the gases are not sufficient to heat the air as desired, additional heat is supplied by radiators of steam in this heater. The temperature of the air is raised about 50° by its contact with the hot gases.

A correspondent of the *Electrical Review* who has been reading about the proposed projection of signs for advertising purposes on the clouds over London, by means of the electric search light, suggests the vandalism of utilizing the Niagara Falls on a similar system. Why not, he says, place electric search lights on the Canadian side of Niagara Falls and project advertising announcements on the American Falls? The immense curtain of water would make a splendid background, and the rapidly falling water would produce novel effects on the signs. The trolley road now operating along the falls might utilize the scheme and give its patrons gigantic magic lantern shows on summer evenings.

Julien P. Cordier.

We present herewith an excellent portrait of the late Julien P. Cordier, manager of the Western branch of the Lalance & Grosjean Mfg. Company, 81 Michigan avenue, Chicago, who died somewhat suddenly at his residence, 5943 Wabash avenue, in that city, on the 2d inst. of hemorrhage of the lungs. Mr. Cordier was 51 years of age, and was born in the city of New York, of French parentage. He had been connected with the company since boyhood, having entered their employment at their organization, 35 years ago. The past 11 years of his service were spent in Chicago, where he was manager of that branch since its opening. He had previously traveled over every section of the United States and through the various South American countries in the interests of the concern. He was, perhaps, most intimately known, however, in the Southern States, where he spent much time and possessed a troop of friends. At the time of his death Mr. Cordier was a stockholder and one of the directors of the Lalance & Grosjean Company, of which his brother Augustus is the vice-president. Another brother, Joseph, is connected with the company's factory at Woodhaven, L. I., while a third brother, Charles, is connected with the Bridgeport Brass Company.

Julien Cordier was widely known and highly esteemed by the hardware trade of this country, and his acquaintance was also extensive in other parts of the American continent. He was a man of polished address and many accomplishments, and his genial nature and strict integrity gained for him a host of devoted friends, to whom the tidings of his too early death will bring a feeling of sorrow and loss. He leaves a widow and daughter. The funeral services were held in Chicago, and temporary interment was made there.

JULIEN P. CORDIER.

SCRAP.

Leon Langlors & Co., the owners of large steel works at Basse Indre, near Nantes, in France, have recently opened new tin plate works, constructed on the most approved principles. The works are under the management of Thomas Day, lately manager of the Waterloo Tin Plate Works, Machen, Monmouthshire, England, who has obtained the assistance of a number of Welsh workmen. The firm are now in a position to manufacture tin plates from beginning to end, instead of being under the necessity of importing the black plates required, as they did formerly.

McClure & Co., 62 Second avenue, Pittsburgh, Pa., are offering to the trade McClure's Redipped, McClure's Hand Coated and O. B. T. brands. The above firm have met with gratifying success since establishing in Pittsburgh and attribute it solely to the fact that their different brands of tin and terne plate have given entire satisfaction to their customers. Both members of the firm have had years of experience in the tin plate business, J. J. O'Connor having been connected with N. & G. Taylor Company in Philadelphia for a long time and later represented the interests of that firm in Pittsburgh. T. G. McClure was connected with the house of John Dunlap & Co. of Pittsburgh for many years.

The first carload of material consisting of black sheets turned out at the new plant of the New Castle Steel & Tin Plate Company, at New Castle, Pa., was shipped to Chicago on Thursday, November 2, the statement that this product consisted of tinned plate being incorrect. As yet no product has been tinned by the above concern, but as soon as a sufficient supply of black sheets has been made the tinning departments will be put in operation. The firm expect to send out in a short time printed matter giving full information regarding the different brands of tin and terne plate which they propose to manufacture and other information of interest to the trade.

Shipments of tin plates from the United Kingdom to this country during the month of October were 13,000 tons, a falling off of 6000 tons from the figures of October, 1892. The total exports to all countries were 27 000 tons, or more than double the amount sent to the United States. As this country usually absorbs at least three-fourths of the British exports of tin plates, the falling off in the proportion shipped to this side is remarkable.

As illustrating the durability of terra cotta, it has been pointed out that the figure of Britannia on the top of the Liverpool Exchange, which is of that material, was made 100 years ago at the Doulton Pottery in Lambeth; and, though greatly exposed, is as perfect to-day as when erected.

British View of the Tin Plate Situation.

One of the great marvels of the people of the United States, and scarcely less so of the people of Germany and other countries, said a leading English trade journal recently, is the fact that South Wales should be able to retain such an almost entire monopoly of the tin plate trade as it has succeeded in holding up to the present time. So far as the export returns for the current year go they would appear to show that a larger quantity of tin plates was sent abroad in the current year than in the corresponding period of 1892. In spite of the considerable outcry about the probable effects of American protection on the tin plate trade, conflicting statements are published in American papers as to the prospects of the tin plate industry in that country. There seems to be no doubt that it is making progress, and it is likely to continue to do so to a larger extent than has yet been attained. This progress is likely to be facilitated by the fact that a considerable increase of demand has hitherto taken place in the United States from year to year, and there is every reason to believe that American markets will continue to become larger consumers. What is still required for the United States is a good home supply of tin, but up to the present time the expectations held out on this score have scarcely been realized, although recent advices from South America intimate that rich tin mines have been found and are being worked to some extent in that region. It is a curious fact that notwithstanding the serious depression of the iron and steel industries on both sides of the Atlantic, our exports of tin plates for the first eight months of the current year were more than 7000 tons in excess of the exports for the similar period of 1892. In Germany, on the other hand, the exports were about 41,000 tons of ship plates and tin plates together, as against 36,400 for the corresponding period of 1892.

Secretary Herbert has selected a special board to inquire into the best and most economical method of correcting the defects reported to be existing in some of the vessels of the new navy. The duty of the board will be to determine which should be adopted of the several plans submitted to the Navy Department for the redistribution or reduction of weights, &c., so as to correct the top heaviness discovered in the vessels. The ships included in the list to be investigated are the "Detroit," "Montgomery," "Machias," "Marblehead," "Castine," "Cincinnati," and "Raleigh," but it is possible that the work of the board may be extended so as to include all the vessels now under construction.

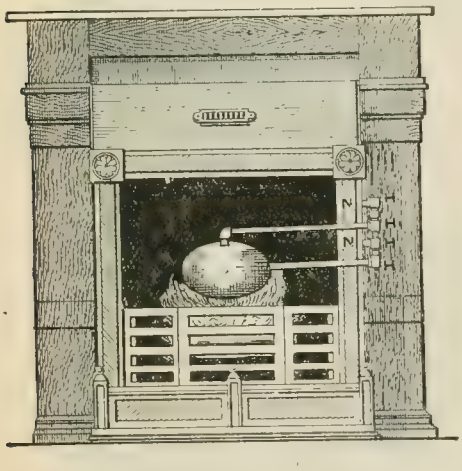
The Morfa Tin Plate Works, Llanelly, Wales, having secured a large order for plates, have resumed operations after a prolonged shut down.

STEAM AND HOT WATER.

Tainter's Latent Heat Retort.

We have received the following communication from E. C. Tainter, Madison, Wis., describing a device which he calls Tainter's latent heat retort, an illustration being presented in the accompanying cut:

The device consists of a steam tight metallic vessel with water attachments at top and bottom. The illustration shows it with hinged water pipes in order better to illustrate the movable advantages of it, especially when required for an open fire place or any kind of a grate fire. The retort, however, is not limited in its usefulness to fire place grates, stoves, nor any one class of domestic heaters. It is portable in a limited way, as shown by the illustration, the novel feature being the two hinged water pipes. The lower pipe is for cold water and the upper for steam or hot water. Both pipes are connected at some convenient point with other pipes used for a like purpose, or with a tank, so that the cold water will be fed by gravity and when warmed up will rise and thus give circulation. The grate shown in the illustration, known as Patton's hot water grate, has water spaces at the sides as well as at the back, and therefore gives an excellent opportunity for illustrating the practical utility of the retort for domestic purposes. The accompanying sketch,



Tainter's Latent Heat Retort.

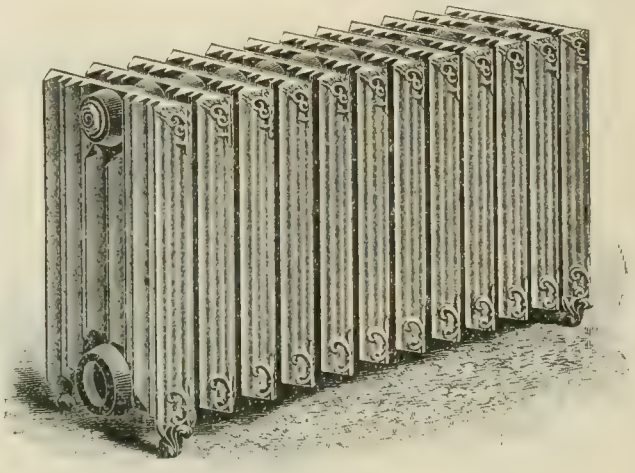
which was sent to *The Metal Worker*, was made by Master Charles Spooner of Madison, Wis.

Steam versus Hot Water Heating.

A somewhat extreme hot water enthusiast sends us the following: The late cool but not cold weather has compelled resumption of heating appliances and has been precisely of that sort which most strongly presents the principal advantage possessed by hot water as a heating medium—the regulation of heat to exact requirements; while, at the same time, it has rendered equally prominent the chief defect of steam as generally used for heating offices and dwellings—the impossibility of gauging the heat to a point not excessive for health and comfort. In the modern office building heated by steam and by direct radiation, most of the rooms are supplied with a single radiator of capacity sufficient to heat the apartment in coldest weather. The occupant, in such weather as has recently prevailed, has learned by experience the uselessness of attempts to moderate the heat by use of the radiator valves. He comes to his office in the morning, say at 9 o'clock, and finds his room a little chilly, as the janitor has had the steam turned on only a few minutes. He opens his mail, gets absorbed in his business, and in about an hour finds himself so uneasy that he pulls his mind out of the depths into which it has plunged, finds himself perspiring, and the thermometer marking 74° to 80° F. He says hard things about janitors, calling them all idiots, or worse, and in his haste to cool off, throws up the window. The autumn winds are out, and without invitation they come in, scattering papers into confusion; and the change of temperature being too marked, down goes the window again with a slam; more obloquy is heaped upon janitors, and the radiator valves are screwed down as hard as angry muscle can twist them. Now things again become placid, and the victim plunges once more into the intricacies of business. After a while he is recalled to a consideration of the condition of the atmosphere; but this time it is chill, not perspiration, that annoys. It being about lunch time now, he usually turns on steam again and goes out, only to repeat the experience of the morning when he gets back, fortunate if he has not contracted a cold to add to his other annoyances. It is probable that annoyances which business men have had with steam heat in office buildings have done more toward booming the business of hot water heating than almost anything else that could be named. It is time earnest attention was given to the perfection of a system of hot water heating for tall office buildings, which, as heated by steam, are, for the most part, very dens of discomfort when required to be heated in early autumn or late spring, and which, on the average, are overheated even in severe winter weather.

The Detroit Flue Radiator.

The American Radiator Company, 111 and 113 Lake street, Chicago, have added to their large assortment another new radiator, called the Detroit flue radiator, which is herewith illustrated. It is made 20, 18, 16, 14 and 13 inches in hight, and is intended for either steam or hot water. The sections are 12½ inches wide and 20 inches high, containing 6 feet of heating surface. It will be seen that this radiator is especially adapted to locations where a low construction is desired but without securing it at the sacrifice of radiating power. The loops are joined by screw and nipple with the same thoroughness and excellent workmanship characterizing all the other productions of this company.



The Detroit Flue Radiator.

HEATING NOTES.

The Avonmore Foundry Company are making arrangements for the establishment of a radiator plant at Avonmore, Pa. A building is being erected for the purpose, measuring 60 x 300 feet, and the plant is expected to be in operation early next summer.

C. S. Graves of the Model Heating Company of New York reports the following as some of the recently closed contracts for the Novelty hot water circulator: The Fire Department Headquarters at Plainfield, N. J. George Hardifer of Paterson, N. J., has recently installed a circulator in the residence of J. Phillips. Harry Smillie & Co., Rhinebeck, N. Y., are installing a No. 24 in the residence of Mrs. Bishop. George Gates of Nyack is placing one in the residence of Mr. Blauvelt at Sparkill, N. Y. Thomas Cusick of Kingston, N. Y., will use one in the new pastoral residence of the Church of the Holy

Comforter. Receiver of Taxes J. H. Rogers of Flushing, L. I., will use a No. 1 for heating water in a 500-gallon tank. Adams & Spencer of Catskill, N. Y., are installing one in the residence of Mr. Spencer.

THE AMERICAN RADIATOR COMPANY, 111 and 113 Lake street, Chicago, are distributing a finely executed engraving of the new Municipal Building at Hamburg, Germany. It is a beautiful building, and the picture is worthily printed on a large card, so that it can be hung up. A peculiar feature of this building is that it is heated with American radiators. No less than four carloads of the company's radiators were required for this purpose. The contract for them was closed at the company's World's Fair exhibit with the official engineers of the city of Hamburg. It was the largest of the many foreign contracts secured by the company as the direct result of the World's Fair. They are excusably enthusiastic over the possibilities of establishing a large export business with the fine beginning thus made.

THE A. A. GRIFFING IRON COMPANY, Jersey City, N. J., issue a handsome new pamphlet catalogue of the Bundy radiators. The illustrations are process and line engravings, and the text is beautified with headlines printed in red. Extensive lines of Bundy radiators are shown, beginning with the Bundy Columbia, next the Elite, the Pyro, Princess, Renaissance and Dining Room. The Bundy Duplex base radiator is a construction that will interest the trade, being a base radiator furnished with two, three or four rows of loops, so constructed that only one or more rows may be used at a time, thus regulating the amount of heat in moderate weather. The various indirect radiators are likewise illustrated, and a page is given to the Bundy Crescent dampers or box base direct indirect radiators. At the close are miscellaneous supplies, and the Bundy floor and ceiling plates.

PRESIDENT JOSEPH E. BOND of the American Radiator Company is visiting the Eastern offices. He spent a few days in New York this week.

W. S. NAUGHRIGHT, the heating engineer for F. D. Stephens & Co., German Valley, N. J., reports that his firm have this year used five carloads of the goods of the American Boiler Company.

C. M. ROBINSON, an architect of Altoona, Pa., recently spent a few days in New York visiting the American Radiator Company and the American Boiler Company getting information on heating apparatus.

A 16 PAGE CATALOGUE, bound with a muslin lined brown cover, is received from the A. J. Bennet Patent Radiator Attachment Company of Woonsocket, R. I., with their name on the front cover in gilt letters and an illustration of a radiator with their Comfort foot rest in gilt on the back cover. The first pages are devoted to showing the Comfort foot rest attached to different kinds of radiators and in different positions. Then comes an illustration of it and an address to the trade, which is followed by illustrations of the different parts used in its construction.

W. M. MACKAY, 236 Water street, New York, recently received an order for 18 dozen valves from an English firm in the hot water and steam fitting business.

Water Hammer.

BY PERCIVAL H. SEWARD.

The knocking in steam pipes, or as it is technically called, "water hammer," is that most perplexing and annoying noise so often heard in connection with a steam heating apparatus. I know of nothing which is more liable to strike terror into the hearts of the timid than the continuous and awful pounding which it produces, seeming, as it does, as if there were a series of explosions taking place within the pipes themselves at frequent intervals, but with sometimes increasing force. The power of water hammering seems to be at times irresistible, as I have had cases brought to my notice in which it has burst and fractured heavy wrought iron pipes like so many pipe stems.

There are quite a number of ways by which water hammering is produced, but it seems to be always due to one cause, and that is a vacuum in the pipes. I do not say that a vacuum in the pipes will produce water pounding, but it is my opinion that a vacuum is always produced before water hammering commences. The most frequent source of this annoyance, and therefore the one which is taken up first, is the radiator. When a radiator has been shut off for some time, allowing it to get cold and then opened again when the system is under pressure, it generally follows that a water hammering is at once started which continues for some time. Its cause is not improper piping or lack of skill in planning the job, but seems to be one that is unavoidable even in the best constructed apparatus. When a radiator is closed off the steam which it contains condenses and falls to the base and with the water already left there when the valve was closed forms a considerable amount, which will be left stagnant in the radiator. When it has been left for some time and then steam turned on again it produces that gurgling sound which is soon followed by severe knocking or pounding. The way in which this effect is produced is, in my opinion, as follows:

The first turn of the steam valve has the immediate effect of producing a sharp sizzling, gurgling sound, caused by the steam entering with such pressure through the small opening that it forces itself through the water collected in the body of the valve, displacing it to a considerable extent, and therefore causing the main body of water to descend to fill its place and in turn be expelled by the entering steam.

This gurgling and cracking sound will be kept up until the radiator is filled with steam and the pressure in the radiator itself is equalized with that in the pipes. When this point has been reached the steam is, of course, not entering with such great velocity, and therefore gives the water a chance to gradually find its way out. The peculiar swishing sound, giving one the idea that the water in the radiator is being pumped back and forth by some seemingly unaccountable power, is another result of turning steam into a cold radiator. This is first caused by the water being driven by the entering steam up the tubes to fill a vacuum caused by the steam in top of the tube being rapidly condensed by contact with the cold surfaces of the radiator. When this vacuum is formed at the top of the loop, the water and steam rushes up both sides, and meeting together at the top produces a short, sharp crack, followed by the sound of the receding water, and directly afterward by the ascending water, and another short cracking sound, but less violent than the first. This is kept up for some time, the noises becoming less frequent and less violent, until they gradually die out. Of course, when I say die out, I mean in that one particular loop. The noise will be heard in the radiator until it is entirely heated. The cause of the second noise is the water receding from the first attack, as it were, allowing the steam to again rise, and, striking the surfaces, become condensed, creating another vacuum, thus causing the two descending bodies of water to be forced upward again and meet as before. This action is kept up until the loop has become sufficiently warmed to allow of steam being supplied faster than it is condensed, which, of course, equalizes the pressure at the top and bottom of the tubes and prevents the water rising and falling as before.

I have generally found that opening the valve one turn at first and then gradually afterward will be the most satisfactory course to adopt when letting steam into a very cold radiator. By opening the valve one turn at a time it will cause that aforementioned sizzling and gurgling sound, but it will generally prevent pounding in the pipes themselves, for the reason that what water does find its way into the pipes will not be of sufficient quantity to produce a vacuum, except in a very small pipe. The sizzling sound is not nearly so annoying as severe pounding, and if it is tolerated until the radiator is filled with steam, and therefore heated, the valve can then be gradually opened, allowing the partially heated water to descend, when in nine cases out of ten no further trouble will be experienced.

If, on the other hand, the valve is opened at once to its full extent the steam will enter with a tremendous rush and carry the water with it, thus causing the first sharp report and then the peculiar swishing sound of the water going back and forth in the loops, and as this is liable to take place in several loops at the same time, the noise, of course, will be intensified. The knocking will also be heard in the pipe itself, caused by a certain amount of the cold water having escaped and therefore condensing enough steam to cause a partial vacuum, which, when being filled, will be done with such force as to drive the water against the sides of the pipe itself, producing the true water hammering.

The first noise produced by opening the valve quickly has the tendency to make the operator as quickly close it again, when the pounding and knocking in the pipe itself is produced with such force as to make the entire radiator tremble. The water which has escaped into the pipe causes a vacuum as soon as the valve is closed, which is quickly filled again by the pressure of the steam below. The water will thus keep condensing what steam does reach the top of pipe, thus creating vacuums and being forced by the steam to fill them again, until the water is heated and little by little finds its way down the pipe. This noise sometimes lasts for a considerable time, and, therefore, even when the valve is opened to its full extent it is better to leave it so than attempt to close it again.

I once heard of a case of this kind in which the side of the valve was blown out. The conditions were somewhat different, but the principle was the same. A battery of boilers were connected with a main steam drum by separate 6 inch pipes, valves being

placed at their angles. One of the boilers had been out of use for some time, but was to be started up again. The fireman went to open the angle valve on the pipe leading from boiler to drum, but on the first turn or so of the steam a pounding was produced which caused the fireman to quickly close the valve again, when, of course, the pounding continued with increased force and with the result above mentioned. The pipe connecting to the boiler was taken from the bottom of drum and therefore full of water. If the valve had been opened and left that way no harm would have been done, as the steam in the drum would have simply blown the water into the boiler and then followed itself; but when the valve was closed the steam that was in the pipe was quickly condensed, thus forming a vacuum, and the filling of same, backed by the high pressure in the drum, was of sufficient force to break the valve, it being the weakest part in this case.

When steam commences to enter a cold radiator during the first starting up in the morning, knocking and hammering will sometimes be caused by air valves being too wide open, allowing the steam to enter too rapidly, forming vacuums and producing the same results as when a radiator is shut off and then opened again after being cooled. After an apparatus has cooled down for the night, or at any other time, a perfect vacuum will be formed in the entire system, providing the air valves do not leak. This is considered an objection by some parties, and therefore they recommend raising the safety valve or else putting on a vacuum valve so that air can be admitted.

As far as my experience goes I have never been able to see the force of this argument. The only advantage secured by it is that if a rapid fire is started in the boiler it will not produce hammering, for the reason that steam cannot ascend to the radiators until the air has a chance to escape, whereas with the system a vacuum the steam would at once rush up and produce the same result as turning steam into a cold radiator. I do not believe in any device or arrangement made to allow of carelessness being practiced, except when it would be a source of very great danger. An intelligent man can be relied upon better than any invention, and therefore ought to be educated up to a point where he will not be liable to kindle a fierce fire in a steam heating apparatus.

If a slow fire is started the entire system will get hot when acting on a vacuum quicker than by heavy firing and a system filled with air.

Water as soon as it receives heat gives off a vapor, which is in reality steam, but is not called so until by confinement it reaches a pressure equal to that of the atmosphere. We have all noticed an open kettle containing heated water will give off this vapor, and if the hand be held over it a slight heat will be felt, increasing as the water gets nearer the boiling point. This is exactly what takes place in our steam boiler, but if the system is a vacuum the vapor having no resistance will ascend as rapidly as it is formed, and thus get all the radiators hot before steam is registered on the gauge. If, on the other hand, the system was filled with air, the steam would have to reach atmospheric pressure before it could expel the air. By leaving the system a vacuum we obtain a quick and effective result, as in a system in which the air is drawn from the radiator by an exhauster or other method, known as the "vacuum system of heating."

When a radiator is cold and filled with air, as is generally the case, pounding and other noises will be prevented by allowing the air to escape very slowly, as steam can only enter as fast as air is expelled. This applies more particularly to radiators which contain no collection of cold water, but can be followed in all cases with marked results. Turning steam into any cold pipe is almost sure to produce water hammering, as, on account of steam being condensed by contact with the cold surfaces of the pipes, a body of water is formed which is forced along with the steam, but with less velocity. The steam traveling ahead of the first body of water will form another separate body, the steam in between, which is rapidly condensed, forming a partial vacuum, and as the two bodies of water each rush to fill the vacuum a sharp pounding or hammering is produced when the two bodies meet or when either one strikes a bend or turn in the pipe. The effect of this hammering, when it occurs with much intensity, is more disastrous to cast iron than wrought iron pipes, as the tenacity of cast iron is much less than wrought iron, causing it to crack or burst more easily. A leak will generally be sprung at points where wrought iron pipe is connected with cast iron fittings before the pipe itself will be fractured.

What I have been dealing with principally up to this point is "water hammer" produced from causes which are no fault of the steam fitter or engineer. I will now take up a few cases in which errors in piping, planning, &c., will produce equally as bad and often worse results.

The most frequent cause for noises in steam piping is the trapping of those pipes used for returning the water of condensation to the tank or boiler. If a pipe should be crowned up at any part of its length steam will collect, and becoming condensed create a vacuum, when the water will rush up and expend its force against the top of the crown or at the end of the pipe if it is closed. This effect may be produced in equally as severe a manner if the end of the pipe is open, as the two bodies of water, being forced to fill the vacuum, one by atmospheric pressure and the other by steam, will meet and so expend their force upon the sides of the pipe. This trouble will never be encountered if the pipes are of sufficient area to do the work required of them and have a gradual fall away from the entering steam.

Single pipes, in which the steam is flowing one way and the water another, are also a frequent cause of water hammering. This is caused in a case of this kind by a larger body of water than usual descending the pipe, closing up the opening for steam and imprisoning that which is already behind. The imprisoned steam condensing forms a partial vacuum, which is rapidly filled by the water driven back by force of the entering steam. This gives more water still, which has to find its way out, and often the hammering will be continued so long as to become not only a nuisance to most people in the building, but a perplexing problem. The best remedy in this case is to enlarge the size of the pipe. I always recommend that the horizontal pipes in regular steam connections be made one size larger than the corresponding vertical pipe, which will be found to reduce the danger from this source to a minimum and prevent it in most cases. Making the return pipes too small will also cause much trouble—that is, what are called dry returns, those which are below the water line in boiler. The cause of the noise in this case is almost identical with that just described, but with the difference that the descending water when filling the pipe imprisons the steam ahead of it. A "dry" return pipe never ought to be more than two-thirds filled with water. Their sizes are determined by the amount of radiation, as its condensation can be easily figured, also the velocity of the flow of water. It is safe to say that if a steam apparatus is carefully figured out, allowing a sufficient area for all pipes, so that they can do what is required of them, with a margin of 25 per cent. for emergencies, and then properly erected, always giving the mains a fall of 1 inch in 20 feet away from the entering steam, no water hammering will be heard.

Connecting a supply and return pipe to each radiator, or, as it is called, the "two pipe system," will not prevent the trouble at the radiators, even when operated in an intelligent manner, while, on the other hand, it will be the cause of continual annoyance, caused by leaving some valves open and the others closed, thus making an unequal pressure in different pipes, which will in itself produce the very trouble against which we try to contend. No pipe running to a radiator connected on the "single pipe" system ought to be over 10 feet in length, and, if this rule is followed, and all these single horizontal pipes are made one size larger (which practically means double the area of the corresponding vertical pipe), no trouble will be experienced if it receives ordinary attention.

If a valve is placed on any steam pipe, a valve ought to be placed on the corresponding return pipe (if there is one), and they must be both either opened or closed, practically at the same time. If we close one valve on main steam pipe leading from boiler and do not close the corresponding return the rapidly increasing pressure in the boiler will drive all the water into the returns and then we will hear water hammering of a kind to be remembered. It is for this reason that check valves are sometimes placed in the return pipe leading directly from boiler, but, as they are liable to get corroded and stuck, I cannot say that I recommend them for this purpose. It is much better for the attendant or fireman to understand the system, and so get into the habit of depending to a great extent upon himself for its successful operation.

Sylvester P. Pierce, president of the Pierce, Butler & Pierce Mfg. Company, died at his residence at Syracuse, November 5, at the advanced age of 79 years. In addition to this firm with which Mr. Pierce's name is associated, he was also connected with S. P. Pierce & Son of Syracuse, who are the proprietors of one of the largest crockerystores in central New York. The two large enterprises with which Mr. Pierce was connected, and which owed their prosperity largely to his work and direction, are left in a flourishing condition.

Lavaoid is a cement for iron and stone recently brought out in Austria and adopted by the Government. It consists of 50 per cent. of sulphur, mixed with iron, silicic acid and some alumina, and it is used in a molten condition, cooling quickly.

THE RETAIL STORE.

Climax Coal Screens.

The Gilbert & Bennett Mfg. Company, 148 Lake street, Chicago, and 44 Cliff street, New York, have just brought out a coal screen adapted for use either on the side of a car or in a yard. Two illustrations are herewith given, one showing how the Climax screen is secured to a car for screening into a wagon and the other showing how the same screen is adapted for yard use by the addition of a head board and a foot rest. In using it on a car the clamps are secured to the side board and the iron leg adjusts it to the required incline, holding the screen firm and independent of the wagon. If it is wanted to screen from a box car it can be secured to the grain door, or one or two or more planks can be fastened together for the right hight long enough to rest against the inside of the door frame. This will also serve to keep the coal from rolling out on the ground. For yard use the clamps are secured to the foot board, and the head board is fastened in position. The screen can be placed at any required incline and the clamps secured so the foot board is always vertical, rendering the screen firm to shovel against. The screen will also stand solid. The screens are constructed substantially and at the same time with a view to making them just as light as possible. Double crimped steel cloth is used. The frames are hardwood and covered with heavy sheet iron where the coal rolls down. The sides are strengthened by strong iron braces. The legs and clamps are strong and capable of quick adjustment. There are as few parts as possible to render the screen complete. All meshes are furnished from $\frac{3}{16}$ inch to 3 inches, but for general use the $\frac{3}{8}$ inch is recommended.

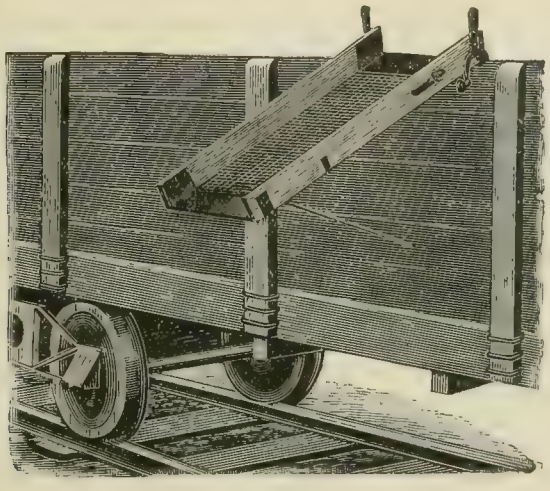


Fig. 1.—Climax Screen on Car.

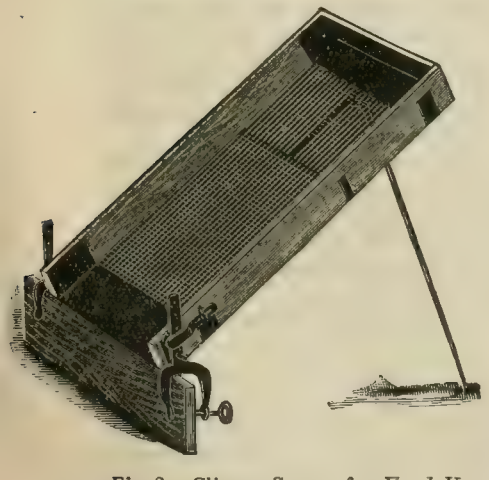

Fig. 2.—Climax Screen for Yard Use.

The Barler Ideal Oil Stove.

In the accompanying illustration is represented the brass oil tank and burner employed by the Huette-Barler Mfg. Company, 111-113 Lake street, Chicago, Ill., in Barler's Ideal oil heater. The outside shell and bottom are stamped from one piece, and the entire construction, together with the wick raising device, is referred to as an excellent piece of work. The manufacturers claim that special attention has been given to perfecting the working parts of the stove, and that it will not get out of order, as is often the case with the ordinary construction. The company's exhibit at the World's Fair received great attention on the part of visitors, and was awarded a premium and medal. In connection with the World's Fair the company disposed of a large number of their heaters in this country and shipped quantities of them to foreign parts.

The Barler Ideal Oil Stove.—General View of the Burner and Brass Oil Tank.

The Sensible Ice Tool.

N. R. Streeter & Co., Groton, N. Y., are offering an ice tool as herewith shown. It is made of cast iron, with sharpened steel points, and measures 9 inches over all. The article is referred to as a combination of an ice pick, chisel, pulverizer and hammer, and as being well adapted to use in any of these capacities. The tool is designed to retail for 15 cents.

The Sensible Ice Tool.

In a local paper of Fort Covington, N. Y., is an account of the tin shop and hardware store of G. A. and J. Farquhar of that place. It says that they have recently removed the partition from the front of their store, put in a new hardwood floor, and devote the entire space to store purposes. The workshop is now located in a large basement, which is provided with ample light for the workmen. In their store they make a fine display of stoves, ranges, hot air furnaces, household articles and farm implements, and a line of hardware and cutlery. Their present store is the outgrowth of a comparatively small beginning seven years ago and the result of untiring industry and perseverance.

The Royal Heater.

The Plume & Atwood Mfg. Company, 18 Murray street, New York, are offering the trade a heater to be used in connection with center draft lamps or

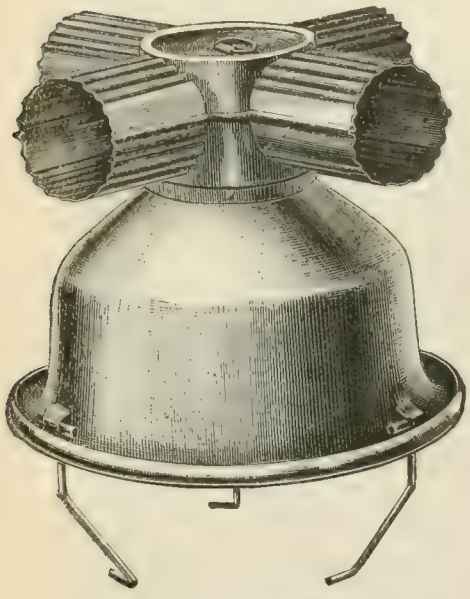

Fig. 1.—The Royal Heater.

argand gas burners, as shown in Fig. 1. The heater is made of full nickel plated metal and is easily attached to a lamp, as in Fig. 2, and as easily removed. The heater is so constructed on top that small vessels containing water for shaving or other purposes, or milk or food for infants or the sick, may be quickly heated. It is remarked that the heater is constructed on the prin-

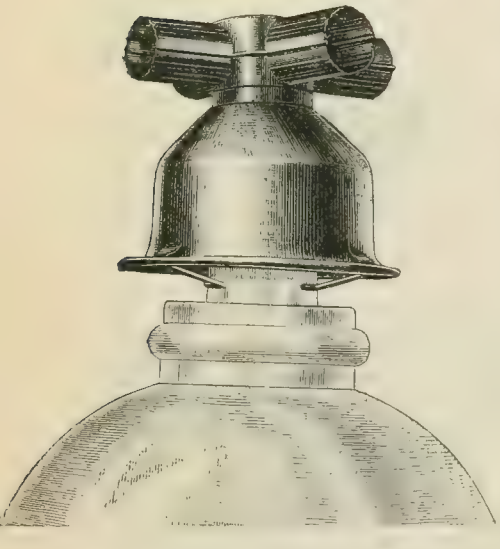

Fig. 2.—Position of Heater on Chimney

ciple that it creates an increased or forced draft, not only through the chimney, whereby the combustion is made more perfect but also under the shade, so that the cold air is constantly drawn under the shade, and being heated by the surface of the hot chimney, ascends to the heater, where it is still further heated by direct influence of the flame before it is discharged into the room. The manufacturers point out that this is a convenient, attractive, efficient and inexpensive mode of heating; that the device will heat small rooms, bedrooms and bathrooms without the use of other heat; that it is a valuable auxiliary in any size room in damp and extremely cold weather and that as a result of better combustion the heater saves 20 per cent. of the oil. The makers state that the best results are obtained by using the heater with their Royal and Banner lamps, though it is adapted to any center draft lamp or argand gas burner.

Retailers' Associations.

BY A. H. HOPE.

The retail hardware dealer is confronted with three influences that tend to reduce his profits and prove irritating in the conduct of his business:

1. The inexperienced competitor.
2. The untruthful customer who misquotes prices for his own benefit.
3. The competition of the jobber and manufacturer.

If he tries to fight them single-handed he makes but little headway.

THE DIFFICULTIES.

To attempt to interfere, advise, or guide his inexperienced competitor would be considered an impertinence. Yet the drawing of such a man into an organization is one way of getting him where he can be influenced to correct mistakes without appearing to single him out for a lesson.

The customer who quotes falsely for the purpose of forcing prices down has a wide field in which to work, so long as dealers hold each other at arms' length, and he is responsible for incalculable harm until he is discovered. When retailers meet in friendly intercourse this man's power of doing harm is curtailed and this evil disappears.

The tendency among large buyers is to get goods as near to headquarters as they can. Having secured quotations from the factory they often give the retailer the option of filling an order at these same prices, and if he does this he sees no profit in it.

How shall he protect himself against these three demoralizing tendencies?

Alone he can do nothing. He sees the evils but cannot conquer them. His profits are each year growing smaller, his work grows harder, and the future is less encouraging.

WHAT SHALL HE DO?

Common sense suggests that he and his competitors unite their forces and call upon their brothers throughout the country to unite with them.

They will discover at the outset that their competitors are pleasanter men than they had given them credit for being, are more kindly disposed and more amenable to argument.

Second, that the man who has been carrying stories from one to the other has been profiting by his falsehoods at their expense.

And, third, that their combined influence can be exerted both at home and abroad against the jobber or manufacturer who is selling their trade.

This latter evil is not one of sentiment, but is one of dollars. It is growing and will continue to grow while retailers do nothing but grumble. A union in one town even will do but little to eradicate it.

When a jobber is asked prices by a contractor in the town of A he refuses to quote him, because he has too good a trade with the retailer there to put it in jeopardy. But he has no trade to protect in B, so he quotes jobbing prices to the consumers there.

How can he be reached?

By the dealers in A and B uniting their forces so that an injury done one is an injury to all.

ORGANIZATION.

No section of the country is free from this trouble, though the more thickly settled the section the easier it is to reach the consumers' trade. The retailers of the whole country should be united to remedy this wrong, but union, like charity, should begin at home.

It would be easy to show how a union of retail Hardwaremen would be beneficial in numberless other minor ways, but the simpler the objects of an organization the better its chances for a long life. It ought not to be bound up in red tape or rituals, but be organized for profit.

In almost all things the individual can best work out his own success when free and untrammeled by organization or combination. But the evils complained of here have grown out of this very independence, and can only be remedied by union and by the massing of forces.

HOW SHALL THESE ORGANIZATIONS BE EFFECTED?

Not by articles in the press, nor after political methods. Some one man must take the initiative, visit his brethren, agree upon the abuses that ought to be considered, and when a number are ready to join with him in the call appoint a time for a meeting of all interested.

The organization must not attempt to limit the independence of any individual member. Whatever is to be accomplished must be through argument and intercourse, not through by-laws and blue laws.

Nothing must infringe the right of each man to manage his own business in his own way, even though that way is a ruinous one. A vast step forward is made when the dealers all agree to come together, and from such meetings helpful work will be evolved. The mere discussion of certain abuses will lead to their correction

Being organized, put yourself in communication through your trade paper with other unions, get into correspondence, work toward a State union, but continue your own local work whether you get up a State union or not. The time will soon come when you can say to the prowling jobber or manufacturer: "Hands off!" and your command will be heeded.

RETAIL HARDWAREMEN, LET US UNITE OUR FORCES; IN UNION IS STRENGTH.

STOVE TRADE NOTES.

Stoves in Belgium.

Consul Geo. W. Roosevelt of Brussels, Belgium, in a recent report to the State Department makes the following remarks in regard to the introduction of American heating stoves into that market: From time immemorial the method of heating houses in this country has until lately been wholly by open grate fires. Owing to the severe cold prevailing here during the long winter months, this primitive mode of heating has to a great extent been superseded during the past few years by the employment of a heating apparatus resembling in style and system the American stove commonly known as the base burner. These, as well as cooking stoves and ranges, are manufactured principally in Germany, and are in nearly every particular identical with the American product, which, I am informed, is rarely found on this market. There is a constantly increasing demand for the heating stove. It is not uncommon to see the base burner in the homes of the middle and lower classes, who have been attracted not only by its artistic construction, but also and mainly by its superior heating power and its great economy of fuel, an article which is scarce and dear here. It appears to me that this branch of trade ought to be entirely in the hands of American manufacturers. There is no reason why our stoves should not be placed upon this market at prices as reasonable as those coming from any other country.

Baldwin & Graham

of Pittsburgh and with a foundry at New Castle, Pa., have issued an attractive catalogue of something over 100 pages in which the Good Luck stoves and ranges are illustrated and described. The name Good Luck, which the manufacturers have adopted as a trade-mark, has been used by them and their predecessors for a number of years as a distinguishing name for some of their best soft coal ranges and cook stoves. A number of new modern and attractive patterns of stoves have been added to their already extensive assortment, and the dealer will be able to gather from an inspection of the catalogue a very good idea of the lines produced. The Margaret Good Luck, a six-hole range made with front or pouch feed, cut long centers, duplex grate, large ash pan, ventilated oven and adjustable oven rack, occupies the leading place. It is a new range of sheet flue construction, and is offered in four sizes and the usual modifications. The Florence Good Luck, another member of this class, is made for hard or soft coal or wood, and is offered either right or left hand, as may be desired. A very pretty soft coal range is the Model Good Luck, made extra large and heavy, and offered in four sizes. The Ella Good Luck is a four-hole range for soft coal or wood, although constructed more especially for using the former fuel. It is shown in several varieties in the catalogue, and is followed by the Good Luck four-hole cook stove, which embodies the latest features of construction and is ornamented in a tasteful manner. The Leader Good Luck, Welcome, Lincoln Good Luck, Rosalind Good Luck, Progress Good Luck, New Winsome Good Luck, the latter being intended for burning wood only, and the Macon City are some of the other goods to which attention is invited. The heaters are represented with the Good Luck square base burner in the place of honor. This is made in three sizes, and has round fire pot, vibrating anti clinker draw center grate and nickel trimmings. The Good Luck Oak, Sterling, the Times Cottage, the Frances Good Luck, the Good Luck Hustler, the Good Luck Franklin, the Gem Good Luck, Senator, Peerless and Alliance follow in the order named. Several pages are devoted to Good Luck gas stoves, portable ovens, hollow ware, stove trucks and a corrected list of stoves manufactured in Pittsburgh. The works of Baldwin & Graham were established by Thomas Mitchell in 1829, who was succeeded by Mitchell, Herron & Co., Mitchell, Stevenson & Co., Mitchell & Co. and Duncan & Baldwin. The works are complete in every particular and have a capacity of producing 30,000 stoves a year.

ODD PLATES.

JOHN D. OTTIWELL of Third avenue and Eighteenth street, New York, recently ordered among some repairs a grate and received a grate of the inverted basket pattern, which was represented as something entirely new. He found it to be exactly the same as the grate used in the Dr. Nott stove of 1836, recently illustrated in *The Metal Worker*, as he was familiar with that stove in the days of its popularity.

WE ARE INDEBTED to the Excelsior Mfg. Company, St. Louis, Mo., for a package of Charter Oak safety paper matches, upon the wrapper of which is the inscription, "No other stove or range is a match for the Charter Oak." We also have from the company a leaflet calling upon the recipient to prepare for the holidays by purchasing the Toy Charter Oak stove. This is said to be a lasting source of pleasure to the little ones, and is made in every detail just like the full size stove and with the same care.

THE WAIF-SAVING ASSOCIATION of America recently held an important meeting in the Hall of Washington at the Memorial Art Palace, Michigan avenue, Chicago, at which addresses were made and papers on the waif question presented. Among the latter was one by George H. Barbour of Detroit, discussing the subject of music as a factor in the training of boys. Mr. Barbour expressed great belief in the power of music not only for boys but for all humanity, and said that newsboys are more appreciative of music, when they are permitted to hear it, than the general public

A HANDSOMELY PRINTED FOLDER from De Haven & Co., Limited, Pittsburgh, Pa., illustrates and describes a new and richly treated open front Franklin stove which the makers are introducing to the trade. It is known as the Perfect Cinderella Franklin, and embodies a number of novel features, among which may be mentioned the arrangement of the blower. This works automatically in connection with the deflection or smoke plate, by which it can be raised or lowered, or placed at any point between, without effort on the part of the operator. The stove also has a draw center shaking basket grate, which is referred to as a novelty in stove construction and insuring a clean fire, as well as ease of cleaning the fire chamber. The patterns are ornamented according to the latest and most approved style, nickel and tile being judiciously combined to produce pleasing effects. The tile linings are made especially heavy to insure durability, and the makers state that the arrangement of the fire chamber is such as to give a maximum amount of heat from the fuel consumed. One style of stove is made with a heavy sheet iron back, fully protected by brick lining, making it, they state, fully as durable as an all cast iron stove, but which can be sold at a much lower price. Accompanying the folder is a tape measure 4 feet in length, carrying upon one side advertising matter concerning Cinderella stoves and ranges.

THE NORCROSS AUTOMATIC GOVERNOR for hot air furnaces is the subject of a circular which reaches us, bearing the names Norcross Regulator Company, C. C. Cobb, manager, 9 Murray street, New York. On one side of the circular is an illustration of a furnace provided with a Norcross automatic governor, while upon the other is a statement of some of the merits claimed for the device, together with the names and addresses of some of those who are using the governors mentioned.

L. E. AMBROSE has recently issued a notice to the effect that having perfected arrangements with the Twin Burner Stove Company of St. Louis, Mo., he will soon call upon the trade in their interests. He asks dealers to hold orders until he calls upon them with samples of the company's goods, special reference being made to the New Process hot generators and Juniors.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., are sending postal cards to the trade bearing the inquiry, "Are you in a hurry?" The inference is that if dealers are in a hurry they should send in their orders at once, as the company declare they have everything necessary in the way of stock and can ship orders promptly on receipt.

THE GOODS of the Bennett & Peck Heating and Ventilating Company of Cincinnati, Ohio, are meeting with a gratifying reception in various sections of the country, and furnaces are being installed in numerous buildings, both public and private. As being of interest in this connection it may be stated that C. C. McGann, a citizen of Guthrie, has decided to put one of the company's furnaces in his new house, while B. T. Davis of Huntington, W. Va., has se-

cured several heaters of the company's make for his opera house building, which is said to be the finest of its kind in the State. The Building Committee for the new Odd Fellows' Temple in Ripley, Ohio, have been investigating heating systems, and finally selected that of Messrs. Bennett & Peck.

The Rock Island Stove Company of Rock Island, Ill., are sending out to the trade a little pamphlet printed in colors and bearing the title "A Novel Race." The left hand pages are devoted to a story told in rhyme, while the facing pages are given up to illustrations of stoves and heaters. The story has to do with a dream in which a number of stoves ran a race for the prize, "Superiority," the first of the illustrations showing the stoves in line with the starter holding the flag and ready to give the word. Another picture shows the Riverside range made by the Rock Island Stove Company gradually drawing ahead, while the third illustration shows it so far in the lead that the others can be seen but dimly in the distance. The fourth picture represents the winner of the race and the Riverside Oak surrounded by spectators, who are bestowing floral offerings upon the successful jockey.

S. S. Jewett & Co., Buffalo, N. Y., are sending to their friends in the trade a letter in which attention is called to the repeal of the purchasing clause of the Sherman act, through which an immediate revival of business is anticipated and that dealers will now have no cause for hesitation in placing their orders. The company have on hand a full line of stoves and ranges with which to fill orders promptly and are running their works full capacity so as to be prepared to ship promptly anything which customers may demand.

The Michigan Stove Company are furnishing their customers with a set of half a dozen "catchy" door signs. They consist of heavy manila paper, printed in imitation of writing with a marking brush, calling attention to the line of Garland stoves and ranges carried inside. They present the exact appearance of the home made signs hastily gotten up by enterprising store keepers whenever they receive a fresh shipment of goods to which they wish to call special attention.

The Copp Brothers Company, Limited, Hamilton, Canada, have issued for the press a neat catalogue of something over 80 pages, illustrated with broken and general views of the line of furnaces with which they are prepared to supply the trade. A few general remarks with regard to heating and ventilation are first given, after which are suggestions concerning the location of a furnace, followed by hints to furnace men and other points of interest in this connection. After illustrating and describing Boynton's new gas tight furnace, the Torrid steel dome and radiator furnace, the Challenge furnace, the Copp wood furnace and Copp's Warrior furnace, tables are given showing prices and dimensions of hot air registers and capacity of pipes and registers. Fully half of the volume is taken up with testimonial letters from some of those who have used the company's heaters. The catalogue is attractively bound in red paper covers, and will likely prove interesting to dealers.

The Columbian gas stove is the subject of an illustrated circular which reaches us from W. R. Calkins & Brother, 752 East Long street, Columbus, Ohio. This stove, we understand, is the outcome of numerous experiments in gas heating appliances, and with it, the manufacturers claim, it is not only possible to get perfect combustion of fuel and a maximum amount of heat at a minimum expense, but also to obtain satisfactory ventilation. "While this stove allows all noxious by products of combustion to pass up the chimney, it is so constructed that it gives off absolutely all the heat generated by the combustion." The front is composed of fire proof asbestos fiber and the heated air and products of combustion after passing over this enter a hood and pass down around the outside of the sheet iron back and then up a flue in the center to the pipe which leads to the chimney. The manufacturers claim that this passing and repassing of the air over the radiating surface of the iron back allows the heat to be given off freely before the air escapes to the chimney. The stove is made in two sizes and finished in such a manner as to prove ornamental. After a room has become sufficiently heated the gas can be turned down as low as will maintain an even temperature.

The Barler Ideal oil stove was the object of no little attention on the part of visitors to the World's Columbian Exposition, and the Huette-Barler Mfg. Company of Chicago, Ill., who make the heater, sold large numbers, many of them being shipped to England, Germany, Australia, South America, India, Japan and Mexico. With the advent of cold weather they disposed of a number at the World's Fair grounds, among the more prominent being six Ideal oil stoves for the officers' quarters of the United States model battleship "Illinois;" one for each of the 34 tents of the United States Marine Camp; six for the Spanish caravels; two for the United States Naval Observatory; three for the chocolate pavilion of Walter Baker & Co.; three for the Administration Building; three for the Texas Building; three for the Hindoo jugglers in the Midway Plaisance; 17 for the World's Fair Steamship Company; two for the Irish Village; three for the chocolate pavilion of Walter Lawney & Co., and one each for the Viking ship, United States steamship "Michigan," the Norway Pavilion, Royal Siamese Commission, Spanish Building at the north end of the grounds, the Spanish headquarters in the Manufactures Building, the office in the Childrens' Building, the Kindergarten in the same structure, the Commissioner General de Colombia and Hagenbeck's Arena.

The Art Stove Company of Detroit, Mich., have had an exceedingly gratifying sale of their oil heaters in connection with the World's Fair, the goods disposed of being intended for nearly every section of the country. Foreign commissioners and representatives manifested a desire to secure samples of these heaters, some of the more important countries purchasing being as follows: India, including six separate portions of the Empire, took 14; South America, 21; France, 12; Germany, 10; Great Britain and Ireland, 12; Mexico and China, 6 each; Hayti, 5; Turkey and Japan, 4 each; Sweden, 3, and Hungary, Denmark, New South Wales and Russia, 2 each. The domestic demand was also large and among the sales were 20 for Michigan, 14 for New York, 10 each for California and Indiana, 7 each for Missouri and Ohio, 6 each for Rhode Island, New Hampshire, Delaware, Minnesota, Massachusetts, Colorado and Pennsylvania, and 4 for Nebraska. The company report collections and business much better than they had anticipated, and expect that 1894 will bring increased activity in all departments of trade.

The Northwestern Stove Repair Company of 227-235 West Twelfth street, Chicago, Ill., announce, under date of October 3, that by a recent decision of the United States Circuit Court of Appeals, they have the right to manufacture and sell all repairs for Round Oak stoves made by the P. D. Beckwith Company, Dowagiac, Mich. They also state that they carry a large stock and are in a position to promptly fill all orders.

The Michigan Stove Company have had prepared for the use of their customers a very handsome silver and black enamel plate as a "close the door" sign. It bears the legend: "Please close the door and use Garland stoves and ranges." It is an acceptable device for the season and will doubtless be found on many store doors in every section of the country this winter.

A rumor has obtained circulation that the Detroit Stove Works contemplate the removal of their plant to some locality in the vicinity of Chicago. The report goes so far as to designate the point selected for the new works. The officers of the company, however, spoil the whole story by emphatically stating that there is not a word of truth in it. Probably the fact that the company are erecting a new warehouse in Chicago has been distorted by some one into the removal of the works. They will have a fine warehouse when it is finished, and its location will be such as to provide greatly improved facilities for serving the Western trade.

A more than usual demand for repairs this year makes things lively at the Stove Manufacturers' Repair Association, at 235 Water street, New York. The experience of Manager Betts enables him to solve all complicated problems satisfactorily.

The Boston Furnace Company of 71-81 Blackstone street, Boston, Mass., will remove on December 1 of the present year to large and commodious quarters at 175 Hanover street.

The friends in the trade of George W. Robertson of Southard, Robertson & Co., are congratulating him upon his success in the election of Tuesday last. Mr. Robertson received more than 2000 majority as a candidate for Senator to the New York State Legislature.

The Fuller & Warren Warming & Ventilating Company have been awarded a World's Fair medal and diploma for their warming and syphon ventilation. This is a system used exclusively in schools and public buildings. It is not a mechanical system requiring the use of a fan. Instead of this, the Fuller & Warren method of heating and ventilating provides a positive, constant and noiseless suction causing an outflow of 100,000 cubic feet per hour from schoolrooms accommodating 50 pupils. The warm air enters near the ceiling and is gently and imperceptibly diffused throughout the room, maintaining the temperature steadily at the proper degree. The exhibit of the company was made in the Anthropological Building. The stoves and furnaces of the Fuller-Warren Company, exhibited in the Manufactures and Liberal Arts Building, were not entered for competition.

Slandering the World's Fair.

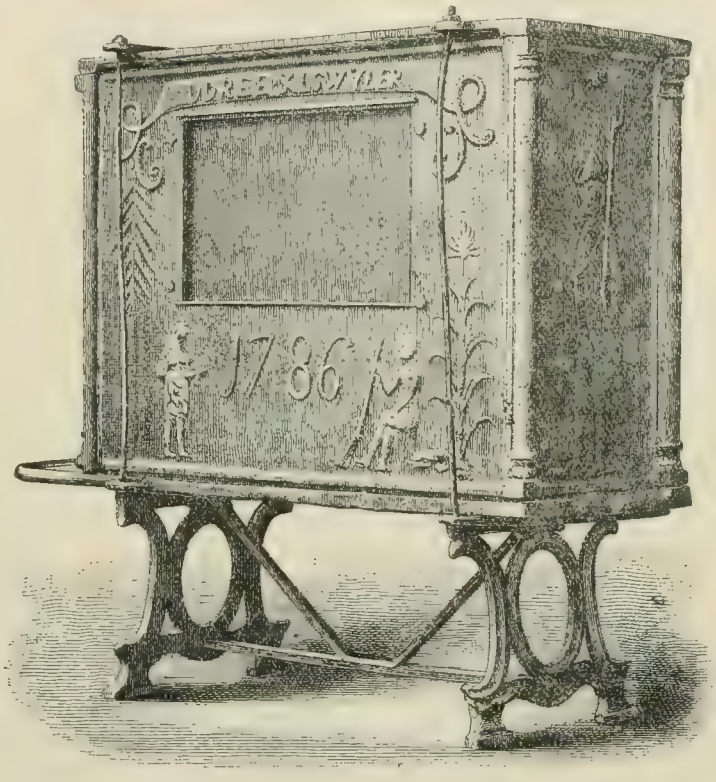
Ugly stories are in circulation regarding the management of the late World's Fair. It is asserted that exhibitors desiring liberal space were obliged to pay a good round price to somebody for the favor. The stories even go so far as to name the exhibitors and give the specific amounts which they were called on to pay. Further, it is alleged that the reason the stove manufacturers withdrew their exhibits from competition was that they realized among themselves that the awards would go to the highest bidder; in other words, that the man with the longest purse would get the most flattering diploma.

We have investigated these stories, so far as they relate to the stove trade, and are glad to say that we believe them to be utterly unfounded. So far as we have been able to learn, not a single penny has been paid by an American exhibitor for space of any size or kind. The space was allotted, as nearly as possible, according to the size and importance of the establishment proposing to exhibit. Those who exhibited say they were not asked to pay anything to anybody on this account. Some of them make the denial in very emphatic language, as an imputation on their fairness and business integrity as well as on the management of the exposition. Some of the foreign nations did charge for space. It was handed over to their commissioners for proper division, and a *pro rata* charge was imposed on those who exhibited for the purpose of defraying the expenses of the commission. In even such cases the exposition authorities received nothing, but the entire amount realized went to the foreign commission. It is possible that in some way this arrangement of the foreign exhibitors has been confused with the management of domestic exhibits. As rumors circulate it is astonishing how they assume definiteness and include names and amounts.

The charge that stove exhibitors withdrew their goods from competition because they knew or feared awards would go to the highest bidder is ridiculously absurd. In the first place, the withdrawal was made before the judges were appointed, and as they were the ones to make the awards, it is almost incredible that their probity should be attacked before knowing who they would be. We are assured that the possibility of venal judges had no bearing whatever on the case. The sole reason for the action taken was that several of the leading manufacturers thought that the premiums would not amount to anything except to stir up strife among their competitors, who should be their friends. A discussion of the matter with the other stove exhibitors developed a similar feeling among them, and the result was that a very large majority of them decided to withdraw their goods from competition. All the remaining exhibitors received prizes, but the distinction thus gained is deprived of its value by the very limited number of concerns left to compete. In no way, however, was there any reflection on the integrity of the exposition management or the judges.

A Curious Old Stove.

We have at different times in the past presented in these columns illustrations of old stoves as they have been brought to our notice, realizing that the members of the trade of the present day could not fail to be interested in constructions which were in vogue when stove making in this country, at least, was in its infancy. The illustration which is given in this connection is made from a photograph sent us by F. J. Allison of Statesville, N. C. He says that the stove was cast in 1786, and has been in possession or under the control of his family for over 75 years. It was hauled from Pennsylvania or Maryland soon after Mr. Allison's family settled in this country, and was first used in old Bethany Church, after which it was used in several school houses and later in the finishing shop at the tannery of Mr. Allison's father. It is still in active service in a finishing shop erected by Mr. Allison 12 or 15 years ago, and looks as if it were good for 100 years more. The stove shown in the engraving is 3 feet long, 2 feet high and about 18 inches wide. It weighs over 400 pounds and has in cast letters at the top of each side the manufacturer's name "Udree & Eswyler." At the left hand corner of each side is the raised figure standing under a hemlock tree of an Indian squaw with her pappoose, and extending her right hand toward a white man who, in the lower right hand corner, is seated on the stump of a tree. With one hand he holds the barrel of a musket, while the other rests upon his knee. Just behind him on the ground is his dog. Still further in the rear is a stalk of Indian corn. On the front end of the stove is an urn and on the rear end is the raised figure of a soldier in Continental uniform and carrying a musket. Mr. Allison is at a loss to know where the stove was cast, but is anxious to learn more particulars concerning its early history. If there are any of our readers who are in a position to furnish information concerning this particular stove we shall be very glad to have them write us in order that we may publish the matter not only for the interest it may have for the one who inquires, but also for the benefit of the trade at large.



A Curious Old Stove.

Boston Sheet Metal Workers' Strike.

A meeting of the furnace and stove dealers of Boston, whose tin and sheet iron workers have struck for a nine-hour work day, with a minimum rate of wages of $3 per day, was held Wednesday afternoon, when the situation was discussed at length. It was finally decided to offer the strikers the following proposition: That on and after the first Monday in January, 1894, nine hours shall constitute a day's work.

A crowded meeting of the strikers was held at 53 Hanover street Wednesday afternoon. The reports of the picket committees showed that the manufacturers had up to the present time been unable to fill the strikers' places. The strikers were unanimous in rejecting the proposition, and state that if the nine-hour day can be granted January 1 it could as easily have been granted November 1.

During the afternoon Business Agent J. T. Dolan had a long conference with one of the principal manufacturers, which resulted in the following proposition being made to his employees: "That 30 cents an hour be the minimum rate of wages, and that the employees be allowed to work either nine or ten hours, as they desire."

This proposition was not received with favor by the men. They claimed that if it was accepted it would be the cause of creating much dissatisfaction in the union.

TRADE REPORT.

The Iron Market.

The event of the week has been the confirmation through actual sales of reports current for some time past that a heavy cut in prices has been made in Steel Rails. The effect of the break in Rails is expected to be favorable to other branches. It is sure to lead to the placing of a far more liberal volume of orders for Rails, which will first clean up the accumulated supplies of Pig Iron at the Rail mills, and then will create a larger demand for Oreand Coke. It seems probable that the outcome will therefore be a strengthening of the markets of raw material as the first step toward a return to living rates for Iron and Steel.

The production of Pig Iron is on the increase again, the additions to the capacity at work in the Pittsburgh, Shenango, Wheeling and Mahoning districts being in response to a larger volume of business of the rolling mills and Steel works.

In the West, and to a limited extent in the East, the volume of orders is larger, but as yet the lowest prices reached are still the basis of business. Whether the Western mills will ease their pressure upon the Eastern markets soon remains to be seen. Until now they have not done so.

Pig Iron.—There has been no increase in the demand for Pig Iron in the New York and tributary markets. We quote: Northern brands $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

In Philadelphia the demand is a trifle better for some grades of Pig Iron, and larger lots have been taken, but prices are as low as ever, and give no promise of early improvement. The demand does not probably exceed 35 % to 40 % of what is usually expected at this season. The advance in freights will, it is believed, probably affect prices at some points, and in fact may involve a readjustment all the way through; but at the moment there is plenty of Iron at the lowest of all the low prices heretofore quoted, which for Philadelphia and equivalent points are about as follows:

No. 1 Foundry	$13 75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

At interior points, such as York, Harrisburg, &c., about 25¢ less is quoted on Virginia Irons.

Chicago advices report a perceptible improvement in the demand, which is especially noticeable in local Coke. Several contracts for round lots have been placed, indicating some revival in activity. The week has developed more inquiry, and business is particularly good in small orders for quick delivery, showing that consumers' stocks are light. It is believed that such stocks are smaller than ever before. The foundries that have been running for some time on their own Scrap or rejected Castings have about run out of that material, and are now obliged to come into the market for fresh supplies of Pig. A better movement is also observed in Lake Superior Charcoal Iron. The low sales made some time back are not being duplicated, but the furnace companies are getting better prices, and seem to have been able, at least, to get control of the value of their product. Sales of several round lots have been made at prices but a shade under $16. Quotations are now as follows for cash:

Lake Superior Charcoal	$16.00 @ $16.50
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 14.50
Southern Silvery, No. 2	@ 14.00
Southern Coke, No. 2	12.10 @ 12.35
Southern Coke, No. 3	11.35 @ 11.60
Southern, No. 1, Soft	12.10 @ 12.35
Southern, No. 2, Soft	11.35 @ 11.60
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.50 @ 18.75
Jackson County Silvery	16.50 @ 17.00
Other Ohio Silvery	15 00 @ 15.50

Pig Iron.—The increased activity among mills that have been in operation right along, together with the demand for Iron that will come from those that have started up within the past week or ten days, has resulted in more inquiries for Iron, and more sales were closed during the past week than in any one week for some time past. The expected increase in demand has resulted in the starting up of a number of furnaces that have been closed for extended periods. While it is somewhat doubtful as to whether it is the best policy to increase production to such an extent just now, at the same time it shows that there is considerable confidence in the future. Quotations are given as $12.50 @ $13, cash, for No. 1 Foundry; and $11.50 @ $12 for No. 2 Foundry on the same basis.

Southern markets show little, if any, improvement in any feature of the Pig Iron trade during the week. There is, it is true, more confidence in the financial situation, but as yet this has not enlarged the demand for Iron to any great extent. The demand for Foundry Iron is very light, and for Car Wheel Iron there is no demand at all. All demands have so far been freely met at previous prices and there are offerings at the same rates to the end of this year, which is as far as the furnaces are disposed to name prices, but it is not improbable that they would accept orders running two months into next year for foundry grades. One hopeful feature in the trade is that shipments of Pig Iron have in many instances been resumed on old contracts. Quotations are as follows:

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke No. 2	10.75 @ 11.00
Southern Coke No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke No. 1	15.00 @ 15.25
Lake Superior Coke No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—The market has recovered slightly from the depression more or less conspicuous last week. Prompt and current month deliveries now command 20.60¢ @ 20.65¢, with 20.70¢ for December, the offering being somewhat reserved. Comparatively few speculative transactions have been reported, and purchases by jobbers and consumers have been on decidedly conservative lines, hardly reaching the average of the season. Still the amount of stock in first hands continues to steadily diminish and the statistical position here is stronger to that extent. A partial offset exists in the fact that European stocks are being largely increased and that prices in the foreign markets are gradually receding to the parity of local market quotations. The visible supply in Europe and America is estimated at about 15,000 tons, or nearly the same as the quantity recorded for the corresponding period last year, including 3700 tons in America, exclusive of Pacific Coast, and 700 tons afloat. Prices for small lots are unchanged since last report.

Copper.—There have been additional purchases of fair sized lots of Lake Superior Ingot for prompt and near future delivery, chiefly by home consumers. At least 500,000 lb were involved. The prices ranged from 9¾¢ up to 10¢, according to delivery and other contract specifications. Meanwhile export movement on old contracts has continued liberal, while the output from the mines is still under more or less restraint, making in all a condition of affairs that serves to give the market greater tone of firmness for the time being at least. There is hardly any speculative inter-

est, and legitimate trade movement seems to be the foundation of the turn for the better that has taken place since the beginning of the month. Jobbers advise that inquiries have increased in number, with a fair proportion of ensuing sales, but usually for but moderate amounts. Stocks in consumers' and retailers' hands are thought to be very light, and the movement, consequently, represents little more than necessary purchases to fill immediate requirements. At the same time holders are not inclined to make contracts at current rates for deliveries more than a month ahead, as it is believed that prices have reached rock bottom, and that any movement will be an upward one. Quotations for small lots remain unchanged.

Sheet Copper. — The market for Sheet Copper has presented no striking features during the week, although the existence of a better feeling among consumers is deduced from the fairly large volume of inquires received from every section of the country. It is not, however, thought that these inquiries will materiailze into orders to any extent before the first of the year, after stocks have been taken and consumers and retailers have found out how they stand financially. Collections are reported to be more satisfactory. The price of small lots of Sheet Copper remains firm.

Pig Lead —Speculative interest in this metal has been on the wane, and consumers have purchased in a very indifferent manner. Sellers have offered in a manner indicative of some pressure to secure orders, and the supply on offer seems to be in excess of the outlet, prices being correspondingly easier. Some lines of common domestic were offered at 3 30¢ in round lots toward the close of the week, but buying interest was exceedingly languid. Jobbers report continued dullness in the consumptive demand, with small prospects of any material improvement in the immediate future. Prices for small lots of Pig remain nominally unchanged, but concessions on quoted rates are not hard to get when spot cash or other inducements are offered.

Lead Pipe and Sheet.—Dullness reigns in the Manufactured Lead trade. The suspension of building operations in the past season has largely contracted the demand for Plumbers' Materials, and it is not probable that any great revival of business can develop before next spring. No change has taken place in New York list prices.

Spelter.—Little if any change has taken place. The popular quotations are 3.60¢ @ 3.65¢ for ordinary Western brands, with an advance of about ¼¢ on small lots and the usual premium for special or fancy brands. Business has been slow here, individual transactions involving more than single carloads being the exception. The demand is exceedingly tame at this writing.

Tin Plates.—Fairly large orders have been placed for 100-lb Bessemer Steel Cokes, for March and April delivery, at about $4 90, landed here. This revived interest in futures is probably due in large measure to the fact that the recent run on these descriptions of Coke Plates has reduced the stocks of them in this country so largely as to threaten serious scarcity. Some interest has also been displayed in other varieties, and spot orders have been rather above the late average. The market is, however, uneven, and orders are mostly of a "peddling" character. There is, nevertheless, sufficient movement to keep prices quite steady for both prompt and future deliveries. Importations continue on a very conservative scale, and are fairly well absorbed; stocks throughout the country being extremely light. This is so much the case that, in the opinion of good judges, should an unexpected impetus be given to the demand for Tin Plates, dealers would be found to be in very poor shape for meeting it. Domestic Ternes, especially some favorite brands, meet with ready sale; and are in some cases hard to get promptly in response to orders.

Sheet Iron —The production of Galvanized Iron is creeping ahead of the demand, which has fallen off somewhat, though still fairly active. Jobbers report less difficulty in securing prompt filling of orders at the mills. The requirements of consumers of Black Iron appear to have been largely satisfied. The movement in this material is but moderate. Although prices are nominally firm, a shading of from 5¢ to 10¢ on quoted rates might be pretty essily obtained for spot cash and desirable orders as to size, time of delivery, &c.

THE COLUMBUS STOVE BOARD is the attractive novelty put out this year by John J. Sweeny & Co., 236 Water street, New York. The boards are furnished either wood or paper lined and crystallized or oxidized in finish, with a design printed in amber and black which includes a bust of Columbus, his flag ship, the American eagle and a circle of Cupids riding bicycles and flaunting the Star Spangled Banner. The design is calculated to warm a Yankee with enthusiasm when the fire in the stove has gone out.

THE COLUMBIA GRAY IRON COMPANY, Columbia, Pa., with New York office 35 Warren street, issue a catalogue and price-list of Hardware, Iron novelties, House Furnishing Specialties and Toys, in which they call attention to the increased line of goods the company are now making, also to the fact that in some instances the price-lists of their former line have been lessened. List prices and illustrations are given of Toy, Tack, Riveting and Upholstering Hammers, Toy Garden Tools, Banks, Hatchets, Hammers, Brackets, Can Openers, Clothes Line Hooks, Harness, Coat and Hat and Pivot Hooks, Drawer Pulls, Barrel Bolts, Latches, Match Safes, Flower Pot Brackets, Shutter Hinges, &c.

Chicago Report.

Scrap.—Trade in Old Material is steadily growing larger, but so much is offered that prices are weaker except for Old Rubber, which has again advanced. A good sale of Old Copper was made for export to Germany. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5 00	....
Cast Borings	3.25	....
Turnings	4 00	....
Horseshoes	8.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3⅛¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—The volume of business was not so large during the past week, but dealers look for another rush of orders after the next cold snap. Prices are very firm. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Grate.	Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8 85

THE ARMSTRONG MFG. COMPANY at 242 Canal street, New York, report a little spurt in business at the present time. Their recent novelties in Pipe Cutting Machinery attract considerable attention, while the Rapid Transit Pipe Wrench and Rapid Transit Pipe Cutter are both appreciated to the extent of numerous orders.

THE RICE & WHITACRE MFG COMPANY'S stock, machinery, tools, fixtures, patents, &c., are offered for sale by the receiver, F. B. Dyche, at 43 to 47 South Canal street, Chicago. Bids will be received up to 12 o'clock noon on the 20th inst.

THE P. H. & F. M. ROOTS COMPANY of Connersville, Ind, who have been makers of rotary blowers for 33 years, have recently established a branch office in Chicago at 501 Manhattan Buildin

CONDITION OF THE

Hardware Trade.

NOVEMBER opens with some indications of improvement, although the volume of business is not, on the whole, materially increased. A goodly number of small orders have been coming in to merchants' and manufacturers' representatives in this market, indicating something of a quickening in the demand and a disposition on the part of the trade, especially of the retail trade, to purchase a little more freely. The advance of the season, however, has its effect in restraining trade. As usual at this time of the year, there is more or less falling off in the volume of business. It is evident that stocks in the hands of retailers are unusually limited, the character of the orders showing that assortments are pretty well depleted. The policy which has been pursued for the past few months of limiting purchases to such goods as are absolutely required is still adhered to, and a very conservative spirit dominates the whole conduct of business. While the effect of this is to curtail trade for the present, it is unquestionable that this is the safest and wisest course, and tends to put business on a solid basis, averting serious disaster and laying the foundation for future prosperity.

Advices from Chicago.—No improvement is perceptible in the Shelf Hardware trade. Perhaps in a few departments there may be some little increase in the volume of business, but the aggregate shows a decline rather than an increase. If trade continues in this way during the month of November the volume of business will be considerably under that of October. The decline is not attributed so much to lack of demand, however, as to hesitation in extending credits. Jobbers state that opportunities are offered them to sell considerable quantities of goods to new customers or to parties whose financial standing is not of the best. The better class of merchants, whose credit is high, buy quite sparingly and are very conservative. The demand for Tin Plate and tinners' stock is much better than it has been, but the improvement is not enough to make merchants feel elated over the change. It is simply a movement in the right direction, which they welcome. Jobbers of Heavy Hardware are still in receipt of good business from consumers of Iron and Steel, like the Implement manufacturers, and also report a little better demand from out of town wagon builders. City trade is quiet.

Notes on Prices.

Wire Nails.—The Wire Nail market continues in substantially the same condition as last week. It is represented by the quotation of $1.20 to $1.25 for carload lots at mill, the former figure being obtainable on good orders. There has been a fair demand and most of the mills are well occupied.

Advices from Chicago. — Manufacturers of Wire Nails report business as keeping up about the same as it has been for the past week or two. They are quoting $1 32½ here for factory lots, but this is now the price for ordinary lots to which the general market has settled. Small lots from stock have receded to $1.45 on account of the lower prices from factory.

Cut Nails.—There is only a moderate inquiry for Cut Nails and the market does not show an increase of strength in price, quotations being on a basis of 95 cents to $1 for carload lots at mill. Concessions are made in special cases. The New York price for small lots from store is $1.20 to $1.25.

Advices from Chicago.—A better inquiry and more sales than the previous week is the report received from manufacturers of Cut Steel Nails. Low freights to the Southwest are having an important influence on their business at present. Some quite large lots are under negotiation. Prices are still quoted at $1.20 to $1.25, Chicago, for factory lots, while small lots from stock are unchanged at $1.30.

Barb Wire.—There are indications of a slight increase in the volume of business in Barb Wire, but trade is on the whole sluggish and unsatisfactory. Quotations continue on the basis of $2 15 for carload lots of Four-Point Galvanized at mill, but this price has been shaded. Manufacturers are solicitous to obtain orders and as a result quotations are somewhat uneven.

Advices from Chicago.—The Barb Wire trade has picked up to some extent, although the demand is considerably less than manufacturers would like to experience at this time of the year. A better outlook is now offered for trade with the Southwest, owing to the low freight rates. This is having its effect on trade, as it comes in addition to the better impulse in the West and Northwest. Prices continue as before on a basis of $2.40, Chicago, for Galvanized in carload lots, and $2.55 for small lots from stock. The demand for Plain Wire has increased rapidly within the past two weeks. Manufacturing establishments consuming Wire have started up quite generally, and some of them are running to their usual capacity in ordinary times. The manufacturers of Mattresses are particularly prominent in this better condition of business, but the implement makers and others who consume Wire to considerable extent are also more inclined to buy than for several months, and are placing good contracts with the manufacturers.

Brace Bit Gauge.—The Wilks & Whitus Brace Bit Gauge, for which T. G. Ellsworth, 85 Chambers street, New York, is agent, is sold to the trade at $9 per dozen net.

Sheet Zinc.—Under date November 3, Matthiessen & Hegeler Zinc Company, La Salle, Ill., issue a revised price-list and discount sheet of Sheet Zinc, quoting the advanced price of $4.50 per 100 pounds in 600-pound casks of the thicknesses between Nos. 9 and 15, inclusive, and of the widths between 32 and 46 inches and of the lengths between 84 and 90 inches. They also announce the following revised extras in cents per 100 pounds:

Extras in Cents per 100 Pounds.

Nos.	5	6	7	8	9	10	11	12	13	14	15
32 to 40 x 84	75	45	30	10	.....	.....	.....	.....	.....	.....	.....

24 x 84	150	110	85	20	15	05	05	05	05	05	05

The extra on No. 4 36 x 84 is $1.35 per hundred pounds.

The following are the charges for small lots:

In casks of 100 pounds (all Nos. up to and including No. 12), 30 cents extra per 100 pounds.

In boxes of 100 pounds (not larger than 30 x 40 inches), 30 cents extra per 100 pounds.

In 200 and 300 pound casks (all Nos. up to and including No. 14), 20 cents extra per 100 pounds.

In 200 and 300 pound boxes (not larger than 36 x 50 inches), 20 cents extra per 100 pounds.

The discounts announced are as follows:

Discounts.	First class. 15 600-pound casks and upward.	Second class. 10 to 14 600-pound casks.	Third class. 5 to 9 600-pound casks.	Fourth class Under 5 600-pound casks.
	Per cent.	Per cent.	Per cent.	Per cent.
Special	0	0	0	0
Cash with order	3	3	3	3
Quantity	3	2	1	0
Total	6	5	4	3

It is stated that all discounts are computed straight when money accompanies the order and the quantity discount is added to the special discount in all cases. The prices thus announced are subject to change without notice.

Old Metals.—The demand for Old Metals is extremely light, low prices being, seemingly, no inducement to purchasers to lay in more material than they absolutely need. Prices in the New York market are nominally unchanged at the quotations given below, but these depend largely upon the conditions of sale, quantity, terms of settlement, &c. The following fairly represent those now ruling:

Heavy Copper	℔ 6¾¢
Light and Tinned Copper	℔ 6¼¢
Heavy Brass	℔ 5¼¢
Light Brass	℔ 4⅛¢
Lead	℔ 3¢
Tea Lead	℔ 2½¢
Zinc	℔ 2½¢
No. 1 Pewter	℔ 14¢
No. 2 Pewter	℔ 6¢
Wrought Scrap Iron....℔ gross ton	$9.00 @ $10.00
Heavy Cast Scrap....℔ gross ton	9.00 @ 10.00
Stove Plate Scrap....℔ gross ton	.... @ 5.60
Burnt Iron (delivered at mill) ℔ gross ton	.... @ 4.00

Old Rags, Paper, &c.—No quotable improvement has developed in the market for these materials, which remains dull at unchanged prices. Quotations for New York delivery are as follows:

No. 1 White Rags	℔ 3¼ @ 3½
No. 2 White Rags	℔ 2¼ @ 2½¢
Mixed Rags	℔ ¾¢
Blues and 3ds	℔ 1 @ 1¼¢
Hard Sized White Shavings	℔ 2¼ @ 2½¢
No. 1 White Book Shavings	℔ 2 @ 2¼¢
No. 2 White Book Shavings	℔ 1 @ 1⅝¢
Light Book Shavings	℔ ¾¢
No. 1 Mixed Shavings	℔ ¾ @ 1 ¢
No. 2 Mixed Shavings	℔ ½ @ ¾¢
No. 1 Printed Books	℔ 1 @ 1¼¢
Ordinary Mixed Books	℔ ½ @ ¾¢
Newspapers	℔ 3-5¢
No. 1 Manila Paper	℔ ⅞ @ 1 ¢
No. 2 Manila Paper	℔ ⅝ @ ¾¢
Bogus Paper	℔ ½¢
Common Paper	℔ ⅜ @ ½¢
Straw Chips	℔ ½ @ ⅝¢
Binders' Clippings	℔ ½ @ ⅝¢
Jute Butts	℔ 1½ @ 1¾¢
No. 1 Jute Bagging	℔ 1 @ 1¼¢

No. 2 Bagging	℔ ½ @ ¾¢
Hemp Twine	℔ 2¼¢
Manila Rope	℔ 2½¢
Jute Rope	℔ 1½ @ 1¾¢
Mixed Rope	℔ ¾ @ ⅞¢

Old Rubber.—Market dull and prices weak and low, being about as follows:

Car Springs, ton lots, ℔ lb.	@ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb..	@ .03
Rubber shoes, less than carloads, ℔ lb	0.02¼ @ .03⅛
Large Hose, ℔ ton	@ 9.00
White Wringer Rolls, ℔ lb.	@ .04¼
White Syringes, ℔ lb	@ .05

THE MANAGERSHIP of the Chicago branch of the Lalance & Grosjean Mfg. Company of New York, rendered vacant by the lamented death of Julien P. Cordier, has been filled by the appointment to that position of Charles W. Hyde. Mr. Hyde, who is widely known and esteemed in the hardware and house furnishing trades, has been connected with the Lalance & Grosjean Company for several years, having represented their interests for a considerable period in the Southern States and recently in the territory lying between New York and Chicago.

Factories for the manufacture of tinware show a considerable increase, both in number and volume of production, by last reports from Victoria, Australia.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

B. H. KELLY of Birmingham, Conn., is putting in a hot water heating apparatus in the conservatory at the St. Mary's Parochial residence.

S. J. MARSHALL of Kearny, N. J., has been awarded the contract for $625 for furnishing a steam heating plant for the church and Sunday school building of Christ Church at that place.

T. F. MCCORMICK is the proprietor of a plumbing establishment just opened at 6 Mill street, Newport, R. I. For many years he was in the employ of Joseph Haire of the same city.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, are to furnish a horizontal tubular boiler and necessary radiation for steam heating in the Speer apartment building, Joliet, Ill.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, have been awarded the contract for steam heating in the North Side Masonic Temple, North Clark street. A horizontal tubular boiler and American radiators will be used.

GEORGE R. ESTABROOK, Springfield, Mass., has recently been awarded the contracts for heating the following buildings, using two Richmond Sectionals and five Victors: First Congregational Church and Chapel, Holyoke; Asbury M. E. Church and parsonage, and Christ Church rectory of Springfield; parochial residence of Rev. J. J. O'Keefe, Merrick, and parochial residence of Rev. F. F. Fallon, Hunting ton, all in Massachusetts.

PHILLIPS, DOUP & CO., Brooklyn, are using a Novelty Circulator to replace an old apparatus that was used in connection with an indirect stack in a large flue, from which an entire building was heated.

J. F. MULVEY, Woonsocket, R I., has been awarded the contract for heating the Hotel Clarendon, at Millville, Mass., using an Eleven Section Richmond for the purpose.

THE HANNIBAL PLUMBING COMPANY, Hannibal, Mo., have been awarded the contract for furnishing the gas fixtures for the new Baptist Church Building at Hannibal, Mo.

THE TRUSTEES of the Hubbard Free Library have contracted with A. D. Ward, Augusta, Maine, to equip the building with a heating system, and have selected the Capitol hot water heater sold by Gilchrist & Taylor of Boston.

TAYLOR & TAYLOR of Meriden, Conn., have recently completed a job of hot water heating in the residence of E. E. Spencer. They used a Victor boiler. The radiators were finished in crimson, orange and gold to harmonize with their surroundings.

THE PORTER HEATING COMPANY of Minneapolis, Minn., have the contract for placing a steam heating plant in the Court House at Cookston, Minn.

THE MARCH-BROWNBACK STOVE COMPANY of Pottstown, Pa., report that their Crown steam boilers have been selected for heating the Reformed Church at Macungie, Pa., the residences of Levi Fritch, Metztown, Pa., Freeman Borneman, Bechtelsville Pa., and dealers Charles Bieler, Pen Argyle, Pa., and McCommon & Smith, Oxford, Pa., are using them in their own residences.

J. FRANK BOYER, Norristown, Pa., has the contracts for heating the residences of the following persons: Patrick Curren and Martin Hunsberger, Norristown; Clarence V. Gardner and Mr. Haywood, Cynwyd, Montgomery County, Pa. Also Dr. D. Z. Hillegass, Mantua, N. J. The Boyer, Mercer and O. K. boilers will be used on the above work.

AN ORDER has been placed with W. H. Mackay, manager of the steam and hot water heating department at New York of Hart & Crouse, Utica, N. Y., for Royal steam boilers to be used in heating ten greenhouses at Long Island City, N. Y. Two Royal hot water heaters will be used in the new church and the priest's residence of the Redemptorist Fathers at Fifth avenue and Fifty-ninth street, Brooklyn, N. Y.

GEO. B. COBB & CO., 42 Duane street, New York, are installing a steam heating plant at Brown's Opera House, at Stamford, Conn. The Florida boiler is used, and both direct and indirect radiation are employed.

It Is Reported—

That D. G. Warfield's Hardware store, at Oakdale, Cal., was destroyed by fire on the 20th ult.

That Wm. H. Lamb recently purchased the Hardware store of E. H. Robinson, at Santa Cruz, Cal. Mr. Lamb originally hailed from Syracuse, N. Y., but for ten years he was engaged in business in South Dakota.

That there is an opening for a Hardware store at Avoca, Mich.

That J. N. Smith has sold out his stock of Hardware at Denmark, Maine, and will retire to his farm.

That H. B. Dowse, West Concord, Vt., has sold out his Tin business to R. S. Brigham.

That O. Bennion of Strykersville, N. Y., has sold his Hardware business to a new firm, under the style of Griggs, Dellinger & Ellis.

That on the 27th ult. the Hardware store and tin shop of W. G. Keith, at Brookfield, Mass., was destroyed by fire. Loss, $12,000; insurance, $6500.

That the Mead Hardware Company's store, at Swanton, Vt., was burglarized on the 21st ult., and $25 worth of goods taken.

That the Elkins Furniture & Hardware Company have been incorporated. The concern are located at Elkins, W. Va., and their stockholders are J. S. Posten, N. G. Keim, W. M. Petingale, W. B. Vana and W. G. Wilson, all of Elkins.

That the Hardware store of A. P. Boswell & Co., Coffeyville, Kan., was entered by burglars on the 31st ult., and $163 in cash, negotiable notes to the value of $5000 and certificates of deposit amounting to over $13,000 were secured. Several Revolvers and Razors were added to the booty. Mr. Boswell is the Mayor of Coffeyville.

That the Hardware store of M. J. Wilson, Penn Yan, N. Y., was entered by burglars on the 30th ult., and a large amount of Cutlery stolen,

That the new Hardware store of John Nuessle, Hamburg, N. Y., is nearly completed.

That F. C. Buell of Earlville, N. Y., and L. W. Farr of Massena, N. Y., have bought out the Hardware business of Tillotson Bros. of Earlville.

That John J. Cardwell, a Hardware merchant of Nebraska City, Neb., was married on the 24th ult. to Miss Bertha McNamar of Hiawatha. The ceremony took place at the latter point.

That the Hardware stores of Charles Halbach & Son and Foxwell & Moyle, Waterford, Wis., were robbed on the 26th ult.

That J. H. Strong has purchased at mortgage sale the Hardware stock of Mr. Woodworth, Onondaga, Mich.

That the W. H. Bartel Hardware business, at South Bend, Wash., has been disposed of to T. R. Brayton of Omaha, Neb., who took possession on October 16.

That E. H. Holmes & Co., Willimantic, Conn., will close out their stock of Stoves, Glassware, Crockery, &c. They will, however, continue the business of plumbing and house heating.

That S. S. Surdam of Oyster Bay, L. I., has removed to Hunt's Corners, Cortland County, N. Y., where he has purchased and will conduct a Hard ware store. Mr. Surdam is well known on Long Island, having served two years as school commissioner of the first district, and as such fulfilled his duties to the satisfaction of all.

That Samuel and Edward Junk have bought a two-thirds interest in the Graham Hardware Company, Rio, Ill.

Price-Lists, Circulars, &c.

HENRY B. NEWHALL COMPANY, 105 Chambers street, New York: Supplement No. 1 to catalogue of 1892, covering Coburn's Track and Hangers. The supplement illustrates and describes, with prices, Parlor Door, Barn Door, Car Door, Fire Door and Elevator Door Hangers; Store Ladder Service, Overhead Carrying Track and Automatic Fire Shutter system. Store Ladder Service is given special attention, two styles of Ladders being shown. Coburn's patent Ladders or Steps have rollers at top and bottom, with a track at the top only, and stand across the aisle. Ladders facing shelves are shown for use where there is lack of space between the counter and ledge.

WITHINGTON & COOLEY MFG. COMPANY, Jackson, Mich.: Farm and Garden Tools. Their 1894 catalogue is bound in handsomely embossed paper covers, and contains illustrations, descriptions and prices of their line of goods. The company remark that it is their aim to improve the grades of their goods where possible, and that they exercise a constant vigilance over material, workmanship and design, that there may be no deterioration in the quality of their products.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

A first-class TINSMITH; must understand all kinds of roofing and guttering, also bench and furnace work; competent to do all kinds of repairs; steady work and good wages to right man. T. W. Dorsett, 1113 Clinton street, Hoboken, N. J. Nov. 11

A TIN and SHEET IRON WORKER, first-class in every branch, wants a steady job; sober, reliable and a hustler; will consider a good offer from anywhere; have had long and varied experience. "Tinsmith," 60 High street, Taunton, Mass. Nov. 11

By a special JOBBING WORKER at inside and outside work; heaters, furnaces, &c. Jos. Frank, 102 Delancey street, New York City. Nov. 11

In stove works, as WOOD PATTERN MAKER; have had 20 years' experience in that capacity; can make own drawings; understand making composition for ornaments; also can do turning. J. T. Tryon, 10 Broadway, Troy, N. Y. Nov. 11

By a TIN and SHEET IRON WORKER and GENERAL JOBBER; 38 years of age; position desired in the South. Forest Holb, Box 51, Maynard, Mass. Nov. 11

AGENCY wanted on commission for Milwaukee, a good selling line of hardware or specialties, advertiser having a good trade with retail hardware and department stores. 548 Fifteenth street, Milwaukee, Wis. Nov. 11

By an experienced traveling man, traveling in Pennsylvania, Ohio, Indiana, Michigan and Illinois, a good line to sell on commission to general hardware and stove dealers. "A. B. C., No. 114," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

By a PLUMBER and GAS FITTER, who can also do a good job at steam and hot water fitting. "Plumber," 45 Warner street, Gloucester, Mass. Nov. 4

BOOKKEEPER, thoroughly competent young man, desires position with wholesale house. "S.," Room 9, third floor, 104 West Fourth street, Williamsport, Pa. Nov. 4

By a METAL PATTERN MAKER of 20 years' experience in locks, builders' and general hardware, iron toys and novelties; competent to take charge of pattern room. "A. H. L.," 315 State street, Bridgeport, Conn. Nov. 4

As PLUMBER and STEAM, GAS and HOT WATER FITTER; 11 years' experience; can also do good tin work; situation preferred in Southern California, Mexico or the Southern States. "M. E. M.," Box 83, Unionville, N. Y. Nov. 4

By a japanner, as FOREMAN with some first-class house in the West; understands all branches of japan business on tin, iron, wood and soft metals with one coat, also all kinds of lacquers and shades to stand the press, and all shades of colors in rubber for lithographing plates to stand the press. "Japanner," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

As FOREMAN in manufactory making hardware specialties, by man with six years' experience in charge of the manufacture of freezers, toys, fruit presses, tin work, &c.; best of reference. "Edwards," Box 195, Little Valley, N. Y. Nov. 4

TINSMITH, married, wants permanent job; 20 years' experience in tin, copper, brass and sheet iron; stoves, furnaces, roofing and general jobbing; country preferred. "Tinsmith," 338 Twenty-second street, Brooklyn, N. Y. Nov. 4

A steady job by a PLUMBER who can do steam and gas fitting and estimate on plans; A1 reference. P. O. Box 1195, Morristown, N. J. Nov. 4

A young TINNER of three years' experience in hardware, stove and tin store and shop wants steady job as general man; have worked on tinware, roofing and spouting; best of habits and reference. "J. H. B," care of T. J. Reece & Co., Walkerton, Ind. Nov. 4

At once, by a strictly sober and reliable young man as an all around TIN and SHEET IRON WORKER; 11 years' experience at the business; both inside and outside work; also furnace work; a first-class slate roofer and general jobber. "L.," 27 West Holiday street, Newark, Ohio. Nov. 4

By a first-class PLUMBER; one who is a good tinsmith; have had charge of shop, sober and steady; good reference. "Plumber," 40 Clark street, Burlington, Vt. Nov. 4

By a young Englishman who has had four years' experience at plumbing and some knowledge of tin roofing; position desired where he could be under instruction for a year or two. "W. M.," 324 Goodwin street, Paterson, N. J. Nov. 4

By a WOOD PATTERN MAKER and CARVER in stove works; competent to make drawings; good reference given. "Pattern Maker," 685½ Mineral street, Milwaukee, Wis. Nov. 4

By a first-class TINNER; experienced on assortment, jobbing, roofing, guttering and furnace work; 25 years' experience. John Corbett, Paxton, Ill. Nov. 4

By a first-class TINSMITH, in the city or country; single. "K.," care of John Klein, 616 Fulton street, Elizabeth, N. J. Nov. 4

FOUNDRY FOREMAN of long experience desires a position where ability and faithful services will be appreciated; good record; distance no object. "Good Record," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

On or off the road, by a thoroughly experienced stove, range, tinware and house furnishing goods SALESMAN; 12 years' experience; good reference from former employers. J. B. Smith, care of Bridgeford & Co., Louisville, Ky. Oct. 28

By a first-class stove PATTERN MAKER who can do any fine pattern work; also fine designing; can take work home if necessary. O. A. Jensen, 779 South Washtenaw avenue, Chicago, Ill. Oct. 28

As TINNER or HARDWARE CLERK; can do anything in the tinware line; strictly temperate and steady. P. O. Box 134, Akron, Ohio. Oct. 28

As PLUMBER, by young man, a graduate of the New York Trade School; has worked at trade one year; a good lead worker; best of references. "Plumber," Box 39, Moundsville, W. Va. Oct. 28

A middle-aged man would like a position as FOREMAN of stove foundry; I have had 20 years' experience as foreman, having handled from 50 to 100 men to good advantage; can furnish the very best references; will work for very reasonable salary. Jno. Ziegler, 139 Brown street, Dayton, Ohio. Oct. 28

By a TINSMITH and GENERAL JOBBER; good hand on roofing, ranges and furnaces; some knowledge of plumbing; city or country. "Tinsmith, care Mrs. Glener, 223 Christie street, New York. Oct. 28

To represent a factory or first-class jobbing house on the road in the West, by a thoroughly experienced nail, iron, steel, carriage and heavy hardware SALESMAN with over ten years' experience; wide acquaintance with factories and dealers from Mississippi River to Pacific Coast; unexceptional references; age 34. "W. S. B.," 76 Archer street, Denver, Col. Oct. 28

As TINSMITH and ROOFER. Herman Landasburg, 292 Delancey street, New York. Oct. 28

By a TINNER and CORNICE MAKER who can do general jobbing; some knowledge of plumbing. John J. Glass, Evansville, Ind. Oct. 28

By a METAL PATTERN MAKER who has worked in the best pattern shops in the country; can file and fit and do any kind of pattern work; an honest worker. J. M. Devore, 11 Delevan street, Auburn, N. Y. Oct. 28

By a first class SPINNER and IRON WORKER; 22 years' experience; can do wiring, beading and trimming. Charles Seider, 263 Floyd street, Brooklyn, N. Y. Oct. 28

By a WOOD and METAL PATTERN MAKER who is also a first-class wood turner and molder; can run almost any machine; generally handy. Madison Vorce, 15 Wood street, Auburn, N. Y. Oct. 28

As all around TINNER; have had 15 years' experience; can do all kinds of tin work inside and out of shop; am married man, sober and industrious; can come well recommended. H P. Powers, Auburn, Ind. Oct. 28

As PLATER in general job shop or bicycle factory, by a man of 14 years' experience in polishing and plating departments; understands making and keeping silver, nickel and copper solutions, also brass and silver oxidizing; can furnish best of references. H. L. Church, 159 West Washington street, Indianapolis, Ind. Oct.

THE METAL WORKER.

NEW YORK AND CHICAGO.

Air Supply in Hot Blast Heating.

The most equable distribution of air and the greatest uniformity in the temperature of a building heated by the blower system certainly results from the introduction of large volumes of air at moderate temperature. But it is possible to do a thing almost too well, when results are to be compared with expenditures. In the ordinary factory, with large cubic space per operative, the air volume supplied per head frequently exceeds the provision called for in the best ventilated school house. In fact, 30 and even 50 cubic feet per minute per occupant is not at all unusual for air supply in manufactories where the work is large and the workmen separated. Now every bit of the air thus supplied at the proper temperature to maintain the warmth of the room must, under the best conditions of ventilation, be discharged through vent flues or escape through cracks, crevices and the porous walls, at the temperature of the room itself. There has thus been thrown away, so far as heating alone is concerned, as much coal as was necessary to raise the temperature of this volume of air from that outside to that inside the building. Whatever temperature the admitted air possessed over that of the room has gone toward supplying the losses by radiation and conduction through walls and windows.

A Possible Economy.

Ordinary practice in factory heating by the blower system in the northern portion of this country demands that approximately one-half of the heat added to the air must be lost by radiation and conduction, while the remainder escapes from the building with the air; or, in other words, about one-half the expense of heating could be avoided if there were no loss of air from the building. And further, the smaller the volume and the higher the temperature of the air admitted the less the cost of maintaining the required temperature within the room. To this end—when the construction of the building will permit—the supply of air may be taken from within the building and the air turned over and over. Not that all leakage or loss of air through walls will thereby be avoided, but the amount will be vastly decreased. This is not to be understood as in the least favoring the reduction of the air supply below that required for proper ventilation, but to point out in what direction economy lies, and to show that in many cases thorough ventilation can be secured with a smaller supply of fresh air than is now provided.

The Lyons Exhibition.

The main building for the international exhibition to be held next year at Lyons, France, will be a remarkable structure. From a description given in *Le Génie Civil* it appears that the building will consist of two practically distinct parts, a central dome like structure and a circular gallery running entirely round it. The dome will be 361 feet in diameter and formed by 16 parabolic half arches. These will be hinged at the bottom and each connected at the top to a circular crown. Each arch will act independently of the others. The roofs of the surrounding gallery will be carried by a peculiar form of a cantilever truss. The total weight of each main arch is stated to be 30.8 tons, and each roof truss of the galleries weighs 44 tons. The total weight of the iron work in the building will be about 2500 tons, and the area covered 9.4 acres, a trifle more than the annex to the Transportation Building at the Columbian Exposition.

A Trade School for Boston.

The decision of the trustees of the fund left by Benjamin Franklin to the City of Boston, over 100 years ago, to devote the entire sum to the erection and establishment of a trade school in that city is a matter for congratulation. The money was bequeathed by the distinguished testator to be applied to "the encouragement of young mechanics." The trustees have thus acted wisely in voting its appropriation to the purposes of a trade school, which shall bear the honored name of Franklin, as being the object best calculated to carry out the presumed wishes and intentions of that great man. The announcement is made that the school will be entirely independent of the public schools of the city, which is also a wise decision. As we have constantly maintained, the extension of the trade school movement in the larger centers of population in the United States is a great and growing necessity. No object is more worthy of the support and encouragement of those interested in the welfare and progress of American youths and in the elevation of the manual trades than the widespread adoption of such means of trade training and instruction.

Success of Trade Schools.

Wherever the trade or manual training school has been tried—provided its organization and conduct have been intrusted to the hands of capable and intelligent persons—it has been an unqualified success. Its advantages have been quickly appreciated by the class for whose benefit it has been designed; and employers of labor, many of whom were at first inclined to throw cold water on the idea, are daily becoming more and more awake to the fact that these institutions are a source from which they can draw their best supply of thoroughly prepared help. The successful careers of so many graduates from the trade schools of New York. Philadelphia and Brooklyn are the best advertisements those institutions can desire. These men act as missionaries in the different parts of the continent in which their lots are cast, and by their testimony to the benefits they have obtained are arousing an interest in the subject of better trade training in many quarters which will, doubtless, develop in time into action. So it has been in Boston, where the success of the New York and Pratt Institute trade schools has admittedly stimulated the Franklin trustees to devote their trust funds to a similar purpose. As the fund amounts to nearly half a million dollars the trustees will be able to start the new school under exceptionally favorable conditions.

An engineering feat worthy of note was accomplished a few days ago in the completion of the boring of the Busk-Ivanhoe Railway Tunnel under the Rocky Mountains, at Hagerman Pass, Col. The tunnel is close upon 2 miles long, and is bored through solid gray granite. Its accomplishment involved 3 years and 20 days' work, each day being of 20 laboring hours. The tunnel is 10,800 feet above sea level, and is on the line of the Colorado Midland Railway.

Telegraphic communication in Persia is said to work fairly well in dry weather, but in times of rain and damp it is unfortunately far otherwise. This arises from the fact that the insulators are not fixed to poles of wood or iron as with us, but are driven into trees that have branches growing round the hooks and touch the wire, thus intercepting the current. When a large tree is not available a small one is resorted to, which often breaks, or the shaking of the slender tree by the wind dislodges the insulator or hook on which it is fixed, and the wire trails on the ground.

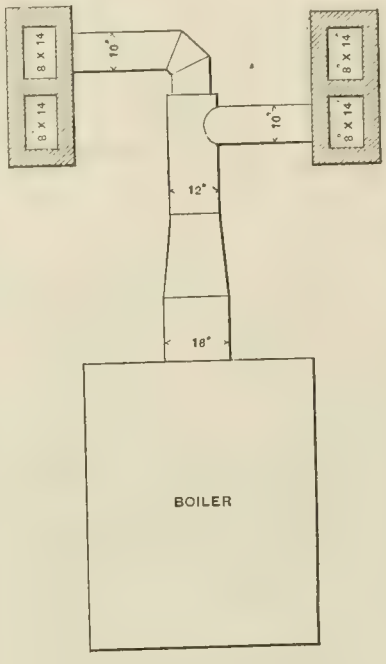
THE LETTER BOX.

Cold Air from Hall.

From L. M. W., *Delaware, Ohio.*—One of the greatest advantages of a furnace for heating a house is the continual discharge of fresh air into the rooms when it is supplied from a proper source, but a source that uses the same air continually is to be condemned. Taking air from a hall that has doors opening into it from all the rooms down to the furnace and heating it, then sending it back through the rooms to the hall, effects good circulation, and will enable the house to be more easily heated than if a continual supply of new cold air had to be heated and some air already warm was forced out of the house and its heat lost. It would be a great mistake to depend on such an air supply to the furnace and to rely on the cracks and crevices around the doors and windows to do the freshening. Under such conditions the air would soon become stale, if it did not become disagreeably foul. The question of air supply for furnaces has made many a furnaceman trouble from the fact that a box from out of doors fails to supply air as often as it supplies too much, and these failures produce so much discomfort that the comfort derived when the supply is just right is used as a standard in criticism. A better way is to set in a room by itself all of the furnace except the front, which would leave the feed door and the ash pit where any dirt or dust made in attending the fire could not get into the air supply room. This could be effected by some ingenious sheet iron and carpenter work. In order that the floor of the room over this air supply room should not be cold, a box of ample size should be attached to the window from which the air was supplied and run down to a point 12 or 15 inches above the floor. This would leave the upper part of the room largely unaffected by the cold air in the lower part. Such a room would prevent the forcing of air so rapidly through the furnace, and would also modify its temperature somewhat before it entered the furnace. Then again, when the wind was in the opposite direction from the supply window there would be little liability of air being drawn from the house through the furnace and out of doors. If desired the hall could be connected with such a room, and, by dampers in the supply pipes, air could be taken from either the hall or out of doors, as preferred, though it is hardly probable that it would ever be taken from the hall. The supply of air from a box of such construction, without the room being built, would be more satisfactory than from a box connected directly with the furnace if care was taken to prevent dust arising when feeding the fire or removing the ashes.

Two Chimneys for One Boiler.

From F. L. W., *Plankinton, S. D.*—I have connected a water tube boiler with two chimneys having 8 x 14 inch flues. As the ceiling of basement is low, the smoke pipe could not be taken from top of boiler, therefore the pipe was taken from the end and into the two chimneys, as in Fig. 1. The collar on boiler is 16 inch, and the pipe is reduced to 12 inch, from which the two 10-inch pipes are taken as shown. With this arrangement of pipes the draft is defective, as the fire smolders, and if the feed door is opened smoke comes out. I have tried the experiment of using only one smoke pipe, but the draft is not as good as with two. The chimneys are perfectly straight and at least 50 feet high. They are in a schoolhouse and there are no other buildings near. The chimneys are built double from top to bottom, one side of each being used for a ventilating flue, but there is no opening between ventilating and smoke flues. Could the ventilating flues injure the draft of smoke flues on account of being so near? I have thought of taking the smoke pipe directly up from boiler, through floor, into hall for about 10 feet and into chimney, Would this change help the draft?



Two Chimneys for One Boiler.—Fig. 1.—Original Arrangement.

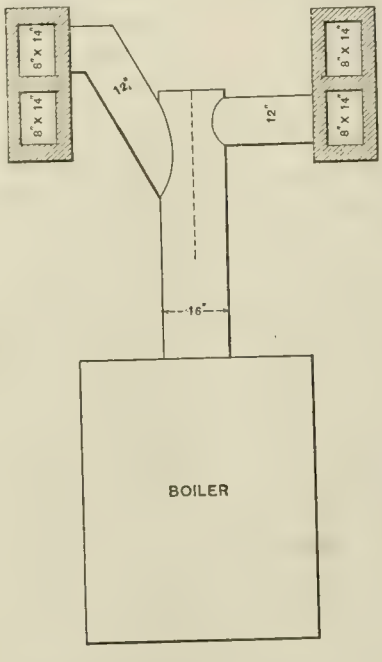


Fig. 2.—Suggested Changes.

Answer—The ventilating flues do not injure the draft of smoke flues on account of being in the same chimney, as the air from the schoolrooms would be warmer than the outer air when the boiler was in use. It is not recommended that the smoke pipe be taken through the hall, as the pipe, being of greater length, would radiate more heat and thus injure the draft by reducing the temperature. As the smoke collar connected with boiler is 16 inches in diameter, it is supposed to indicate the size of pipe required. By reducing the pipe to 12 inches, and then taking two 10-inch pipes from same, it would appear that sufficient draft is not obtained. The area of a 16-inch pipe is nearly 201 inches, and of a flue 8 x 14 is 112 inches or 224 inches for the two. This is slightly in excess of the area of the smoke collar. The area of a 10-inch pipe is nearly 78.5 inches, or 157 inches for the two. It will be seen that the area of the two 10-inch pipes is less than that of the smoke collar, or of the two chimney flues. The area of a 12-inch pipe is nearly 113 inches, or 1 inch more than that of the chimney flue. As it is supposed that a 16-inch pipe is the proper size for boiler, it is suggested that the pipes be arranged as shown in Fig. 2. The two 12-inch pipes are taken from the main pipe in a convenient manner, and connected with the chimney flues. If desired, a diaphragm, as indicated by the dotted lines, can be placed in the main pipe, thus giving to each pipe its share of draft.

Principles of Pattern Cutting.

From W. N., *New York.*—In answer to "F. D.," whose letter appeared in *The Metal Worker* of October 21, I wish to say that if he will make application to be admitted to the mechanical drawing class, teaching descriptive geometry, in Cooper Union, Eighth street and Fourth avenue, New York City, he can at least learn the principles underlying all pattern cutting in sheet metal work.

Loss of Heat From a Furnace.

From C. E., *New York.*—I have a customer who has a furnace which heats the cellar very much, although it has an inside lining of asbestos and the pipes are covered with asbestos. I would like to know how to remedy this trouble, and would be glad to have suggestions on the subject.

PLUMBING and GAS FITTING.

Franklin Trade School, Boston.

Benjamin Franklin, in his will, gave the citizens of Boston, Mass., in 1791, the sum of £1000, which he directed to be loaned in small sums at 5 per cent. interest to young married artificers of good character, under the age of 25, who had faithfully served an apprenticeship in that city. Dr. Franklin estimated that the £1000 would increase in 100 years to £131,000, and then the managers of the fund were to lay out in some public work £100,000, the balance continuing on interest for a further 100 years. The whole sum will then revert to the people of the city of Boston and the State of Massachusetts. The trustees under the will are the Selectmen (now the Board of Aldermen), united with the ministers of the oldest Episcopal, Congregational and Presbyterian churches in Boston.

The 100 years having expired, a meeting of the Franklin trustees was held on November 10, to decide on the appropriation of the available money, amounting to some $415,000. Out of 27 suggestions for its disposition, it was finally decided by vote that the whole amount should be devoted to the purposes of one object, and that object the establishment of a trade school, pure and simple. It was further agreed that the school is to be an independent one, unconnected with the public schools, and that it shall bear the name of the famous donor. The erection of the necessary building, or buildings, will probably be put in hand without delay, as soon as the site is decided on. Although the general plan of the school is not yet made public, it is understood that it will be started gradually and in separate buildings, perhaps one at a time.

The plumbing trade will, most likely, be the one in which a beginning will be made, as was done in the case of the opening of the New York Trade School years ago. Bricklaying, stone cutting, painting and carpentry will follow. The present idea of the managers is to follow, more or less closely, the Auchmuty system, which has proved so satisfactory in New York and elsewhere.

GAS PIPES that are claimed to be perfectly gas tight, says a foreign exchange, are now made of manila paper, cut in strips equaling in width the length of the pipe to be made. These are passed through a vessel filled with melted asphalt, then wrapped firmly and uniformly round an iron core until the required thickness is attained, then subjected to pressure, after which sand is strewn over the outside and the whole cooled in water. The iron core is then removed and a coating of waterproof composition put on the outside of the pipe.

A Question of Authority.

From E. S., *New York.*—Will you kindly explain for me in *The Metal Worker* how the township or county authorities who make rules for Astoria, L. I., can prevent a good plumber from doing work there? I figured on two frame houses, and no sewer or main water pipe being in the street, assumed they could not interfere with a man who was capable of doing work in the city of New York and had a New York license. I still believe that the authorities cannot go to such extremes, and have had a dispute on account of it, and to be sure have concluded to ask your opinion and decision in the matter. It may be that the new law enacted by the State covers this point and allows the Board of Health in each town such privilege. I should not think, however, that there could be a law preventing a man from doing plumbing anywhere as long as he required no permit for sewer and water connection, opening street and setting water meters, &c.

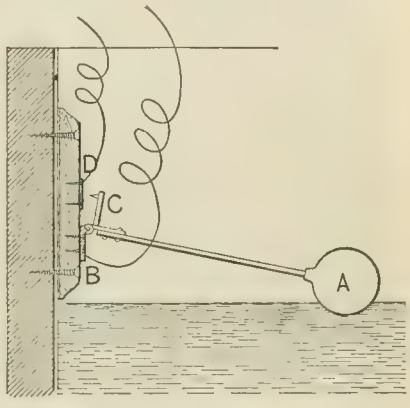
Note.—Chapter 602 of the laws of 1892 provides that any local government may form regulations to control plumbing and plumbers within its jurisdiction. These regulations, as a rule, require that any person wishing to carry on the plumbing business within the locality must pass an examination and take out a license. The law does not intimate that a license granted in one place is of any use in another place where a license is required. If such a set of regulations are in force in the city in question it seems hardly probable that our correspondent can continue to work there. Having received a notice from the authorities, it is presumed that they have not acted without power, and if he should ignore them it is probable that their powers would be exercised and the question asked would be decided in the courts. The law as it now stands requires that to do business certain requirements must be met. This opens a very interesting question, as a great many plumbers are carrying on business without a license at the present time. In the past plumbers have experienced no difficulty in working in different cities by hiring a local plumber to do that portion of the work which required a permit. The case reported by our correspondent is the first that is brought to our notice of difficulty being experienced where no permit was required.

C. W. MCDONALD has moved to Corpus Christi, Texas, where he is prepared to do plumbing in all its branches.

Electric Tank Filling Alarm.

BY OLIVER TWIST.

In many city and country buildings large tanks for storing water for domestic purposes are used in connection with the plumbing of the building. In some of our large cities the pressure in the street mains is not sufficient to reach over the fourth flat, and the fixtures on the floors above this point are supplied from a tank placed at the top of the building and filled by a pump. Although country villas are not usually very high it is necessary to have a tank when there are no water works, and a wind mill is used to pump water from a well to the tank, which furnishes the water to supply the fixtures located throughout the house.



Electric Tank Filling Alarm.—Fig. 1.—View of Float and Connections.

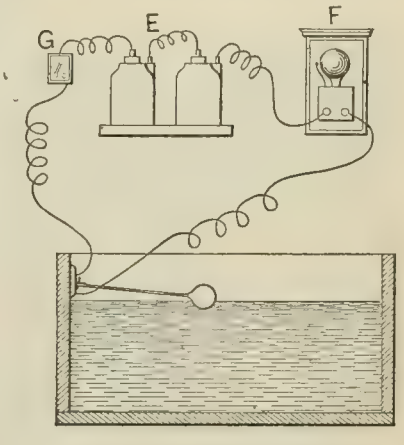


Fig. 2.—Alarm Connected with Tank.

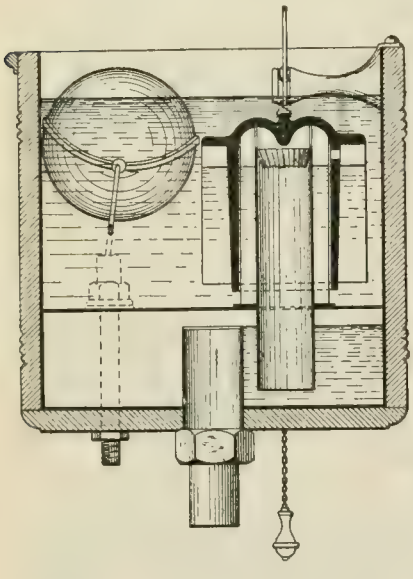
Fig. 3.—The Switch G Enlarged.

In the cities the water is pumped

from the basement to the tank by an engine of some kind, and some device for warning the engineer when the tank is full is desirable. For this purpose the device here illustrated has been set up. It is very simple and can be made by almost any mechanic in town or country. In Fig. 1 A is a float about 2 inches in diameter, which is soldered to one end of a lever, and a brass hinge, B, is secured to the other end, as shown. A piece of brass, C, is placed at right angles to the lever to make contact, when the float rises, with the brass plate D, which closes the circuit of the battery E, Fig. 2, and rings the bell F, which should be placed where it will be sure to be heard at the pump. The bell would continue to ring when the tank was full but for the switch G, which should be located near the pump so that it can be moved over so as to break the circuit until the water in the tank has fallen low enough to release the contact between the points C and D. G is a block of hardwood, Fig. 3, having a brass lever pivoted at one end and arranged, as shown, to make or break contact between the points *a* and *b*, to which the wires are attached. Before commencing to pump again all that is necessary to do is to switch on the current, then pump away till the bell rings. The battery, E, Fig. 2, consists of two cells of Leclanche style connected, as shown, the same as an ordinary bell circuit.

The I. P. W. Syphon Pull Tank With After Flush.

The Walcott-Hurlbut Company, 175 and 177 Lake street, Chicago, are introducing the I. P. W. tank, which



The I. P. W. Syphon Pull Tank with After Flush.—Sectional View.

is herewith illustrated. This tank is constructed in such a manner as not to have any valves or parts to wear out. As shown in the sectional view the lower portion below the first bottom of tank is divided into two parts, one to receive water which forms the seal of the upright pipe, and the other to receive the water which is stored for the after flush. The operation of the tank is as follows: The upright pipe being sealed as shown, water enters the tank through the ball cock. This water continues to rise in the tank until the float or ball of the cock has by its buoyancy closed the cock and stopped the flow of water. To start the water all that is necessary is to pull the handle which is attached to the lever in the tank. This raises the bell, which raises the water inside of it, and this water overflows into the pipe within the bell. Being guided by the lips in the pipe the water falls free of the sides, rarefies the air, and carries it out under the lower edge of the pipe, thus forming a partial vacuum. When more water runs over more air goes out, and this is repeated in quick succession until such a body is passing over as to form a complete vacuum, when the pipe is running full. This continues until the tank is emptied and the air rushing under the bell has broken the syphon and stopped the flow. The float having fallen with the water has opened the cock, and the water again rushes in. The I. P. W. cannot overflow its tank, for, if the ball cock should fail to act, the water would rise in the tank to a certain hight, when the syphon will act automatically and give as good a flush as if the lever had been operated. The after flush is also useful for a washout, as it furnishes water to fill the depression in closet to receive the soil, chilling it and suppressing the gases. A difficulty experienced in the use of syphons is the breaking of the stream and stopping the flow of water when it is desired to do so. By the attachment of Poore's breaking device an absolute break, it is said, is secured when a full stream of water is flowing into the tank under heavy pressure. This device is shown in the cut, it being the outer bell with an opening for communication with the inner bell.

Where Are the Aged Plumbers?

From C. J. P., *New York.*—Why do we see so few aged plumbers in our profession? In speaking of aged plumbers I refer to the journeyman plumber, the every day worker, and not to the boss or master plumber. Being one of the profession I can, to a great extent, explain the reason, having studied the causes that remove the plumber at an early age. From observations and contact with a number of men in our profession, it can be safely said that their short life is to a great extent due to the reckless disregard which they have for their health. From a few of the facts that have a bearing on the above explanation its correctness can easily be seen. There are a number of elements of a poisonous character with which the plumber has to come in contact that are taken into the system of the thoughtless mechanic as if they were pure and good for him. The well-known sewer gas or air, with the many diseases that mingle with it, that come from all points, the deadly illuminating or coal gas, and the quieting charcoal gas. One of the chief and most dangerous agents is the new lead pipe and sheet lead that he is constantly handling and forcing particles of the metal through his skin and into his blood, along with what he breathes into his lungs. Red lead, white lead and all other filth, of which he has a constant stock under his finger nails, that is bound to be taken up by the blood to help the rest of the poison that is taken up at other points. He breathes the foulest kind of air in filth soaked cellars, under basins and sinks, where dirty housekeepers' rubbish, and frequently garbage, are put. Rats and mice also play their part in impregnating the air. All this and what it implies are some of the reasons why we have so few old journeymen plumbers. All this to a great extent can be remedied and bring longer life to the plumber. Bring about you all the fresh and pure air possible. Keep the deadly hot air of the charcoal and gasoline furnace away from you. Handle lead pipe with gloves, keep your finger nails clean, keep all sewer openings closed as much as possible. Never eat with dirty hands. Keep clean overalls, or you will be carrying poison about with you all the time. Keep your working surroundings clean. Eat your meals regularly, masticate your food well, go to bed in time, and last, but not least, avoid liquor. This when mixed with the other poisons leaves the plumber no show whatever for longevity.

TRAPS AND VENTS.

D. G. FINNERTY, president of the National Association of Master Plumbers, recently attended a meeting of the local association at the Master Builders' Exchange, at Philadelphia, Pa.

HENRY TEXTOR, 2 Throop avenue, Brooklyn, N. Y., reports an increasing demand for the Textor cellar drainer, sewer gas and back water trap. The trap provides for draining the cellar, and it is arranged to be easily cleaned. A deep water seal is provided against sewer gas, and a copper plate is arranged with a guiding stem to rise against a brass seat and prevent water backing into the cellar from a flood in the sewer.

HEALTH COMMISSIONER MCLEOD of Detroit made a statement at the recent meeting of the Board of Health which showed that the city had maintained its Health Department for the last year at less expense than that of any other city of the same size in the country, and strong claims were made for its efficiency.

THE PLUMBING FIRM of Bird & Marshel, at Greenville, Ohio, has been dissolved, and the business is now conducted by W. P. Marshel & Son.

P. H. HORGAN is having a two-story frame building erected on Mill street, Newport, R. I., to be occupied as a plumbing establishment.

AFTER PROPER EXAMINATION by the board appointed for that purpose, certificates have been ordered issued to the following named plumbers, at Los Angeles, Cal.: Masters—E. G. Ord and Arthur Sharples; journeymen—E. E. Knight and J. Murlock.

THE FOLLOWING from a foreign exchange is a suggestion worthy of consideration: This is a very good time for plumbers to remind their customers and others of the importance of having all range boilers, and both hot and cold water pipes, put into safe and efficient condition before winter comes on. A carefully drawn circular would doubtless be the best medium for persuading even the least prudent that an inspection is advisable; for if all is well, that need cost him little; if aught is wrong, it is better to know it in time. The sense of security is worth something to everybody. Range boilers (water backs) degenerate, pipes corrode, exposed supply pipes freeze. If the danger of accidents, of loss by possible damage, and the inconveniences resulting from defects were stated forcibly but plainly in a businesslike way, followed up by a suggestion that a careful survey should be made with a view to commencing the winter with the water system of the house in shipshape order, most householders would regard the suggestion as at least a happy thought and look upon the suggestor as a wide awake tradesman whom it would be desirable to bear in mind when any work was needed, even if they did not promptly seek his services.

IT APPEARS that the Colwell Lead Company were not the only losers by the sinking of the "Dean Richmond,"

which occurred recently in Lake Erie. The Rochester Lead Works, Rochester, N. Y., were also losers to the amount of 80,000 pounds of pig lead, making a total loss of this metal of 176,000 pounds.

BEAGLE BROTHERS, formerly with M. L. Snow, stove and hardware dealer, of Saratoga Springs, N.Y., have taken a store at 53 Court street, where they will establish a plumbing, stove repairing, &c., business. They are enterprising men in this line.

GEORGE G. RADDIN is one of the recently licensed plumbers of Lynn, Mass.

JOSEPH C. DUFF, a plumber, of Jersey City, N. J., is now engaged in renovating the heating apparatus of the different institutions belonging to St. Paul's Catholic Church of that city.

THE SHUSTER FOUNDRY of Franklin and William streets, Philadelphia, and South Pittsburg, Tenn., are shipping two carloads of their plumbers' soil pipe and fittings to British Columbia. This speaks well for the reputation of their goods.

THE THOMAS H. RADCLIFFE PLUMBING COMPANY of Brooklyn, N. Y., were incorporated on November 9, with a capital of $5000. The directors are Thomas H. Radcliffe, Michael J. Lawless and Alice Radcliffe of Brooklyn.

THE CONTINUANCE of the office of plumbing inspector at Indianapolis, Ind., is still being urged by a goodly representation of both the journeymen and master plumbers of that city. A letter from J. Arnold, a member of the plumbers union, recently appeared in one of the daily papers explaining the necessity of an inspector.

BUILDING AND PLUMBING INSPECTOR Charles Lane of Butte, Mont., reports some activity among the plumbers of that city owing to the extension of the sewer system.

THE MASTER PLUMBERS of St. Louis, Mo., the home of ex-President Sheehan, are making preparations for the entertainment of Daniel J. Finnerty, president of the National Association of Master Plumbers, who will visit that city in the near future, accompanied by several other national officers. It is proposed to tender them a ball and banquet.

MASTER PLUMBERS' ASSOCIATION of Baltimore recently had a banquet in honor of D. J. Finnerty, president of the National Association of Master Plumbers. D. J. Barry, president of the local association, made an address of welcome. Other addresses were made by John Trainor, William H. Rothrock, James McCart, Daniel A. Sullivan and Edward J. Healey, Jr. Among the other guests present were George Knipps, James P. Carey, Thomas B. Boland, Henry Bowman, Thomas B. Hibberts, Patrick Sullivan, Thomas Ward, Charles Fredericks, W. W. Bowles and P. Sherry.

A RECENT VISITOR at Trenton, N. J., noticed some activity among the sanitary earthenware manufacturers.

AT THE QUARTERLY CONVENTION of the New England Plumbers' Union, recently held in Boston, there was a good attendance present. The officers elected were T. J. Collins, president; A. J. Bradley, vice-president, and W. T. Brown, secretary and treasurer. Resolutions were adopted on the death of Patrick Regan, which were ordered to be engrossed and presented to the widow of the deceased member. New by-laws were adopted and reports from different cities gave the business of the craft as fair. The next meeting will be held in Providence, R. I., January 14.

PITTSBURGH BRASS COMPANY, Pittsburgh, Pa., and 36 Park place, New York, issue an illustrated catalogue and price-list of plumbers' supplies and specialties for the season of 1893-94, including lavatory supports, fittings, brackets, tank and seat brackets, traps, closet and urinal slab supports, pipe holders, soap cups, towel racks and shelves, &c. At the back of the pamphlet will be found illustrations of various kinds of metal work for banks, offices, stairways, water closets, bathrooms, &c., as well as a number of styles of low ash pan screens, brass fronts for gas fires and ornamental kettles for water to be used in rooms as air moisteners.

News and Notes.

The Howell torpedo tests at the Newport trial station have been brought to a close. About 80 tests, of the most severe character, have been made in all, and, so far as is known, to the complete satisfaction of the naval ordnance officers. Considerably more than the contract speed was obtained.

In some districts in England coal is retailing at $15 a ton, in consequence of the miners' strike. Cold weather having set in early, the condition of the poor, who cannot afford to pay so high a price, is considered serious.

October's fire loss of the United States is estimated at $11,014,700, which is over $2,000,000 less than the amount lost in Octobar, 1892. The increase in the total for the first ten months of this year, as compared with the same months of last year, amounts, however, to nearly $25,000,000, a sufficiently startling presentment. The actual figures are: January 1 to October 31, 1893, $132,847,400; same period, 1892, $108,341,550.

Eckley B. Coxe of Drifton has been nominated for a second term of the presidency of the American Society of Mechanical Engineers.

A decree has been publis hed by the Italian Government that all customs duties in that country shall hereafter be paid in gold.

The ponderous after barbette of the United States battle ship "Indiana," building at Cramp's yard, was put in place last week. It is composed of the heaviest nickel steel armor ever fitted, and has been in course of construction at Bethlehem for nearly two years, the work of putting it in place occupying two months. The barbette is made in 13 plates, which were forged under the 125 ton hammer. It is 30 feet in diameter, 13 feet high and 17 inches thick, the total weight being 406 tons. The "Indiana" will, it is calculated, be ready for her builders' trial trip by February 1, and the vessel will be delivered to the Government about June 1.

The Edison patent on incandescent lamps expired in England on November 10, and from that date their manufacture and sale in that country will be free, with the probability of a considerable reduction in prices.

Depression in the shipping trade is reflected in the returns of Suez Canal receipts for the first nine months of this year. They were $754,000 less than those for the corresponding period of last year. Hitherto each year has shown an advance on the previous one.

At Indianapolis every effort is being made by the Commercial Club, the Board of Trade and the city officials, in combination, to organize relief for the more than 6000 idle workingmen in that city. Citizens have been appealed to to make every improvement of any sort that will give employment, and renters are asked to be lenient.

The work of fitting out a new navy for the Brazilian Government is being urgently pushed at New York, where a number of recently purchased craft are undergoing rapid transformation into war vessels. Most of the ships are expected to be ready for service by the end of this week.

October's foreign trade returns for the port of New York show a decrease of $16,500,000 from the aggregate of October, 1892; but this falling off is due entirely to the large contraction in imports of foreign goods. Exports, indeed, show a slight increase for the month; and for the ten months of the year the aggregate movement of foreign trade shows $57,150,522 over the corresponding period of last year.

The new steamer "Gloucester," built at Baltimore for the Merchants & Miners' Transportation Company and which made her first trip to Boston a few days ago, is probably one of the finest coasting vessels afloat. The hull is built of steel throughout, and she has four decks as well as a promenade deck. Her length over all is 293 feet; beam, 43 feet; depth, 33½ feet, and tonnage, 2500. Power is furnished by direct tricompound engines with inverted cylinders, and the four cylindrical and return tubular boilers are capable of developing 3000 horse-power. The arrangement of her water tight compartments renders the vessel practically unsinkable.

The new Pacific built cruiser, "Olympia," underwent a most successful trial off San Francisco last week, proving herself remarkably speedy and an excellent sea boat. Her record showed a maximum speed of 21.26 knots; and her average for 68 hours, with a heavy sea and strong head wind, was just under 21 knots. The builders of the "Olympia" believe she will manage 22 knots on her official trial, and thus carry the palm of the American cruiser fleet.

The Manchester Ship Canal was completed last week and water was admitted to its entire length. It will take two weeks for the canal to receive its full depth of water. The first steamer to traverse the full length of the canal will, it is expected, make the trip on December 1.

It is estimated that damage to the extent of at least $4,000,000 has been caused to the crops in the Northwest during the present year by a weed known as the Russian thistle. The Department of Agriculture is now investigating the pest.

Buffalo, N. Y., now enjoys the distinction of possessing the largest grain elevator in the world in the new Eastern Elevator, which was completed and opened for service on Monday. Its capacity is 45,000 bushels an hour.

Washington advices have it that the Secretary of the Navy will recommend a considerable appropriation for the construction of battle ships.

Prices of California cereals have of late been the lowest ever known on the Pacific Coast, and over two-thirds of the surplus wheat for export is still being held in the State, on the chance of a rise.

ROOFING AND CORNICE.

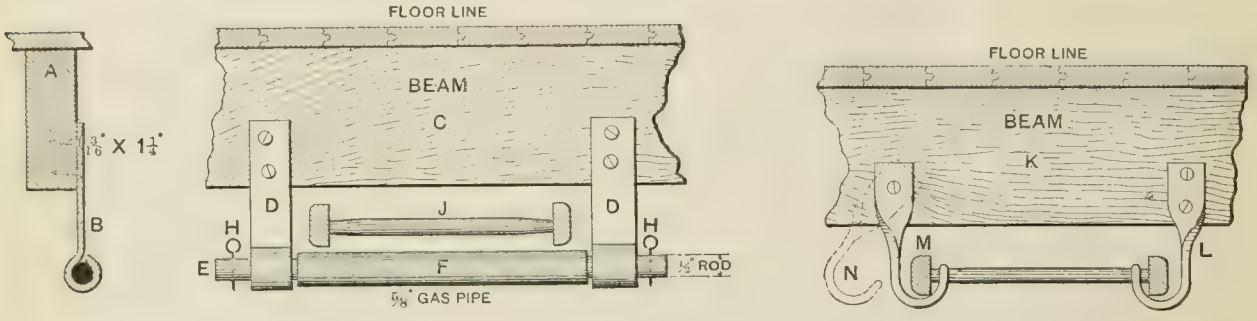
Class for Sheet Metal Pattern Cutting.

We are glad to hear that the announcement made in *The Metal Worker* of October 28, regarding a proposed class for sheet metal work, in connection with the trade school of the Pratt Institute, Brooklyn, has evoked some interest in the roofing and cornice trade in that city and in New York. Mr. Richards has received several applications from would-be students, but several more candidates will be necessary before he would feel justified in embarking in this new department of instruction. So far as we know, there is no class of the kind in existence—in this part of the country, at least—and as the need of thorough education in sheet metal pattern cutting is constantly becoming more evident, it is to be hoped that the present opportunity of securing so valuable a class will not be lost, but that a sufficient number of applicants will come forward to reap the advantage which the director of the Pratt Institute trade school is ready to present on the above condition.

The British Trade Journal for November states that the position of the English galvanized iron trade is exciting much notice. Orders for export have greatly increased of late, and manufacturers are said to be filling up their books for South America, South Africa, Australia, New Zealand and Canada. An attempt is to be made to advance prices.

Economizing Shop Space.

From W. N., *New York.*—I present herewith, for the consideration of your readers, my method of storing ladders and scaffolds in length from 20 to 28 feet. As the space in the shop was limited, a novel idea came to mind, namely, to make the necessary hooks, bands and rollers, and store the ladders or scaffolds underneath the floor beams, or, in other words, hang them beneath the ceiling. The illustrations herewith presented will show how this was accomplished. In Fig. 1 is shown the front and sectional views of a ladder hanger, the ladder being placed at right angles to the beams. A, in the sectional view in Fig. 1, indicates the wooden beam; B, the sectional view of the $\frac{3}{16}$ x $1\frac{1}{4}$ inch band iron bracket, which is screwed against the beam A as shown;



Economizing Shop Space.—Fig. 1.—Front and Sectional Views of a Ladder Hanger, Hung Crosswise to the Beams.

By boring or drilling two $\frac{1}{8}$-inch holes at each end of the rod E, two pins, H and H, are placed in it to prevent the rod from slipping out of the brackets when putting up the ladders. Before placing the rod E through the brackets a $\frac{5}{8}$-inch gas pipe (inside measure) is slipped over it, as shown at F, and forms a roller, which lightens the work of sliding the ladders in place. L, Fig. 1, indicates a stationary hook made of $\frac{3}{16}$ x $1\frac{1}{4}$ inch band iron, twisted half way around, as shown, and screwed fast to the wooden beam. M is a twisted hook fastened to the beam with one long wood screw, which acts as a pivot, and allows the hook to be swung outward when desired. To hang a long ladder, say 25 feet in length, the brackets D and D and hooks M and L would be placed about 20 feet apart. To slide the ladder between the ceiling with hardly any trouble whatever proceed as follows: Raise one end of the ladder up from the floor until it rests upon the pipe F, Fig. 1, then raise the other end of the ladder, being careful always to press toward the pipe F, as the tendency is to slide out; now, holding it up at arms' length, obtain a spruce slat $1\frac{1}{4}$ x 3 inches in thickness and long enough to reach the ceiling, have a groove cut in one end of the slat, as shown in Fig. 3, and placing the groove under one of the rungs of the ladder, raise it slowly, always pressing toward the pipe F, until it sets in the stationary hook shown at L in Fig. 1; now press the hook N forward by means of a strip of wood to the position M, which secures the ladder.

When taking down the ladder or scaffold the same operations should be

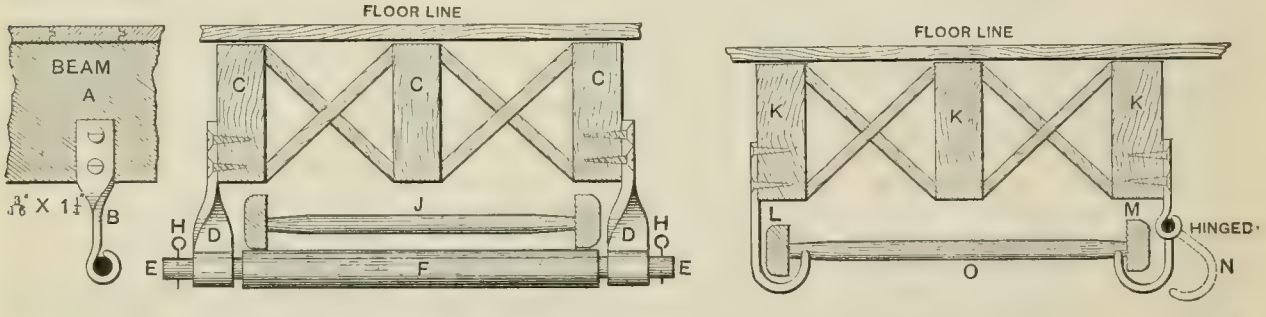


Fig. 2.—Front and Sectional Views of a Ladder Hanger, Hung Parallel to the Beams.

Fig. 3.—Spruce Lifter.

D and D show the front elevation of the brackets, screwed to the beam C. The width of the ladder J being known. the brackets D and D are spaced accordingly, so as to allow the ladder or scaffold play room to slide in or out, as shown. E represents a $\frac{1}{2}$-inch iron rod placed through the brackets D and D as shown.

performed reversed. Fig. 2 shows the front and sectional views of a ladder hanger, the ladder being hung parallel with the beams; whereas in Fig. 1 the ladder is hung at right angles with the beams. The only change required in this case is that the brackets shown at D and D in Fig. 2 require twisting, as shown, and the hook shown at M in Fig. 2 must be hinged so as to allow it to work back and forth.

A Fallen Ceiling.

Below we give a letter from a correspondent which contains some useful information:

The following experience in replacing a fallen ceiling may be of interest to some of your readers: The hallway in an ordinary city dwelling one morning was found to be littered with a lot of plaster that had fallen from the ceiling above. Appreciating the wealth of dirt that would accumulate in putting up a new plaster ceiling, a search was made for some more suitable material. In visiting the houses who make a specialty of interior wood decoration it was found that an ordinary strip ceiling with a hardwood finish, put up complete, would cost from 50 cents to 60 cents a square foot, and if something more ornamental and elaborate was desired, of a panel character, the cost would approach $1.75 per square foot. The next search was for something of the Lincrusta Walton or *papier maché* order, and here it was learned that it would be necessary to replaster the ceiling previous to the use of any such material, and after the ceiling was plastered, the cost of material, the labor of putting up and the cost of decorating would make such a ceiling cost from 35 cents to 50 cents a square foot.

The search was continued for something in sheet metal, which was found to be adaptable without any labor being spent on the old ceiling. What were called furring strips would be required to be nailed to the joists and wood work, and the sheet metal panels would be fastened to these furring strips, saving all the labor and dirt in tearing down the old ceiling, and the claim was made that after it was in place all joints would be covered, so that the ceiling would be of the same finish as if it had been of molded plaster and frescoed. The designs seemed to be almost unlimited in variety; borders and friezes with coves and cornices provided everything that could be desired for such a purpose. With all this variety to select from it was found that a ceiling put up, decorated and finished complete, would cost from 15 cents to 25 cents per square foot, according to the character of the design and distance of the building from the dealer's shop. An argument in favor of the metal ceiling was that the Lincrusta Walton would be permanently destroyed if a fire occurred in the room above and the water soaked through, and the same was true of wood. It was also stated that cracks and warping from the ordinary heat of the house were sure to follow the use of a wood ceiling. A fire in the room above with a metal ceiling might destroy its finish from water, but repainting would leave it in as good condition as in the first place, while a considerable fire might occur on the floor below without passing beyond the metal ceiling.

The Niagara Stamping & Tool Company, Buffalo, N. Y., have received an award of excellence from the World's Fair for their tinners' machines and tools, squaring shears, presses, &c.

FLASHINGS.

Cooney, Seiner & Co. have succeeded Myer & Cooney, 19-20 East South street, Indianapolis, Ind., manufacturers of the Centennial water cut off for cisterns.

Among those who received blue ribbons at the Columbian Exposition were the Sykes Steel Roofing Company of Chicago, Ill., and Niles, Ohio. A duplication of the official ribbon which we have received announces that it is a premium awarded on Sykes patent cap steel roofing.

Building operations are reported by the Canadian *Journal of Commerce* to be quite brisk in the city of Montreal. The Montreal Roofing Company have a large number of men at work, of whom 90 per cent. are engaged in the roofing of new buildings.

Columbia Roofing Company, Canton, Ohio, are distributing an illustrated circular giving directions for applying the Columbia standing seam roofing, corrugated and V-crimped roofing and siding, beaded siding and ceiling. Practical information of this sort is always appreciated by the trade.

N. A. Haldeman & Co. of 59 North Second street, Philadelphia, manufacturers of steel and iron roofing, corrugated iron sheets, roofing paints and cements, have opened a branch office in New York. This was rendered necessary by the growth of their business. With their office in Baltimore and main office in Philadelphia they now hope to be able to look after all branches of their trade to the increased satisfaction of their patrons. Their business includes a large and growing export trade. During the early part of the present month they shipped a large quantity of painted corrugated sheets to Gutierrez, Mexico, and a number of galvanized sheets to Santa Clara, Cienfuegos, Cuba. Among the home orders recently executed was one for curved sheets for the ceilings of the new court house at Mauch Chunk, Pa., which order covered over 1700 sheets, the whole weighing upward of 22,000 pounds. One of their specialties is the N. A. Haldeman patent steel roofing, which is self capping and is quickly and easily laid by an ordinary mechanic. The method employed in laying this roofing, it is claimed, insures an absolutely wind and storm proof roof. Another specialty is their roofing paint, which was introduced by the firm about 17 years ago and has met with large demand. The corrugating of iron and steel is a leading feature of their business, and taxes the resources of their plant for this work. For the accommodation of the trade Messrs. Haldeman undertake the work of corrugating for those wishing to furnish their own material.

In a few weeks the Cambridge Corrugating Company, Cambridge, Ohio, will place on the market Stanley's patent felt lined iron and steel roofing. Sheets treated in this manner are said to be impervious to the action of moisture arising from the insides of buildings, and this company claim to be able to manufacture the material at a slight increase over the cost of plain roofing.

The Canton Steel Roofing Co., Canton, Ohio, have reproduced their factory, which was destroyed by fire, and have added many new facilities. The building is lined inside and outside with sheet iron, following the surface, care being taken not to leave any places which would act as fire flues or air conductors. It is said to be the first building of its kind ever constructed. Every part of the wood work is covered completely. The plant will be equipped with new and improved machinery, calculated to produce maximum quality at minimum cost.

HEATING NOTES.

The Watson & McDaniel Company have filed articles of incorporation in Hudson County. With a capital of $100,000 the company propose manufacturing steam and hot water appliances of brass and iron. The corporators are: Thomas H. Williams, George W. Conklin, Charles F. Imrie and Samuel R. Harlow of New York.

The Herendeen Mfg. Company, Geneva, N. Y., have opened an office in New York at 206 Centre street under the charge of James G. Dudley. Among the sales already made through their New York office may be mentioned two No. 9 steam Furman boilers to the New York Steam Fitting Company for the building 126, 128 and 130 White street, New York. This is a nine-story structure, and the specifications called for 4500 square feet of heating surface.

The Robinson Heating & Ventilating Company of Altoona, Pa., report a satisfactory trade in steam and hot water heating the past fall. They use principally the boilers made by the American Boiler Company, and the radiators of the American Radiator Company.

The Improved Palace King hot water heater is brought to the notice of the trade in the catalogue just issued by Russell Wheeler & Son, Utica, N.Y. The circular contains but a moderate number of pages, and has a certain elegance of appearance due to the small amount of letterpress, excellence of typography, colored ink, and finally the printing, which is on but one side of the pages. The particular feature to which the attention of the trade is called is the method of joining the boiler sections by nipple connections, which are pocketed in the water posts. General and sectional views and separate illustrations of the sections are presented, together with sufficient description to make clear the chief features of the heater.

The Y. M. C. A. of Cleveland, Ohio, recently gave a reception to the Stationary Engineers and Metal Workers of that city with the idea of acquainting them with the privileges of the association. Several hundred attended and were entertained by short talks, music and an exhibition in the gynasium.

Oldham, England, is said to have a furnace for destroying the town refuse, which burns at such a high rate of temperature that its heat, applied to raising steam, furnishes sufficient power to more than cover the cost of collecting and burning the garbage.

A good paint for iron work exposed to the weather can, it is said, be made by mixing ½ gallon of linseed oil to an equal quantity of good outside varnish, and adding sufficient red lead to make it of the consistency of paint.

THE TIN SHOP.

Pattern for Elliptical Cover.

From G. W., *Coal Creek, Col.*—Will *The Metal Worker* publish a method for describing the pattern of a pitched cover for an oval dinner pail ?

Answer.—In Fig. 1 is presented the end and side elevations, also plan, of a pitched cover. The shape in plan is indicated by B*a* D*a* C*a* E*a*, in side elevation by B*b* Y*b* C*b*, and in end elevation by E*c* Y*c* D*c*. The shape shown in plan is struck from two sets of centers, which is a convenient method to use when an approximate ellipse is required.

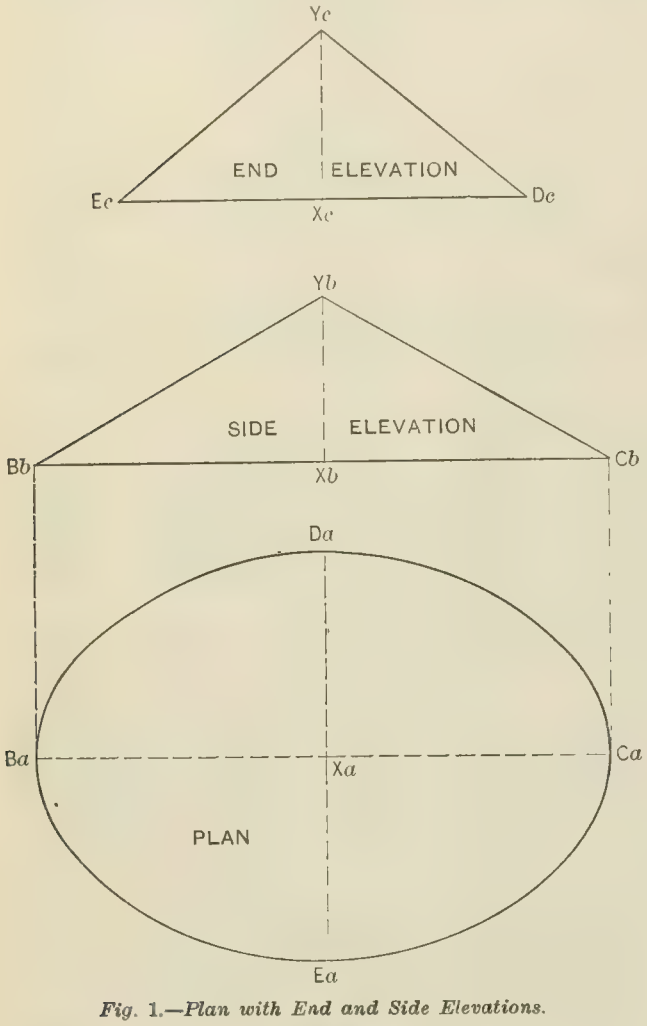

Fig. 1.—Plan with End and Side Elevations.

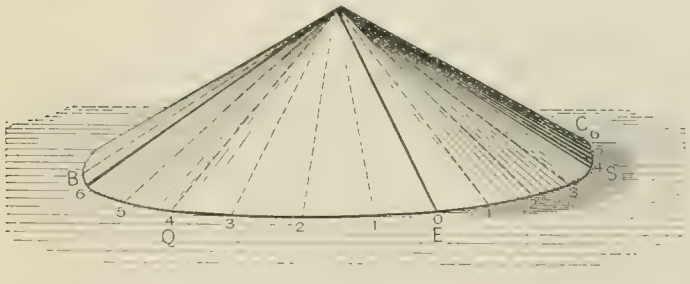

Fig. 4.—The Finished Article.

The ellipse shown in Fig. 2 is a duplicate of the one in Fig. 1, and is described as follows:

Let B C represent the length of the required figure and D E its width. B C and D E are drawn at right angles to each other, intersecting at their middle points at X. The next step in describing the figure is to obtain the difference in length between the axes X D and X B (conjugate and transverse axes), which can be done as indicated by the arc D G. This difference, G B, is to be set off from the center X on X B and X D, as shown by X H, X J; then draw H J and set off half of H J to L, as indicated by the arc K L. The object of the operation so far has been to secure the point L, which is to be set off from X on X D, X C and X E, as shown by the points L, M, N, O, which give the centers from which the ellipse is be struck.

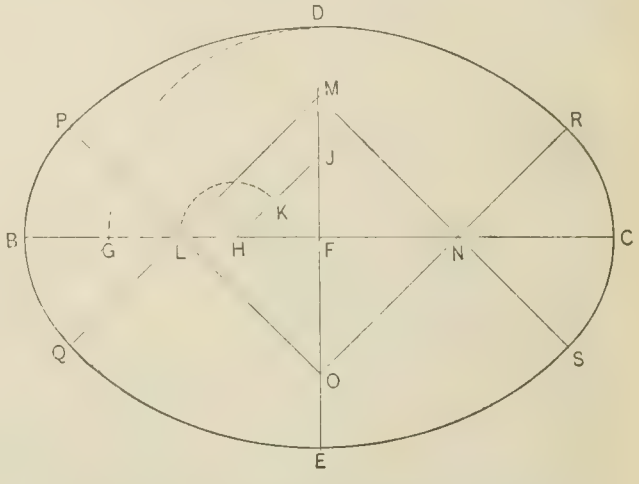

Fig. 2.—Method of Describing the Figure from Centers.

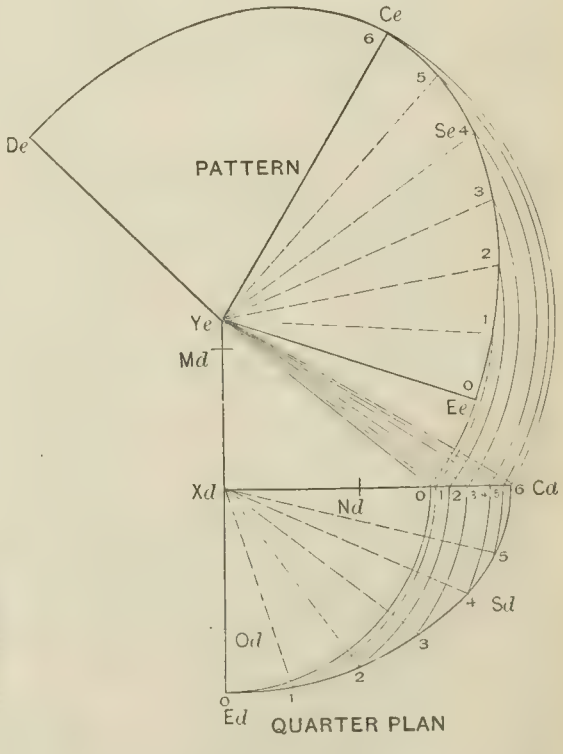

Fig. 3.—Method of Obtaining the Pattern from the Quarter Plan.

PATTERN FOR ELLIPTICAL COVER.

For convenience in describing the figure, from M draw M L Q and M N S indefinitely, and in a similar manner O L P and O N R. With O as center and O D as radius strike the arc P D R, cut-

ting O P and O R as shown. In a similar manner and with the same radius, or, which is the same, with M E as radius and M as center, describe the arc Q E S. With L and N as center and with L B or N C as radius strike the arcs Q B P and R C S, thus completing the figure. If the lines are not drawn from O and M the point of contact between the arcs is difficult to determine.

Having thus obtained the shape of article in plan, any desired hight can be given to it, as indicated by X*b* Y*b*, X*c* Y*c* of the elevations in Fig. 1. An examination of the plan will show that it is composed of four similar parts, as X*a* E*a* B*a*, X*a* B*a* D*a*, X*a* D*a* C*a* and X*a* C*a* E*a*. It must be evident that a pattern for one of these parts, as X*a* C*a* E*a*, can be used for marking off the others. As the article is for a pail cover it might be convenient to have the pattern in two pieces, the seam being as represented by E*a* D*a*, the apex of the elliptical cone being at X*a*.

For the purpose of illustration it is convenient to show the two elevations and the plan, as has been done in Fig. 1, but for obtaining the pattern of one of the four parts, the hight of the article being known, it is only necessary to draw the quarter plan, as has been done in Fig. 3. For the purpose of avoiding a confusion of lines, in this figure the method of describing it has not been shown. The method is the same as previously explained. The arc E*d* S*d* was struck from M*d* as center, and the arc S*d* C*d* from N*d* as center.

Then to describe the pattern shown in Fig. 3 proceed as follows: On E*d* X*d* extended lay off the hight of the article, as indicated by X*d* Y*e*. Divide E*d* S*d* C*d* into any convenient number of equal parts, as indicated by the small figures. As E*d* S*d* was struck from M*d* as center, and S*d* C*d* was struck from N*d* as center, it may be well to divide these parts into equal parts, as has been done. Lines can be drawn from the points in E*d* C*d* to X*d*, if desired. These lines, if drawn, give the base lines of triangles, the altitudes of which are to be equal to the hight of the article. A convenient method for drawing these triangles is as follows: With X*d* as center strike arcs from the points in E*d* C*d*, cutting X*d* C*d*, as shown. Lines drawn from the points thus obtained to Y*e* will give the hypotenuses of the triangles, which, if set with their bases on the proper lines in plan, would give the distance from points in E*d* C*d* to the apex of cone as if measured on the finished article. These triangles are shown in X*d* Y*e* C*d*.

With Y*e* as center and the points in X*d* C*d* as radii strike arcs indefinitely. Draw any line, as Y*e* E*e*, which will form the edge of pattern corresponding to X*d* E*d* of plan. With the dividers set to the distances used in stepping off E*d* C*d* of plan, and starting from E*e*, pace off the stretchout of E*d* C*d*, stepping from arc to arc, as shown. From the point 6, or C*e*, draw a line to Y*e*. Through the points thus obtained trace a line freehand, or by bending a strip of metal the desired shape and drawing the desired line, as shown. Then Y*e* C*e* E*e* is the pattern for part of article shown on plan, Fig. 1, by E*a* X*a* C*a*, or in Fig. 3 by E*d* X*d* C*d*. The other part of pattern, as Y*e* D*e* C*e*, can be obtained in a similar manner or by duplication. As the net pattern only is shown, suitable edges are to be allowed for joining. The finished article is shown in Fig. 4.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

The Pawtucket Steam & Gas Pipe Company of Pawtucket, R. I., report that they have used the Exeter radiator made by the Exeter Machine Works of Boston, Mass., in a number of heating contracts this year. Some of the residences and buildings in which they are used are those of George H. Dean, Robert Wood, David Salisbury, Terrence O'Reilley of Providence; Mrs. Olive M. Ashton, James Linton, T. T. Berry, George R. Newman, John F. Jodat, John F. Street of Pawtucket; Lonsdale Company, Lonsdale, R. I.; Circle Jacques Cartier Club, De Never Building, and John McGrath, Central Falls, R. I.; Richard W. Whittle, Saylesville, R. I.; Frank C. Viall, Auburn, R. I., and J. A. Snell, Barrington, R. I. The company mention that these radiators have given perfect satisfaction with regard to workmanship and appearance, their customers having nothing but words of praise for the same.

Maurer Brothers of Reading, Pa., have been awarded a contract for steam heating plant in the office of J. Howard Jacobs.

D. S. Ingersoll, Beverly, Mass., is installing a steam heating plant in the Universalist Church.

B. F. Shaw of Wilmington, Del., has been awarded the contract for the steam piping and plumbing in the new power house of the Atlantic Improvement Company of Long Island City, N. Y.

Bids for heating and ventilating the new morgue at Philadelphia are all in, but as yet Director Beitler has not awarded the contract.

The Swamscot Machine Company of South Newmarket, N. H., will instal the steam heating plant in the new court house at Exeter, N. H.

Getchell & Taylor of Exeter, N. H., have been awarded the contract for the plumbing work in the court house of that city.

Apgar Brothers, steam and hot water fitters, at Seventh avenue and 125th street, are using a Novelty Circulator to heat a hotel and *café* at 126th street and Third avenue.

Wm Comly, King of Prussia, recently conferred a favor on J. F. Boyer, Norristown, Pa., by awarding him the contract for a steam heating plant for his Montgomery County residence. Mr. Boyer does not, however, enjoy the distinguished honor of being court steam fitter, as the King of Prussia in this case is a Pennsylvania village of 150 inhabitants.

The Illinois Heating Company, 88 Lake street, Chicago, are to furnish the steam heating plant for the residence of C. J. Owen, Sheridan drive.

The Kewanee Boiler Company, 96 Lake street, Chicago, are to supply one Haxtun boiler for the Library Building at Elgin, Ill., and two for the Blackburn University, Carlinville, Ill.

The Blackmore Heating Company, 88 John street, New York, recently closed a contract for heating ten apartment houses at 133d street with Sunray hot water heaters, and will use the Bundy Columbian radiators.

R & J. Robertson of Beverly, Mass., has had 12 plumbers and hot water men busy attending to jobs which they are installing.

James B. Alger has the contract for installing a steam heating plant in the Parker Block, at Great Barrington, Mass. The boiler will be from the McCormick manufactory, at Wallingford, Conn.

The Gainey Mfg. Company of Hamilton are to install a new steam heating system in All Saints' Church, at Detroit, Mich.

E. Baggot, 169 and 171 Adams street, Chicago, has taken contracts for plumbing, sewerage and gas fitting in the residences of J. Monahan, Buena Park, Ill., and Theodore Kochs, Lake Geneva, Wis.

The first specimen of tin plate ever made in the Shenango or Mahoning Valley was turned out at the New Castle Steel & Tin Plate Company's works, New Castle, Pa., on November 7. The company have been making black sheets of a high quality for some time at their new rolling mills, but the tinning department was not completed until last week. The samples of tin plates turned out are reported to have been very good, and the management are highly pleased with the results. The work will now go on without intermission and a large output of tin plates is looked for.

"I have 70,000 cubic feet of air an hour in this small office," said a professor of chemistry, at the Massachusetts Institute of Technology, to a recent visitor. "I might be called one of the best ventilated men in the country. We all fare well in this respect throughout the building. The ventilation and heating are simultaneous. The cold air outside is forced by revolving fans over hot steam coils in the cellar, and rises in our walls, which are hollow, entering each room through registers near the ceiling, and escaping through openings on the opposite side near the floor. This means that fresh hot air is constantly invigorating and warming us. Believe me, good ventilation makes a ready worker."

The value of the evening educational facilities offered by the various branches of the Young Men's Christian Association throughout the country is evidently appreciated by the class for whose benefit the evening classes—such as those conducted at the Young Men's Institute in the Bowery, New York—have been instituted. G. B. Hodge, educational secretary of the International Committee of the Y. M. C. A., said recently: "There are 20,500 young men in 316 places receiving evening instruction from 700 teachers in these 'gas light colleges' of the association."

Sheet Mill Progress.—II.

BY A. BEARD, CAMBRIDGE, OHIO.

Modern Housings.

Parallel with the increase in weight of sheet mill machinery designs have been improved. The strength has been distributed to parts where it is required, and an effort more pleasing to the eye obtained. Illustrations are given in this article of various makes of housings. These will serve to show the ideas of different makers.

The high shoulders have disappeared and there is more symmetry about the modern housings. Wrought iron screws, which were continually being "jammed" and a source of great trouble and annoyance, have given place to steel screws, and the diameter has been increased from 6 to 8 inches. Dovetailed bed plates, in which housings were fastened by means of wooden blocks and iron wedges, have disappeared and V-shaped bed plates have taken their place. Upon this bed plate housings can be easily moved and made secure in a few minutes; previously it took hours to do this work. Every improvement that can be suggested has been made to prevent breakage and keep things moving.

Herein lies profit for progressive mill owners. Keeping in continuous operation reduces standing charges, such as salaries, taxes, &c., to a small cost per ton of finished product, and success follows.

It is an unexplained truth that while all these changes have been going on in design and construction of machinery, sheet mill men have made but little progress in improving methods of working. Outside influences have done more in this direction than has been done in sheet mills. Steel bars rolled on universal and other specially constructed mills, cleaned from scale in rolling, have to a large extent taken the place of bars made from muck bar piles. Quality has been improved without additional cost, and so many steel sheets of superior finish have found their way into market at the same price as iron sheets that consumers have grown critical, and it is a difficult matter to dispose of large quantities of iron sheets unless corrugators and roofing men are ready to buy.

Reworking Scrap.

Following cheap steel sheet bars several mills have been built without bar mills attached to them, no provision being made for reworking the scrap or trimmings from sides and ends of sheet packs. This has been found to be a source of trouble, as sheet scrap cannot be sold at a figure that will pay for the trouble and expense of handling and transporting it to other mills to be reworked. It is too light and bulky. Sheet mill managers have always found it necessary to devise means of using their scrap in an economical manner. A common method is to bushel the scrap in an ordinary puddling furnace, pass through the squeezer and roll into a bar, which is cut to length and made into a pile, reheated and rolled into sheet bars. To save the expense of one heat, it is now a custom in many mills to fagot scrap.

The method employed is as follows: A bench is constructed upon which a wrought iron box is placed, the ends being open and a door on the front side In the bottom of this box a muck

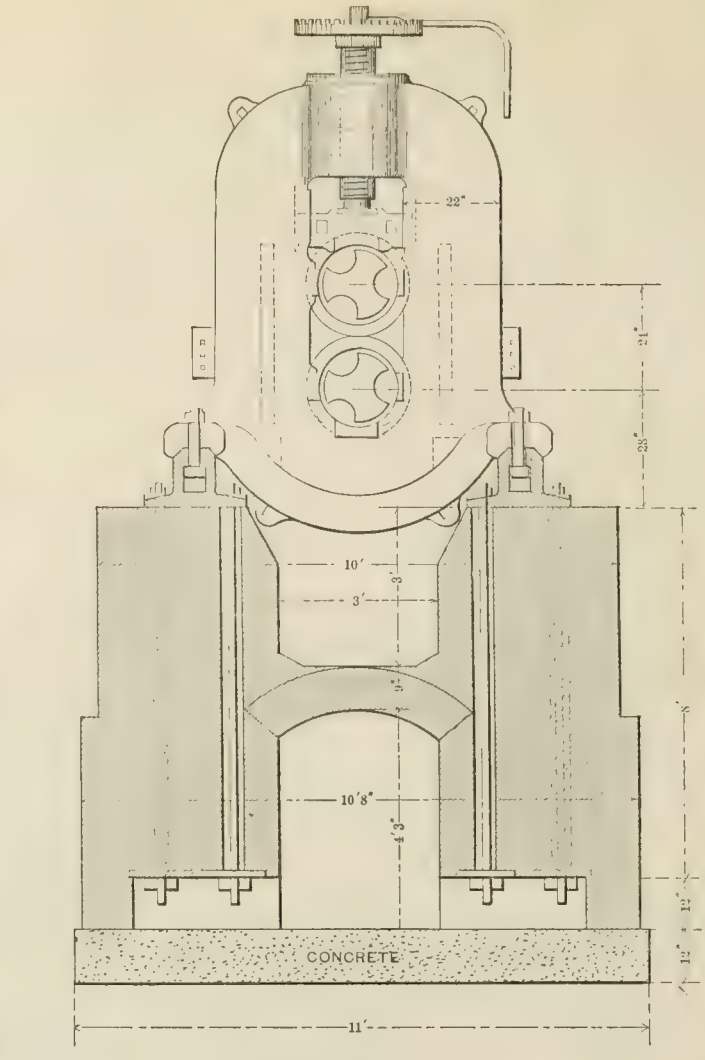

Fig. 6.—Sheet Mill Housing, Booth Design, 1893.—24-Inch Rolls.—Weight, 23,000 Pounds.

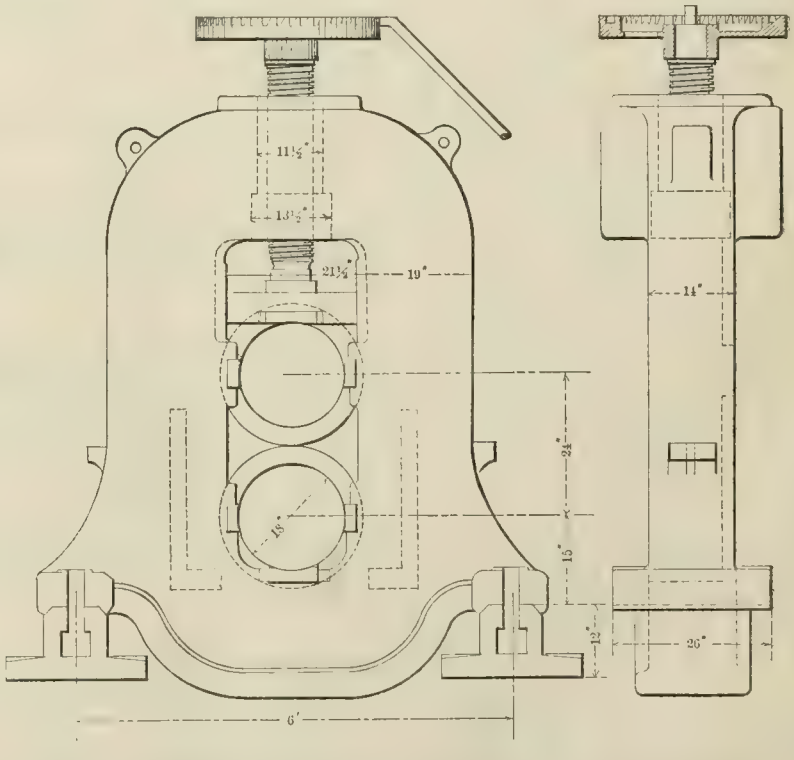

Fig. 7.—Sheet Mill Housing, Lewis Design, 1893.—24-Inch Rolls.—Weight, 19,500 Pounds.

SHEET MILL PROGRESS.

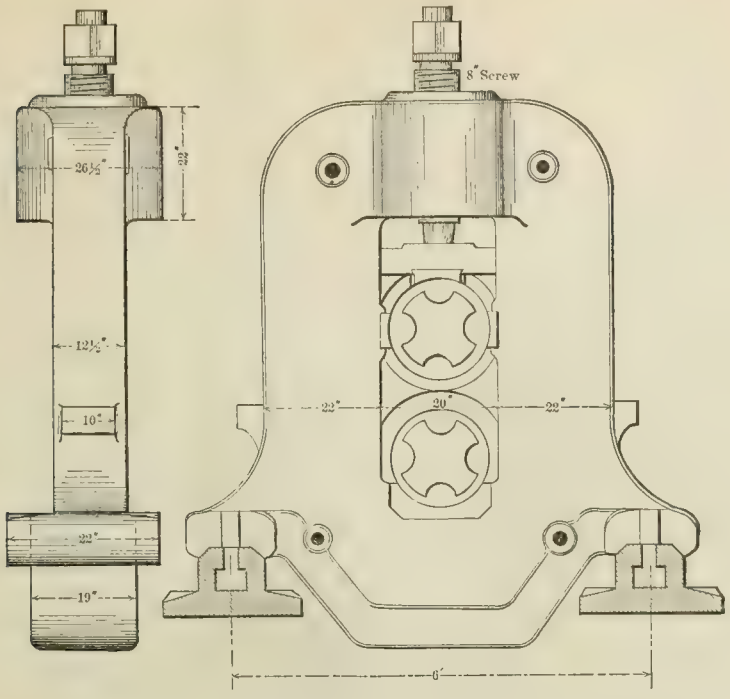

Fig. 8.—Sheet Mill Housing, Leechburg Design.—24-Inch Rolls.—Weight, 21,000 Pounds.

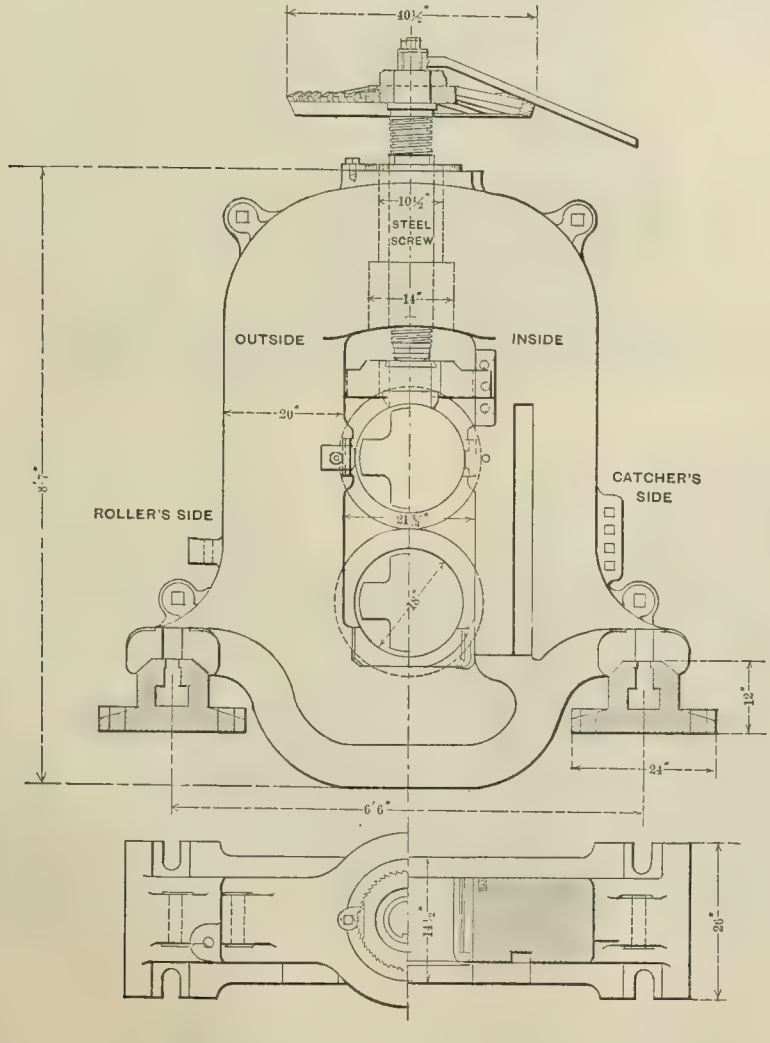

Fig. 9.—Sheet Mill Housing, Garrison Design.—Weight, 21,000 Pounds.

SHEET MILL PROGRESS.

bar is placed, and upon this sheet scrap bent to the length of the bar is piled, another muck bar is placed on top of the scrap, then more scrap and a third muck bar on top of the fagot. The whole pile or fagot is then about 12 inches high, it is reduced by means of a screw to a hight of 7 or 8 inches and bound together with round iron ¼ inch diameter. It is necessary that iron be used for binding, if steel is used it will not unite with the muck bar and a seam is left in the bar. In this manner nearly all the scrap can be worked up into such shape that only one heat is required to roll into sheet bars ready for use. Attempts have often been made to work scrap fagots in this manner without using muck bars but without success. The scrap works dry and muck bar is necessary as a flux. The proportion of scrap to muck bar in a well made fagot is about two-thirds. This plan of using scrap is second only in cheapness to the practice of rolling sheets from ends of boiler and ship plate. In Scotland large quantities of sheets are made in this manner, but American shipyards are not so numerous, and only a limited quantity of the material can be obtained.

Having described the general methods of rolling sheets of iron or steel and noted the changes made in machinery during the past 20 years this article would not be complete without reference to the attempts recently made to revolutionize the method of rolling sheets.

Continuous Mills.

Last year a patent was granted to William Garrett, Joliet, Ill., for a progressive process of rolling iron and steel sheets. If the process was ever given a trial the fact has not been made public, but experiments were made in an Indiana mill last year which embodied some important points of Mr. Garrett's plan. In sheet mill practice it has always been a custom to use only one pair of chilled rolls, upon which the work of molding out, running over and finishing is done. The reason given for this being that if sheets molded out through one pair of rolls are taken to another pair of rolls to complete the process of elongation, the fit or concave shape of the two pairs of rolls would not be the same unless they were turned exactly alike and were subjected to precisely the same amount of work and degree of heat. To preserve a uniform shape the rolls must each have the same treatment. If this shape is not equal buckling or dishing will result when a pack of sheets is taken from one stand of rolls to the other. If the finishing rolls are more concave in shape than the other pair the edges of the pack will elongate faster than the sides, and buckling will result, but if the conditions are contrary the middle of the pack will elongate faster than the sides, and the pack will be dished. This is the established theory of sheet iron rollers for years past, and the experiments made in Indiana seem to have proved that it is correct. A plan of the mill in which experiments were made is presented herewith, Fig. 10. The roughing mill was provided with four pair furnaces which were kept full of bars. When taken from the pair furnaces bars were passed through the sand rolls and molded out to about No. 18 gauge on one of the two pairs of chilled rolls; two roughers were employed who took turn about at the sand rolls, also two pair heaters. After being molded out the sheets were matched in threes and taken to the reheating furnaces and when ready were run over through

chilled rolls A in the finishing mill. They were then doubled and again heated, after which they were finished on chilled rolls B, and thrown off to squaring shears. The method was tried many times, and sometimes a good heat would be rolled, but the general result was "stickers, "pinched packs," "buckles" and other imperfections, and it was generally conceded that the old established theory regarding the fit of rolls was correct. It was expected that the output of the mills would be more than doubled as compared with old methods, but in this also disappoin'ment was met and the plan was finally abandoned. The mills have since been changed to old style, and old methods continue to hold full sway.

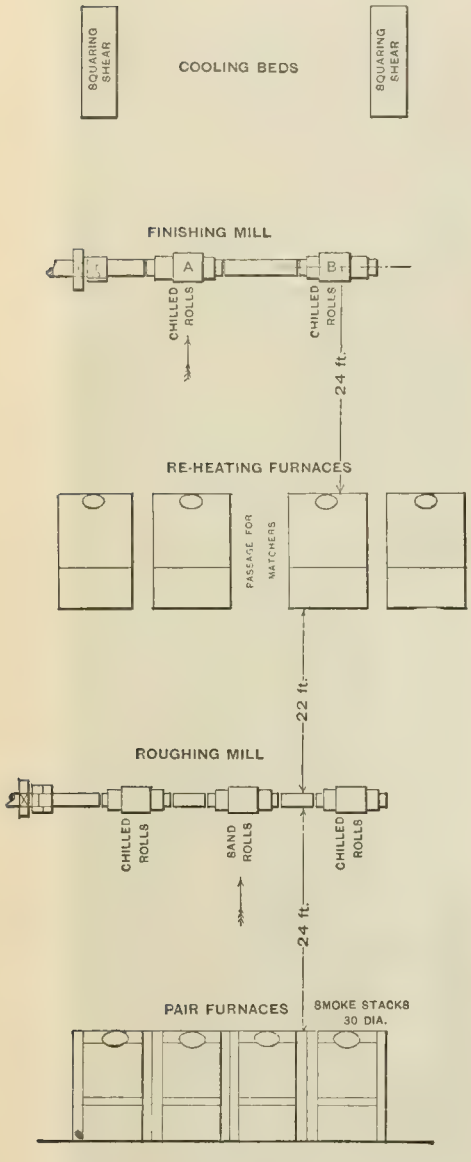

Fig. 10.—Plan of Experimental Continuous Sheet Mill.

If all other conditions and mechanical possibilities had been favorable the test of this plan would have resulted in failure, for the reason that there was a lack of concerted action on the part of the workmen and an evident opposition to the innovation. This indifference on the part of the men was apparent even to an outsider, and was in general line with their attitude toward all improvement that is liable to increase tonnage and reduce the number of men required to do a given quantity of work.

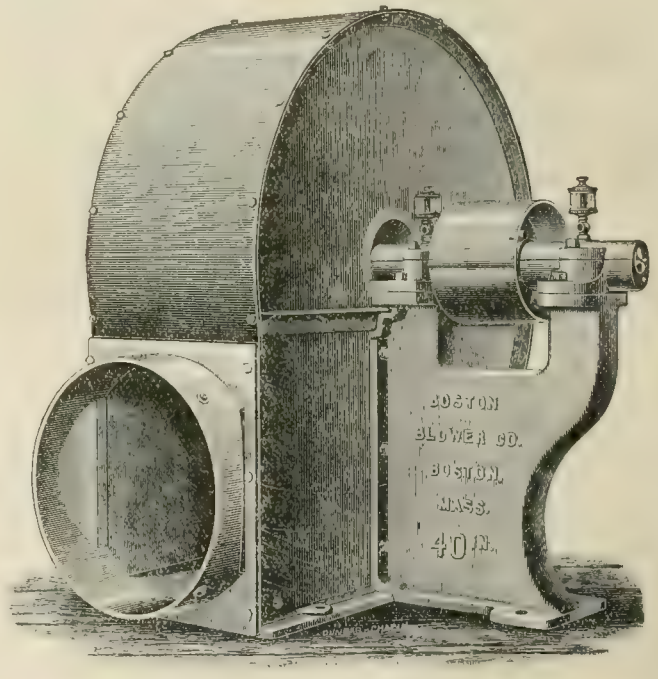
Since this article was written news comes from Bohemia that a method has been introduced by Carl Wittgenstein of Rudolfshutte, near Teplitz, by which means sheets about 150 feet long and No. 20 gauge are produced directly from the ingot with only one intermediate reheating, but so far the output has only reached 30 tons per day. Five stands of rolls are used and they are placed in continuous order. Nearly all the labor is performed automatically and only a few men are employed. Considering the enormous expense of the plant the output ought to be considerably over 30 tons per day to prove a paying investment. It will be noticed that sheets are only reduced to No. 20 gauge by this method. If Americans ever adopt this process they will have to use their wits and devise means for reducing sheets to much lighter gauge, as more sheets are sold lighter than No. 20 than are sold of heavier gauges.

A dozen or more different methods of rolling sheets have been heard of, but the inventors have so far failed to find the man with the money and energy to test their ideas. When that man is found we may hear of important sheet mill progress.

The Boston Steel Plate Exhauster.

The exhausters made by the Boston (Mass.) Blower Company are intended for removing shavings and sawdust from wood working machinery; dust from tumbling barrels or emery wheels, and for use in connection with hot-blast apparatus for conveying and distributing heat to hot rooms or dryers. They are made either single or double, and have heavy steel plate cases and jackets secured to angle irons. The angle iron to which the jacket is fastened is on the outside of the case, making it easy to remove if necessary, and at the same time giving a smooth and unobstructed surface on the inside of the machine. The fan wheels are made on heavy T-iron arms, which are cast into a solid cast iron hub, the floats and side plates being securely riveted to the same. These wheels are carefully balanced, as are also the pulleys. The shafts are of steel and the bearings, which are long, are provided with adjustable sight feed oilers.

The hanger, which is bolted to one side of case and extending to the floor, is a heavy iron casting of the box pattern cored out inside, thus securing a very rigid bearing and true alignment.



THE BOSTON STEEL PLATE EXHAUSTER.

A cement, which is said by an exchange to possess specially valuable properties for steam pipes in filling up small leaks, such as a blow hole in a casting, without the necessity of removing the injured piece, has been compounded. The cement in question is composed of 5 pounds paris white, 5 pounds yellow ocher, 10 pounds litharge, 5 pounds red lead and 4 pounds black oxide of manganese, these various materials being mixed with great thoroughness, a small quantity of asbestos and boiled oil being afterward added. The composition as thus prepared will set hard in from two to five hours, and possesses the advantage of not being subject to expansion and contraction to such an extent as to cause leakage afterward, and its efficiency in places difficult of access is of special importance.

Arthur B. Clarke, president of the Old Dominion Iron & Nail Works Co., Richmond, Va., visited the World's Fair some weeks ago, and on his return secured a large hall and delivered to the employees of the company, their families and other invited guests, a lecture on the great fair, which was richly illustrated with large stereopticon views. The instruction and entertainment was so popular that Mr. Clarke has been induced to repeat it several times with admittance charges, the proceeds being devoted to charitable objects of that city. Wherever delivered the houses are crowded, and many who could not visit the fair have had an enjoyable and instructive substitute. The interest thus shown in the pleasure and instruction of employees is worthy of a special commendation and might with advantage be imitated by other manufacturers.

The World's Fair Diploma.

Through the courtesy of the *Inland Printer* of Chicago, we print herewith a *fac-simile* of the diploma granted by the World's Fair, the accepted design being that of Will H. Low, New York. There seems to be considerable misunderstanding concerning the awards made. Announcements that a manufacturer has received the "highest award," the "first prize," &c., are not justified except under special circumstances. Every exhibitor obtaining an award at the World's Fair will receive a medal and a diploma. There is only one medal, bronze. All receive the same. It conveys no statement as to rank or relative quality of the exhibit. The only distinction there is lies in the wording of the award which is engrossed on the diploma. This is the finding of the jury. If the claims for superiority allowed by the jury, as forming the basis upon which the diploma has been granted, are clearly greater than those of any competitor, the manufacturer may be justly entitled to the assertion that he has received the highest award. In view of the large number of awards granted, successful exhibitors will closely study the verdict of the jury in their own case and in that of rivals.

THE WORLD'S FAIR DIPLOMA.

A Liverpool, England, hotel has put in some penny in the slot gas fires. This system is applied so that a fire in the grate can be turned on when required. The experiment has been tried in one bedroom for 12 months and having proved satisfactory the machines are now to be put into every bedroom of the hotel.

THE RETAIL STORE.

Exhibit Stand.

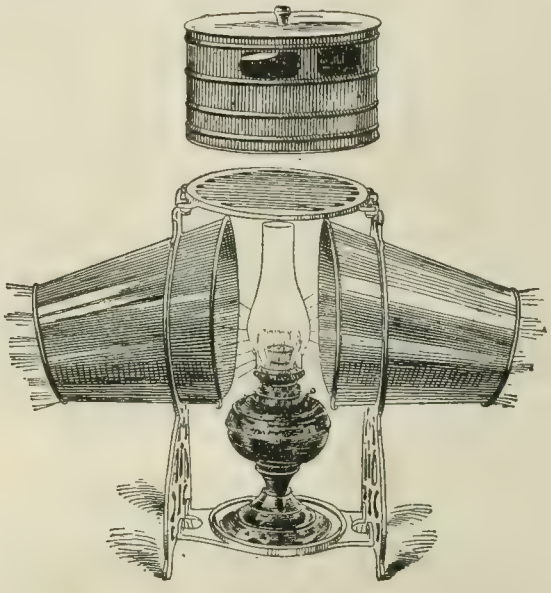
Silver & Co. of 20 Warren street, New York, are putting on the market wrought iron stands for the exhibition of whatever goods a tradesman may have for sale. The illustration presented shows one of the exhibition

Exhibit Stand.

stands displaying their Royal Roaster. The stands are made with three or four uprights and with different number of shelves. They are japanned in different colors and ornamented. The stands are adapted for the display of crockery, hardware, household goods, and, shown with a line of Britannia tea pots, present a handsome appearance. They are made in standard sizes, but special sizes can be furnished if ordered in sufficient quantity.

The Climax Lamp Stove.

Clarence M. Kemp, 101 North Frederick street, Baltimore, Md., has just placed upon the market a lamp stove of novel construction, intended for heating, lighting and cooking purposes. The illustration which we present shows so clearly the general arrangement of parts and the method of operation that extended description is unnecessary. Simply removing the top or heating drum discloses a large grate, which can be used for boiling, baking, roasting, heating flat irons, &c. The manufacturer states that the frame work is sufficiently strong to sustain a weight of over 100 pounds, and that the device can be set on the floor or on a table, as

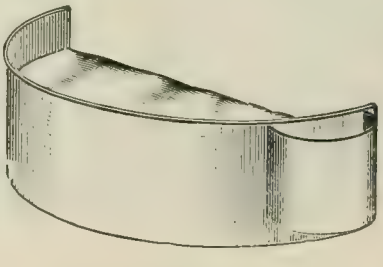


The Climax Lamp Stove.

may be most convenient. From an inspection of the cut it will be seen that the position of the lamp is such that it can be instantly removed without disturbing other portions of the stove. Mr. Kemp states that this stove does all that any other lamp or oil stove will do, and in addition warms the feet, as it throws the heat to the floor.

Patent Scrubbing Protector.

The illustration herewith shows a patent scrubbing protector invented by Mrs. Sarah Waterman, 722 Van Buren street, Milwaukee, Wis. It consists of



Patent Scrubbing Protector.

a galvanized iron tray, semicircular in shape, and a cushion. It is 2 feet long, 1 foot wide and 7 inches high. The tray is so made that no sharp edges are left to scratch even a polished floor. In use it brings the weight of the body entirely on the knees, which rest comfortably on a cushion instead of on the hard floor, and by its hight relieves the feet and toes of a disagreeable, cramped position. Probably more important is the protection from wet skirts and clothing it affords. It is provided with a cup at one side for holding soap or a scrubbing brush, and a ring for hanging it up when not in use. The right to manufacture and sell it in New York City has been sold to E. Ridley & Sons, corner Grand and Allen streets.

MEMORANDA.

THE HARDWARE FIRM of Heacock & Durfee of Gloversville, N.Y., have been dissolved. The first named will, however, continue the business.

TRACY BROTHERS, Ballston Spa, N Y., stove and hardware dealers, have completed in the rear of their mammoth store a splendid new storehouse to take the place of the one recently destroyed by fire.

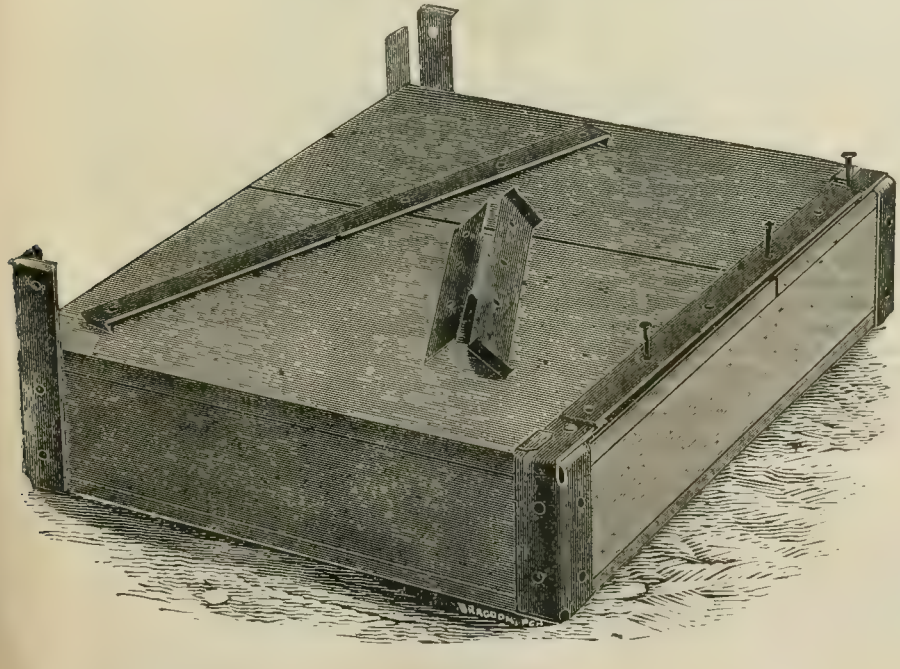
BRADLEY & HUBBARD MFG. COMPANY, 26-28 Park Place, New York, have rehabilitated their extensive display rooms, renewed their samples and otherwise completely effaced the ruin accomplished by the recent fire. On entering from the street, at the foot of the stairs leading to the main floor, they have a large show window which is kept brilliantly lighted by electricity so as to effectively display the high class goods, consisting of Lamps, Shades, Statuary and other articles contained in it. On the floor above, where their line is really seen, will be found some very recent attractions in the way of Venetian Iron Work in dead black. Many of these goods are not of the customary wrought iron, but have been successfully made of cast iron to resemble the genuine and more expensive goods. These wares are offered at approximately one half the usual cost.

Among the kinds of goods treated in this manner may be mentioned Andirons, Fenders, Fire Sets (including Shovel, Tongs and Poker). They have likewise brought out lines of goods of cast iron finished in brass plate, which for delicacy of treatment and excellence of design will readily pass for real cast brass.

Meriden Bronze Company, 30 Park place, New York, in addition to several other recent departures in the way of supplementing their already large line of fine lamps, table and art goods, have just brought out an assortment of hall lanterns for gas in Venetian wrought iron work, consisting of many attractive shapes and designs in dead black finish. There are also a number of chandeliers for gas of the same character of workmanship, together with a line of chandeliers of the same sort, finished in real gold plate, some of which also combine onyx effects. These goods were all prepared for the current season's trade and have just been placed in their showrooms.

Box Strap and Corner Iron.

The accompanying cut represents a box strap and corner iron being introduced by Dunshee & Snowden, McKeesport, Pa. One of the straps and one of the corner irons are shown across the top of the box, in the cut, while straps and corners are fastened to the box, to show the manner in which they are applied. After the corner piece has been nailed in position its wings or ends at

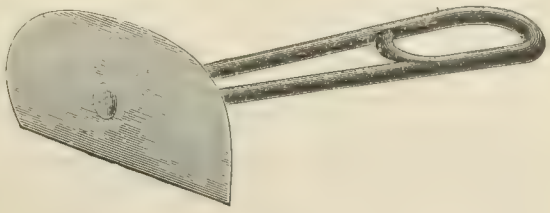


Box Strap and Corner Iron.

top and bottom are bent across one another. One of the wings at each end has hook shaped ends, which are engaged with similar hook shaped ends on the strap pieces when put in position on the box and then hammered together. The straps and corners have countersunk holes, to allow the edges of the holes to be driven into the wood, and to prevent the nails or screws projecting beyond the surface of the metal. The side edges of the straps and corner irons are beveled or curved, to prevent the otherwise sharp edges of the irons catching against persons or other boxes, and to provide runners upon which the boxes may be easily slid. The object of the device is to adapt boxes of somewhat frail construction to receive and transport materials of great weight. The manufacturers remark that the straps and corner irons are well adapted to boxes for tin plate, as shown in the cut, and that the corner irons and bottom strips are best put on during the construction of the box. Straps and corner irons suitable for boxes of any size are made to order.

Smith's Novelty Scraper.

Fernando B. Smith, Canton, Ohio, is putting on the market the scraper herewith shown. The scraper is well and strongly made, a steel blade being attached to a malleable iron japanned handle. The manufacturer remarks that with it any kitchen utensil can be cleaned, whatever its shape—corners, angles, flat and round surfaces, any kind of kettles, sinks, chopping bowls, tables, cupboards, molding boards, rolling pins, bread and pudding pans, &c. It is further remarked that fish are easily cleaned with the scraper, and that it will be found useful for scraping walls preparatory to papering. The point is made that in its use the hands are not soiled, as it is not necessary to put them into hot or greasy water, and that all danger of cutting or burning the hands or tearing the finger nails is avoided.



Smith's Novelty Scraper.

According to the calculation of Shelford Bidwell there are no fewer than 200 tons of sulphuric acid in the air of London on a cold day.

Linenoid Goods.

Crane Brothers, Westfield, Mass., manufacture a line of goods made of linenoid, including seamless pleasure boats, canoes, warehouse and mill baskets; butchers', grocers', bakers' and laundry baskets; desk, office and school baskets; bathtubs, washtubs, umbrella holders, &c. The manufacturers state that in making linenoid nothing is used but the strongest new linen stock, such as linen threads, canvas cuttings, &c., which, after being reduced to pulp in a beating engine, and chemically treated to render it impervious to water, is run on a cylinder machine into endless sheets of any size and thickness. It is then molded on wooden or iron forms, subjected to great heat and pressure, which, it is stated, results in a material that cannot be broken; that is light, tough, water proof, durable, taking a high polish, and similar in appearance to rawhide. It is remarked by the manufacturers that owing to their method of molding boats on forms, and thus making them seamless, they have what makers of wooden boats have been aiming to produce for years—absolute freedom from leakage. Another advantage mentioned is that, as there are no seams to open, the boats are not affected by heat or cold, will not warp, crack or split, and gain no weight by use.

Improved Lamp.

Clark Bros. Lamp, Brass & Copper Company, 43–45 College Place, New York, and Trenton, N. J., whose plant is operated by the American Lamp & Brass Company, are introducing an improved center draft lamp, the main features of which are alluded to by them as follows: The fount has sufficient oil capacity to burn eight hours. There is a patented feeder cup, with double seating, making it oil tight, also a lift guide of extra length. A patented concave chimney gallery contains 1080 extra large perforated air conductors, making, it is remarked, by improved combustion a reduction in heat equivalent to 40° F. by actual test. There is likewise a new chimney lift and beaded top center tube to keep the flame spreader from direct contact with the wick, thereby preventing the weeping of oil down the center tube. It is also provided with an improved wicking device. This lamp carries an 8-inch wick.

Immigration returns for October show the number of aliens entered during that month to have been less than half the average for the season. Last year 36,798 were landed in October, but this year the number sunk to 15,466. The authorities attribute the falling off to the business depression in this country having prevented people from sending prepaid passage tickets to their friends in Europe.

STOVE TRADE NOTES.

Future of the Hot Air Furnace.

By A. W. Glessner,

President of the Excelsior Steel Furnace Company.

CASINGS.

In any discussion of the furnace question the casing should receive consideration, not that it is such an extremely important part of the equipment of the hot air furnace, but rather because it is one factor of the whole and contributes its quota to the success or failure of the completed apparatus. The casing, like all other parts of the modern hot air furnace, has had its evolutions and traditions, but it may be said to have at last settled down to its original form —the single casing—with some modifications, which will be referred to further on. Russia or smooth refined iron, I am told, was used for the first casing, but galvanized iron soon replaced that metal, probably owing to its cheapness as compared with the first and its superior appearance as compared with the second metal, and galvanized iron has continued in use, except for room heaters, for which Russia or American planished iron is still used.

The single galvanized iron casing is open to the objection of radiating into the basement too large a proportion of the heat generated by the furnace, and to avoid this loss by radiation the double casing was devised, consisting of an inner casing of black or galvanized iron about 2 inches smaller in diameter than the outer one and held in position by the same rings. This is a great improvement over the single casing. One disadvantage urged against the adoption of the double casing was the taking of valuable space by the inner casing.

In many constructions of furnaces too little space is provided between the fire pot and radiator and the casing, with the result that it is often impossible to admit a sufficiently large volume of air to pass up through the furnace, and this leads to the heating of the air supply to a degree of temperature entirely too high to be consistent with first class heating, and the double casing was found to aggravate this frequent trouble. Complaints of this nature probably led to the substitution of corrugated tin lining, which has found a place in a very large proportion of the casings now made in cities where there is a call for a casing better than the ordinary common single one. This lining takes up little room, is effective, and above all, inexpensive.

One manufacturer of furnaces, I have been informed, has made thousands of yards of this corrugated tin lining and supplied the same to his customers at a nominal figure, owing to the fact that the use of the lining would make the work of his furnace more satisfactory and he could in consequence afford to forego all profit on the lining if he could get his customers to use the same on the casings which they made.

Another form of modern casing, and one which is growing in popularity very rapidly, is the single casing lined on the inside with two or more thicknesses of asbestos paper. This form of casing has been brought to the attention of the trade within the last 12 months and presents advantages over any of the casings heretofore described, for the reason that the paper occupies less space than the corrugated tin lining and at the same time is more effective, as paper is recognized as one of the best insulating materials that can be employed in connection with heating, whether by hot air or steam.

The discovery of asbestos has led to the production of many materials now used by heating engineers, and the placing on the market of a paste for attaching asbestos paper to furnace pipe and casings has made possible the construction of the improved furnace casing referred to. In point of cost the single casing lined with asbestos paper has the advantage over either of the casings referred to.

One peculiarity of the furnace trade that has been often remarked is that the best country trade as a rule uses a higher grade of material for the equipment of the modern furnace than the ordinary city trade, which is due in part to the fact that in large cities the house builder puts up buildings in long blocks and has brought the construction of such buildings to a science, and while putting them up so as to present a good appearance and equipping the same with appliances that will undoubtedly do their work, everything has been whittled down to the lowest possible cost and the slight extra cost of the improved casings and bonnets has been such as to prevent their use in a very large portion of the houses erected in the large cities. This is to be regretted, but nothing can be done to avoid the movement now in progress in the cities to take the building of homes largely out of the hands of the individual house owner and we must probably look to the country for the adoption of furnaces and fittings of the highest class.

(THE END.)

Jubilee of the Brand Stove Company.

The Brand Stove Company of Milwaukee, Wis., celebrated the twenty-fifth anniversary of the establishment of the enterprise on Saturday last, the 11th inst. We acknowledge the receipt of an invitation to be present, and regret that owing to the pressure of other business *The Metal Worker* was unrepresented. The invitations were souvenirs of the event, being handsomely gotten up. Cards were inclosed with them giving views of the stove plant in 1868 and in 1893. The contrast thus made is marked. The works in 1868 were very modest, consisting of two one-story buildings forming an L. Now the plant, which stands practically on the same site, covers a whole block, most of the buildings being from three to five stories in hight. The following account of the celebration on Saturday is taken from a Milwaukee paper:

The Brand Stove Company celebrated their twenty-fifth anniversary yesterday afternoon and evening with a banquet to their employees and to their friends and patrons. A space had been cleared in the north end of their large new storeroom at Sixth and Prairie streets and fitted up with tables in the shape of a right angle. The tables contained a delicious spread. Potted plants, flowers and ferns were arranged along the center of the tables and on the window sills. At a short distance from the festive board was seated Professor De Bona's band, which discoursed pleasant music.

A prominent feature of the celebration was the presentation of a gold watch and chain to the head of the firm, Sebastian Brand, by his employees. Vice-President Julius Goldschmidt, late United States Consul-General at Vienna, Austria, presented Mr. Brand with the gift and delivered a happy speech in which he congratulated Mr. Brand upon his success and the harmonious relations which had always existed between him and his workingmen, who to-day, tendered him a slight token of their esteem. Mr. Goldschmidt regretted that Frederick G. Brand, the secretary of the firm, was prevented by sickness from attending the silver jubilee of the concern. President Brand responded by saying that he felt proud of the friendly relations existing between the firm and its men and among its officers, and he felt deeply moved by the manifestation of esteem shown by his men.

The Brand Stove Company were incorporated in 1883. Previous to that time they existed as Brand & Co., who began operations on November 11, 1868, with 20 men, and whose total output for the first year did not exceed $5000. The firm now employ between 250 and 300 men, and the value of their annual output exceeds $250,000.

Among the invited guests present were Mayor John C. Koch, Ferdinand Kieckhefer, Charles S. Schmidt, Henry Bielefeld, W. H. Simpson, John Pritzlaff, Lorenz Maschauer, William Jahns, J. B. Kalveiage, August U. Krueger, Christ. Koerner, Herman Jacobi, Gustav Kayser, Henry Uecke, John Hern, Charles Hilgendorf, John F. Sivyer, Emil Weisskirch, John Graf, Philip Gross, Charles Foster, Charles Schloessing, F. Harnischfager, Henry Froedert, Jacob Knoernschild and John F. Helm.

Edward D. Ransom.

Edward Delavan Ransom, one of the most enterprising and popular citizens and business men of Albany, N. Y., died on Sunday, November 12, at his residence, 202 Lark street. He was apparently in his usual health upon retiring Saturday evening, but at 11 o'clock he was taken sick, and at 4 o'clock death ensued, the trouble being hemorrhage of the brain. Mr. Ransom was born in Ballston in the year 1851, removing early in life to Albany, where he resided until the time of his death. His connection with the stove trade was principally through his business in foundry facings and founders' supplies, although he was with the Ransom Stove Company and later with the Ransom Stove Works for a number of years in the capacity of general superintendent. In 1882 he formed a partnership with Samuel Charles under the name of Charles & Co., but on the death of Mr. Charles in 1883 the firm of E. D. Ransom & Co. was organized, with James D. Wasson as partner. In the year following J. S. Ransom was admitted, Mr. Wasson retiring in 1885. The two brothers conducted the business of foundry facings and founders' supplies until May, 1890, when E. D. Ransom became sole proprietor.

Mr. Ransom was a man of sterling

qualities, honorable and upright in his business relations and genial and popular in his social life. He was a member and trustee of the Second Presbyterian Church, a member of the Fort Orange Club and of Company A Old Guard. He leaves a widow and a son. The funeral services were held on Tuesday, November 14, from his late residence.

William V. Channon.

The stove trade of the West will learn with regret of the death of William V. Channon, president of the Channon-Emery Stove Company of Quincy, Ill. Mr. Channon, whose portrait we present herewith, was ill but little more than a week, and his condition was not considered serious until a day or two before his death, which occurred at 4 o'clock on the morning of Thursday, November 9.

WILLIAM V. CHANNON.

He was born in the town of Honiton, Devonshire, England, on November 26, 1812, and was therefore 81 years old at the time of his death. He was educated in the schools of his native country and later learned the trade of paper making in Devonshire. In the year 1841 he came to America and went to Philadelphia to seek employment at his trade. As nearly everything was imported he found it difficult to secure work, but after a faithful search he finally secured a situation in a wholesale dry goods house, where he remained several years, serving in various capacities. His ambition, however, was to locate in the West, and in August, 1848, he went to Quincy, Ill., where he found trade dull and the outlook rather discouraging. Being possessed with a determination to succeed, he served in various capacities until 1852, when he obtained steady employment in what was known as the Comstock Foundry. He remained with Comstock & Co. until 1865, when he entered the new foundry of Bonnett & Duffy, where he was engaged for four years. He then returned to the Comstock Foundry, which had been reorganized, remaining there until he and Joseph W. Emery constructed their foundry at the corner of Fifth and Ohio streets. When the stock company was formed Mr. Channon was elected president, which position he occupied at the time of his death. Despite his advanced years he was active in his business, and under his management the company rapidly increased their trade, which extended to all parts of the country.

The funeral services were held at 3 o'clock on the afternoon of Saturday, November 11, at his late residence, 217 South Eighteenth street.

That Curious Old Stove.

We have a letter from Leicester Allen, Brooklyn, N. Y., in which he says:

The old stove noticed and illustrated in the issue of *The Metal Worker* for November 11, is not the only one of its kind that could be unearthed in the United States. I recognized the design at once as an old acquaintance of my boyhood's school days. As late as 1838, in a country schoolhouse in the town of Smithfield, Madison County, N. Y., the head of the continental soldier (who had suffered decapitation by a crack in the back plate extending entirely across) was a favorite mark for the mischievous schoolboys—of whom I was one—seated on the back seat of that time honored institution of learning. As the inhabitants of that locality were never noted for liberality in the matter of furnishing schoolhouses, this old stove may be there yet. The plates were enormously thick—I should think at least 1¼ inches. Whence it came or who manufactured it I am unable to say. It was undoubtedly one of the earliest specimens of iron founding in this country, provided it was made here at all, which I do not regard as improbable, as the design strongly indicates an American origin.

The Portsmouth Stove and Range Company

of Portsmouth, Ohio, have issued a very neat catalogue illustrating and describing their leading specialties. The place of honor is given to the Northern Queen, a four-hole range embodying the modern features and ornamented in an attractive manner. It is made in several sizes and various styles, some of which are illustrated. The Southern Queen is a companion to the stove just described and is made in the usual varieties. Among the cook stoves we find the Northern Queen, a substantial four-hole construction offered in several sizes; the Southern Queen, intended for burning coal or wood; the Exposition, the Welcome, Domestic, Derby and Queen. A four-hole construction intended for burning wood only is known as My Queen, and has the same sheet flue construction employed in connection with the Northern Queen coal range. The decorative features are also the same as that of the stove mentioned. Some of the other goods include the Victoria, Arcade, Indianola, Excel and Relief cook stoves; the Guarantee, a neat square cottage parlor heater; the Franklin, an attractive open stove; the Pansy, a sheet iron cylinder heater; the Climax box, the Mogal, Erie, Burnside, Star and Spray globe and cannon stoves. Some designs of square and oval grates, sugar kettles and price-lists of hollow ware, &c., complete the catalogue, which is printed on good paper and bound in colored paper covers.

ODD PLATES.

Buck's Stove & Range Company, St. Louis, Mo., favor us with a copy of the Kansas City *Star*, printed at Kansas City, Mo. The entire back page of the paper is occupied by an advertisement of Buck's stoves and ranges by the J. H. North Furniture & Carpet Company, who are agents for these stoves in Kansas City, Mo. The advertisement referred to is one of the most striking we have seen for some time, there being 18 trade-mark cuts and 21 stove cuts, making a page that is at once unique and effective.

Special dispathces to the Indianapolis papers state that on November 9 a suit was instituted for the appointment of a receiver for the Wells Mfg. Company, proprietors of the Greenfield Stove Works, at Greenfield, Ill.

The Norcross Regulator Company, 6 Friend street, Boston, Mass., have bought out the furnace business formerly carried on by Moses Pond & Co. at 79 Blackstone street, and will continue the manufacture of Pond's furnaces and ranges, with foundries at South Newmarket, N. H., and East Bridgewater, Mass.

During the recent fair held at Dallas, Texas, Sam Shannon, Texas representative of the Excelsior Mfg. Company, St. Louis, had his hands full with a party of Shriners from Galveston. Mr. Shannon showed the Shriners all the sights of Dallas, and all those acquainted with the genial Sam know that those under his care had a good time.

W. M. Barber, representing the Smith & Anthony Company of Boston, Mass., was in Waterbury, Vt., recently looking after the installation of the heating apparatus in the asylum buildings, for which the company named have the contract.

The Peninsular Stove Company send us from their Chicago office a four-page folder illustrating and describing their new Radiant Peninsular furnace, which is claimed to be a quick and powerful heater, adapted for burning hard or soft coal, coke or natural gas. One of the special features to which attention is invited is the return flue radiator, the arrangement of parts being such that the heat makes a complete circle before reaching the smoke pipe. Another feature is the company's patent duplex grate and annular shaking ring, so constructed as to prevent the accumulation of clinkers and cleansing thoroughly the fire pot of all dead matter. The device is self mounting, requiring therefore but a few seconds to remove the entire grate through the ash pit door. The makers state that it can be replaced with equal facility.

The Chicago & Erie Stove Company of Erie, Pa., have issued a neat circular calling attention to their line of gas ranges with steel oven improvements, for which they make many claims. The circular states that by the company's plan retail dealers can show cast ranges in the same style, shape and finish as steel ranges, with quick oven, without extra cost to them. The goods are made in many styles and sizes, with four and six holes. Dealers who have handled these ranges refer to their operation in very flattering terms, and the company expect a large business.

The Excelsior Steel Furnace Company, 110 to 114 South Jefferson street, Chicago, have just started a new machine of their own design and construction which double seams five joints of furnace pipe at one operation. It not only does its work beautifully but rapidly, turning out about 15,000 feet of pipe per day.

Mrs. Sarah Waterman of 722 Van Buren street, Milwaukee, Wis., the well-known inventor of the Waterman adjustable interlocking stove cover and several other useful household articles, has recently been granted patents for a patent ash receiver for stoves. It is calculated to decrease the space required for setting a stove by doing away with the end hearth and deep hearth of cooking stoves and ranges, which are easily broken in shipment and are difficult to replace. It is also adapted for use with heating stoves and is intended to relieve the task of removing ashes from stoves of much that is disagreeable and to entirely avoid the dust that makes so much work for the housewife. It consists of three parts and requires the stove to be made with a hole in the bottom under the grate and three ledges or grooves and low, wide slots at the front. The first part is a thin grating that slides in and out under the hole in the bottom through one of the slots at the front and is used as a sifter. The second part is a thin plate that entirely closes the hole in the bottom or when pulled out through one of the slots at the front lets everthing fall into the ash receiver beneath. The ash receiver is a drawer more or less deep that slides on grooves and can be removed without raising any dust.

Luther & Lederhos, 30 Cliff street, New York, manufacturers of gas and oil stoves, have placed on the market the Brilliant Star gas heating stove, which possesses many new features. It has a door for lighting, which the makers state is a great improvement, as it not only answers the purpose of lighting, but at the same time one can readily see that all the jets are burning, which in the old style is claimed to be impossible without getting down on the knees. A polished nickel rim on the top gives a fine effect. In the door is a star, and with the body of flame back of it one may see that it is what the name implies, a "Brilliant Star." It is made in five sizes.

One of the departments of Rathbone, Sard & Co.'s stove manufacturing plant, at Albany, N. Y., has closed down until spring, causing the laying off of about 200 employees.

The foundry of the Bussey & McLeod Stove Company, Troy, N. Y., was damaged by fire on the evening of November 9. The fire originated on the fourth floor, in the mounting department, and is supposed to have been caused by sparks from the cupola falling among a lot of patterns. The watchman discovered the blaze and was nearly overcome by the smoke. The fire was conquered after an hour of hard fighting. The damage to the foundry will probably reach $1000, as many valuable castings were damaged. The works had only resumed operations the day previous.

Some time since an article appeared in one of the Cincinnati papers intimating an attempted reduction of wages on the part of the Favorite Stove & Range Company of Piqua, Ohio, and the employment of convict labor, which has brought out from the concern named an emphatic denial that any such step was contemplated, and that no one connected in any manner with the company "ever thought of employing convict labor." The company say that there was a slight difference in the price of molding hollow ware between this foundry and others making the same class of fine ware, but that this difference was adjusted in a pleasant and entirely satisfactory manner without the least disturbance. The company also state that they operated their works the entire year of 1893, in addition to increasing their capacity largely, and worked full time with a complete force of hands, consisting of about 350 employees. The statement is also made that convict labor could not make Favorite stoves and ranges, as it requires the most skillful workmen which the company can employ to produce them. In the letter which the company issued in regard to this matter they conclude as follows: "There is not the least indication of any disturbance in our labor circles, hence the article referred to is false in every particular."

J. Allison Orr of the Mount Penn Stove Works, Reading, Pa., has been in town during the past week calling on his friends in the trade. During his stay in the Metropolis he was the guest of Sam S. Utter.

The business of the Kearns Wrought Steel Range Company, manufacturers of steel ranges and hot water stoves, with office and store at 1020 Arch street, Philadelphia, and factory at Burlington, N. J., has been sold out to John J. Kearns and Charles Rudolph, who will in future carry on business under the name or style of the Kearns & Rudolph Range Company. The members composing the new concern are men of practical experience, and the business under their management will doubtless continue its rapid growth. It is the intention of the partners, in addition to the already large stock of goods carried, to carry a complete line of culinary utensils, in order to enable them to fully equip hotel and family kitchens with all the appliances known to culinary science.

W. H. Whitehead of the Chicago & Erie Stove Company spent a portion of the past week in Chicago. Mr. Whitehead takes a philosophical view of the situation in the stove trade, and discourses cheerfully regarding circumstances commonly considered discouraging.

The Michigan Stove Company are distributing book marks to their customers to be used as advertising devices. They are furnished in sets of four. They are made of fine paper, lithographed in imitation of silk ribbon, each bearing a pleasing picture of a child on the obverse side. The reverse is devoted to some remarks concerning Garland stoves and ranges.

We are indebted to McKenney & Waterbury of 181 Franklin and 164 Congress streets, Boston, Mass., for a copy of the fall and winter catalogue which they have just issued relating to gas stoves. The lines shown cover heaters of various description, together with gas radiators, gas burners, tubing, &c. The Brilliant Star gas heater is first considered, following which we find the Home Comfort, the Enterprise reflecting gas heater, the Pilot, a sheet iron cylinder stove, the Enterprise gas log, the Eclipse and the Charm. In connection with the illustrations is presented brief descriptive particulars, together with prices of the various sizes in which the goods are made.

A recent issue of the Portsmouth *Blade*, published at Portsmouth, Ohio, contains a somewhat lengthy reference to the Portsmouth Stove & Range Company, who are referred to as "one of the two establishments in the State that never banked their fires on account of the scarcity of money, want, general distress and bankruptcy that have strewn the channels of commerce with wreckage the past four months the country over." The article states that the goods of the company are in demand in many sections of the country, and that the makers have at times been embarrassed in their efforts to promptly fill orders. The statement is made that something over six weeks ago they were compelled to call in their traveling men on this account, and that the company are now working more men than ever before. Their shipments for the month of October are said to have exceeded the sales for the same period in any year since they commenced business.

Mrs. Granville G. Hallett, the widow of Mr. Hallett, whose death was noticed in *The Metal Worker* of November 4, will, for the present, continue the business of her late husband at 92 Beekman street, New York City. Mr. Hallett's name is well known in connection with the Hallett ranges and the Hallett caboose stoves. He was also agent for other goods, and Mrs. Hallett will carry on the business, as it was her husband's wish that she should do so.

In the infringement case of the estate of P. D. Beckwith *vs.* the Detroit Stove Works, the United States Supreme Court handed down a decision on Monday, the 13th inst., in favor of the defendants.

Around the World in a Day.

BY JEEMS.

Eighty days is considered pretty good time to get around the world and you have to be humping yourself to do it, without leaving much time to look at anything. You can take a peep at things as you pass by, but not much more. A good many people only had a day at the gigantic Chicago fair, but if they even took a squint or half a squint at things, it was equivalent to a trip around the world. In fact, outside of land and water views, you could see more in one day in Chicago than you could on an 80-day trip around the world. The fact is, every one who saw Chicago's stupendous exhibition has seen all the world and more, too, while those who did not see it have missed the trip, and a trip that they may never have an opportunity to take again.

To Chicago belongs the credit of giving to the world at large the greatest object lesson ever projected, and let us all honor her for it. It is very easy for critics to say how it ought to have been, and no doubt many improvements could be made now, but to do what has been done Chicago deserves the admiration and respect of the people of the United States, which is but a small recompense for this gigantic work. As so much has been written about the fair by experienced people and so many have seen it, any description of it by me would be superfluous, but I would like to add an humble testimonial to its great worth, as I had an opportunity to accompany the boss over to the last two Paris exhibitions and to the New Orleans show, and last, but not least, to the great World's Fair, at Jamaica, W. I., where a good many of the natives felt that they had a show "of course not so great as Paris, but we think it is very fine," as one of the natives told me, but really it was not much more than one of our populous county fairs in point of attractions; and while nothing could be said or written by me of Chicago's pride that would add one iota to its fame, still I find it a great pleasure to testify to its grandeur and superiority to anything that has ever yet been attempted of this kind by any nation. Of course, there is a hypercritical, captious set of people, who, had they been consulted, could have put the thing in a real proper shape; but as they were not asked for suggestions they think the thing is tolerable, but—. The world is full of them; if they could get hold of the Lord they think they could just put Him on the right road to run the universe. No doubt they are very good men, but they "can't keep a hotel," as Jerry Bryant used to say.

LEARNING TO SPEND MONEY.

Some of the stove men in Chicago say stove trade is poor because the people "spent their money in going to the fair and can't buy stoves, &c.," and other traders say the same thing. I don't believe any such theory. It seems to me when the cold day comes that stoves will be bought if they mortgage the farm. Why, the people are just seeing how to spend their money. A new era of wants will arise; more than that, they will be supplied. The visitors had their eyes opened and saw the wonders of the world, useful as well as ornamental. While the inventors and schemers were busy studying out points for the future, others were making up their mind what they would have and what they would like to have if they had the money, and when they get it they will buy, and those that have got it will begin to get their wants, and spending money will be more in order than hoarding it. We are a nation of wanters and spenders; trot out your goods, &c., and they will go into circulation.

This is what is going to give an immense impetus to the growth of the United States. Agriculture, mining and manufactures will be stimulated beyond anything we have yet experienced. Millions of people have seen the products of the world in every department that they never dreamed or thought of; and further, many people who have hoarded money will begin to spend it, as stated before, because they have found an entirely new set of wants. New homes, new furniture, new clothes, new everything will be demanded, &c., and a mighty ball will be set in motion that will send the country along at a tremendous rate. How it is possible for any one to have seen this huge show and not feel this way I cannot conceive. If you find croakers predicting ruin and desolation set it down as a rule they did not see the fair.

All this will be done, not by the great political parties and politicians who are continually reminding us of their great value and how they make the thing go. It will be carried on by the people who can and are running their own affairs, and have done it in spite of these great claimants. So, I say, heap the honors on the people of Chicago; you can't say too much. The fact is, the Government of the United States should pay the whole bill, for the country at large is the gainer by the vast exposition.

AVE CHICAGO.

There is one thing the Chicago people appear to derive intense satisfaction from—that is, that the great exhibition has demonstrated their superior ability to the effete East, and, while they are booming ahead, the East is sinking out of sight. But west of Chicago the same feeling exists; they are the coming man and Chicago is in the rear. This intense love and confidence and continuous lauding of the West is good solid business drumming; it catches on and sinks deep in the hearts of the wild and woolly Westeners. The finest exemplification of this talent was given by the old gentleman who lectured on the car which contained the products of the country traversed by the Northern Pacific road. There was a continuous crowd passing through the car, and the solid facts and figures which he slung at them were overwhelming, advancing the claims of his great territory, the "land of four seasons," as he termed it, and the way he socked it to the East was a caution. I sat in a chair and enjoyed the lecture hugely. In fact, it made me feel bad because my native land was the Bowery, and I felt myself wanting to fly to the "four season country," but—upon reflection—he never mentioned that they had a Bowery, and I thought after all that a Bowery of one season would be better suited to one of my youth than the quadruple arrangement so eloquently sat forth. While ruminating on the matter I was much startled to hear the vehement and stentorian lecturer—for he put as much energy in his speech as if he was addressing a political meeting—say, "Why, we have kept the Chicago people from being paupers; yes, kept you out of the poorhouse!" and he poured forth the reasons for it.

This surprised me, and instead of Chicago supporting the East she herself was being supported by her more vigorous Western brothers. About the size of it was that Chicago was East, and had become addicted to Eastern indolence and sloth. I am sorry he made this statement, because it will breed unhappiness. I saw several of the "four season" constituents, at least I supposed they were, looked very miserable when they found they had been working so hard just to keep the Chicagoans from being paupers. This will be a blight on their lives, and perhaps they will go home and never work any more and let 'em go to the poorhouse. Why should we trouble ourselves about keeping Chicago out of the poorhouse. It is this intense feeling and rivalry in the West that makes it grow and will continue to do it, but the East is all right, she will get her share. If we were to change the name of the United States to Chicago and number all the States as wards she would work just as hard to add Canada and South America as new wards run her famous streets from Baffins Bay to Cape Horn, and from the Golden Gate to Maine, and after she had finished would clap her eyes on Europe and divide it up in wards. The truth is Chicago wants to be the universe, and she may, but the East will get along somehow, and if she has got to be a ward of Chicago so be it. But it will be Chicago's boast at that time to say "At last we own the Bowery." Just fancy if it should take place, what a shout would go up when they reached the famous chorus of that grand old song.

IN THE MATTER OF STOVES.

Like the great exposition, there is no end to this subject, yet it had to stop and so must I. It was rather unfortunate that the stove industry in all its branches, oil and gas, cooking included, could not have been grouped under one roof. It would have made an interesting exhibit, and perhaps might have benefited export trade. The Michigan Stove Works' big stove is to be utilized as a summer residence by Fred Gardner. Fred has bought a shore front on the lake and will get the affair ready by next season. He will have it got up in real esthetic and high art style. The *salle de coal* will be fitted up in Louis Quinze fashion; the ash pan will be a picture gallery, with illustrations from the Midway—"Bedouins at Prayer," "Javanese Darning Socks," &c. The culinary department will be in the flues, and an elevator will run up the flue de smoke pipe. The poker hole is to be well supplied with chips, &c. In short, everything will be done to make it novel and interesting. On fine days the oven door side of the house will be swung wide open and the public will have the opportunity of seeing how a real first-class house should be run. As the big elephant on Coney Island is the first great wonder that all see who come over the ocean blue to the home of Chicago, as they approach the canal that goes past the village that is stretched on the Hudson opposite Jersey City, so when they reach the great Lake City they will observe this great stove as they enter it, looming up in all its majesty and grandeur, No doubt the effect will be overpowering, especially to Paddy when he first sees it. A special reporter ought to come on with the first Pats.

TRADE REPORT.

The Iron Market.

Attempts are being made to persuade people that things in the Iron market are improving, but evidences thereof are not very satisfactory. It would not require very much of a demand to start such a movement, however, and the chances in that direction are not unfavorable, but that the turn has actually been made is "not proven." Prices are in no case better than they were a week ago; there has been no general increase in the volume of business, and no tangible evidences that either of these desirable features are on the point of being immediately realized.

A more cheerful feeling has been manifested since the elections, however, and there is more inquiry for quotations, indicating that the trade are disposed to anticipate requirements, providing that developments are favorable, but confidence has not been strong enough to induce heavy purchases. It may also be noted that there is less pressure to sell, so that, taking everything into account, even if there has been no other gain, the disposition is to look for better times, rather than the reverse.

In Pig Iron there has been a somewhat livelier buying movement, notably in Cincinnati, where Pipe founders have covered the material for sales made. In Philadelphia contracts for about 24,000 tons of Cast Iron Pipe have been taken, a part being captured by a Southern foundry. Another Southern works has secured the contract at Waterbury for about 6700 tons. The Chicago market has been upset by a cut in freight rates on Southern Iron to $3.65 from Birmingham.

Pig Iron.—A very encouraging feature in the New York market, so far as the consumption of Pig Iron is concerned, is the appearance of a number of large orders for Cast Iron Pipe. Through Warren, Wood & Co. of this city, the Chattanooga Pipe & Foundry Company secured the order for 6700 tons of Pipe for Waterbury, Conn., at $23.52, delivered, per gross ton. The Howard Harrison Company of Bessemer, Ala., captured about 8000 tons of the 48-inch Pipe for Philadelphia at $24.12 per gross ton, delivered on the streets, the balance of the order, about 16,000 tons, going to Eastern shops. About 1300 tons has been closed for Burlington, Vt., and a good lot is coming up in Northern New York. We quote: Northern brands, $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

In the Philadelphia market improvement is thought to be due, but it has not responded as promptly as could be desired. In most cases orders can be placed at the same prices as last week, and, so far, no one has had the courage to ask an advance. At the same time there is less pressure to sell, and buyers may not be entirely safe in postponing their orders much longer. The market is a waiting one, sales in the meanwhile being within the following range for Philadelphia deliveries:

No. 1 Foundry	$13 75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

The most important event of the past week in Chicago was the decline in Southern freight rates of 20¢ ℔ ton to Chicago. It is expected that this reduction will only be temporary, but it has had the effect of reducing prices all along the line. It has not yet had the result of increasing sales, but it would be natural that buyers should take advantage of it as soon as the fact becomes generally known. The demand for Southern Iron for the past week has only been for small lots, although there are some inquiries for round lots which it is hoped may result in transactions at an early day. Business on local Coke Iron has been fair, but no heavy sales have taken place. The quotations made on this class of Iron are for small lots only. Concessions are given on sales of any size and in direct competition with Southern Iron prices are made to take the business. Quotations are now as follows for cash:

Lake Superior Charcoal	$16.00 @ $16.50
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 14.25
Southern Silvery, No. 2	@ 13.75
Southern Coke, No. 2	11.85 @ 12.10
Southern Coke, No. 3	11.10 @ 11.35
Southern, No. 1, Soft	11.85 @ 12.10
Southern, No. 2, Soft	11.10 @ 11.35
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.25 @ 18.50
Jackson County Silvery	16.50 @ 17.00
Other Ohio Silvery	15.00 @ 15.50

Pittsburgh advices state that while stocks of Pig Iron at furnaces are large, the increased demand for Steel and the prospect of some business in Rails is expected to lead to a material lessening of stocks before this year is out. The uncertainty existing as to what price will have to be paid for Coke after December 31 next, on which date a good many contracts expire, is having the effect of making furnace operators unwilling to accept contracts for Iron for delivery very far into next year at present prices. Quotations are as follows:

No. 1 Foundry	$12.50 @ $13.00 Cash.
No. 2 Foundry	11.50 @ 12.00 "

A considerable increase in the volume of business in Pig Iron is indicated by Southern market reports. Yet there has not been the improvement in prices that was confidently expected. The sales aggregate upward of 50,000 tons, and were largely of No. 2 Soft, No. 3 Foundry and Gray Forge, on the basis of $8 ℔ ton, f.o.b. Birmingham, for No. 2 Foundry; $7.50, and in some instances $7.40, for No. 3 Foundry, and $7 ℔ ton for Gray Forge. The purchases were made by Iron Pipe works in the East, in the West and in the South, and are for deliveries running to next May. Other than these orders there has not been much business, but there is about the usual run of orders from the jobbing foundries, but Charcoal Iron is exceptionally dull, and there are free offerings of No. 2 Foundry. There continue to be fair deliveries on old contracts. Collections are reported as all that could be desired. Quotations are as follows:

Southern Coke, No. 1	$12.75 @ $13.00
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—The market has been characterized by depression during the greater portion of the week. Although no great amount of Tin came out, there proved to have been enough early in the week to force prices down to 20.30¢ @ 20.35¢ for prompt and immediate future delivery. Toward the close of the week, however, bids were raised to 20.50¢ for spot and November deliveries, and 20.60¢ for December. Speculative manipulation, it is alleged, played some part in the turn, as well as other transient factors. In any event the movement of prices is very perplexing to the general buyer, as also the fact that the range is lower at the present time than it was a year ago. The distribution by jobbers is reputed to have been on a very moderate scale, consumers adhering to a strictly conservative policy in their orders. Prices for small lots are rather weaker, and are quoted at 21½¢ @ 22¢ for Straits Pig, with ½¢

advance for Bars. Straits shipments during first half of November, as per Metal Exchange advices, were 1175 tons, including 700 tons to Great Britain and the United States and 475 tons to the Continent. Total shipments during the corresponding period last year were 1475 tons.

Copper.—Current report has it that the Calumet & Hecla Company have effected a large sale. No particulars were divulged as to the quantity of metal involved, as to the price paid or whether home consumers or exporters, or both, were the buyers. That there has been a deal is the fact, however, since the company referred to have refused subsequent orders for deliveries this year, while other producers have marked their price up to 10¢. Other descriptions are also held higher, or say 9¾¢ for Electrolytic and 9½¢ for ordinary casting stock, but the intimation was given in some quarters that desirable orders for the cheaper varieties would have been taken at some concession from those figures. The tone of the market is, however, firm. No startling improvement is noted in the jobbing movement of Copper, orders and inquiries continuing on a somewhat limited scale. Prices for small quantities remain unchanged at recent quotations.

Pig Lead.—The market is decidedly firmer, but at the higher range of prices there is hardly any buying on the part of home consumers. In other words, it looks very much like a speculative movement with the more aggressive operators well fortified. One strong point is that late low prices have checked production and prevented any serious accumulation of the metal at first hands, while operating to increase the consumption. Prompt and current month deliveries have been sold at 3.37½¢ @ 3.40¢. Speculative bids were made of as high as 3.42½¢ for December, 3.45¢ for January and 3.47½¢ for February delivery. The general consumptive demand continues to be of the slightest character, with no visible indication of any expansion in the near future. Prices for American Pig in small lots are quoted at 4¢ @ 4⅛¢.

Lead Pipe and Sheets.—Only a perfunctory movement is noted in the market for Manufactured Lead, and there is no reason to anticipate any material revival in the near future, the season being too far advanced for any general resumption of activity in the building trades. Much has been made by the daily press of a meeting of a committee from the Western Lead Pipe Association at New Haven, Conn., to confer with the local jobbers in respect to the maintenance of prices in Lead Pipe. It was alleged that a New Haven firm had obtained the whole output of a Western factory, and was flooding the market with it at a very large cut in the prices quoted by the association. The affair appears to have been grossly exaggerated and to have had little beyond a local and limited bearing. The Eastern prices for Lead Pipe and Sheets remain unchanged as per list.

Spelter.—None but ordinary sales on home account have been made in this quarter the past week, and the demand has continued slow. Such as they were, however, the orders were difficult to execute, since most replies from smelters virtually amounted to a refusal to sell for delivery during the next six weeks. The presumption is that the bulk of stock is in second hands. There were intimations of a "short" interest in the market. The nominal quotation at the close was 3.70¢ @ 3.75¢ for ordinary brands. Small lots of Western Spelter are usually offered at 4⅛¢ @ 4¼¢.

Tin Plate.—Orders for futures have dropped off to very moderate proportions, and buyers' views seem to have been moderated also. Spot business has not exceeded ordinary proportions, nor have ordinary out of town inquiries been up to the average. The market has, in fact, relapsed into a condition of dullness, relieved only by the usual hand to mouth business previously referred to. This kind of business is, however, likely to keep the market from stagnation while stocks in consumers' hands remain, as they are, practically nothing. Importations continue on a moderate scale. Prices are somewhat irregular, yet show no radical change. The undertone is, however, weaker, and concessions on quoted rates for desirable orders would not be as hard to obtain as was the case a week or two ago.

A special cable dispatch from London to *The Iron Age*, dated November 15, reports on the British market as follows: There has been no improvement in the Tin Plate market. From the Continent there is a little more inquiry, but as the expected demand from the United States was not realized buyers became reserved and purchased only as immediate orders required. Black Plate is scarce and £8. 5/ is now quoted at Swansea. Stocks at Swansea are now about 265,000 boxes. Liverpool quotations were as follows:

IC Charcoal, Alloway grade	12/6 @ 13/
IC Bessemer Steel, Coke finish	11/6 @ 11/9
IC Siemens " " "	11/9 @ 12/
IC Coke, B V. grade, 14 x 20	11/6 @ 11/9
Charcoal Terne, Dean grade	11/3 @ 11/6

CORDLEY & HAYES, 172 Duane street, New York, issue a circular under date of November 10, in which they state that their factory at Lockport, N. Y., which was destroyed by fire some time since, will be running again within two weeks, and with this increase of capacity they will be able in future to be more prompt in the filling of orders. It is intimated by the agents that they now have on their books orders for a large quantity of goods, which will be filled as nearly as possible in the order in which they were received.

Chicago Report.

Scrap.—A fair demand is experienced for all kinds of Old Material, except Steel, which is still neglected. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb.
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	8.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—Trade has been light for the past week, but with the advent of colder weather is expected to improve speedily. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

ON THE NIGHT of October 31 the plant of the Irondale Steel & Iron Company, at Anderson, Ind., was entirely destroyed by fire, which is supposed to have originated in the oil house. The works, consisting of two sheet mills and a puddle mill, with the necessary bar rolling capacity, were in full operation at the time, but as the buildings were almost entirely constructed of wood, which was very old and dry, the fire was of brief duration. With the exception of some new parts added last spring, the plant consisted of buildings and machinery which had passed through the hands of various owners, having been moved from Aurora, Ind., several years ago. The loss was about $40,000, partly covered by insurance. It is probable that the company will rebuild at a nearby point and take advantage of an abundant supply of natural gas in the territory under consideration. This unfortunate circumstance takes 20 tons of sheets per day out of the market at a time when orders are becoming more plentiful, and throws about 150 men out of employment.

CONDITION OF THE

Hardware Trade.

THE TENOR of recent reports from the trade shows something of an improvement in feeling, indicating that a more confident tone is prevailing, with, perhaps, an increase in the volume of business. Orders are referred to as more frequent, but for small quantities, indicating that stocks throughout the country are exceptionally limited and that purchasers are adhering to the conservative policy which has governed them for some time. Collections also are better, and little complaint is now made on this score. Another favorable indication is in the fact that the large trade are placing orders for next season, the size of which suggests the expectation of at least an average trade. Prices are without special change, most lines being held pretty firmly, but with the low prices ruling for the raw material and the low quotations current for some staple goods, the tone of the market is not strong, and it is not unlikely that prices in the future on some lines will be lower. The result is probable if, as seems not unlikely, a reduction in wages is made. Manufacturers are certainly scrutinizing their costs very closely, effecting economies wherever possible, and the question as to wages is receiving consideration. Both manufacturers and merchants are thus pursuing a conservative course, but it is pleasant to note the better feeling in mercantile and manufacturing circles and the continuance of a steady if not a large business.

Advices from Chicago.—A better demand has been experienced within the past two or three days for seasonable goods, caused, of course, by the change to colder weather throughout the Northwest. In other respects the trade in Shelf Hardware is about as previously reported, but there is some encouragement in the fact that the trade seems to be going along steadily, and not decreasing in volume. There may be a slight shading on prices here and there by jobbers with large stocks, but the movement is not by any means general, and prices may be said to be well maintained considering the circumstances. Heavy Hardware is doing considerably better this month. Sales so far are about double what they were during the corresponding period of last month. The movement is principally in Iron and Steel, but the demand for season goods is improving, and cold weather will probably make it much more active. Competition on staple goods in Heavy Hardware is getting a little keener and some shading is being done, in which, however, all the jobbing houses are not participating.

Notes on Prices.

Wire Nails.—The past week has brought but little change in the market for Wire Nails. Prices remain on about the same level as for the past few weeks and are apparently not any firmer, quotations being on a basis of $1.20 to $1.25 for carload lots at mill, and it is intimated that the former figure is given a little more freely than it has been, so that on good orders it about represents the market. While thus in the matter of price there is no improvement, the volume of business has somewhat increased, and a good many houses have been taking advantage of the low prices ruling and have been purchasing more freely than for some time past. As a result the mills are quite well supplied with orders. The desire to have goods shipped before the close of navigation has something to do with purchases, and the improved financial condition is also having a perceptible influence on trade in this line. Small lots from store are quoted in the New York market at $1.60 to $1.65.

Advices from Chicago.—A remarkable change is perceptible in the tone of the Wire Nail trade. Manufacturers' agents report their books well filled with orders and specifications coming in freely. Orders for 1000 keg lots have been decidedly more numerous of late. The condition of this trade is much better now, so far as the volume of business is concerned, than at any time for the past month. Quotations are maintained at $1.30 to $1.32½, Chicago, for factory lots. Jobbers quote $1.45 to $1.55 for small lots from stock.

Cut Nails.—A moderate volume of business is reported by the manufacturers. The trade are not purchashing with much freedom and the market on the whole is sluggish. Prices are represented by the quotation of 95 cents for carload lots at mill. Five cents more is sometimes asked, but, on the other hand, attractive orders can be placed at 90 cents. The New York price for small lots from store is about $1.20.

Advices from Chicago.—Business in Cut Steel Nails keeps up very well also. The trade with Southwestern points continues to be a good feature of current business. Prices are fairly steady at $1.20, Chicago, for factory lots, the only variation from the base price being made in case of particularly good specifications. Small lots are selling from stock at $1.30.

Barb Wire.—Barb Wire continues to move in moderate quantities and at the somewhat irregular prices which have been ruling for the past few weeks. Manufacturers are evidently desirous to secure such orders as are going and the market is decidedly in the buyers' favor. We continue to quote $2.15 for carload lots of Four-Point Galvanized at mill as fairly representing the market, but concessions are made with more or less freedom.

Advices from Chicago.—Trade has improved considerably in Barb Wire. Jobbers in the Northwest are beginning to inquire as to prices and terms on spring shipments, and those who have bought for delivery after January 1 are in some cases ordering shipments to begin now, as they are out of Wire. Prices are not so low here as reported in other sections of the country, carload lots being quoted $2.40 for Galvanized Barb Wire, and small lots from stock at $2.55.

Standard Watering Pot.—The Standard Watering Pot, manufactured by Engelhart & Co., Glenville, Ohio, which was described in a recent issue, is sold from the following list, which is subject to a discount of 33⅓ per cent.:

Quarts	8	10	12	14	16
Each	$1.25	1.35	1.50	1.75	2.00

Bread, Cake and Paring Knives.—The Clauss Shear Company, Fremont, Ohio, and 100 Chambers street, New York, issue a revised net price-list of the Clauss Bread, Cake and Paring Knives and Perfect Carver, as follows:

	Per dozen.
Set A, consisting of Bread, Cake and Paring Knives	$6.00
Set B, consisting of Bread and Paring Knives and Perfect Carver	6.00
Bread Knife	3.00
Cake Knife	2.00
Paring Knife	.00
Perfect Carver	3.00

Glass.—Window Glass houses continue to go into operation, one by one, and probably a large proportion of the entire number will be making Glass by the end of this month. It is not anticipated that the amount of Glass manufactured will be allowed to be much in excess of the demand. The Glass business may be said to compare favorably with other lines, although prices are unsettled. There is no basis for official quotations, as each maker or jobber is getting what he can. A Cleveland jobbing house quotes Single and Double Glass, by the box, at 80 and 20 per cent. discount, f.o.b. Cleveland, or in 25-box lots, 80 and 20 per cent. discount, freight allowed. Some of the Plate Glass works are starting up, the open weather having been favorable for building, and the demand, though not large, shows no signs of falling off, nor have prices advanced.

Old Metals.—The market for Old Metals, other than Iron, shows no sign of improvement. The demand is light and supplies abundant. Scrap Iron is in rather better demand in some quarters, but prices are not yet on the up grade. They are so low that in many cases small producers state that it does not pay them to gather it up and ship it to market. The following quotations show the prices now ruling in New York:

Heavy Copper	₩ lb 6¾¢
Light and Tinned Copper	₩ lb 6¼¢
Heavy Brass	₩ lb 5¼¢
Light Brass	₩ lb 4⅛¢
Lead	₩ lb 3¢
Tea Lead	₩ lb 2½¢
Zinc	₩ lb 2½¢
No. 1 Pewter	₩ lb 14¢
No. 2 Pewter	₩ lb 6¢
Wrought Scrap Iron ₩ gross ton	$9.00 @ $10.00
Heavy Cast Scrap ₩ gross ton	9.00 @ 10.00
Stove Plate Scrap ₩ gross ton	.... @ 5.60
Burnt Iron (delivered at mill) ₩ gross ton	.... @ 5.00

Old Rags, Paper, &c.—But little improvement is noted in the market for these materials. Paper mills are still purchasing in a conservative manner, but a turn for the better is hoped for within the next few weeks. Meanwhile New York prices rule about as follows:

No. 1 White Rags	℔	3¼ @	3½
No. 2 White Rags	℔	2¼ @	2⅜¢
Mixed Rags	℔		2¼¢
Blues and 3ds	℔	1 @	1¼¢
Hard Sized White Shavings	℔	2¼ @	2⅜¢
No. 1 White Book Shavings	℔	2 @	2⅛¢
No. 2 White Book Shavings	℔	1 @	1⅛¢
Light Book Shavings	℔		¾¢
No. 1 Mixed Shavings	℔	¾ @	1 ¢
No. 2 Mixed Shavings	℔	½ @	¾¢
No. 1 Printed Books	℔	1 @	1¼¢
Ordinary Mixed Books	℔	⅛ @	¾¢
Newspapers	℔		3-5¢
No. 1 Manila Paper	℔	⅞ @	1 ¢
No. 2 Manila Paper	℔	⅝ @	¾¢
Bogus Paper	℔		⅛¢
Common Paper	℔	¾ @	⅛¢
Straw Chips	℔	⅛ @	3/16¢
Binders' Clippings	℔	½ @	⅝¢
Jute Butts	℔	1½ @	1¾¢
No. 1 Jute Bagging	℔	1 @	1¼¢
Mixed Bagging	℔	¾ @	1 ¢
No. 2 Bagging	℔	½ @	¾¢
Hemp Twine	℔		2¼¢
Manila Rope	℔		2½¢
Jute Rope	℔	1½ @	1¾¢
Mixed Rope	℔	¾ @	⅞¢

Old Rubber.—Nothing worthy of note is being done in this material. Prices continue low, being about as follows for New York delivery:

Car Springs, ton lots, ℔	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔	@	.03
Rubber shoes, less than carloads, ℔	@	.03⅛
Large Hose, ℔ ton	@	9.00
White Wringer Rolls, ℔	@	.04¼
White Syringes, ℔	@	.05

Trade Notes.

I. P. FRINK, 551 Pearl street, New York City, is in receipt of a very flattering testimonial from Rev. Richard Hartley of the Hope Baptist Church, New York, in which he refers to the very satisfactory results obtained from the use of two Frink Reflectors, and is of the opinion that the lighting of a building from a central Reflector is superior to any other method.

THE GRISWOLD MFG. COMPANY of Erie, Pa., received from the World's Fair five awards on their complete line of Hollow Ware, American Waffle Irons, American Dampers, &c.

THE FACTORY of the Grand Rapids Refrigerator Company, Grand Rapids, Mich., manufacturers of the Leonard Cleanable Refrigerators, is running full time and force. The company advise us that they have been awarded three medals and a diploma at the World's Fair on the excellence of their goods. Their new catalogue is now in preparation and will soon be distributed to the trade. It is stated that many new designs and improvements have been added for the coming season.

THE TIN AND STAMPING WORKS of the Thos. McDonald Mfg. Company, at Montreal, P. Q., have been burned. The loss is $50,000, covered by an insurance of $27,000.

ATTENTION IS CALLED to the full page advertisement of the Ringen Stove Company, St. Louis, Mo., which appears in another part of the paper. A review of the sales of this concern will prove interesting. In 1882 they sold 876 stoves, in 1884 they disposed of 8997, being over ten times as many as in 1882 In 1887 their sales amounted to 20,317, which were more than twice as many as in 1884 Again in 1891 we find them selling 36,242 stoves, which is almost twice as many as sold in 1887, and in the present year their sales foot up 71,316. With their increased facilities they will be in position to sell 100,000 stoves during 1894.

THE MICA MFG. COMPANY, 89 Fulton street, New York are placing on the market a variety of new and useful articles, such as Canopies for gas globes, made with an adjustable holder and which can be readily applied to any style of globe. They also are making Mica for magic lanterns, and Mica Protectors and Screens. Also a very useful article, a Mica Protector for silk shades. This corporation was established in 1884 Since that time their trade has steadily increased. They also make goods for electric purposes, as well as assorted Mica in pound packages for the stove trade.

THE AMERICAN WIRE GLASS COMPANY'S works, at Tacony, near Philadelphia, started into full operation on Monday, after some weeks of stoppage. Over 100 men, mostly skilled workmen, are employed.

SHEPARD HARDWARE COMPANY Buffalo, N. Y., issue three circulars, which they are sending out, offering for sale metal patterns of any goods formerly made by them, second hand machinery, also a considerable number of Floor Flasks for foundry use. Included in second hand machinery, fixtures, &c., are Boilers, Steam Pump, Blowers, Riveting Machine, Fire Extinguishers, Ladle Shanks, Japan Ovens, Office Furniture, Fixtures, &c. Metal Patterns include those of Blind and Shutter Hinges, Gate Hinges and Latches, Dampers, Presses, Toy Banks, Stove Lid Lifters, Sausage Stuffer, Coffee Pot Stands, Boiler Handles, Iron Toys, &c. Any inquiries regarding these articles will be cheerfully answered by the company.

The 9585 men who enlisted in the United States army last year represented some 200 different trades or occupations, including lawyers, doctors, chemists, school teachers, civil engineers and others from the educated professions. The large majority, however, were drawn from the laboring and mechanical occupations.

The Toledo, Ohio, Manual Training School has opened for the season with an enrollment of 300 pupils. George S. Waite, a former pupil and instructor at the school, has taken charge as superintendent, in succession to Superintendent Mills, resigned. Mr. Waite is said to be an enthusiastic advocate of manual training, to which he has devoted close study.

A general depression exists in insurance circles in this country, and many very unsatisfactory statements are looked for in January. Experts assert that the fire underwriting outlook is far from cheerful.

The death is announced at Union City, Mich., of John Palmer, the man who invented the baggage checking system, from which, however, he received not a cent of profit.

The dry goods trade has figured prominently in recent notices of failures and embarrassments.

It Is Reported—

That burglars recently entered the Hardware store of Teeple & Caldwell, Pinckney, Mich., and stole about $50 worth of Cutlery.

That William Roseberry has opened a new Hardware store at Wharton, Texas.

That the Hardware firm of Atchison & Knowlton, Newton, Kan., has been dissolved. T. B. Atchison will continue the business under his own name. The firm had been in business for 18 years.

That Alexander Warner has sold his Hardware business at Palouse, Wash., to Wheeler Bros.

That J. E. Fawcett is preparing to build a large Hardware store at Platteville, Ill.

That A. O. Wible, formerly with A. J. Turney, has entered the firm of Allshouse, Beck & Co., who have just opened a new Hardware store in Greensburg, Pa.

That C. Wirths, Hardware merchant, 844 West Indiana street, Chicago, shot and seriously wounded a burglar who on the morning of the 6th inst. tried to effect an entrance into his store.

That John P. Barnes, a Hardware dealer, who has been in business in Anderson, Ind., for more than a quarter of a century, is soon to retire. An Indianapolis firm have made a deal with Mr. Barnes and are now practically in possession of the business, as the stock has been invoiced. Mr. Barnes will be retained for the present as busines manager, but will probably retire altogether in a few weeks.

That Grossman & Geiseman's Hardware stock, at Shannon, Ill., was destroyed by fire on the 6th inst. Loss, $2000; insurance, $500.

That the Hardware store of Joseph Mohr, Danvers, Ill., was destroyed by fire on the 6th inst.

That James King's Hardware store, at Arena, Wis., was burned out on the 30th ult.

That E. W. Johnson has sold his interest in the Rockford Hardware Company, Rockford, Mich., to H. C. and W. F. Hessler and retired from the business.

That the Hardware store of M. J. Wilson, Rushville, N. Y., was broken into by burglars on the 29th ult., and robbed of 30 dozen Pocket Knives and a quantity of Table Cutlery.

That Turner & Archibald, Hardware merchants, Ridge Farm, Ill., have sold out to W. F. Jenkins & Bro.

That James A. Moren of the Hardware and Stove firm of Draper & Moren, Converse, Ind., has disposed of his interest to A. J. Webb. The business will hereafter be carried on under the style of Draper & Webb.

That the Hardware firm of Wentworth & Brown, Benton Harbor, Mich., are now Wentworth & Baker, Elwood Brown having sold his interest to J. J. Baker.

That Monroe Hoffman has opened a Stove and Tin store at Alliance, Ohio.

That the store of the Shafers Hardware Company, Butler, Ohio, was recently damaged by fire.

That H. D. Newcomb, dealer in Hardware, Stoves and Guns, Ironton, Ohio, has sold out to Goldcamp Bros. & Co.

That C. N. Hopkins is out of the Hardware business at Union City, Ind. Hatch & Hopkins will continue.

That Geo. W. Harris, Petaluma, Cal., has disposed of his Stove business to Hurd & Dies.

That E. H. Robinson has sold out his Hardware business at Santa Cruz, Cal.

That H. Edwards' Hardware store, at King City, Mo., was recently visited by fire.

That David S. Donovan has entered the Stove and Tin business at Plainfield, N. J.

Price-Lists, Circulars, &c.

WM. FRANKFURTH HARDWARE COMPANY, Milwaukee, Wis.: Price current of fall and winter goods. Illustrations and list prices are given of the Winslow and Czar Skates, Table Cutlery, flat Silver Ware, Butcher Knives, Carvers, Scissors, Pocket Cutlery, Razors, &c.

JOSEPH F. MCCOY COMPANY, 26 Warren street, New York: Illustrated circular and price-list of Coates' and French Horse and Hair Clippers, for which they are headquarters. Numbers are given of the most desirable patterns of Clippers for use on horses, especially patterns with anti-friction rollers, and for trimming horses' legs. An assortment to order is suggested as desirable for those who have never handled these Clippers.

THE CLAUSS SHEAR COMPANY, Freemont, Ohio.: Shears, Scissors, Knives, &c. A pamphlet sent out by the company illustrates the Clauss Carver, Bread, Cake and Paring Knives, also Shears, Scissors, Knife Sharpener, Flexible Pot and Kettle Cleaner. The company were awarded three medals and three diplomas at the World's Fair for Shears, Scissors and Knives.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

HELP WANTED.

SALESMAN visiting hardware trade to carry patented article in constant use as a side line; liberal commission; big seller. "Galit," 85 Franklin street, New York. Nov. 18

A first-class all round PLATER for job shop. Address, with references and salary expected, Leonard C. Crouch, 13 West Bridge street, Oswego, N. Y. Nov. 18

A first-class TINSMITH; must understand all kinds of roofing and guttering, also bench and furnace work; competent to do all kinds of repairs; steady work and good wages to right man. T. W. Dorsett, 1113 Clinton street, Hoboken, N. J. Nov. 11

By a wholesale manufacturing house in Boston, a thoroughly competent and first-class HOT AIR and HOT WATER FURNACE SALESMAN to travel among the trade in New England; high grade men only need apply; a man thoroughly acquainted with the stove and range business also would have the preference; state salary desired, and give references and experience. "A. B. C.," office of *The Metal Worker*, 146 Franklin street, Boston, Mass. Nov. 11

Immediately, a good PATTERN MAKER who understands making patterns for core casting for steam and water heaters, and who can also make wood and iron patterns and do molding. H. Munson, 200 Northampton street, Easton, Pa. Nov. 11

SALESMAN, for States of Kansas and Nebraska, for a strictly first-class line of stoves; one acquainted with the trade and on a commission basis preferred; address, with all particulars, "Eclipse," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 11

SITUATIONS WANTED.

A FOREMAN and SUPERINTENDENT of cornice shop working 50 men desires a change. "Reliable," Box 1118, office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 18

An ADVERTISING SIGN PAINTER with ten years' experience in retail trade is open for an engagement; would like to hear from parties wishing to work the California trade. H. M. Merrill, Marshall, Mich. Nov. 18

As SUPERINTENDENT or FOREMAN of stove works, by a thoroughly competent man, capable of handling a large number of men; 15 years' experience; position just vacated on account of closing of shop. P. O. Box O, Greenfield, Ind. Nov. 18

A thoroughly experienced tinware and housefurnishing goods salesman would like position as OFFICE MANAGER or BOOKKEEPER and CORRESPONDENT with large jobbing house or manufacturing concern; can furnish good references; no objection to locality. "J. S.," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 18

SUPERINTENDENT of stove, range and furnace foundry desires position for January 1, 1894; has had 13 years' experience, and can furnish first-class references from present and other employers. "Superintendent," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 18

With a good, reliable house as TRAVELING SALESMAN for tinners' and plumbers' supplies, hot air furnaces and steam heaters; can furnish the very best references regarding character, ability, &c. "J.," Box 1118, office of *The Metal Worker*, 96-102 Reade street, New York. Nov. 18

As FOREMAN of stove foundry; thoroughly experienced; can furnish references regarding character and ability. "W. M.," Box 38, East Woodstock, Conn. Nov. 18

As FOREMAN of brass foundry, by a good brass molder, 40 years of age, with many years' experience; steady and reliable; well up in mixtures of metal, core making and all the details of foundry work, steam and water work, machinery and general jobbing; reference furnished. Chas. McKenna, 68 Beech street, Paterson, N. J. Nov. 18

By a practical TIN and SHEET IRON WORKER, PLUMBER, and GAS and STEAM FITTER; strictly sober; single. W. G. Sofleiss, Woodbury, N. J. Nov. 18

As STOVE MOUNTER, a young man with 12 years' experience. J. P. Rothfuss, 821 Lome street, Philadelphia. Nov. 18

By a young Philadelphia PLUMBER, who has had eight years' experience; can furnish best of references; country town preferred. "J. M.," Box 1118, office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 18

A young man with two years' experience at plumbing desires a chance to finish trade and also to get a good idea of steam fitting. Thomas F. Dacey, 56 Hildreth street, Marlboro, Mass. Nov. 18

A thorough PLUMBER and GAS FITTER wants steady employment; correspond for particulars. Box 93, Naples, Ontario County, N. Y. Nov. 28

STOVE SALESMAN for Southern or Western territory or Canada, or in any position with a good concern, by experienced, reliable man; competent in costs, estimating, catalogue work and advertising, and willing to start at a reasonable salary. T. A. Hindmarsh, 308 Third street, Detroit, Mich. Nov. 18

By a young man, 23 years of age, as POLISHER on brass or iron; four years' experience; situation preferred in New York, Brooklyn or New Jersey. William Zylinski, 57 Grand street, Brooklyn, E. D., N. Y. Nov. 18

ELECTRO PLATER and POLISHER; thoroughly competent and practical electro plater desires situation; experienced polisher, grinder and buffer; strictly temperate; first-class references. "J. H. R.," 77 Cornelia street, Brooklyn, N. Y. Nov. 18

A steady job by a TIN and SHEET IRON WORKER; accustomed to in and outside work; also range and furnace work; reference if required. "W. S. N.," 144 East Front street, Trenton, N. J. Nov. 18

By a young man, 21 years of age, as BOOKKEEPER in some good reliable wholesale house; good penman and accurate at figures; references furnished as to character and ability. Isaac Smith, 113 Baker avenue, Syracuse, N. Y. Nov. 18

A young mechanic, sober and industrious, with six years' experience at all branches of tinners' trade, plumbing and heating, desires a situation in a large shop where he can get a complete knowledge of plumbing, heating and ventilation; salary not so much of an object as a good position. "Young Mechanic," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 18

To represent a factory or first-class jobbing house on the road in the West, by a thoroughly experienced nail, steel, iron, carriage and heavy hardware SALESMAN with over ten years' experience; wide acquaintance with factories and dealers from Mississippi River to Pacific Coast; unexceptionable references; age 34. "W. S. B.," 76 Archer street, Denver, Col. Nov. 18

As TRAVELING SALESMAN, by a young man, for a hot water or hot air heating firm; seven years' experience in both lines; can speak English and German. "C. A. M.," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 18

Steady job desired by a good PLUMBER in a shop where good work is done; New York City preferred. F. Higgins, 148 North Tioga street, Ithaca, N. Y. Nov. 18

An honest country boy, age 18, desires a position in a shop where he can learn the tin and sheet iron trade in all of ts branches; is a smart, stirring fellow, handy around horses; habits good; Any firm in want of a live, active boy will do well to give him a chance. I. Addison Brown, foreman Lee & Bunce, Box 366, Riverhead, Long Island, N. Y. Nov. 18

By a young man, where he can learn high grade steam fitting; has had five years' experience at plumbing, and 1½ years at steam and hot water fitting; thoroughly honest and strictly temperate; can furnish references. H. A. Delius, Jr., 320 Patchen avenue, Brooklyn, N. Y. Nov. 11

By a first-class TIN and SHEET IRON WORKER, in New York or in the country, within 10 or 15 miles of Newark, N. J.; 15 years' experience; can also do cornice and skylight work and draw designs and cut patterns. Henry Edlstein, 59 Lewis street, New York. Nov. 11

With some good reliable stove foundry, carriage factory or jobbing house, who are desirous of being represented in Ohio, Indiana, Illinois, or further West, on salary or commission and expenses; would make immediate engagement, or for next year; A1 reference from former employer. S. I. Hoff, York, Pa. Nov. 11

By a practical mechanic, as CORNICE CUTTER, or would work at the bench; 20 years' experience; state wages. L. W. Cutter, 488 Winchester avenue, Chicago, Ill. Nov. 11

STOVE PATTERN MAKER (wood) of considerable experience desires steady work. "J. J.," 1157 Carroll street, Baltimore, Md. Nov. 11

Experienced young HARDWARE SALESMAN of ability and extensive acquaintance wishes to represent manufacturer of hardware specialties on commission in New York, Boston and Philadelphia. "Solid," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 11

Young man wants a situation as TRAVELING SALESMAN or SHIPPING CLERK with stove house; have had five years' experience; good habits; come well recommended. "W. H. G.," 142 West Third street, Williamsport, Pa. Nov. 11

By a young man 27 years of age, with 12 years' experience in tin and sheet iron work, roofing and general jobbing; can speak English and German; position desired in New York. John Fink, 640 East Ninth street, New York City. Nov. 11

By a BRASS MOLDER on plumbers' supplies of all kinds; ten years' experience; capable of taking charge; city or country. "D. N.," 214 South street, Boston, Mass. Nov. 11

A TIN and SHEET IRON WORKER, first-class in every branch, wants a steady job; sober, reliable and a hustler; will consider a good offer from anywhere; have had long and varied experience. "Tinsmith," 60 High street, Taunton, Mass. Nov. 11

By a special JOBBING WORKER at inside and outside work; heaters, furnaces, &c. Jos. Frank, 102 Delancey street, New York City. Nov. 11

In stove works, as WOOD PATTERN MAKER; have had 20 years' experience in that capacity; can make own drawings; understand making composition for ornaments; also can do turning. J. T. Tryon, 10 Broadway, Troy, N. Y. Nov. 11

By a TIN and SHEET IRON WORKER and GENERAL JOBBER; 38 years of age; position desired in the South. Forest Holb, Box 51, Maynard, Mass. Nov. 11

AGENCY wanted on commission for Milwaukee, a good selling line of hardware or specialties, advertiser having a good trade with retail hardware and department stores. 548 Fifteenth street, Milwaukee, Wis. Nov. 11

By an experienced traveling man, traveling in Pennsylvania, Ohio, Indiana, Michigan and Illinois, a good line to sell on commission to general hardware and stove dealers. "A. B. C., No. 114," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

By a PLUMBER and GAS FITTER, who can also do a good job at steam and hot water fitting. "Plumber," 45 Warner street, Gloucester, Mass. Nov. 4

BOOKKEEPER, thoroughly competent young man, desires position with wholesale house. "S.," Room 9, third floor, 104 West Fourth street, Williamsport, Pa. Nov. 4

By a METAL PATTERN MAKER of 20 years' experience in locks, builders' and general hardware, iron toys and novelties; competent to take charge of pattern room. "A. H. L.," 315 State street, Bridgeport, Conn. Nov. 4

As PLUMBER and STEAM, GAS and HOT WATER FITTER; 11 years' experience; can also do good tin work; situation preferred in Southern California, Mexico or the Southern States. "M. E. M.," Box 83, Unionville, N. Y. Nov. 4

By a japanner, as FOREMAN with some first-class house in the West; understands all branches of japan business on tin, iron, wood and soft metals with one coat, also all kinds of lacquers and shades to stand the press, and all shades of colors in rubber for lithographing plates to stand the press. "Japanner," office of *The Metal Worker*, 96-102 Reade street, New York City. Nov. 4

As FOREMAN in manufactory making hardware specialties, by man with six years' experience in charge of the manufacture of freezers, toys, fruit presses, tin work, &c.; best of reference. "Edwards," Box 195, Little Valley, N. Y. Nov. 4

TINSMITH, married, wants permanent job 20 years' experience in tin, copper, brass and sheet iron; stoves, furnaces, roofing and general jobbing; country preferred. "Tinsmith," 338 Twenty-second street, Brooklyn, N. Y. Nov. 4

A steady job by a PLUMBER who can do steam and gas fitting and estimate on plans; A1 reference. P. O. Box 1195, Morristown, N. J. Nov. 4

A young TINNER of three years' experience in hardware, stove and tin store and shop wants steady job as general man; have worked on tinware, roofing and spouting; best of habits and reference. "J. H. B.," care of T. J. Reece & Co., Walkerton, Ind. Nov. 4

At once, by a strictly sober and reliable young man as an all around TIN and SHEET IRON WORKER; 11 years' experience at the business; both inside and outside work; also furnace work; a first-class slate roofer and general jobber. "L.," 27 West Holiday street, Newark, Ohio. Nov. 4

Domestic Electrical Work.

We begin the publication this week of a serial article that we believe will be of more than usual interest and value to the plumbers and tinners among our readers. The article relates to domestic electrical work, and the successive chapters will cover all of the ordinary work of the kind. Already many progressive plumbers and tinners have added electrical work to their regular line, and we believe that they have found it a profitable enterprise. There is not so much competition in it, there is a growing demand for the installation of simple electrical apparatus, and furthermore, we believe that the prices are much better than in the regular trades. The author of these articles is an experienced person who is familiar with the subject he writes upon and is now in the practical work of electrical fitting. It is not by any means intended to be an exhaustive treatise on electricity, neither is it addressed to electricians. Particular care has been taken to avoid the use of technical terms, and the explanations are all given in the simplest possible way, so that one who is absolutely ignorant of electricity and wiring can yet learn how to do the work by carefully reading the descriptions and following the instructions step by step. All ordinary bell work, fire alarms, burglar alarms, gas lighting, &c., will be covered in the series. If there are other simple classes of work that are overlooked in the articles, we will be glad to have attention called to them, so that we may make the account complete.

Taking Stock.

The usual time for taking stock and making up the final balance sheet for the year in many kinds of business is fast approaching. With its approach, a growing anxiety to know just what the year has brought forth of prosperity or adversity will possess the minds of men to whom the memorable commercial events of the year have already brought anxiety enough. Some of these will undoubtedly have to face a very unsatisfactory result in the aggregate of the year's trade, and very few will be able to congratulate themselves upon large profits gained in 1893. The majority will esteem themselves worthy of congratulation if they have paid all expenses and come out even. All who have been able to do this may feel sure that, with improved conditions of trade certain to come, they can compensate themselves for the trials from which the business of the country is emerging.

The Annual Inventory.

Nothing exceeds the annual inventory in importance as related to good business methods. But with oversanguine or timorous men it often is made the source of gross self deception. A man who deceives himself about anything is the most complete of dupes. The man of true courage and commercial ability, however much he may be willing that others may deceive themselves as to what he may be worth financially, is most reluctant to hide from himself the exact condition of his affairs. Therefore, in estimating the value of his assets, if any uncertainty exists as to what any particular asset may be worth he rather estimates it at its lower than its higher possible value.

Assets Often Overestimated.

In manufacturing business where iron founding is a prominent element, assets frequently much overrated are the patterns, flasks, core boxes, &c. These things often cost a great deal of money in the aggregate, and in valuing them from year to year there is a tendency to put down patterns in particular at their original cost, even after they have ceased to be of that value either on account of deterioration, or because the goods they were made for have become more or less unsalable. An element in the value of a pattern is its present utility as one of the appliances for conducting business. It may, and often does, become merely so much lumber, and, as such, of no value whatever as an asset. As to core boxes and flasks, especially if these be of wood, they deteriorate rapidly in use, and an underestimate of wear and tear may lead to erroneous conclusions in the profit and loss account. An exaggerated valuation of assets has often proved a rock upon which commercial enterprises have been wrecked.

The Mayor of Boston, Mass., writes to the trustees of the Franklin fund of that city that he has "been informed that trade schools, established elsewhere, have not proved successful." The Mayor might, with advantage, collect some opinions from neighboring cities as to the success, or otherwise, of such institutions as the New York Trade School, the Master Builders' Mechanical Trade Schools of Philadelphia, or the trade school connected with the Pratt Institute, Brooklyn.

Pipe Fitter and Penman.

BY L. M. W.

Visiting a prominent heating establishment recently, a face, that had been absent for over two months during the fall, was again seen at the desk where invoices, statements and the ledger furnished ample occupation. A few minutes leisure was used for a chat, which discovered that the bookkeeper had swapped jobs with the son of the boss, and had been out getting some practical information on pipe fitting by acting in the capacity of a workman. The son had returned from a long job and wanted a little rest, and the bookkeeper made the suggestion that he would find it a pleasant change to run the office while the bookkeeper ran some pipes. The bookkeeper said it was hard work, "but look at me now, I weigh more and feel better, besides I have learned a heap. Before I started the practical work I had the theory down pretty fine, and working with an experienced old fox I had two chances to catch on and apply it, and I believe I unloaded a lot of good information on Mr. Reynard, for every morning he had some question for me that kept me thinking, and every day he gave me some new wrinkle that kept the kinks from bothering my system. I know how to handle pipe, from ⅛ to 8 inch, and a pipe wrench is as handy as a pen, and I can fill the bill."

"How did I find the books? Oh! Well! the charges are all made, but aside from that I have plenty to do to get things in perfect order again, for the junior boss is a better pipe fitter and engineer than he is a pen artist and accountant. He has one valuable qualification, however; everything is charged, with explanation when necessary, and bills were sent promptly. He recognized that connections with bad collections were disastrous, while bad connections hindered collections. I am more than pleased with my experience, and am of the impression that if more bookkeepers forgot that they had contracted for one branch of service only, and sought to acquire wider information as salesmen and practical men, they would never regret it. I know bookkeepers who are quite expert at technical accounts but entirely ignorant of goods which are the basis of the accounts.

In opening the Bride Lane Polytechnic Institute in London, on November 20, the Prince of Wales strongly advised the managers to have practical work taught by practical workmen and not through theoretical lectures by professors. The institute, which is mainly designed to furnish manual instruction in various trades, on the lines of the successful Borough Polytechnic Institute, has been built by the Corporation of the City of London, and is planted in the heart of one of the poorer quarters of the British metropolis.

THE LETTER BOX.

Tinning Cast Iron.

From G. M., *Camden, N. J.*—Please describe in *The Metal Worker* the process of tinning iron. We have some links which we wish to make into an endless chain for a machine. One is malleable and the other is wrought iron. We cannot get the tin to take well, the coating is full of blisters and some parts are bare and very rough. We used Welsh tin for the last lot.

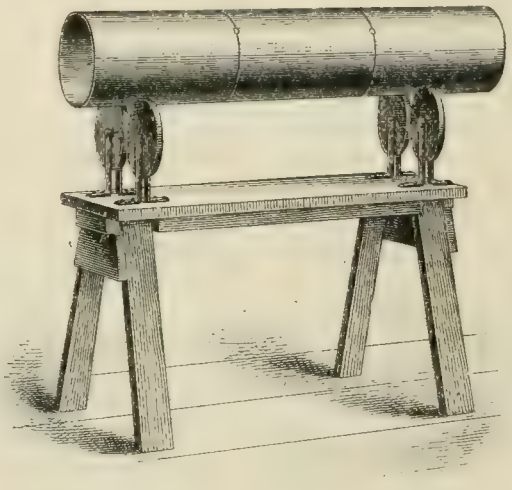
Answer.—For the benefit of our correspondent we reprint the following from *The Metal Worker* of April 4, 1891. He will find a longer article on the same subject in the issue for November 11 of the same year:

I have often seen inquiries in *The Metal Worker* for information about tinning cast iron, and while I cannot attempt to fully explain the process in a letter, some remarks on the subject may prove of interest and value. A number of difficulties are to be encountered in tinning cast iron, one of which is the difficulty of securing castings that are alike in all respects. The last iron taken from the cupola may not be like the first, as it has been subjected to the action of the heat for a longer time. Two lots of castings from the same foundry may also differ and a similar variation is found in castings from different foundries. The castings to be tinned should be first cleaned from oil or grease, which can be done by boiling in caustic soda water, after which they are to be rinsed in clear water. For the purpose of removing the scale the castings are to be placed in a pickle composed of sulphuric acid and 3 or 4 parts of water. After the castings have remained in the pickle for a few days the scale should be so loosened as to be easily removed by washing in clean water or by friction. The scale can also be removed by turning or filing. If it is not convenient to proceed with the tinning after the castings have been cleaned, they should be kept under clean water to protect them from the action of the air. For a flux, take ordinary soldering acid, to which add the one-tenth part by weight of sal ammoniac. The cleaned castings are to be dipped in this solution, quickly dried, and then dipped in the melted tin, the surface of which is to be kept from the action of the air by being covered with tallow. While the above is a theoretical method for performing the operation, it may not result successfully, as the iron may not be of such a quality as to take the tin properly. This point can only be determined by actual experiment. Care should be taken during the work to prevent the melted tin from becoming too hot, otherwise the articles will be discolored.

There is another process by which it is said that cast iron can be tinned, but it is one that should not be used for culinary articles, as mercury is used in the work. The article to be tinned is thoroughly cleaned, and must be free from oil or grease. It is then rubbed with a cloth moistened with muriatic acid, after which an amalgam of tin and mercury is rubbed over the surface. The article is then to be dipped in the melted tin. The amalgam should be of the consistency of putty. Still another method is to first coat the iron with copper, for which the following process is given: Melt in a crucible one part of dry chloride of copper and five or six parts of cryolite, combined with chloride of barium to make it more fusible. This mixture will give a permanent coating of any desired thickness to articles, according to duration of immersion, the articles having been first thoroughly cleaned by pickling in acid.

Soldering Furnace Pipes.

From J. J. F., *New York.*—In soldering furnace pipes I have found the subject of this illustration and description of great convenience, as well as a time and labor saver. An ordinary tressel made of a piece of 4 x 6 timber with four legs serves as a base, and as the upper part need not be fastened to it the tressel can be used for other things. To a board an inch thick, 10 inches wide and 4 feet long, nail two strips long enough to go between the legs on the side of the tressel. They should be nailed edgewise and so that the center of the board would come over the center of the tressel. They should be as wide as the tressel is thick, about 4 inches, and 1 inch thick. This will enable the board to rest firmly on the tressel, and it can be lifted off or on with ease. Now get four wooden wheels 6 inches in diameter and 1 inch thick and bore a hole in the center for a ¼-inch stove bolt. If you prefer you can make these wheels of tin. Bend eight pieces of the band iron that comes around bundles of sheet iron at a right angle. Make one end long enough to take two ¾ No. 9 wood screws to hold it to the board. The other end should have a hole in it for a ¼-inch stove bolt, which serves as an axle for the wooden wheels. This end should be long enough to bring the tops of the wheels about 3 feet from the ground. These uprights should be screwed fast to the board 6 inches from the end and 3½ inches from the center and 1½ inches apart, to give the wheels room to turn. Then put the wheels in place and fasten them with the ¼-inch stove bolts through the holes in the upright. Now tack three sections of 14 inch pipe on the bench and then lay them on the wheels and with some rosin run around the seam. Then with a hot copper and a bar of solder a seam can be soldered without any stops and starts, evenly all around, almost as quick as the rosin was put on. It beats a trough for quick, easy work, and saves some solder.



Soldering Furnace Pipe.

Cleaning Sewer Pipe.

From E. D. S., *Neuman, Cal.*—Is there any liquid that will cut slime loose from the inside of a sewer pipe? There is a hotel in this city which has a sink in the kitchen supplied with what seems to be a very good grease trap, but the drain pipe that leads from it to the main sewer is almost filled up, so that it takes some time to drain the sink. A force pump has no effect nor has hot water. As a considerable amount of brick work has to be removed to take it out, I thought there might be some better or easier way. I should be glad to hear from you or the readers of *The Metal Worker* on this subject.

Answer.—It is a common opinion that the only proper way to clean such a pipe is to open it, so that a brush or swab can be used to clear it. Some-

times a strong solution of lye is used. This will get the accumulation loose at the upper end of the pipe, but is likely to stop it up below. If the pipe then has to be opened up for clearing the workman who does it must be careful or the strong lye is likely to burn his hands when the opening is made. The use of the lye might be tried, and if it failed would not increase the labor of clearing the pipe with a swab later.

Capacity of Pipes.

From C. W. H., *Altoona, Pa.*—Please inform me, through *The Metal Worker*, which pipe or pipes would furnish the most water under the same pressure. one 12-inch pipe or four 6-inch pipes?

Answer.—The combined area of the four 6 inch pipes is exactly the same as that of the 12-inch pipe, so, practically, the answer to our correspondent's inquiry is that the larger pipe is of the same capacity as the four smaller ones. Of course, if he is going into very fine points, the item of friction would be greater in the four 6-inch pipes than in the larger one; but this, we assume, is not to be taken into account. The area of a 12-inch pipe is 113 inches, and the area of the 6-inch pipes is 28¼ inches each.

Partition Flues.

From CÆSAR, *Louisville, Ky* —"P. F.," in your issue of November 11, strikes the right note on the right string in discussing faulty wall piping. It is a custom among the architects in this section of the country in letting contracts on new buildings to include the wall pipes for furnace in contract for the roofing, guttering, &c. The consequence is that when the furnaceman examines the building he finds a botch from A to Z and if he has any pride for his work he will refuse to attach a furnace to such work. Right here the furnaceman is placed in a serious position. If he refuses to place the furnace the architect downs him on all future contracts. If he places the furnace it will not work satisfactorily, and again he is in a hole of such magnitude that he will never get out. On the other hand, if the furnaceman offers any suggestions to Mr. Architect he is sat down on as being very impertinent, and is informed that when he needs any information he will write him a letter. In regard to proper shape of wall piping it is to be conceded that the round pipe is the best, but where are you going to put such a pipe when there is no space for it? The usual width of stud here is 4 inches. I never use less than 4 x 12 and up to 4 x 16, and by following this rule have had unqualified success. Another point: The cause of poorly working wall pipes is often in the adjustment of sizes of round pipes from furnace to the foot of the wall pipe and in bad connections, improper protection, the use of IC tin, &c. In the use of IC tin a heavy per cent. of the heat is lost in radiation and often causes trouble with certain pipes. The architect is to blame in a majority of cases for defective furnace work from the fact that he does not make a special study of heating, and, of course, is not competent to criticise work when it is left to his judgment. The consequence is he is imposed upon by ignorant furnacemen and tinners. There is a great stress laid upon some particular make of furnace. This is all bosh. A furnaceman who understands his business can use the commonest furnace made and put upon the market if he gets his adjustment right, with a proper amount of cold air and a sufficient square area for escape of hot air into building.

Note.—Our correspondent says that there is a great amount of heat lost by using IC tin for furnace pipes. This is a common opinion in the trade, but if it were accurately determined just what the difference is in radiation between IC and IX tin we think it would surprise furnacemen to find that the variation was so little.

Making Solder.

From S. M. H., *Union City, Pa.*—Having had some experience in making solder, I would say to any one wishing to make their own solder: If your metals are pure, melt your lead and add as much tin as will make a strictly half and half solder. If the lead is not pure, put in the melted lead a small lump of brimstone and skim off the dross. Stir constantly and do not allow the metal to get too hot. In the olden time we often bought old pewter, which we used in the making of solder. Then we had certain tests to determine the quality. After getting ready to pour, we would run out a small bar, letting it cool, and by bending the bar, holding it close to the ear, if we could hear just a faint creak, we called it O. K. I once worked with a German who said they determined the quality of solder by the flower or blister which would appear upon cooling, and which is never seen in bought solder. Inclosed is a sample of the solder I make.

Note.—With this letter came a sample of solder 2 inches long, ⅛ inch thick and ⅜ inch wide, in which the creak mentioned is plainly discernible when held close to the ear and the solder bent. The general appearance of the solder would lead one to suppose that it is fully up to the quality claimed for it. This creak is due to the tin in the solder, and if there is only a small percentage of tin in the mixture the creak is not perceptible.

Pipe Fitting and Plumbing Queries.

From E. V. S., *Neuman, Cal.*—Please tell me in *The Metal Worker* if there is any preparation other than white or red lead for fitting iron water pipe together — something that will dry quickly and make a tight joint? Sometimes a joint is made as tight as tongs can make it, but it will still drip a little, and it often happens in such a place that it requires to be tight at once. I would be pleased to hear if there is anything of the kind.

Note.—If any of our readers have suggestions to make to this correspondent it will no doubt be interesting to many others. It is the opinion of a number of good fitters that whenever a leak occurs in an iron pipe water job, the only thing to do is to take out the fitting or piece of pipe and put in new, and that no other kind of a job is creditable to a first-class workman. A mixture of red and white lead is generally used and considered equal to all ordinary requirements. A cement for a quick setting rust joint is given as 1 part sal ammoniac in powder, by weight, 2 parts flour of sulphur and 80 parts iron borings, made to a paste in water. A cement was described on page 45 of *The Metal Worker* of August 28, which may be useful in this case.

Flush Tanks and Syphon Closets.

From J. K., *Norwich, N. Y.*—I have a question I would like to have explained in *The Metal Worker*. Does a syphon jet closet require a special tank? If so, what kind and in what way does it differ from an ordinary closet tank?

Note.—Some of our readers may have practical experience on this subject that will be of interest to this correspondent. As a rule, the flush tank is made to discharge a given quantity of water in a given time to suit the construction of the particular closet with which it is sold, and the experience of the trade has been that more satisfactory results are secured from the use of the closets when such tanks are used in connection with them. The difference from an ordinary closet tank is purely in the quantity and time of the discharge, which depends, as a rule, upon the construction of the valve.

Hot Air out of Cold Air Opening.

From H. N. R., *Hawkeye, Iowa.*—A small furnace that I have put in is causing some trouble, for which a remedy is desired. The furnace is set in brick, has two heating pipes, one 8½ inches, that is taken out of the top, and one 9½ inches, that comes out of the side. The latter is 5 feet long, and has a rise of 9 inches. The cold air pipe is round, 12 inches in diameter, and is taken from a window in the cellar. The opening for same is on the east side of the house, and is provided with a slide for regulating the supply of air. When the wind is from the south, warm air comes out of the cold air opening.

Answer.—As the south wind causes the warm air to come out of the cold air opening, it might be well to place a shield at the south side of opening so as to break the force of the wind. If this course was not expedient, the experiment might be tried of running a cold air pipe from the hall to the furnace. This pipe could be provided with a damper or register. When there is a wind from the south the outer opening can be closed and air taken from hall, thus preventing the wind from interfering with the action of the furnace. Conflicting currents of air so often interfere with the satisfactory operation of a furnace when wholly supplied with air from the outside of a house that it is eminently desirable to also provide facilities for taking the air supply from the inside. The occupant is then enabled to control the action of the furnace according to circumstances, and always secure good results from the fuel he burns.

Progress in Foundry Practice.

Thomas D. West of Sharpsville, Pa, in the paper read before the Western Foundrymen's Association, discusses as follows some of the phases of progress in foundry practice:

With our present methods, one field now presenting itself for the acquisition of knowledge in matters of melting and cast iron is in the chemical action taking place in the remelting of iron. I have been greatly interested in the papers and discussions emanating from this organization upon the questions of chemistry, and think the subject of the utmost importance to many foundries. There are those that can get along without having chemical service, but they are very few who could not obtain practical benefit from a use of the knowledge now obtainable upon the question. I know that in the ingot department of our foundry we could not afford to abandon chemistry. Not only do we know the chemical qualities of every charge of iron that goes into our cupola, but also that of the coke. When running full our heats range from 50 to 70 tons per day, and the product is analyzed and a record kept, so that we are enabled to ascertain if anything is going wrong and chemically compute what goes in and what comes out of the cupola.

The adoption of chemistry in our foundry was not a question of choice. We were compelled from self defense to know what our product contained, as we found our customers often attributing short service in particular molds to excessive silicon or sulphur when it was plainly not due to these causes. To protect ourselves against claims of this nature, as well as to insure uniform analyses, we found it necessary to know not only the analysis of our pig iron, but also of our product. Comparison of analysis with service naturally followed, which in time resulted in a somewhat elaborate system of records. It might be advisable to state here that in our practice we use all pig iron, and that such practice gives an advantage for obtaining reliable data that foundries purchasing scrap to mix with pig metal could not secure as readily. Generally speaking, purchased scrap iron is a miscellaneous collection of everything, and to attempt to know its chemical composition would generally involve so much labor and expense as to make it impracticable. With some scrap piles, by taking several samples and mixing their drillings, so as to obtain an average, an analysis might often work very fairly, but such a case would be the exception to the rule. It would be best in such cases, when special results are desired, to abandon the use of scrap and use all pig iron.

The president of our company, Geo. H. Boyd, has formulated quite an elaborate system for recording the chemical and physical qualities of our iron and product coming from it. The way the subject is classified enables us to obtain some very valuable data. As an illustration we will take up the question of silicon and sulphur. Here we find, by remelting or by the action of the fuel and blast in the cupola, that we reduce the silicon from one tenth of 1 per cent. to four-tenths of 1 per cent., but this reduction is generally uniform. We think it is only through some radical change in manipulating the blast to the cupola it is caused to be reduced below two-tenths of 1 per cent. On the other hand, we increase the sulphur one time two-tenths of 1 per cent., and perhaps the next five-tenths of 1 per cent., when using coke of same analysis and in uniform ratio to iron charged. The manipulation of the cupola alone seems to affect the sulphur to a greater degree than the silicon, for the silicon is generally reduced uniformly, while the sulphur seems to have no regularity about its increase; and I am inclined to think the varying temperature existing at time of meeting is the main cause of the irregularity found in the sulphur when same coke is being used. The Connellsville coke we use will average 0 80 in sulphur; the iron 1.50 silicon, 0.040 sulphur, manganese 0.34, phosphorus 0.093. The analyses of the above materials are given so as to enable any one that might be inclined to do so to take the matter up and compare notes with us.

There is a large field for investigation in chemical matters for the founder to explore, and the information to be obtained will enlighten us upon many mysteries we now find ourselves at a loss to fathom. I do not wish it understood that we are wholly relying upon the chemical analysis of iron, for there is too much to be discovered in that line ere we can ignore the physical qualities of iron in judging of and attaining results. While cupola work is progressing in respect to chemistry, I think from my late efforts and results there will be further achievements in melting barring what might come from the little explored region of electricity.

An investigation of the experiments made in cupolas with a view to economy in fuel shows that there have been many failures and we find almost all plans imaginable have been tried. Europe far surpasses this country in originality and novelty of designs, but I question if America has not excelled in the points of good general utility. The first radical benefical step we find to have been taken is in the adoption of the "drop bottom," an American invention. Ere this came in use bottoms were composed of solid masonry or fire proof material from the ground up to the spout and in order to get the "dump" or refuse out of the cupola after a heat was finished the "front breast," being made large, would be knocked out and by means of pokers the refuse and cleanings would be raked out. I am led to believe that this plan is still being used in some parts of Europe. From the adoption of the "drop bottom," improvements have been mainly in the line of securing greater economy in the use of fuel. The most radical divergence from the common cupola has been caused by experiments in designs arranged as in the Woodward cupola, which sought to create a blast economically by means of a steam jet blowing up the stack; also as in the Krigar cupola, which instead of forcing the blast upward reversed the order; then, again, as in cupolas arranged to utilize gas for a fuel. In examining some of the cupolas that have been tried one would surely think that if crooks and oddity had any virtue, perfect combustion would have been accomplished long ago. This may be secured, but we find more founders have faith in the common cupola. My definition of common cupola is one of plain cylindrical form having one or more rows of tuyeres. The question of inside formation and illogical shapes given to cupolas have about ran their course of absurdity and this has been helped by late literature upon melting. We are rapidly advancing in understanding the principles and sciences involved in the proper construction of cupolas and melting, and to-day we find the only element of any value that has been grasped from out the chaos of ruined expectations in the construction of cupolas is that of economical combustion being attained by two or more rows of tuyeres. In order that all may be able to follow this paper intelligently and understand the philosophy and advantages to be gained by "upper tuyeres" we will first note the action of fuels in order to obtain perfect combustion. "According to Dulong 1 pound of carbon combining with the necessary quantity of oxygen to form carbonic acid develops 12,906 units of heat. The specific heat of cast being about 13, the melting point 2190°, and the coke containing 82 per cent. of carbon, then to heat a ton of cast of a temperature of, say, 40° to a temperature of 2190° would require $\frac{2150 \times 2240 \times 0.13}{12906 \times 0.82} = 59.1$ pounds coke. This is supposing that the whole of the carbon is converted into carbonic acid, but if by any means carbonic oxide is formed a very different result is obtained; then 1 pound of carbon to carbon oxide only evolves 4453 units of heat. If, however, by admitting air above the zone where the oxide is formed we recover 4478 units, this plus 4453 gives 8931, which is a little over two-thirds of the available heat to be gotten out of 1 pound of carbon. Allowing 10 per cent. for moisture in the coke, 10 per cent. for radiation and 20 per cent. for loss of heat passing off at the top of the cupola, or 40 per cent. in all, the amount of coke per ton of metal should not exceed 112 pounds, although the actual consumption is, as we have shown, usually much higher."

The combination of carbon with oxygen or air blown through the "lower tuyeres" produces carbonic acid gas in the bottom bed of fuel and this in passing up through fuel heated to incandescence takes up more carbon and is converted into carbonic oxide gas. Now, if the carbonic oxide can again have sufficient oxygen or air admitted to it we will again have carbonic acid, or more nearly complete combustion, and by such alternate zones, which at every repetition become less volient, we could, if it were only practical to hit the right spot of the descending stock with the proper amount of air, almost achieve the theoretical figure of melting 1 ton of iron with 59 pounds of fuel, as given in above table; but instead of that we consider if we can accomplish such with 200 pounds of fuel we are doing exceptionally good work.

We have cupolas figured to achieve the above results by combination in tuyeres and in reality cupolas having two or more rows of tuyeres can be the only ones properly entitled to the claim of being scientifically constructed as far as the admission of blast is concerned. Were it only possible for the blast passing through their tuyeres to penetrate to the center of the cupola and have an immovable zone of fuel to play into, they might successfully accomplish the end intended, but as it is the results are but partial. It is a question if the extra burning out of the lining which two or more rows of tuyeres cause by having more melting zones does not often more than compensate for what saving in fuel may be acquired.

In the opinion of Nikola Tesla, the distinguished electrician, the people of the city of New York will eventually use electrical power from Niagara Falls to heat their houses and cook their meals.

PLUMBING and GAS FITTING.

Domestic Electrical Work.—I.*

By W. A. W.

SIMPLE BELL CIRCUIT.

In writing on electrical work for the benefit of plumbers and tinners there will no doubt be those who, without giving the matter a second thought, will say, "What do we care about electrical work? That is entirely out of our line of business; we don't get paid for doing such work as that." But suppose we look at the matter in another light. Suppose we strive to gain all the knowledge we can, and apply it to our business, don't you believe we would stand a much better show of getting paid for something we are actually doing than something we have never attempted?

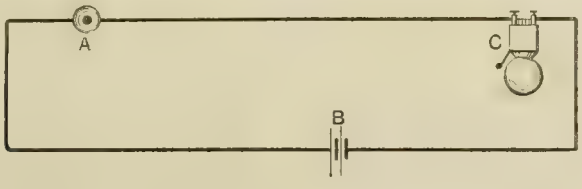
The writer has more than once heard the remark, "I am only getting $2 a day, and I am going to work accordingly." How much of a show does an individual like this stand of getting to the top of the ladder? He belongs to that class who are constantly bemoaning their fate and waiting for something to turn up. Certainly no one who aspires to a higher position or better wages can entertain such an idea. Every successful business man or employer makes it a rule to gauge wages by what an employee can earn for him, and if the $2 a day man makes no effort to earn more than he is getting, his wages surely will never be raised, neither will he be advanced to a higher position.

> Not the man who moans and cries,
> But the man who acts and tries,
> Finds the blessing 'neath the woe.

Roll up your sleeves, "act and try;" see how much money you can make for your employer. Make yourself a source of profit to him, and you will soon find that in this, as in any other respect, your employer will be loath to part with that which is a profit to him, and you will find in the majority of cases your employer will, after deducting a fair profit for himself from your labor, be willing to give you the balance of what you are earning.

But to return to my subject. There are a great many towns and cities where there are no regular electricians who do this kind of work, and consequently no one could complain that you were encroaching on their calling, and even if you did, "self preservation is the first law of nature," and we might just as well look the matter square in the face. Has not the tinware factory encroached upon our calling and deprived us of the pleasantest part of our labor?—that of all working together in the shop almost like a family during the long winter months, making up the next season's tinware. The writer well remembers the "fish" stories that were told, and the songs that were sung by the jolly crew of tinkers as they worked away at their benches those gloomy winter days. But now all this is changed, and the tinker must be able to earn enough during the spring, summer and fall to support himself in idleness a great part of the winter. Is not the carpenter encroaching upon our calling when he puts on iron roofing? Numerous instances could be mentioned where other trades are encroaching on us. Then why are not we justified in doing likewise?

The subject of domestic electrical work may appear to some as too intricate a thing for them ever to master, because electricity has for years been shrouded in a sort of mystery, but after once taking it up you will find it to be a comparatively simple thing, and the writer will endeavor to avoid all technical expressions and use the simplest terms and explanations in his efforts to awaken interest in this kind of work.



Domestic Electrical Work.—Fig. 1.—Experimental Circuit in Shop.

In the first place, get the proper tools to do the work with. These will cost but a trifle and consist of the following: A good corner brace (not ratchet, they are too slow), several sizes of small bits, one 12 and one 24 inch twist point bell hangers, gimlet about ⅜-inch hole, combination handle with set of small tools, rat tail file, small screw driver, flat chisel for taking up floors, medium sized hammer, keyhole saw, about 20 feet of flat steel spring wire for fishing purposes, 10 inches of No. 19 double jack chain, double pointed tacks, and an assortment of insulated wire, prices and descriptions of which will be found in any electrical house goods catalogue.

Next procure supplies, which consist for ordinary bell work of 3-inch bells, No. 18 annunciator wire, a roll of rubber tape, push buttons and open circuit batteries A technical description of batteries is here unnecessary, as we buy them all complete and ready to set up. They are composed of a rod of zinc (negative pole) and a cylinder or strips of carbon or porous cup filled with this material (positive pole), and 5 ounces of sal ammoniac dissolved (preferably) in soft water. The writer, however, prefers a battery having a large carbon surface without the porous cup. The direction of the current cuts no figure in this kind of work, so all you have to do is to connect the opposite ends of the circuit to the opposite poles of the battery and the circuit is complete. On receiving the supplies, if you are a novice, it is well to lay out a circuit in the shop, as shown in Fig. 1; it will give a better idea of the workings of an electric bell than any explanation can give.

A is the push button, B the battery and C the bell. Start from push button and connect a wire to each of the contact points, cutting the insulation from the ends of the wire for this purpose. Now run one of the wires to the bell and the other to the battery and connect with one of the connecting points on each. Connect another wire to opposite pole on battery and run direct to bell, connecting there with the other point. Press the button and the bell will do the rest. Do all the work on this general plan.

The next step is to go into actual work, and, as we are working from the bottom up, we will select an easy job, that of a new house in course of erection. Suppose Mr. A is building a house and you have succeeded in making clear to him the advantages of an electric over any other kind of bell (if you have he certainly has ordered one). The time to do the wiring for this job is when the house is boarded up and the partition studding set (before any lathing is done). Start in at the door where the push button is located. Bore a ½-inch hole through the door casing, about 30 inches up from door sill and at such an angle that the bit will come out behind the lath. Now from the cellar bore a hole that will bring the bit out behind the lath. Next locate the battery, which should be placed in the basement, unless it is excessively wet, in which case any other location, not too dry, may be selected. Where 12-inch joist are used all that is necessary is to nail a piece of board across two of them and set the battery on it.

The bell should be located so that it can be heard in any part of the house, and is usually fastened to a door casing. Bore a hole through the floor between the studding, drive a tenpenny nail where bell is to be fastened, allowing a foot or so of slack wire at the end by wrapping it about the nail. Run one wire from this point down through the hole previously bored through the floor into the basement, thence to door where the push button is located. Drive a nail beside the hole where push is to go and wrap about the same amount of slack wire around it that you did at the bell. Run a wire from push button to where the battery is placed, and do the same thing from the bell. The wiring for this job is now done and all that remains when the house is finished is to put up the bell, battery and push button. In putting up the bell do not cut off the slack ends of wire, but straighten them out smooth and wrap them like a spiral spring around a lead pencil. Bare the ends of the wire about ¾ inch and scrape clean and connect with binding posts on bell. This leaves all the slack wire for future emergencies and looks much better than a straight wire connection.

At the push button the wire cannot be coiled as at the bell, therefore simply bare the ends of the wire and scrape clean. Make the connection and push the slack wire back into the hole and fasten up the push. Prepare the battery according to the directions that will be found on each bell. To get a good clear ring out of the bell use two cells of the battery for an ordinary house circuit. Connect the

* Copyrighted, 1893, by David Williams.

wire from the push to the zinc we will say, though either will do. Coil up a short piece of wire and connect one end to the carbon of the same cell, the other end to the zinc of next cell, and connect the wire from the bell to the carbon of the last cell. The job is now complete and the bell should ring sharp and clear.

Plumbing Work in a New York Tenement House.

The enforcement of the plumbing regulations of New York City with an impartiality that secures to the occupant of the east side tenement the same protection from sewer gases as that enjoyed by residents in the fashionable quarters has always been claimed by the Health Department and the claim conceded by those who have had opportunities of forming an opinion on the subject. If any difference exists between the plumbing work in the two classes of dwellings it is due to the use of a more expensive quality of sanitary appliance with a more elaborate arrangement of material, but the application of scientific theories marks the one as well as the other in the exclusion of sewer air.

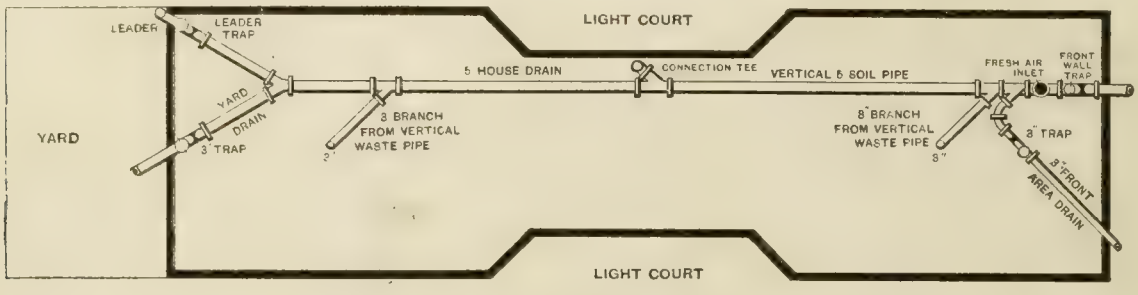
The illustration which we present in this issue shows the arrangement of the pipes and fixtures in an average New York tenement of what is known as the "cold water class"—that is, where there is no range boiler nor hot water circulation.

Fig. 1 shows a ground or cellar plan of the house drain and connections of rising lines therewith. The house drain is 5 inches in diameter, and extends backward in the cellar to receive the roof and yard drainage, the former through the 5-inch leader, the latter through the 3-inch drain pipe. The leader is generally of galvanized iron to within about 5 or 6 feet of the ground, where it is formed by a length of cast iron pipe of same diameter, which is carried through the house wall into the cellar by means of a ⅛ bend, where it is trapped and connected with the house drain. The 3-inch yard drain takes in the surface drainage of the 10-foot space required by law at rear of every tenement and lodging house and discharges through a 3-inch running trap into the house drain inside rear wall, as shown.

Sometimes a bend with a 3-inch opening is used on the leader, in which case the yard drain is connected therewith, by which means the use of the 3-inch trap is obviated, as the leader inside the rear wall answers the double purpose.

A similar drain pipe arrangement is made for the front area, the 3-inch pipe being carried inside the front wall, trapped and connected with the house drain on the house side of the running or front wall trap.

The house drain receives at front and rear the 3 inch waste pipe from the sets of apartments on the several front and rear floors of the building. These cellar connections are made with one-eighth bends at foot of rising lines and through Y-connections on house drain.



Plumbing Work in New York Tenement House.—Fig. 1.—Cellar Plan, Showing House Drain and Connections.

The soil pipe connects with the house drain about midway in the cellar, just inside the light court. There is an air shaft, size 3 x 3 feet, provided for the water closets, and in this air shaft the soil pipe, which is 5 inches in diameter, and the vent pipe (3 inches) are run. Two water closets on each floor discharge through this 5-inch soil pipe. The rising lines, therefore, in the building are one 5-inch soil pipe and one 3-inch vent pipe for the water closets, and two 3-inch waste pipes and two 2-inch vent pipes for the sinks and washtubs of the front and rear apartments respectively.

Fig. 2 shows the arrangement of the fixtures on each of the floors. In the two sets of apartments, to be found front and rear, the tubs and sinks for use in each set are placed in position on either side of the dividing partition. A double Y-branch opening is set in the 3-inch waste pipe, into which the wastes from both sets of fixtures discharge, the traps of each being properly vented, in accordance with sanitary practice.

The setting of the water closets is as closely looked after in the tenements of the poor as in the homes of the rich. The enameled iron full S-trap, if set above the floor, must be calked into the iron hub, as no other connection is allowed.

The flushing facilities are the same throughout, whether in the mansion or the tenement, and the expensive washout or syphon of the former, with its brass or nickel plated flush pipe and its copper lined and cabinet trimmed cistern, does not more effectively remove the contents of the bowl and seal the trap than the flush rim hopper of the latter, with its iron cistern and 1¼-inch flush pipe.

The care of the fixtures subsequent to their being placed in position has, however, much to do with after results, and in this respect the plumbing in the average tenement is at a disadvantage.

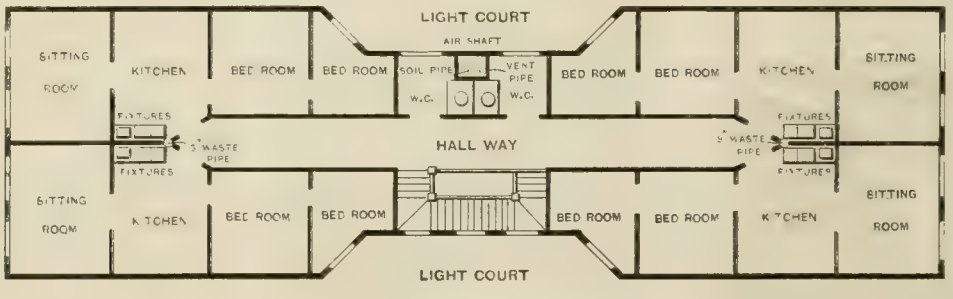


Fig. 2.—Plan of Floor of Tenement.

Interesting to Plumbers.

From OLD PLUMBER, *New York.*—Having carried on the plumbing business in New York for over 20 years, some of my recent experience may be interesting. When the new law came into effect I was examined, as it required. Whether or not I passed I don't know, and have been too busy to find out. I have been engaged principally in jobbing and repairs, which required no permit from the city departments. In one case, however, I needed a permit, and applied to the clerk, who knows that I have always had a license in the past, but he very properly refused to grant the permit, as I had taken out no license under the new law. To go to the office and find out if I had passed, get my certificate, furnish my bondsmen and secure my license would require more time than I could have spared then. So I hired a plumber, who had gone through the business and procured a license, to take out a permit to do the part of the work which required one, just the same as I do in Jersey City or other cities where I work. This was some time ago, and I am still doing business. I have no doubt but that I shall take out a license eventually, for I feel certain that I passed the examination, for here are the questions that were asked me as near as I can remember:

What have sanitary requirements to do with plumbing?

How would you make a peppermint test?

How would you make a water test?

What is the seal of a trap and its purposes?

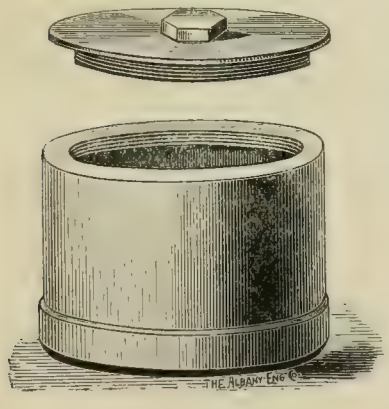
What causes a trap to syphon?

What is the construction of a pump?
What holds the water in a suction pump?
How high will a pump lift water?
What is a by way?
What is a proper soil pipe?
Give weight of lead for calking joints?
How should wrought soil pipe be vented?
Where should a trap be located?
What is a vacuum?
Where should a soil pipe terminate?
Where should a fixture be trapped?
What is sewer gas?

Note.—The experience given by this correspondent is one that is attracting attention at this time and involves a question of law. The new plumbing law, with the intention of protecting the public from improper work, provides that any citizen who wishes to earn a livelihood in the plumbing trade must fulfill certain stated requirements. Yet here is a man who seems qualified to do such work, from the fact that he had a license under the old law, but who without conforming to the new law is still working at plumbing. Referring to unlicensed plumbers, the New York law reads: "It shall not be lawful in any city of this State for any person to conduct such trade, business or calling, unless he shall have first obtained a certificate of competency from such board of the city in which he conducts or proposes to conduct such business."

Common Sense Trap Screw Ferrule.

We show in the accompanying illustration the Common Sense trap screw ferrule manufactured by Thomas



Common Sense Trap Screw Ferrule.

Hyde, 69 Perry street, Albany, N. Y. The principal features of this screw ferrule is that it is made of cast iron in regular pipe sizes, both standard and extra heavy. The opening, it is claimed, is larger than usual, and the thread is greased properly to protect the thread, making a gas tight joint. It is further pointed out that the brass cover and the iron ferrule cannot rust together.

TRAPS AND VENTS.

APPLICATION has been made for a charter for the Street & Kent Mfg. Company, at Chicago, for manufacturing plumbing supplies; capital stock, $20,000; incorporators, Conrad D. Street, Thomas M. Kent and William B. Dale.

AT A REGULAR MEETING of the Plumbing Board of Watertown, N. Y., Geo. H. Mowe passed the examination with a standing of 86 out of 90, and L. A. Howard with 48 out of 68. Both received certificates.

JOHN H. VAN TINE, 123 West 125th street, New York, is one of the uptown plumbers who reports that he is very busy.

A HANDSOME DISPLAY of gas fixtures and chandeliers and lamps, among which is a novelty in a gas banquet lamp, is the preparation for the holiday trade made by the Jos. P. Carney Gas Fixture Company, at 137 West 125th street, New York.

WILLIAM E. DONNELLY has completed his plumbing shop on Broadway, at Chicopee Falls, Mass., and the stock of stoves, &c., has been moved in. He is now ready for business in his new quarters.

WALSH & ULMER are to erect a handsome plumbing and gas fitting store and shop at Bellvue, Ky.

THE INSPECTOR OF PLUMBING, C. C. Crowley of Clinton, Mass., has gotten up an ordinance explaining all the departments of the new office and what people should do in case their plumbing is not in proper condition.

IN A RECENT ISSUE of a Chicago illustrated paper an account is given of the exhibit at the World's Fair of the Glauber Brass Mfg. Company, Cleveland, Ohio. Particular exhibits are referred to and illustrations are presented of some of their goods.

THE PHILLIPS MFG. COMPANY, 219 East Thirty-fourth street, New York, are sending out a catalogue of plumbers' specialties. Among the goods is a covering plate for soil pipes that enables a hole to be made in a pipe to remove an obstruction and then covered with the plate, which avoids the taking out of a length of pipe. The others are a wash tray plug, a new clean out filter, a ferrule burner, a center movable sink strainer, sink collars, basin clamps, expansion bolts and vent hubs.

THE PLUMBING ESTABLISHMENT of James Leary, at Monson, Mass., was recently destroyed by fire.

THE BOARD OF ALDERMEN of Cambridge, Mass., recently passed an ordinance placing the inspection of plumbing work under the charge of the Inspector of Buildings.

LOUIS VETTER is making improvements in the plumbing and sanitary arrangements of Miss Porter's school in Farmington, Conn.

CHARLES MCPARTLAND is about to open a plumbing shop at West Catskill, N. Y.

WILL TAYLOR has resigned his position with Gimbel & Co. and assumed the management of the electrical department at the plumbing and gas fitting establishment of L. W. Straw & Co., Danville, Ill.

THE SCHENECTADY, N.Y., Examining and Supervising Board of Plumbers has chosen officers as follows: William C. Vrooman, president; Dr. H. C. Van Zandt, vice-president; Frank Bauder, clerk.

THE SEWER PIPE MANUFACTURERS of the Ohio Valley met at Toronto, Ohio, on November 23 for the purpose of forming a combination. Twenty-four firms, representing more than $2,000,000 capital, are in the deal, located as follows: Nine in Toronto district, one in New Cumberland, one in Penrith, three in Wellsville, one in East Liverpool, two in New Lisbon, one in East Palestine, one in New Brighton, one in Malvern, three in Uhrichsville and one in Cincinnati. Headquarters will be established at Steubenville. T. F. Anderson of East Liverpool was elected president of the association, and C. A. Freeman of Steubenville secretary.

SMITH & WEBSTER, 193 Lake street, Chicago, are to remove their factories to 19–21 Clinton street, near Lake. Their new quarters have a frontage of 76 feet and a depth of 180 feet. When completed, the firm will have one of the most complete factories in the country for the manufacture of regular and special plumbing goods. Their showroom will be located on the south side.

THE PLUMBERS of Cleveland, Ohio, have withdrawn from the Central Labor Union because that body favored going into politics.

MONTGOMERY & PATTISON, 256 West Eighteenth street, New York, are engaged in completing the plumbing apparatus in the new Eighth Precinct station house on Macdougal street. One of the features of this job is the arrangement of automatic cisterns for flushing the water closets. The plan of the architect for the plumbing system in this building failed to meet the approval of the Bureau of Plumbing and Ventilation in the Department of Buildings, and an entirely new arrangement was laid out and drawings made by Mr. Pattison before the work could be commenced.

THE EFFORTS of the Protection Committee of the Master Plumbers' Association of New York to secure an agreement between the manufacturers and dealers to afford the plumber better protection has been attended with success. Houses that have for years refused to enter into any agreement have now consented to what was desired, after some cocessions being made on both sides. The agreement embodies the spirit of the famous "Baltimore resolutions" with the exception that selling to railroad and electrical companies and federal and city governments is not included.

The New York Trade School

Last Tuesday afternoon the Board of Trustees of the New York Trade School held their annual meeting at the school building, at Sixty-seventh street and First avenue. R. Fulton Cutting was elected president of the board and chief executive of the school for the ensuing year. At the next session of the school, on Wednesday evening, Mr. Cutting visited the different classes making an address. He stated that he would endeavor during his term of office to extend to the boys the same advice and assistance which had been received by the scholars in the past from the founder, Colonel Auchmuty, and he endeavored to impress upon them the fact that a spotless reputation was the most lasting and substantial capital that any young business man could have. His remarks were received with appreciation by all the classes.

Negotiations are reported to be on foot, backed by the Russian Government, with the view of ending the competition between the Russian and American petroleum interests, and forming a great international trust. The recent cutting of prices is said to have led up to the proposal, which is made by the Russian dealers. The alleged scheme is that Russian oil producers shall control the Eastern, European and Asian markets, while America shall hold England and Western Europe.

Management of Men and Manufacturing Industries.

FIRST PAPER.

Elements for Consideration in Locating Manufacturing Enterprises.

BY THOS. D. WEST.

It very often becomes a serious question with contemplated enterprises where to locate their works. They are often solicited to settle here and there, and shown advantages until their heads fairly swim with bewilderment. And having themselves no definite reasons why they could not settle as well in one place as another, it is no wonder they are "all at sea," and the one giving them the most wind carries them to anchorage.

No enterprise should choose a location without being able to have a chart upon which they could knowingly write the advantages and disadvantages of any place which might be brought to their notice for consideration. To have logical reasons for locating there, and not at some other point, is one of the first essentials to giving confidence in sailing onward to success, and not becoming weak-kneed at the first squall that blows adversity; for those engaging in any new enterprise can make up their minds that they will have to weather many a storm before they can reach, by experience and good financial steering, an open port in which they can be secure from foundering.

No two enterprises can be said to require the same conditions to exist in choosing localities. What might be an advantage to one would be a disadvantage to another. There is much more in being able to foresee what elements should exist than there is in seeing what do. Often the most experienced are deceived in their first conceptions and opinions. After getting started or having the plant in operation they find that they had jumped too quick at conclusions and had not taken sufficient time for investigation and study of prevailing conditions and elements which would rise, interfere, injure and be detrimental to their business.

Before treating this subject further the writer will endeavor to classify as far as he can the different conditions and elements that generally should be weighed by experience and judgment before contemplated enterprises are located. The first and in many cases the most important is: Good opportunity for procuring labor and knowledge concerning the character and training of the people where labor is expected to be obtained.

2. The advantages a locality may afford in the transportation of the concern's imports and exports.

3. Protection to life and property.

4. Cost of living and taxation.

5. The sphere there is for the enlargement of a plant.

This first proposition, that of procuring good labor in a new field, has often proved adverse to conceptions when labor came to be practically tested. Every industry has its own characteristic elements that demand from man an endurance and tax upon physical powers peculiar to and different from what some other line may call for. We find that one industry calls for spasmodic efforts of man. Another for constant steady labor—not one minute should they be idle. Then again we find industries calling for accuracy and neatness, while others require neither of such qualifications.

Still further on we see industries requiring men to withstand offensive odors and injurious dusts. Then we have those necessitating man to be standing or sitting in one position all day long. Also such as require him to endure all kinds of weather; and again we find him being required to withstand oppressive heat and flaming fires. It is often remarkable how men can be found "standing up to work" day after day that from observation or a short trial would by many be thought unbearable.

The lesson to be learned by study of the demands made upon a man's endurance in our different callings is that he can do most anything if only schooled and trained to it, but the trouble begins when we are required to do some labor foreign to what our endurance by actual experience has been trained to withstand. Of course, we have men who can conform readily to almost any kind of labor. As soon as they find some new muscles or sensibilities being made to pain or suffer they don't think they are going to die immediately. But men who will stick to labor that aches until their muscles become used to the work are scarce and far between. Any enterprise looking for a location should investigate very thoroughly the training men have had in the vicinity from which they expect chiefly to obtain their labor. For if they start in a vicinity where the schooling in endurance of labor differs radically from that which their industry demands, they can make up their minds to having much trouble and financial loss before they can procure and educate labor to profitably operate their plants. Heretofore this is a factor that has not had the attention it should have had. It has had, if the truth were only known, as much to do with strikes and failures in business as some other elements that might be mentioned. Every observing manager who has "knocked around" much will, I think, agree with the writer in saying that in changing localities he would be often deeply impressed how the little technicality and customs one place would think just right would at once cause dissention in some other locality. Therefore, to the interest of labor as well as capital it behooves the latter to use good reasoning in judging of labor in selecting its location and in the disciplining of it when first starting operations.

The Advantages a Locality May Afford in the Transportation of Imports and Exports

Means for any enterprise to figure out as far as possible what it would cost for freight or cartage of any raw materials or products it might require coming to its plant, and what it would cost to ship their finished product to contemplated customers. With enterprises intending to do a national business, the latter becomes a very important factor, for long railroad freights are a costly item, and all care in locating should be taken in figuring to avoid long hauls in freights to customers or their own plant, for ofttimes the imports or raw materials an enterprise may use in the manufacture of its product might cost more to be conveyed or shipped to its plant than its product would be to contemplated customers, and, other things being equal, it may often be much more advantageous to be located near to the section for obtaining the raw material than to the customers using the finished product.

Where a question of freights in imports or exports would be the most essential to be considered in locating, a good plan is to lay out a map, encircle by a mark the sections from which the raw materials are expected and trade to be catered for, and then locate nearest to the sections thought to be most advantageous in saving cost of freights.

Protection to Life and Property.

Manufacturing buildings going up at the present day are, as a general thing, being constructed as much fire proof as possible, and many buildings are all iron or brick and iron, and their owners care little for fire protection or insurance. If this can be done, it is certainly the wisest plan to adopt. But where it cannot be and fire protection is required, such should not be looked into after the buildings are up, as is the case many times. Enterprises locating within city limits are, as a general thing, fairly protected; but outside of such, and in villages and so forth, the protection against fire is generally very poor, and new enterprises should endeavor if at all possible to construct fire proof buildings. Another point which might be well to hint at is the question of floods. It is always well to figure to be high and dry. Protection to life is an element not to be overlooked, for all business must feel that it will be protected against ruffianism, drunkenness and theft. In cities aid can very soon be had to repel attacks or insults of this character, but in small towns, villages, and so forth, a man is generally left to defend himself, for the protection that may exist is generally so meager and out of sight it rarely can be found when wanted.

Cost of Living and Taxation.

These factors are also very essential to be investigated. If food, clothes and house rent are dear, a firm can safely figure that wages will be higher than in places where living is cheaper. As a general thing house rent is much cheaper in the smaller places and oftentimes food, but for clothes the cost is much less in the large towns and cities than in villages, and so forth. Taken as a whole the wage earner can live much cheaper in small towns, and so forth, than in large cities, and during business depressions is better taken care of when out of work in the small than in the large places, for the supply dealers are confined to a small territory for trade, and as what is one man's business is generally everybody's business, the dealer fears the ill will of one man might seriously hurt his business. Hence he will let him have credit to a larger extent than could be obtained in a large city and take his chance for pay when the man returns to work. In regard to taxation little is to be said other than upon general principle, and that is, taxation is found much lighter in small than in large places.

Enlargements of Plants.

While this is a point that would be thought to be minor and sure to be provided for, yet it is astonishing the lack of foresight manifested by many firms in locating a plant. For had they at all figured on such, thousands of dollars could often have been saved by their locating in some other locality or building different. A new enterprise, in planning their works, should look ahead and figure so that if any enlargement is necessary after they get started half of their building will not have to be torn down to obtain what they de-

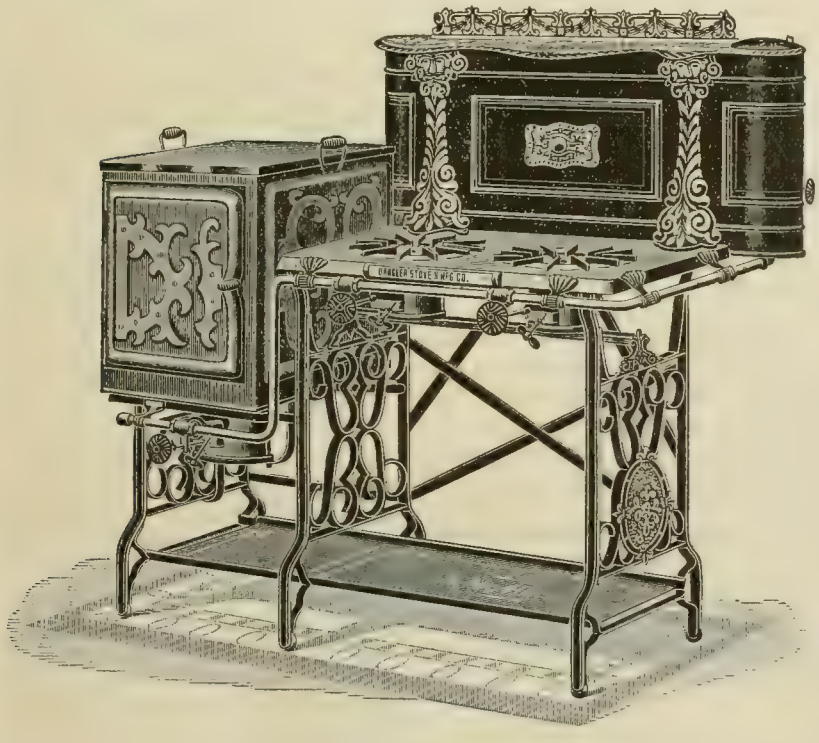
sire. The condition can be but rare that would not permit original plans to be made of the largest plant that might be necessary, and in starting in only build as much of it as will assure sufficient room for a moderate business; and then, when a growing trade would demand more room, it can be constructed without destroying present building or causing a loss of time to manufacture.

The Advantages and Disadvantages of City and Village.

It would not be doing justice to say either one was the best for any contemplated enterprises. To decide such a question can only be done by taking into consideration the various elements herein cited, and if more points are found favorable to the village let it be accepted, but if the points are in favor of the city, why then let it have the preference. Each has its advantages and disadvantages, and if logical reasoning is only used a firm will not be misguided in their choice. A few elements yet exist that might be well discussed in regard to procuring labor in the city and village. In the village labor will be found much more characteristic in having established customs and habits than in cities, and any new industry that might call for characteristic elements different than those found in the locality in which, for other reasons, they would like to locate, they can make up their mind that if they start in they will have much trouble and expense before they get their labor to the proficiency they would desire. In a large city the lines of habit and custom are not so clearly drawn, and there is a large body of labor to draw from, so that a firm can much quicker obtain the characteristic element they need to best suit their requirements of manufacture, and, of course, in the matter of obtaining supplies for repairs, and so forth, and chances for communication with the outer world by mail, wire or telephone, the city has many advantages over the village. In starting any enterprise every possible advantage should be taken. To be well located means that half the battle to win success is fought. Too much care and judgment cannot be exercised in choosing a locality, and if the reconnoiter, in starting out, will but keep in the files of his memory the factors, characteristic requirements for labor, transportation, protection to life and property, cost of living, and taxation and accommodation obtainable in matter of supplies, mail, telephone and telegraph, he cannot make any very serious mistake in selecting a locality which in after years experience will surely have proved to be a good locality.—*The Iron Age.*

The New Delight Stove.

The Dangler Stove & Mfg. Company of Cleveland, Ohio, have recently added to their already extensive and interesting assortment of stoves designed for using gasoline as a fuel the construction illustrated in the accompanying cut and known as the New Delight. The stove is furnished with a substantial frame, neatly and attractively finished in black and gilt. The special feature is the burner, which the makers claim is so simple that any child can operate it, while at the same time it is durable and economical. The company also claim that a tank similar to the one used in connection with their Surprise stove can be employed, while on account of the arrangement of the parts of which the burner is composed they can use the Process cone, giving an intense heat with an economical consumption of fluid. The expansion chamber of the burner, for mixing the vapor and air beneath, is claimed to maintain a uniform feed and pressure to the burner "without the usual method of an elevated tank or the Process principle." The theory is that the pressure is secured by the expansion which takes place in the expansion chamber, the company maintaining that the idea is new and novel, and the result of many years of study and experimentation. In operating the stove it is only necessary to light the burner once a day, and when not needed it can be turned off, as when required for cooking purposes the valve is turned and the burner lights itself. The manufacturers state that the object they had in view in bringing out this construction was a stove combining simplicity, durability and economy with a powerful burner, and at the same time something that would be convenient, safe and ornamental, and these features they are convinced are combined in the New Delight here illustrated.



The New Delight Stove.

SCRAP.

G. L. Morris and J. Williams of Landore, Glamorganshire, Wales, have been granted a British patent for a new arrangement of machinery for coating metal sheets with tin or other metals or alloys. The special features of the apparatus are that two or more plates may be passed through the rolls at the same time, and a novel arrangement of the pot in which guides are placed to direct the sheets into the rolls.

Wallace, Banfield & Co., Limited, operating the Irondale Rolling Mills, at Irondale, Ohio, manufacturers of tin and terne plate, are operating their entire plant to its utmost capacity, three turns of eight hours each being the rule. The firm have met with gratifying success since they embarked in the manufacture of tin and terne plate, and have had a ready sale for their product right along as fast as it could be turned out. They are running on orders only, and find it necessary to operate their plant as noted above in order to keep pace with the demands made upon them by the trade for their plate.

The Morewood Company, manufacturers of tin plate, at Gas City, Ind., are represented in Chicago by Saunders, Fielding & Bond, Room 419 Ashland Block, corner of Clark and Randolph streets. The company are now making several brands of bright and roofing plate, but have been hampered hitherto by the deficient supply of black plates. They started their tinning pots first, and have been purchasing plates in Pittsburgh, as well as importing from Great Britain, but in a very short time they will have an independent source of supply in their own rolling mills, which are now completed at Gas City and will be run slowly until the machinery is found to be in proper condition for regular work.

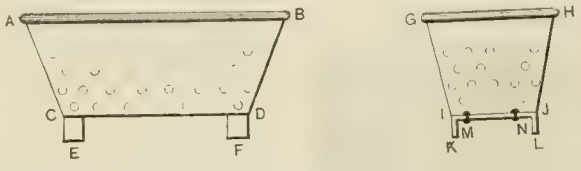
N. & G. Taylor Company, Philadelphia, manufacturers of tin plate, have just sold a lot of their roofing tin to the Harvey Steel Car & Repair Works of Chicago. This firm have secured the contract for altering about 200 of the Illinois Central Railroad cars that were in use during the World's Fair. N. & G. Taylor Company report that the demand for their brand of Taylor Old Style is very large and constantly increasing.

The St. Louis Tin Plate Works, operated by the St. Louis Stamping Company, started up full Tuesday morning after a shutdown of several weeks' duration for repairs. They will employ between 600 and 700 men. They report an increasing demand for tin plate, and hope to run full time for an indefinite period.

ROOFING AND CORNICE.

Fire Pan or Paint Burner.

From W. N., *New York.*—For the benefit of roofers or tinners in general, who have more or less repairing to do, I submit diagrams and descriptions of a fire pan or paint burner which is used in repairing roofs. As is well known, in repairing old roofs the paint must first be scraped off before soldering, and as some roofs have two or three coats of paint, it requires not a little time and labor to scrape off the paint with a scraper until a smooth surface is obtained, so that a joint can be made with solder. The illustrations show the method of constructing a fire pan or paint burner.



Fire Pan or Paint Burner.—Fig. 1.—*Side and End View of Pan.*

In Fig. 1, A B C D represents the side view of the fire pan and also shows the side view of the legs E and F. G. H I J is an end view, showing the band iron legs K L riveted to the bottom of the pan at M and N. A wire is placed at the top of the fire pan, shown by A B in side view and G H in end view. After the pattern is laid out holes are punched in it before forming up. The holes are punched in the entire bottom and all around the four sides to within 1½ inches of the top edge, a hollow punch ¼ inch diameter being used for the purpose. The corners can be double seamed or riveted, as in the illustrations. Fig. 2 is a perspective view of the finished fire pan with full size measurements. The pan is usually made from No. 22 black iron, a wire or seamed edge being placed at the top, as shown. The legs and the handle are made of the band iron with which the sheet iron is packed. When using the pan a few small, hot coals are taken from the fire pot and placed inside, then the pan is filled to the top with charcoal broken into small pieces. By having the holes punched, as shown, a draft is created so that the charcoal gives off an intense heat. After finding the spot on the tin roof which is to be repaired, the fire pan is set over it for a few minutes and the result will be that the paint begins to crack and blister so that it can be easily scraped off with any piece of stiff metal. The tin plate is then wiped smooth and bright with a rag, which enables one to solder with ease. The handle, which is riveted to the end of the pan, as shown in Fig. 2, has a hole punched in it at H for hanging it up when not in use.

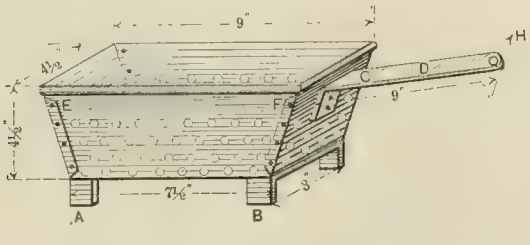


Fig. 2.—*Finished View of Pan, with Measurements.*

The Iron and Steel Roofing Industry.

In looking backward over the conditions that have existed in the iron and steel trade during the past six months it may be a source of wonder to many that those mills devoted to the manufacture of sheets of the lighter gauges have been running steadily notwithstanding the hue and cry about hard times and the unparalleled, complicated labor troubles which have claimed so much attention locally and generally. In searching for reasons why sheet mill operators should be the favored few the main causes soon become apparent. Building has not been interrupted to any great extent during this year and the demands of iron roofers and cornicemen for black and galvanized sheets have been quite lively compared with activity in other branches of the trade. It is these demands which are the life of the sheet iron trade and their importance is probably only thoroughly understood by those having a direct connection with the business.

Without taking into consideration the quantity of galvanized sheets consumed by manufacturers of cornices, skylights, ornaments, conductor pipe, &c., figures regarding quantities of sheets annually consumed by manufacturers of iron and steel roofing prepared ready to lay will probably surprise the uninitiated.

Twelve years ago the sale of iron and steel roofing and siding, such as corrugated, rolled roofing, standing seam, V-crimp, beaded siding and the innumerable variety represented in the hundreds of patents granted to roofing men, had to be pushed hard, and traveling men were obliged to spend their time telling customers in the best and most effective language they could command the virtues of the new material and instructing how it should be applied. The order of things is now changed. Good advertising does nearly all the work of selling, and as the quality is necessarily nearly uniform, the stock used being standard grade, the seller who names the lowest price and best terms usually gets the orders.

The State of Ohio produces fully one-half of the total quantity of iron and steel roofing sold in the United States. As nearly as can be ascertained, Cincinnati was the first important seat of the industry and it still heads the list as a producing center. The first business of the kind was established about 1868, and up to 1880 there were some few additions made yearly to the number of manufacturers. It was a hard struggle against prejudice, and not more than 15,000 tons of sheets were consumed for the purpose during 1880. After this time, however, the material found favor and a wonderful development commenced. It has increased year by year and there are now about 75 concerns engaged in the business, East and West. A conservative estimate of the annual consumption of iron and steel sheets for these purposes is about 100,000 tons. The surface which this enormous quantity of material would cover may be easily estimated, basing the weight at 1 pound per square foot when laid. To give an idea how the above figures are arrived at, a table is printed below showing the approximate tonnage of 59 manufacturers:

	Number of manufacturers.	Tons.
Ohio	27	55,000
Illinois	8	10,000
Pennsylvania	5	4,000
Missouri	3	8,000
West Virginia	3	8,000
New York	2	2,500
Indiana	2	1,000
Minnesota	2	2,000
Michigan	2	1 000
Tennessee	1	1,250
New Jersey	1	500
Massachusetts	1	500
Alabama	1	7?0
Kentucky	1	2,000
Small manufacturers	..	3,500
Totals	59	100,000

It would be interesting to illustrate how this enormous quantity of material is handled, but as the machinery used for the purpose is mostly built to special

designs, and as details of economical and effective manufacture are closely guarded, information on the subject is not considered due to the trade generally. It is sufficient to say that vast improvements have been made, both in the power of producing quantity and good quality, and the low prices at which iron and steel roofing is now sold are due to energy and enterprise spent in this direction. The favor into which this material has grown is illustrated by the figures presented. In Australia and other British colonies the use of iron and steel for roofing purposes has been an established industry for a great many years, but the methods of applying it are not so effective as in the United States. American ingenuity has developed the industry into a distinctive business, and the sales have increased during about 12 years from $1,000,000 to $6,000,000 per annum.

FLASHINGS.

THE *Southern Journal of Commerce* of Birmingham, Ala , states that one of the industries most needed by the South is rolling mills for the manufacture of sheet steel for roofing purposes. The great State of Texas alone would, says the *Journal*, absorb the product of several sheet trains, and at present prices it would be a difficult matter to name any branch of the iron or steel business that would yield, in the South, as handsome a revenue to its owners as a large sheet mill properly managed.

THE SLATINGTON-BANGOR SLATE SYNDICATE report that orders for slate are coming in in far greater volume than was expected. There were shipped during the month of October 3280 squares, or 68 carloads, of roofing slate and 22,000 square feet of blackboards, besides several carloads of milled stock and mantels. Last week the syndicate booked two Western orders, for the season of 1894, of 41 carloads of roofing slate. Mr. Foote, the manager of the syndicate's business, recently stated as follows : "Everything indicates a prosperous year for slate in 1894. Architects all over the country are preparing plans and the building movement will probably be the largest in the country's history. This means an increased demand for slate, which is constantly growing in favor as the only desirable roofing material. Money is easier and collections are very satisfactory with us. Our trade in the South has opened full of bright promise."

THE ROANOKE ROOFING & METAL CORNICE COMPANY, Roanoke, Va., have been awarded the contract for the galvanized iron work on the Anson County Court House being erected at Wadesboro, N. C.

C. S. WEBER & Co., 415 Broadway, New York, sole agents for the American Wire Glass Mfg. Company, Tacony, Pa., have just closed two large contracts for wire glass. One contract calls for 6000 square feet of ¼ inch thick wire glass, to be used as a roof for the New York Post Office. Geo. Bickelhoupt is furnishing the skylight work. Another large contract calls for 1700 square feet of ¼ inch thick wire glass, for two of the largest skylights ever designed or used in New York. They were designed by Architect Stephen D. Hatch, and the contract for the work was awarded to Geo. Hayes, the expert on fire proof construction.

THE AMERICAN ROOFING COMPANY, St. Louis and Cincinnati, report an increasing trade from both their St. Louis and Cincinnati houses. They confidently expect to equal their November business of last year, and with orders already in hand and others in negotiation will doubtless do so. They are increasing their force and are running nearly all departments full time.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

SOME of the new contracts that will occupy the time of Geo. B. Brown, 125th street and Fourth avenue, New York, are for the plumbing in the new Twelfth Ward National Bank on 125th street, an apartment house at Sixty-sixth street and Ninth avenue and a private residence at Sixty-ninth street and Fifth avenue. He is also engaged in remodeling the plumbing arrangements in the stations of the Manhattan Elevated Railroad.

J. P. CLARE & SON have recently installed a Volunteer steam heater in the Hose house at Hudson, N. Y. A toilet and bath room are yet to be built and equipped with plumbing fixtures.

GEO. M. ROSSMAN has received the contract for a steam heating plant for the Y. M. C. A. building at Keene, N. H., and will use Exeter radiators.

THE CONTRACT for the interior finish, plumbing and approaches to the new Post Office building, Jackson, Mich., has been let to R. M. Jack & Son for $22,000, they being the lowest bidders.

BATEMAN BROTHERS of San Francisco, Cal., have been awarded the contract for finishing the interior of the San José Post Office building and putting in the plumbing and gas piping for $30,470.

THE SANITARY PLUMBING COMPANY, Oskaloosa, Iowa, have closed a contract to place one of their Ideal heaters in the Wightman Building, in that city.

BENNETT & PECK COMPANY, Cincinnati, Ohio, have been employed by the Board of Education of that city to put in their new automatic ventilated flushing closets in the Tenth District School. Recent contracts for apparatus of this kind in connection with the heating and ventilation of school buildings have been closed by the Board of Education at Columbus, Tiffin and Cleveland, Ohio; Logansport, Auburn, Richmond, South Bend and Shelbyville, Ind.; Dayton, Piqua, Marion, Kent and Hamilton, Ohio; Johnstown, Tyrone, Allegeheny, Duquesne and Pittsburgh, Pa., beside other towns in the West and South.

SEALED PROPOSALS will be received at the office of the Supervising Architect at Washington, D. C., until December 12, for the plumbing and sewerage at the U. S. Court House and Post Office building at Helena, Ark. Drawings and specifications may be obtained from the Supervising Architect at Washington or from the custodian at Helena.

THE STEAM HEATING PLANTS in the Town Almshouse and the Sisters of Notre Dame Convent at Milford, Mass., have just been completed by Henry Willard. He used Exeter radiators.

F. COGGESHALL, Providence, R. I., has used the Exeter radiators, made by the Exeter Machine Works of Boston, Mass., for the following contracts in Providence, R. I.: Young Women's Christian Association Club, Hazard Memorial Hall and the residences of E. A. Loomis, W. H. Ballou, Charles C. Harrington, E. C. Ostby, E. Baxter, W. J. Crossley, James Estes, E. C. Burnham, Dr. J. H. Akers, Mrs. Honora Connors, William M. Bailey, Edward Short and H. R. Farnum. Mr. Coggeshall is free in his commendation of the finish, construction and work done by the radiators.

THE J. L. MOTT IRON WORKS, 311 and 313 Wabash avenue, Chicago, have finished the large heating contract for the First Congregational Church at Kenosha, Wis. A recent letter received from the church trustees speaks of the results as more than satisfactory.

THE BAKER & SMITH COMPANY, 193 to 197 Van Buren street, Chicago, are to furnish a horizontal tubular boiler and radiators for the steam heating in the flat building of J. B. Scott, Ashland Boulevard.

C. F. MONROE has been awarded the contract for installing the steam heating and plumbing fixtures in the Orphans' Home at Washington, Ind.

J. C. RIGHTER recently installed a Sun steam heater in the residence of H. F. Bacon, at Salem, N. J. Ten radiators were used, and on making a test not a leak was found or a sound heard. The boiler is so arranged that it is said that it can be changed to a hot water apparatus in a few minutes.

SCHOOMAKER & WILLIAMS, Walden, N. Y., have secured the contract for heating the new M. E. Church at that place, having been assisted by A. H. Phelps, a representative of the American Boiler Company, and the plant will be installed according to plans made in their engineering department. The church and Sunday school, having a space of 220,000 cubic feet, will be heated by steam with direct radiation of the Bundy pattern and a No. 58 Florida heavy duty steam boiler.

GEO. B. COBB & Co., 42 Duane street, New York, will use 1800 feet of Bundy radiation and a double Florida boiler in heating the new Elmore Ferris Building, at Pawlings, N. Y.

STEPHEN BANSON, 357 West street, New York, has the contract for heating the new City Hall and Opera House at Hudson, N. Y., and the Brooks store building and Opera House at Athens, N. Y. He will use Florida steam boilers and New Excelsior radiators.

THE L. J. MOTT IRON WORKS, 311 and 313 Wabash avenue, Chicago, furnish the plumbing material for the New York Life Insurance Building, Y.M.C.A. Building, and stations of the Metropolitan Elevated Railroad in Chicago.

DANIEL KAY is installing a hot water heating plant in the residence of Thomas Albertson, at Westmont, N. J.

MACDONALD & Co , 296 Third avenue, New York City, are erecting the plumbing system in the Home Life Insurance Company building at 256 Broadway. This building is 15 stories high, and the drainage system will be of the wrought iron screw joint pipe character.

THE ROOSEVELT BUILDING, Thirteenth street and Broadway, New York, for which Stephen P. Hatch is the architect, will be heated by a plant in-

stalled by the Baker & Smith Company, who will use 13,000 feet, or about two carloads, of radiators made by the American Radiator Company. Another contract which they have in hand, for which they will use the same style of radiator, is the new American Theater at Eighth avenue and Forty-first street.

G. A. SUTER & Co., 139 South Fifth avenue, New York, are installing a heating plant in the National Shoe and Leather Bank, at Chambers street and Broadway, using Perfection radiators.

GILLIS & GEOGHEGAN, 33 South Fifth avenue, New York, are installing a steam heating plant in the Corn Exchange Building, at Beaver and William streets, using the American Radiator Company's radiators.

SEALED PROPOSALS will be received for the erection of a court house at Alexander, Douglass County, Minn., up to January 4, 1894, by Fred Von Baumbach, County Auditor. The building will include a heating and plumbing system.

Evolution in Iron Founding.

Writing in the June number of the *Engineering Magazine*, Simpson Bolland entertainingly traces the evolution of the iron founders' art from its earliest stages down to the present time. Of this article we give the following abstract, which contains a good deal of interesting information in regard to old methods and modern improvements in the foundry. In introducing his sub ject, Mr. Bolland makes passing mention of the biblical references to iron and to the statement of Pausanios (A.D. 120) that Theodorus of Samos was the first to discover the art of casting in iron and making statues of that metal, about 440 B.C. As no tangible evidence of his skill has survived, however, he must have died leaving the world no wiser as to the methods he pursued. At any rate, no mention of the casting of iron is found until 1544, in which year a patent was granted in England for a process of this description. Nevertheless, works written much later than that date give no intimation of castings being made from this metal.

About 1740, we are informed, iron cannon were successfully cast in the South of England by workmen who were afterward taken across the Channel to teach the Frenchmen the new art. At this time there were very few furnaces that would produce more than 1 ton of pig iron per day. Consequently, where the foundry operations were of more than ordinary magnitude, a number of these miniature blast furnaces might have been seen at work together.

REAUMER'S METHOD.

Reaumer, the great French metallurgist, published in 1722 an interesting account of the methods then practiced by him. The remelting of the pig iron had previously been conducted in crucibles, but he conceived the idea of facilitating foundry operations by melting his metal in direct contact with the fuel, using for this purpose what may be taken as the forerunner of the cupola at present in use. A shaft was provided which fitted the top of the crucible, into which the iron and fuel were charged at the top in alternate layers; the blast, produced by two large blacksmiths' bellows, was forced in at the lower end of the shaft, and maintained at a vigorous rate until the requisite quantity of iron was melted, after which the shaft was removed, the *débris* cleared away, and the crucible, containing the molten iron, was emptied into the molds. From this we may date the beginning of modern foundry methods.

It was not until Reaumer's death in 1757 that these primitive cupolas came into anything like general use, though the itinerant founders of the day were not slow to discover their practibility as portable furnaces. These "tinker founders" traveled about the country making cast-iron weights, plates for different purposes, cast new and patched old hollow ware.

But it appears that Abraham Darby at his iron works in Coalbrookdale, England, had been making cast iron with pit coal, and casting articles therefrom, secretly, since 1713. After his death in 1717 the new enterprise was carried on by his son and namesake, through whose exertions coke, instead of charcoal, was finally used in smelting in 1760. The steam engine of Watt coming into use at this time revolutionized iron manufactures. By its means blast power was increased, and all rude contrivances, as blacksmiths' bellows and rotary machines driven by horses or oxen, which had been employed for creating blast in furnaces, were abandoned in favor of blowing engines driven by steam.

INCREASED DEMAND FOR IRON CASTINGS.

Castings in iron for the early engines of Boulton and Watt were made at the Darby Foundry at Coalbrookdale, as were also those for the first cast-iron bridge, which was erected over the Severn in 1779. As the practicability of steam power became manifest the demand for iron castings increased, and these had to be of a superior kind to the very ordinary castings first made. Nearly all parts of engines, including crank, connecting rod and beam, were then made in cast iron of elaborate and intricate design. The difficulties attending the early efforts in this line were great; and all this new work had to be done by molders who, necessarily without knowledge of the nature of materials, had to grope their way with only painful experience to guide them. Nevertheless examples of high-class molding, made in loam and dry sand, were set in those early days, which, with very few exceptions, have abided with us, unaltered, to this day. The screw propeller is an instance of this, being still molded after plans discovered in the early days of steamboating.

OLD AND NEW METHODS.

Up to 30 years ago very few of the improved methods of molding now practiced had been introduced in the foundries. The ponderous and slow wooden cranes have, by a gradual process of evolution, merged into machines of wonderful efficacy, and are now almost automatically controlled. The overhead trolley for conveying molten iron direct from the cupola to any part of the foundry is a great advance over the old system of hand carrying. For the time-honored wheelbarrow has been substituted the conveyor, which hauls everything to its destination entirely clear of the foundry floor. Where once all the iron and fuel were carried by hand to the cupola scaffold, provision is now made of electric, steam or hydraulic appliances for performing this work. The old rule of thumb methods of charging the cupola have given place to the more economical system of weighing all material in correct proportion. Many minor improvements, too, have been made. The riddle is superseded by the swinging and sliding machine riddles or the revolving screen; cleansing mills, provided with an exhauster for carrying off the dust, have replaced the primitive methods of scrubbing the sand off the casting. Loam mills are used instead of the chopper. Modern and ingenious methods for clamping together the flasks have been devised, and Nasmyth's geared ladle is much used.

CHEMISTRY IN THE FOUNDRY.

One of the greatest aids to modern founding is the system of tests, chemical and physical, to which, by some firms, the pig iron is subjected before it is charged into the cupola. When eminent chemists inform us that whatever quality of iron the iron founder demands can be furnished by the furnace manager, it would seem that it only remains for the foundryman to acquire such chemical knowledge as will enable him to know the exact measure of every element needed to produce the desired quality of iron, and thus by chemical analysis determine all his mixtures.

The introduction of some late inventions for melting iron indicates the march of progress in this particular very forcibly. Every effort is now put forth to prevent the immense waste of heat which occurs in ordinary cupola melting by a disposition of the tuyeres such as will burn the ascending combustible gases without heating the fuel to incandescence, in which instance the developed heat preheats the iron and fuel before it reaches the melting zone. What may we not expect in the prevention of heat waste when we find that electricity has at last been successfully applied for melting cast iron? It is claimed for the "Taussig" electric system of melting cast iron in exhausted chambers that oxidation and creation of air bubbles are avoided, and that the cost of driving the dynamos is 50 per cent. less than would ordinarily be required for melting by the best practice.

The advent of the chemist in the foundry marks a new era in iron founding, and is perhaps the surest indication of a desire for thorough advancement, as by his aid the indecision and doubt hitherto existing must ultimately cease. Mixing of different brands of cast iron, as well as the alloying of cast iron with other metals, to obtain a higher degree of homogeneity or any other special quality in the resultant casting, will, under such qualified direction, be more easy of accomplishment.

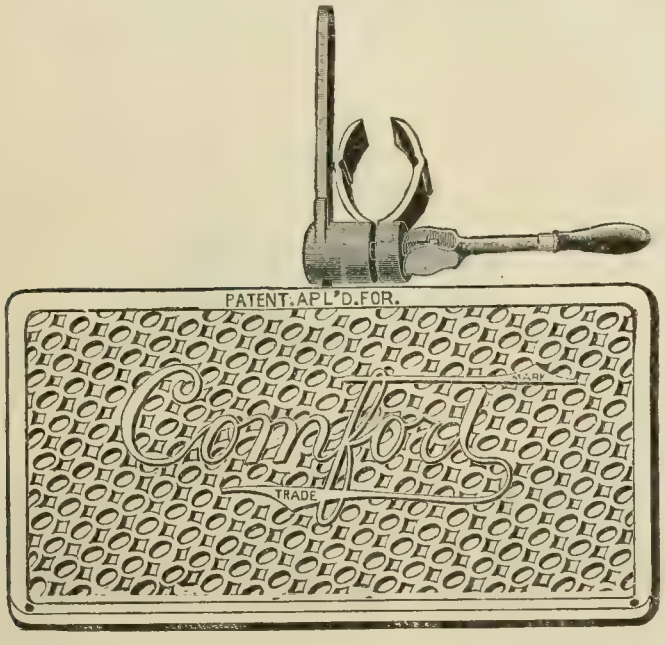
Given superior direction, we may confidently anticipate the time when, by the united efforts of the scholar and the trained artisan, the art of iron founding, in neither equipment nor skill, shall be second to any of the iron industries.

"El Cid," late of the Morgan line, purchased by the Brazilian Government and fitted out as a war vessel, sailed from New York under her new name, the "Nictheroy," on Monday. She took on board the former steam yachts "Javelin" and "Feiseen," now turned into torpedo boats, and a large supply of torpedoes and ammunition. The steamship "Britannia," also purchased by Brazil, is taking in her supplies and will follow as soon as her heavy armament is received. Rumor has it that the insurgent Admiral, Mello, is making preparations to intercept the vessels.

STEAM AND HOT WATER.

The Comfort Foot Rest.

The illustrations herewith show a radiator attachment manufactured by the A. J. Bennett Patent Radiator Attachment Company of Woonsocket, R. I. Fig. 1 shows the attachment ready to be connected and Fig. 2 shows it in place. It consists of an ornamental fret work casting, which is arranged to be attached to any and all radiators by means of a specially constructed connecting device, which permits it to be adjusted at different hights and angles,



The Comfort Foot Rest.—Fig. 1.—General View of Foot Rest.

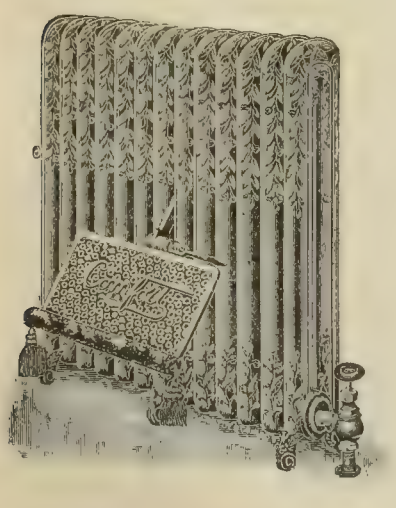


Fig. 2.—Foot Rest Attached to Radiator.

or dropped down when not in use to save space. It is called by them the Comfort foot rest, but can be used for a warming shelf very acceptably in a dining room and elsewhere. It is furnished with a handsome plush roll in different colors, adding much to its appearance.

D. Saunders' Sons

of Yonkers, N. Y., send us a 90-page catalogue in an old gold cover, proclaiming that they have greatly increased their manufacturing facilities during the past year and showing a varied line of pipe threading machinery that is said to embrace many substantial improvements. The greater portion of the book is devoted to machinery adapted for use either by hand or with power, and some special power machinery. The smaller machines are adapted to working pipe from ⅛ to 2 inches, though the UNXLD is adapted for pipe up to 4 inches and is also made in portable form, so as to be readily taken to a job and attached to a bench. The large machines work pipe up to 16 inches. All are provided with adjustable expanding die head with interchangeable chasers, the large machines having numerous other specially advantageous labor saving features. Upright drilling and tapping machines are shown for working fittings up to 8 inches. These are followed by a line of hand tools, stocks, dies, taps, reamers, pipe cutters, pliers, tongs, wrenches and pipe vises. Adjustable expanding dies, nipple chucks and gripping chucks are made a feature of the catalogue.

HEATING NOTES.

A. W. JANSEN of Lincoln, Neb., recently submitted a contract for the approval of the city authorities. He offered to pay $50 a year if the city would allow him to connect with the exhaust steam pipe of the engine at the pumping station at Twenty-first and N streets. He wants to use the exhaust steam to heat his house. At the end of 10 years the city gets all the pipe used to make the connection. The proposition was referred to the city attorney and water committee.

AMONG recently authorized corporations in Illinois are the Sanitary Heating & Ventilating Company, at Peoria; capital stock, $10,000; incorporators, Roberth Strehlow, Charles F. Cooper and Robert H. Lovett.

J. S. DODGE, Minneapolis, Minn., has been granted a patent on a device for preventing soot, dust and other impurities entering with the air used in heating and ventilating buildings.

IT IS STATED that the Holland Radiator Company of Bremen, Ind., have erected a branch works at Avonmore, Pa., some 40 miles from Pittsburgh.

J. B. PIERCE of the Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., spent a few days this week in New York City.

THE CAUSE of defective circulation that was reported to a prominent house by a customer was found on investigation to be a hole big enough to put both fists in, in the chimney just above the smoke pipe. On stopping the hole with bricks and mud at hand the fire brightened and circulation started immediately.

THE SANITARY HEATING & VENTILATING COMPANY, at Peoria, Ill, have recently filed articles of incorporation with a capital stock of $10,000. The incorporators are Robert Strehlow, Charles W. Cooper and Robert H. Lovett.

HIS MANY FRIENDS in the heating trades will regret to learn that A. C. Mercer of the H. B. Smith Company, 133–137 Centre street, New York, recently fell down a hatchway in an unfinished building where he was overlooking the installation of a heating plant. This misfortune, coming just as he was recovering from breaking a shoulder blade in a previous accident, again confines him to his house, as the injuries sustained, while not considered serious, are severe.

A. H. DUDLEY, one of the traveling men of the Herendeen Mfg. Company of Geneva, N. Y., is making a few days' stop at the New York office recently opened at 206 Centre street.

ONE OF THE NEW THINGS seen on the sample floor of the American Radiator Company at 92 Centre street, New York, is the Detroit flue radiator. This radiator is made for window use and in sizes varying by an inch in hight from 13 inches to 20 inches. Another thing that they are sending out to keep their goods before the architects is a handsome white metal pen rack, a feature of which is a section of the Detroit radiator.

The passenger transportation record of the Illinois Central Railroad Company during the six months of the World's Fair reaches the unprecedented total of 19,342,684 persons carried on their lines.

THE RETAIL STORE.

Union Skate Sharpener.

The Union Hardware Company, Torrington, Conn., and 95 Chambers street, New York, are putting a skate sharpener on the market, as shown in Fig. 1.

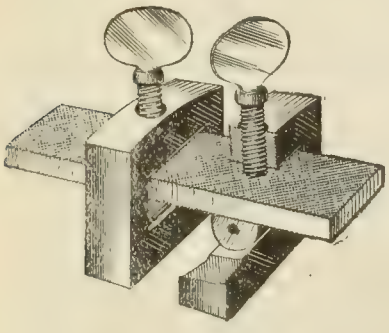

Fig. 1.—Union Skate Sharpener.

A file 1½ inches long, ¾ inch wide, is held in two metal frames by set screws. The file rests on rollers, one side of which is flattened, to allow the frames to be adjusted to any make or style of runner. In Fig. 1 one of the frames is cut away to show the position of the screw and roller. In operation the sharpener is adjusted to the skate as in Fig. 2, and is pushed forward and backward on the runner. The manufacturers claim that the article sharpens perfectly with little labor; that to use it requires no practice or skill, a child being able to do as good work as a machine shop; that being composed of but three pieces it is easily adjusted at once; that the sharpening is done with a file set in frames, and can be so adjusted that there is no chance to do anything but perfect work, and that it can be carried in the pocket, always ready for work.

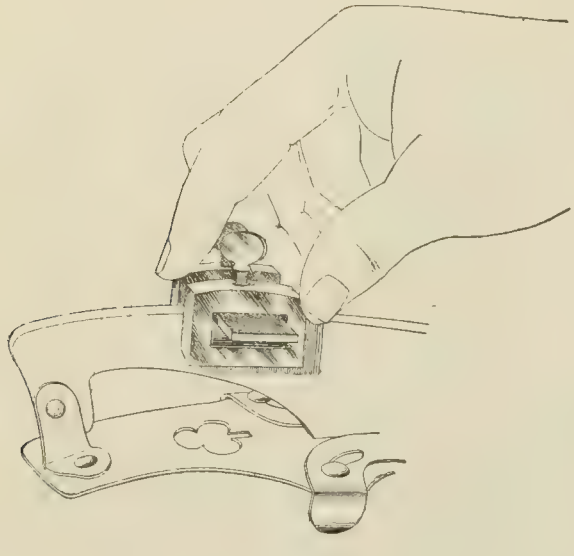

Fig. 2.—Skate Sharpener in Use.

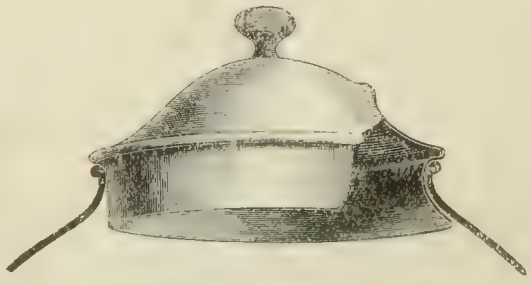
Hingeless Cover.

Stransky & Co., 27 Murray street, New York, are introducing hingeless covers, as shown in the accompanying cut, in connection with their Cameo English tea pots. The breast of the pot is represented by the lines on each side of the rim of the cover. It will be noticed that one side of the rim corresponds to the shape of the breast lines, while the other side of the rim is straight, also that a small elevation on the cover above the rim indicates the point at which the flare of the rim is the most pronounced. In use the cover is placed on the tea pot so that the flare of the rim is at the back of the pot nearest the handle. As the pot is tipped forward the flare of the rim is to prevent the cover from falling off the pot. The cover is stamped from one piece of metal, which obviates the possibility of the rim coming off.



Hingeless Cover.

The committee appointed by the Brooklyn (N. Y.) Board of Education to inquire into the best systems of manual training, with a view to the establishment of a manual training school in that city, are actively engaged in investigating the subject. They are visiting a number of similar institutions in other cities from which they will select that which they consider the best system of instruction in order to adopt it in their new school.

Changing a Credit into a Cash Business.

BY E. D. WARNER.

That a business upon strictly a cash basis is preferable to one part cash and part credit, or to one all credit, is conceded by all progressive merchants. But while the theory and desirability are granted, the practicability is doubted—in fact, even derided. To a merchant starting a new business, to open and continue an all-cash trade is comparatively a simple matter; the rub comes upon changing a credit into a cash business.

CAN IT BE DONE

without injury to my business? Most emphatically yes, if one has push, patience and perseverance, but if one be weak and vacillating, then a negative answer must be given. While the beginning may be marked by a decrease in the amount of sales, yet the net profits will usually be found to be as great, if not greater, than before; for in a part cash and part credit business three-fourths of the profits will result from the cash part. A large share of the items of expense, if examined carefully, will be found to consist of matters relating largely to the credit side of the ledger, such as bad debts, bookkeeper, cost of collection, extra help required, interest on capital invested and a number of other charges traceable to the same cause. In a cash business these are eliminated, while as added sources of profit we have cash discounts, increased custom because of lower prices, quick returns upon compound interest of money invested and the freedom from that peace destroyer, worry. Besides, one has his business well in hand, is ever pushing it, and with a gilt-edge credit—the best of capital.

LESSENED SALES.

Without doubt the first year or two will see lessened sales, but remember it

is but the shrinkage from inflation to real value and that the growth afterward will be more healthy and satisfactory than it ever otherwise could be.

The end is desirable, but how is it to be obtained?

In the first place, decide to change to a cash basis and do it. Do as Cortez did when entering Mexico with but a handful of men against a rich and powerful nation — burn your boats behind you and press on with a firm determination to succeed, and you will. Set a day for the change, and prepare your customers for it by explaining to them as far as possible, either personally or by letter when well acquainted, by circular, as we did, or through the press, the advantages to be derived therefrom by yourself, but especially by them.

When we decided to make the change to a cash basis we issued a circular, which was distributed among our customers, as follows:

We take pleasure in announcing to our friends and the public generally that after this date we propose to conduct our business, both buying and selling, on the cash plan.

A long experience in the Hardware business has convinced us that the system of selling goods on credit, to be paid for when convenient, is a most vicious one. The increased expenses of doing a credit business, on account of salaries of bookkeeper and collector, the amount of inevitable losses every year because of bad debts, which will occur notwithstanding the most careful discrimination, and the loss of interest from having a large amount of capital "tied up" in book accounts, all render necessary a larger margin of profit, which has to be considered as business expenses and paid for by the cash buyers.

Besides this, the bad feeling constantly occurring because credit is given to one customer and refused another, and the disagreeable necessity of being obliged to "dun" customers for past due accounts, confirm us in our determination in the future to sell for cash.

In these times of close competition cash buyers expect, and are entitled to, the very lowest prices, and should not be required to pay the losses incident to a credit business.

In the future it shall be our aim, by giving the most careful personal attention to every detail of our business, to satisfy the demands of close cash buyers, and to carry a still better assortment of carefully selected lines of the following goods. Endeavoring in all things to further the interest of our patrons by giving them all the advantages of a cash system, we shall hope to merit a continuance of the patronage which we have received in the past.

On the other side of the circular we called attention to the fact that we carry in stock a large and complete assortment of the following goods, purchased direct from the manufacturers for cash. The various lines of goods were mentioned under the following headings:

BUILDERS' HARDWARE.
CUTLERY.
MECHANICS' TOOLS.
BUTCHERS' SUPPLIES.
BLACKSMITHS' GOODS.
FARMING IMPLEMENTS.
HOUSE-FURNISHING GOODS.
MANUFACTURERS' SUPPLIES.

Show by your prices how much cheaper you can sell now than before, as you surely can. It is unnecessary to make a pro rata reduction through your stock, but make leaders many and often, display tastefully, advertise extensively and trade will be attracted. This now can be done with no fear of loss. Upon those articles where competition is severe figure very low, for here comparisons will be made; but from those unattacked a good profit can be reaped. In the first case, however, good returns will be obtained because the stock is quickly turned into money and reinvested, the interest or profit being now compound instead of simple.

FOR CASH.

One, except in special cases, can always sell for cash closer than for credit, and in this way is able to make greater inducements to the public to trade with him than can his credit competitor. Without doubt a few customers will become offended when refused trust, but for every one thus lost two will be gained, and as the firms see that their money will go further for cash than when time is given they will soon return. A man if he thinks he has saved money upon an article of good quality will be pleased. Such a customer is the best advertisement one can have. Sell close at a fixed price, back it up by strict honesty and courtesy, and there will be no doubt of your success.

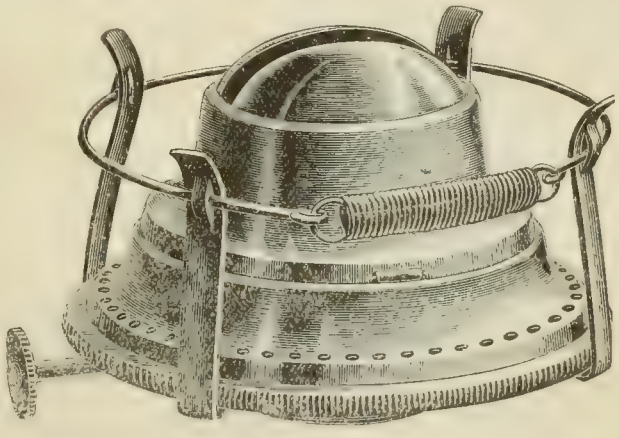
IN CHANGING

to a cash basis, to get the best results most quickly, circumstances will alter cases. With a wide fund to draw from the change can be made at once, but when restricted it is often better to allow, for convenience, a little time to those you know will pay your bill as soon as presented. They will, however, soon become educated to paying cash. But let the time given be brief as possible.

Our experience of a year in a cash business has confirmed our theory. While the amount of sales has of necessity diminished, we are constantly, by reason of reduced expenses, lower prices, &c., extending our business to fields into which we could not otherwise have gone. Moreover, while selling on much closer margins than before the change was possible, the ratio of profits to sales is greater. But best of all, when we leave at night "we go not like the galley slave, scourged to his dungeon," by worry over approaching bills, but "sustained and soothed by an unfaltering trust—we lie down to pleasant dreams."

Improved Security Burner.

The accompanying cut represents an improved burner being introduced by the Bristol Brass & Clock Company, Forestville, Conn., and 32 Warren street, New York. The improvement consists of a circular shaped wire, with a spiral spring connecting the ends. It is designed to secure the chimney in place and to make a hand lamp safe to carry about the house. The manufacturers claim that the burner secures a steady light, obviates accidents, results in better combustion and prevents chimneys falling off and breaking.



Improved Security Burner.

Selling at a Loss.

We have received the following interesting communication from an esteemed Western correspondent:

"I sold two carloads out of store Saturday, but did not make a cent—there was no profit in it." The speaker was a young salesmen representing one of the largest houses in the iron trade in the West. And why "no profit in it?" Was it because the young man lacked capacity to transact business profitably, or are his employers brainless? If no profit, then a loss. There is no other ending, except the final one of bankruptcy. And bankruptcy brought about by a policy so deliberately suicidal is positive dishonesty. All merchandise ought to be sold at a profit to the merchant. Not a profit that will enable him to just live and finally die poor, but a profit that pays his reasonable expenses of doing business and leaving him a comfortable income for old age and his family. But the policy of "there was no profit in it" induces the merchant to contend fiercely for still lower prices when buying goods, thereby forcing values downward. No sooner has he obtained a slight concession than he wires his traveling salesman "take the order at any price." And the man who has just bought at "any price" at once proceeds to "knock out" his hated rival

in business by taking the contract or order when there is "no money in it." And so he swings surely toward the point where he "cannot pay," and the one who sold him "two carloads of goods with no profit in it" is struck with possibly $15,000 worth of hopeless debt, and then proceeds to tell everybody that these are terrible times. A house strongly intrenched in capital may stand up for many years under such a policy, but the weaker ones die young.

In my experience I recall no instance of a business governed by a sound policy being forced to the wall and compelled to accept defeat. I recall a marked example of selling goods with no profit. A buyer for a large house, in my presence, made a strong attempt to secure a concession on a bill of goods, claiming that they were resold at cost. The house is noted for selling goods at low prices, and while they have secured trade in several of the Oriental countries, I have known profitable business almost at their own doors to be neglected. Why send goods to Japan while home trade goes uncared for? Why sell a carload of goods with a value of, say, from $1000 to $1500 for less profit than could be realized on one-tenth of the sum named? When we engage in business we hope to succeed; but we can only have success by getting back our dollar with interest and a profit added. Any other policy than this leads to dishonest bankruptcy.

It is time the press called attention to this subject. It ought to be placed before the eyes of every man in business, and in such a way that when he goes home he will carry the matter in his mind. Thinking about a thing at home generally results in something good.

Closely related to this matter of selling goods at no profit is this: Every traveling man ought to be instructed never to make a price on his goods unless there is a reasonable ground for securing an order. It is not good policy to walk into a wholesale Hardware house in St. Paul and, knowing that the house is already heavily stocked with nails and does not wish to buy, offer 30,000 kegs at 10 cents less than market rates. This is bound to "come back" at the traveling man's house sooner or later with bad results.

Business men, you do not like a loss in dollars and cents, but you do like to see good round profits. Some of you are not on the right track to secure the latter. Think of this matter with care and you may adopt a policy that will secure you a good return on your money invested and at a reduced risk. Better sell less and make more profit than make little profit and sell more.

Iron Clad Salamander Ware.

Iron Clad Mfg. Company, 22 Cliff street, New York, are putting Salamander ware on the market, as illustrated herewith. The body of the ware is made of steel, seamless, and is covered with Iron Clad enamel, as in Fig. 1. In addition to this, each utensil has a second bottom, as in Fig. 2, seamless, made, it is claimed, of the best quality of copper. The second bottom is perforated and ridged, and is permanently attached to the article, so that an air chamber is formed, to permit a free circulation of air, and to prevent the contents from burning or scorching. The makers claim that this ware can be used in direct contact with the fire without injury to the vessel or contents. In addition to the cooking pot shown in Fig. 1, saucepans and sauce-

Fig. 1.—Iron Clad Salamander Cook Pot.

pots are made of this ware, all in ½, 1, 2, 3, 4 and 6 quart sizes.

How to Treat Clerks.

FIRST ARTICLE.

By Fred Macey.

It is a notable fact that almost every man who has made a marked success of his business has possessed and exercised the ability to gather and keep about him good assistants. To be able to do this is one of the richest faculties a business man can possess. A man's start and early growth in business depends entirely upon himself; but as business extends duties multiply, and he is forced sooner or later to divide his duties and intrust some of them to hired help. To know just the right kind of help to se-

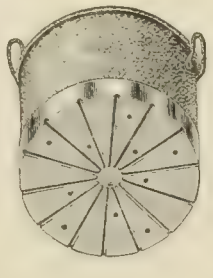


Fig. 2.—Second Bottom of Pure Copper.

lect, what duties to place upon it and how to treat it to secure his best services, is something that every business man must possess.

HUMAN NATURE.

A careful study of this subject forces upon one the fact that, while all men have their own peculiarities, which must always be taken into consideration with them as individuals, yet there is a certain likeness in human nature that makes it possible and necessary to take a certain position regarding the treatment of those in the employ of another; *e. g.*, it would not be practical for an employer to insist upon his bookkeeper using some set rule to calculate the correctness of an invoice—how he does it is a part of his education—but it is perfectly right for an employer to insist that it shall be calculated correctly. Neither would it be policy to set up certain rules as to how a salesman shall make a sale of goods, but it is entirely correct to require that if he sells he must do so at a certain price. How he does it is characteristic to himself and must be left very largely to him, but that it shall be done, and with certain results, is something that an employer has a perfect right to require.

HIS EMPLOYER'S INTEREST.

All men are engaged in business to make money, and the sooner an employer balances everything with this final end in view the better it will be for his best interests. Clerks should not be an exception to this rule, and no business man should keep in his employ any clerk that does not earn more than he receives, and it should be the aim of every clerk to serve the best interests of his employer, and the best service can only be given when a clerk works as if his employer's interests were his own. Few clerks work from this standpoint, but it is the only true one to work from. The rapid promotion of the clerk who is not afraid to work, who is constantly suggesting where small leaks may be stopped, expenses lessened, trade improved, business extended, is ample testimony to prove the truth of this rule—a clerk of this stamp is worth a dozen of those whose main aim seems to end in putting in so many hours for so many dollars.

PROMOTION.

While it is true that the value of a clerk to his employer lies mainly in himself, yet very often the employer himself is very largely to blame for the lack of results from his help. Instances come to mind of a young man who has left the service of one employer for that of a competitor. With one he could make but little progress, with the other his promotion has not only been rapid, but well founded. Why should this be so? The only answer that seems reasonable is, The one did not appreciate his ability and study to draw out his good qualities, whereas the other did.

INSIST UPON RESULTS.

Perhaps one of the most important points in dealing with a clerk is to have a definite understanding at the outset of just what is expected from him. Give him a definite field to work in and then insist upon results. Give him all the encouragement possible, but do not lose sight of results. They alone count in business. By giving him a definite field to work in the main cause for jealousies among clerks has been removed. Yet these outlines must be elastic enough to permit of suggestions that will be to the interest of the business. Throw the responsibility of a certain department upon a clerk. Hold him accountable for its success, and then, and not until then, can his ability be fully measured. No business man can hope to achieve suc-

cess without some definite end in view. Neither can a clerk.

BEING SOCIAL AND FAMILIAR.

A business man should command the respect of his employees. It is much pleasanter to receive a word of encouragement from an employer who is thoughtful in his suggestions, sincere in his actions, thorough in his work and careful of his character, than from one who is not. A cold shoulder should be turned to all familiarities from clerks. They should cease at once. They never are productive of any good and certainly do harm. Do not confound being social and being familiar. It is an employer's duty to be social toward his employees, but familiar, never. An employer who is familiar with his clerks is generally not their best friend and seldom commands their respect.

MONTHLY WRITTEN REPORTS.

Clerks should feel that their efforts are appreciated, and it is an employer's duty to know what they are doing. Many a faithful clerk has been wronged by an employer not making it his business to know for himself, and know beyond a doubt, where to place the credit for a valuable suggestion. Many times a trusted clerk is less competent than some of his assistants. Many times he takes credit of merits that belong to another, and in return receives the advancement that rightly belongs to an assistant.

Compensation of employees is one of the vexed questions that a business man must contend with. While it is unquestionably an employer's right to say what he can and cannot afford to pay for a service rendered, yet it is his moral duty to allow himself to be influenced in these matters by a strict sense of justice, and justice only. Relationships, friendships, favoritism or sentiment should find no consideration whatever in these matters. When a young man feels that nothing stands between him and promotion except merit, he then has an incentive to push to the front, and it is an employer's duty to see that he has credit for what rightly belongs to him. Perhaps there is no more practical way to solve this question than to have each clerk make a monthly written report of what he has done. Knowing that a report of this kind must be presented to his employer, a clerk's pride and ambition will lead him to make a good record. He becomes careful, thoughtful, ever on the alert to make a suggestion that will help the business, ambitious to produce good results. There is an incentive in these reports to a clerk to do his best. And not only this, the employer also gets better work, gets a better idea of what is being done, and knows where to place the credit. An employer who will use these reports, verify them and adopt good suggestions from them, places himself both in a position to compensate his help justly, and to adopt improved methods for his business.

UNRELIABILITY OF HELP.

Honesty in a clerk is a quality that cannot be too fully appreciated, but the multitude of cash registers and similar devices in constant daily use testify to the unreliability of help. It is an employer's duty to insure

HONESTY

as far as possible, but just how to do it each employer must decide for himself.

Confidential clerks are an absolute necessity in every business, yet how difficult it is to find them—somebody who can be trusted, who is not afraid to work, who watches his employer's interests as if they were his, who has good habits, some one who can be relied upon at any time, who never says a thing is so unless it is so.

GOING TO A COMPETITOR.

The extent to which a business man takes a clerk into his confidence must be decided by himself. There is always the liability of a man's help becoming dissatisfied and going with a competitor. This cannot always be avoided, and it is poor policy to let him know more than is necessary to the proper discharge of his duties. Unnecessary knowledge can do a clerk no good and may do an employer great harm.

CONFIDENCE.

In selling goods, clerks should be furnished with a complete list of the prices at which they should be sold. These are the selling prices, and if any special occasion seems to warrant a special concession it should come from the management. What a dealer pays for an article should be kept a matter of confidence to himself and his buyers. This information in the hands of indiscreet clerks would do more harm than good.

LET THEM GO.

When an employer engages a clerk, he agrees to give in exchange for certain services a certain salary. If a clerk insists on his salary the employer has the same right to insist on his services. Punctuality in commencing work should be insisted upon. Many an order is lost for no other reason than tardiness in opening up. Better be half an hour too early than three minutes too late. Dissatisfied clerks will appear in every business. There is only one of two things to do. Satisfy them or let them go. It never pays a clerk to stay after he becomes dissatisfied—much less does it pay his employers.

MISTAKES.

Don't expect too much from clerks. Don't expect that they will not make mistakes. They certainly will, all men do. When they make a mistake, don't forget all their good qualities; these very often more than offset the other. An employer should never lose control of his temper. Good seldom comes of it—but harm, invariably. A business man cannot afford to give way to his passion. As soon as he does, he loses the mastery of the situation. An employer cannot afford to employ uncivil clerks; he should insist on neatness, pleasant address; should discourage profanity, lounging, use of tobacco, drinking, gambling, gossiping. The absence of these qualities, gives character to a house, draws a better class of trade than where they are permitted. A customer never objects to good character, but very often finds fault with the opposite.

PERSONAL INTEREST.

An employer should always manifest a personal interest in the private life of his help. It somehow seems to bind the interests of employer and employee more than anything else. An employer who can command both the love and the respect of his clerks can always get better service, more of it, and at less cost than one who fails in this respect.

Ætna Curling Iron Heater.

Nicol & Co., 55 West Washington street, Chicago, offer the Ætna curling iron heater, cuts of which are shown herewith. The frame work fits snugly

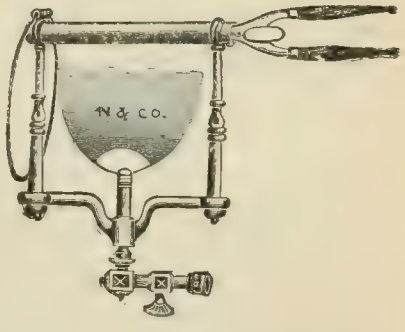

Fig. 1.—Ætna Curling Iron Heater.

over the neck of the burner, thus bringing the nickel plated case, which holds the curling iron proper, directly over the flame, thus obviating blistered or

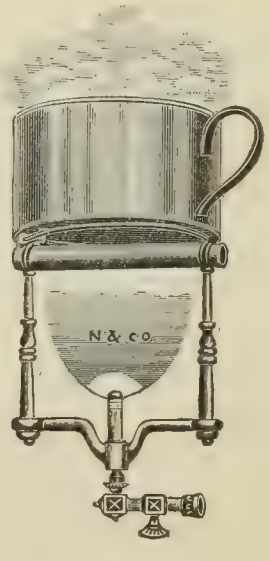

Fig. 2.—Ætna Heater with Wire Attachment.

black fingers, or singed hair. Fig. 2 shows the Ætna with wire attachment for heating liquids. This is referred to as a convenient device and as contributing much to the desirability of the heater.

STOVE TRADE NOTES.

Demand for Cheap Stoves.

Stove manufacturers observe an increased demand this season for cheap goods. To some extent there has been a lessened demand for high priced stoves and ranges. This is evidently the result of economy now enforced in every line of expenditure by families in their household expenses as well as by business concerns. An increased demand for cheap goods, however, does not necessarily mean that they are taking the place of high class stoves. Every year there are new consumers coming in the field. Newly married couples or people who have been boarding go to housekeeping and buy new outfits of furniture for that purpose. In the depressed condition of business at present they keep such expenditures down as much as possible. Cheap stoves go with cheap carpets and cheap chairs. In the case of old established housekeepers, however, an effort is usually made to get better furniture and better stoves when the old ones wear out. Rather than buy cheap goods the majority of people will patch up and repair until they see their way clear to getting a first class article. This is a promised compensation for the present period of slackening demand. As soon as times improve and workingmen are again regularly employed at fair wages, making money easier in all branches of trade, the better grades of stoves will undoubtedly be more largely called for and the trade in them will be better than ever. The competition of other heating and cooking devices will perhaps continue to increase, but there will always be a wide field for the manufacture of stoves, in which those who are most enterprising will reap the greatest benefits.

The Giraud Thermo-Electric Stove.

The following account of an electric heating and lighting apparatus is taken from the *Gas Engineers' Magazine:*

Dynamic electricity, ever since the practical introduction of electric lighting in our midst in 1878, has proved the great center of attraction to electricians, and around it have clustered some of the most brilliant achievements of electrical science. The potentialities of dynamic electricity appear to have led investigators to ignore the more modest claims of thermo-electricity as a source of light, and it has been to all intents and purposes neglected. Of late years, however, it would seem to have attracted some attention as affording a possible means of furnishing both light and heat. Hence some of our leading electricians have investigated the principle with the view of developing it into practical usefulness. Several at tempts have been made to utilize it, but none of them have hitherto succeeded commercially. Its utilization has, however, now been accomplished in an ingenious manner by Dr. Paul Giraud, a French savant, who has perfected a thermo-electric stove by which the purposes of both heating and lighting are subserved. . . .

Dr. Giraud's thermo-electric stove is, as its name indicates, for the production of heat and electricity, the current being used for lighting or for any other purpose. A portion of the heat is utilized in producing the current, while the remainder serves for heating purposes. This stove consists of an inner chamber which constitutes the stove proper and in which the fuel is burned upon the stove combustion principle. This chamber is cylindrical, and around it, at a given distance from it, are arranged the elements in a series of rings forming the battery and connected up from the bottom to the top of the stove. Outside all is the stove casing, which is of iron, the whole resembling an ordinary closed heating stove. The elements are formed of a homogeneous and constant alloy, having antimony for its base. They are of a special form and are connected together by plates of pure copper. They are arranged side by side around the stove and from top to bottom, their sockets being placed against a metal tube surrounding the combustion chamber of the stove. This tube, by conductivity, transmits the heat of the stove to the elements through a layer of asbestos board impregnated with silicate of soda, which is not acted upon by heat, and which serves to insulate the elements electrically. The elements are also further insulated by means of a paste composed of asbestos and silicate of soda. At their outer extremities the elements are cooled by being exposed to the action of a current of air, which enters by openings formed in the base of the stove and passes away by an outlet in the top cover. The current is taken by conductors in the usual way from the top and bottom of the battery and is stored for use in accumulators, or it may be used direct as produced. The products of combustion pass away through a flue in the manner common to closed stoves.

These stoves may be seen at work at the office of Messrs. W. R. Renshaw & Co., Queen Ann's Mansions, Westminster, where one is fitted up in a room about 21 feet square. The stove is about 3 feet high and 20 inches in diameter, and during 24 hours will generate sufficient current for the supply of one glow lamp of eight candle power for 30 hours or ten such lamps for three hours. During a visit six lamps of eight candle power each were being supplied by it, an excellent light being given. The heating power of the stove was far above that necessary for the room in which it was placed. An important feature of the Giraud stove is the remarkable economy which is claimed for it. The fuel consumption is stated to be only 40 pounds of a mixture of anthracite coal and coke per 24 hours, the cost of which is about 5 pence. The stoves are made of any size or power, and can be arranged to utilize the waste heat from ranges or other heat producing sources.

American Stoves for Holland.

A dispatch from Reading, Pa., announces that, as a result of their exhibit at the World's Fair, Orr, Painter & Co., the well-known stove manufacturers of that city, have just filled a heavy order for heaters and stoves to be shipped to Amsterdam, Holland. This is the first European shipment made by the firm, although they have a trade in South America and Australia. It is probable that the firm will extend their foreign trade should the practical tests of their stoves in Europe prove successful. Orr, Painter & Co. furnished some of the experimental stoves when the Reading Coal Company sent an agent abroad to introduce anthracite coal into the European markets early in the year.

In a recent number of *The Metal Worker* we referred to the assertion of United States Council Roosevelt of Brussels that a fair field for the American stove trade existed in Belgium and quoted his suggestion that the opportunity should be embraced by American manufacturers. As the two kingdoms of Holland and Belgium, which are contiguous, present very much the same conditions, the above mentioned order of stoves from Holland bears out Consul Roosevelt's opinion that a demand for such goods, of the American pattern, does exist in that region and that the trade should be cultivated.

ODD PLATES.

THE PLANT of the Schmalzried Stove & Range Company suffered damage in the great fire in Memphis, Tenn., on November 13, to the estimated extent of $35,000. They carried about $25,000 insurance.

A FEATURE of a new bathroom radiator for gas brought out by L. Ketcham, at 23 West 125th street, New York, is adjustable towel rods. The sale of his Challenge water heater for gas, which supplies a gallon of water per minute at a temperature of 150°, is increasing and large numbers are shipped to foreign countries. There are said to be 11,000 of the Challenge gas heating stoves in use.

A PLANT to manufacture steam boilers and stoves, &c., will be established at Meridian, Miss. W. R. K. Stanford of that city is said to be the moving spirit of the undertaking.

THE BAXTER STOVE WORKS, at Birmingham, Ala., have recently resumed operations, giving employment to about 50 hands.

THE PORTLAND STOVE FOUNDRY Company, Portland, Maine, notified their employees on Saturday, November 11, that wages would be reduced 15 per cent., to take effect November 22.

PRESS DISPATCHES from Dowagiac, Mich., are to the effect that the Round

Oak Stove Works of the place named closed their works on Friday, November 10, with the expectation on the part of the management of resuming operations on the first of the new year.

THE WEIR STOVE COMPANY of Taunton, Mass., are reported very busy just at present in all departments, and it is hoped that the business will continue of such a nature as to render it necessary to maintain the present activity.

THE ENTERPRISE STOVE WORKS of Vincennes, Ind., have made a contract with the Electric Street Railway Company for the installation of electric lights in their works.

THE PORTLAND STOVE FOUNDRY COMPANY of Portland, Maine, are meeting with a good demand for their St. Nicholas surface burner, which is of attractive ornamentation, fine proportions and careful finish. The makers state that the stove "was modeled by the best artists from original designs in clay." They state that the shell of the stove will not rust, nor is it liable to damage. The company have received a flood of testimonial letters from those who have purchased St. Nicholas stoves, referring to its operation in very flattering terms.

A NOTABLE FEATURE of the gas stove trade this year, reported by L. Ketcham of 23 W. 125th street, New York, is the sale of large and expensive gas logs that are large consumers of gas. These are in as active demand in the more luxurious residences as the gas radiators are in apartment houses.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., favor us with a copy of a circular issued by their agent at Port Huron, in the State named. It is composed of eight pages and presents a list of some of the names of those now using Regal Peninsular square parlor heaters and Special Peninsular four-hole ranges. The two stoves named are illustrated and described, while the list of names presented gives an idea of their popularity.

HANSEN & SALTENBERGER have opened the old Humboldt Foundry at 931 Fairfield avenue, Chicago. They make a specialty of hotel ranges and light gray iron castings.

RECEIVER JOHN GUTMANN of the Albany Stove Company, Albany, N. Y., was authorized by Judge Herrick to receive sealed bids for the purchase of the plant and property of the company. The ground upon which such action was ordered was that two attempted public sales were failures. The receiver was authorized to obtain sealed bids for the property in two parcels, the real estate, buildings, machinery, tools and implements in one; the patterns, shop rights and flasks in the other. The bids are to be submitted to the court and no sale without its permission. Saturday, November 18, was the second day set by Receiver Gutmann for the reception of bids, but no proposals were made. It is understood, however, that the plant will soon be bid in.

ONE OF THE LINES OF GOODS turned out by leading stove manufacturers which has been rapidly gaining in favor with the public is the four-hole range. Although its popularity may be said to be of comparatively recent origin, the progress has been steady, and the manufacturers who have made a specialty of the four-hole range have been gratified at the success which it has met. Experience, however, has taught stove makers that the trade find a four-hole range fully adequate to meet the requirements of families of small size. One of the concerns who have been greatly surprised at the sales of four-hole ranges is the Syracuse Stove Works of Syracuse, N. Y., who on June 1, of last year completed the patterns of a stove of this class. Since that date they have been manufacturing the goods, but up to the present time they have been unable to accumulate any stock, having sold in the period named over 2000 four-hole ranges. These sales, we understand, are owing to the features of construction embodied and the satisfactory operation of the stove under all reasonable conditions. Among the letters they have received is one from a customer in Vermont relative to this range, which is known as the Magic Welcome, showing in a very forcible manner the estimation in which it is held by those who handle it in a business way.

THE EXCELSIOR MFG COMPANY, St. Louis, are sending out an advertising novelty which will be appreciated by many in the trade. It consists of a pack of 52 playing cards, on the back of which appear the words "Excelsior Mfg. Company, Charter Oak stoves and ranges, St. Louis, Mo." None of the cards carry any advertising on their face, except the joker and the four aces. The cards are of excellent quality, and one pack is sent with each Charter Oak stove or range. Parties desiring additional packs are requested to send 15 cents, which will entitle them to a pack, postage paid.

A DESPATCH from Royersford, Pa., to the Philadelphia *Ledger* mentions that all the manufacturing industries of that town and its sister borough across the Schuylkill River, Spring City, are now in full operation. These include the stove foundries of the Buckwalter Company, Floyd, Wells & Co. and the Grander Stove Works at Royersford, and the Schuylkill Valley Stove Works and those of the Yeager & Hunter Company at Spring City. Some of these works have orders ahead for several months. The twin boroughs, says the report, have not suffered as much during the panic as have other towns in the Schuylkill Valley.

THE QUICK MEAL STOVE COMPANY, St. Louis, Mo., recently made their first shipment of gasoline stoves to Africa. The Transvaal Trading Company ordered 12 of the largest size Quick Meal stoves complete, with furniture and 6 of the Quick Meal picnic stoves, to be shipped to Johannisburg, South Africa. The Quick Meal Stove Company have made several shipments to England, and for a number of years have been shipping their goods regularly to Mexico and Canada, while in Melbourne, Australia, their representatives have incorporated under the name of the Quick Meal Stove Company of Australia, for the purpose of dealing in Quick Meal stoves.

THE MICHIGAN STOVE COMPANY have put out a unique postal card, which cannot fail to attract attention, being so radically different from the Government message bearer. It is a piece of thin poplar board, a trifle smaller than the regulation postal card. A penny stamp carries it through the mails. On the reverse side appears a printed advertisement of Garland stoves and ranges headed by the appropriate question "Wood You?" On a regular postal card the company suggest that the best season of the year for the sale of cooking goods is just before Thanksgiving, and that housekeepers generally would feel more thankful for something new and modern upon which to cook the Thanksgiving turkey than for the ordinary presents which are made about the holidays. Another advertising device issued by the company is a chiromantic chart, which should prove popular among young people in trying to tell their fortunes by the marks on their palms.

ERNEST C. MOSES, assistant secretary of the J. F. Pease Furnace Company, Syracuse, N. Y., is to stay a few weeks in Chicago. The amount of business done by the firm during the season is reported to be very satisfactory.

THE GOBEILLE PATTERN COMPANY, Cleveland, Ohio, deserve especial praise for lessening the terror in which the red flag of anarchy is held. That bloody standard they have perverted to a peaceful end, and the little banner that they send out merely calls attention to the danger that lies in neglecting patterns. To avoid this danger the one thing needful is, of course, to counsel and contract with the Gobeille Pattern Company.

GAS STOVES are often decried on account of the chance they offer to careless persons for wasting the gas by their neglect to turn off the supply as soon as the heat is no longer required. This objection has been overcome in England by the invention of a simple contrivance, which turns on the cock by the weight of the cooking utensil as it is placed over the burners. On the removal of the utensil, a spring turns off the tap again automatically.

Condition of Welsh Tin Plate Market.

The present condition of the tin plate trade in South Wales is thus described by the Swansea representative of the *Iron and Steel Trades Journal*, London, November 11 : The tin plate market is going from bad to worse. In the western valleys of Monmouthshire most of the works are at a standstill, and so little prospect is there of any revival that the workmen have been counseled by employers to seek work elsewhere. At Abertillery only four mills are kept going, while at Machen black plate alone is made. There is considerable distress existing at Pontymister, Nantyglo, Blaina and Abercarn. In some parts of Glamorganshire a similar state of things prevails. The men employed at the Aberdare and Melingriffith tin plate works have received notice to terminate contracts. At Neath, however, affairs are brighter. Three mills are being added to the Eagle Tin Plate Works, which will afford employment for nearly 150 additional men ; while the Cilfrew Tin Plate Works, which have been idle for nearly six weeks, are to be restarted on Monday next. The two new mills erected at the Dafen Tin Plate Works, Llanelly, are nearly completed, and will be started in the course of a few weeks.

FRED. W. CLARK, for many years one of the leading stove merchants of Rome, N. Y., has sold out his business at 174 West Dominick street to Isaac B. Adams of 319 West Court street. Mr. Clark, who has large land interests at La Porte, Texas, will leave with his family December 5 to reside there.

Price of Gas at Toledo.

The Council Committee of Toledo, Ohio, in approving the following ordinance on the price and quality of gas, have made a move that will be welcomed by the manufacturers of gas stoves as well as the public:

AN ORDINANCE

Fixing the price of illuminating gas to be charged by companies furnishing the same in the city of Toledo for a period of ten years.

SECTION 1. Be it ordained by the Common Council of the city of Toledo, That companies furnishing gas for illuminating purposes in the city of Toledo may charge therefor not to exceed 90 cents per 1000 feet from January 1, 1894, to January 1, 1899, said gas to be 18 c. p., which prices are hereby fixed for illuminating gas of 18 c. p. for a period of five years, as above specified; Provided, that when bills for gas remain unpaid for a period of ten days after presentation, said companies may charge and collect therefor at the rate of 15 cents additional for each 1000 feet.

SEC. 2. No charge shall be made for gas furnished for illuminating purposes of less than 18 c. p., and no company furnishing gas under this ordinance shall charge for adjusting the meter (including the lead tubing, meter cock, wrench and all other material and labor) a sum greater than the following, to wit:

For a No. 3 or 5 size meter	$2.50
For a No. 10 size meter	3.15
For a No. 20 size meter	4.40
For a No. 30 size meter	5.00
For a No 45 size meter	6 25
For a No. 60 size meter	6.90
For a No. 80 size meter	7.50
For a No. 100 size meter	9.40
For a No. 150 size meter	11.25

Provided, That no company furnishing gas under this ordinance shall make any charge for resetting a meter or setting a meter in the same place from where a meter has been removed by said company.

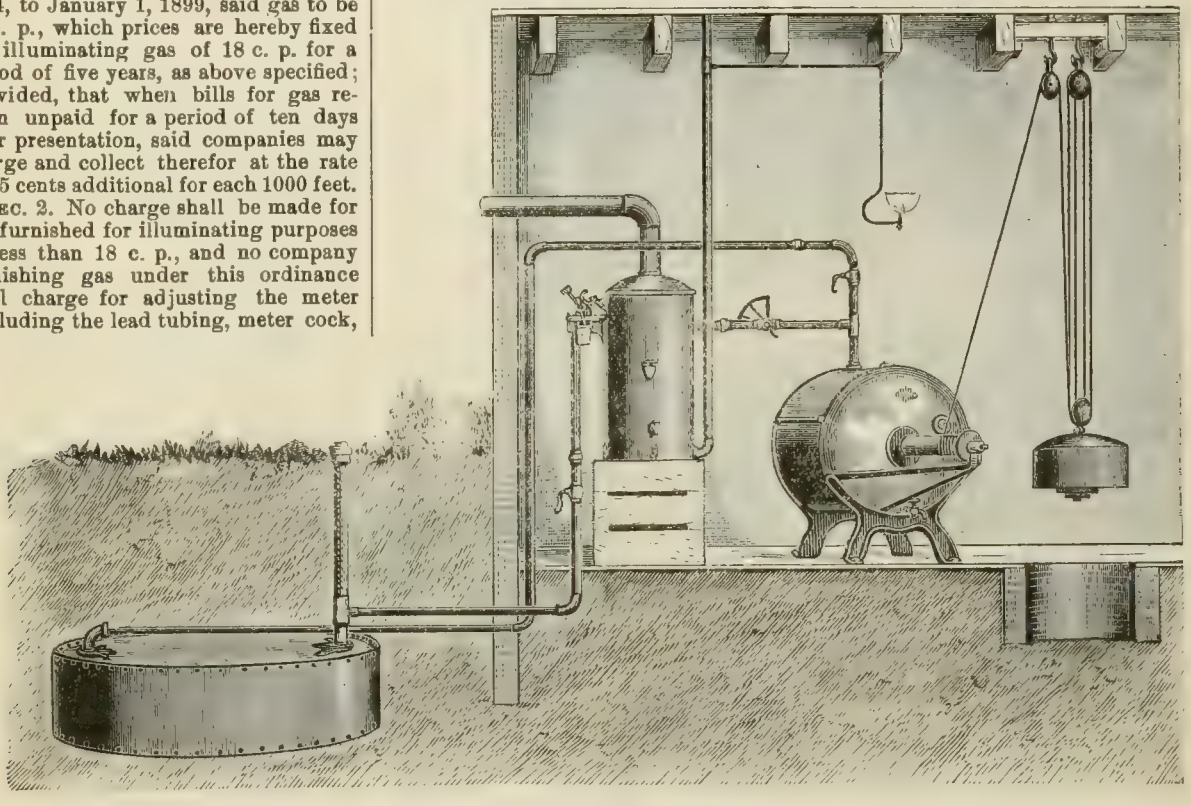
SEC. 3. No company furnishing gas under this ordinance shall be required to render a bill in any month where the amount of gas consumed in that month is less than 200 feet, but may make a service charge of 25 cents in lieu of said bill and in full payment of said amount of gas so used in said month.

SEC. 4. When any company shall file with the City Clerk their acceptance in writing of the terms hereof, as provided in Section 2479 of the Revised Statutes of Ohio, this ordinance and such acceptance shall be deemed a compliance with Sections 2478 and 2479 of the Revised Statutes of Ohio, and after such acceptance said company or companies shall not be compelled by said Common Council to furnish illuminating gas at a lower price than herein named during the terms for which such price is fixed.

SEC. 5. This ordinance shall take effect and be in force from and after its passage and legal publication.

The Improved Climax Gas Machine.

We show in the accompanying illustration the Improved Climax gas machine and Gas Mixer manufactured by Clarence M. Kemp, Baltimore, Md. The cut shows the apparatus in place and ready for operation. The Climax gas machine has been improved in several ways, the latest patent on it having been issued in October of this year. These gas machines are intended for lighting country residences, hotels, colleges, churches, institutions, &c. It is claimed to give a cheap, brilliant and highly satisfactory light, and it is particularly pointed out that the flame is smokeless and that the gas may be burned with plain lava tips, thus obviating the necessity of using the argand or other form of adjustable burner. It is said that gas with this machine can be furnished at an expense of from 65 to 75 cents per thousand cubic feet, according to location.



The Improved Climax Gas Machine.

At a recent meeting of the New York Board of Fire Underwriters a resolution was adopted authorizing the president of the board to address a communication to the Governor of the State of New York, calling his attention to the enormous increase of fire waste of late years, due largely, in the opinion of the underwriters, to the improper wiring of buildings for electric lights and power, asking his influence to secure legislation which shall require that no person shall be permitted to wire buildings for electric light and power purposes who has not been duly licensed as competent to perform the task by some Board of Control competent to test the qualifications of applicants, as is now the case in connection with engineers having charge of boilers.

W. H. Preece, the famous English electrician, remarked during his recent visit to this country that one of the things that struck him most forcibly was the number of very young men that were coming to the front in the various branches of electrical effort. This impression might well be intensified by a recent announcement that the control of the entire electric system of the town of Bloomfield, N. J., has been placed in the hands of a juvenile electrician named Perry, whose years number just 15. This electrical prodigy has, it is said, invented a model electrical car possessing points of merit, and he is at work on other experimental lines in the same field.

By the use of the improved dock equipment at the ports of the Lake Superior region, the expense of handling the iron ores has of late been remarkably reduced, as well as the time occupied in loading and unloading. Where the expense of putting the ore into the holds of vessels was estimated at from 10 to 15 cents per ton, with the apparatus in use at some of the docks this ore is now lifted from the vessel, carried back 350 feet, and dumped, at a total cost, including all expenses, of from ¾ cent to 1½ cents per ton. With 21 men in the hold of a vessel carrying 2000 tons of iron ore, the entire cargo has been stocked in 17 hours.

The longest iron railway bridge on the European Continent was opened last week across the river Vistula, between Forden in Prussian Poland and Culmsee in Germany. It is 1450 yards long and cost 8,000,000 marks.

TRADE REPORT.

The Iron Market.

The event of the week has been the sudden cessation of war among the Steel Rail mills, through the completion of an arrangement by which the Illinois, Carnegie, Cambria, Bethlehem and Lackawanna mills lease the Rail making plants of the Maryland and Pennsylvania Steel companies. We understand that the former will be closed down with the exception of the Marine department, and that the latter will cease making standard sections, a business from which it has practically withdrawn for some time. The price of Rails is now $24 at Eastern mills and $25 at Western works, for delivery during the year 1894.

On the whole, reports from the different markets are not encouraging. Pittsburgh concerns are making what is practically a clean sweep in Eastern markets. They are underbidding in a way which leaves rolling mills east of the Allegheny Mountains hopelessly out of the race. It almost looks as though their future existence depends upon the grace of the Smoky City. At present prices for raw materials and present rates of labor the mills of Pittsburgh and its allied districts can put down Rolled Iron and Steel in Eastern markets below the cost of production of Eastern mills. That fact has been proven during the past few months. The only consolation is that the Western works are unable to supply the whole demand in times of ordinary business activity.

Pig Iron.—As indicating that low prices for Pig Iron are attracting attention in distant quarters, the fact is cited in the New York market that an English house has bought 5000 tons of Alabama Coke warrants at the reported price of $7.50 for No. 3, equivalent to $7.25 at furnace. Consumers are showing but little interest in the market, although bargains keep cropping up. We quote: Northern brands, $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

No material change can be noted in the Philadelphia Pig Iron interest, unless it be that sellers appear to have better control of the market. Good buyers can get all the Iron they want at last week's prices for reasonably early deliveries, but for long dates sellers either quote slightly higher figures or postpone acceptance of bids that have been made to them. There is a strong impression that the ultimate outcome will be a rising market. For the present quotations for Philadelphia deliveries may be given as follows:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

Chicago advices intimate that the drop in Southern freight rates has disappointed all interested, as it brought no improvement in the volume of business. Consumers are only purchasing according to their necessities, and few are inclined to anticipate their requirements to any extent, even if the bait of lower prices is held out. The sellers of both Southern and local Coke report the week very quiet. The demand for Ohio Soft Irons has made marked improvement within the last few weeks, owing to the scarcity of local brands of Soft Iron. Charcoal Iron market is irregular. Some makers are getting more anxious to sell and transactions which have recently come to light are on a somewhat lower basis. Bankrupt stocks are still being offered, and these tend to depress the market. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.50 @ $16.00
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 14.25
Southern Silvery, No. 2	@ 13.75
Southern Coke, No. 2	11.85 @ 12.10
Southern Coke, No. 3	11.10 @ 11.35
Southern, No. 1, Soft	11.85 @ 12.10
Southern, No. 2, Soft	11.10 @ 11.35
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.25 @ 18.50
Jackson County Silvery	16.50 @ 17.00
Other Ohio Silvery	15.00 @ 15.50

While there is a little more metal moving, the condition of the Pittsburg Pig Iron market is far from being a satisfactory one to makers. As is well known, there are large stocks of Iron on hand there and in the Mahoning Valley as well, and with the recent increase in production it will take just so much longer to clean this stock up. Quotations are given as:

No. 1 Foundry	$12.50 @ $13.00	cash
No. 2 Foundry	11.50 @ 12.00	"

In Southern markets the volume of business in Pig Iron has been comparatively small during the week. The Iron Pipe works, having previously supplied their wants for a long time, have not been in the market and consumers did not want much, but stove works and agricultural works have bought to a fair extent, and although their orders seldom reached 1000 tons in any one instance, yet in the aggregate they were larger than usual of late, but no better prices were realized. In fact, the tone of the market is easier, for purchases are being made for the first half of next year at the same rates as current for spot delivery. No. 1 Foundry is especially weak, there being little demand for that grade, and sales have been made as low as $9.50 ℔ ton, f.o.b. Birmingham. The other grades are well sustained, there being a fair demand for No. 2 Foundry. The trade contends that the outlook, from a statistical point of view, is more favorable and that there should be an early improvement in prices, but as long as buyers can supply their wants at the current low rates they pay little attention to sentimental views. Quotations are as follows:

Southern Coke, No. 1	$12.25 @ $12.50
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—Prices have been moved a little higher, or to 20.65¢ @ 20.70¢ for present or next month delivery. Comparatively little Tin has changed hands in a speculative way, however, and regular consumptive movement is believed to have been below the average for the season. The turn for the better in prices, as a matter of fact, has the appearance of being what may be termed a nicely timed natural reaction, engineered by some few prominent operators, with nothing more substantial behind the manoeuver than the fact that this market is still a good deal below the level of Europe. "Short" interest in the speculative branch of the market here seems to have been pretty well eliminated, and the outside holdings are believed to be comparatively small. Several hundred tons of Pig Tin have been shipped to this port from Europe during this month, the largest portion of which will go into bond pending the coming tariff changes. Jobbers report a strictly routine demand, confined to present requirements. Quotations for small lots are unchanged at 22½¢ for Banca and 21½¢ @ 22¢ for Straits Pig.

Copper.—Regarding the alleged late sales of Ingot by the Calumet & Hecla Company, no official information is imparted, but facts came out from outside sources going to show that about 5,000,000 lb were disposed of to exporters and that the price was 9¾¢ ℔ lb. Rumor has it that sales have also been made to home consumers at similar

price, with deliveries running up to March 1, if not further ahead, and that some business has been done at 10¢. The latter price is now bid for round lots and most sellers have advanced their limits to about 10¼¢. Toward the close of the week bids were made on the Metal Exchange of as high as 10.15¢ for December and 10.25¢ for January and February deliveries of Lake Superior Ingot. The market shows something of substantial firmness in this product, but the cheaper varieties of Copper merely hold their own in price, with but ordinary sales. Better inquiry is noted by jobbers for Ingot Copper, and sales have made a rather better showing during the week. Quotations for small lots remain unchanged.

Sheet Copper.—An increase in inquiry for Sheet Copper is noted during the past week, particularly for forward deliveries. Dealers are not, however, inclined to close much beyond spot sales just now nor to contract far ahead at present prices, believing that they have reached bottom figures, and that an upward movement is more than likely to occur before long. Stocks in consumers' hands are believed to be extremely low throughout the country, and it is thought that with anything like a return to normal conditions a satisfactory business should develop after the holidays. Prices are inclined to harden in sympathy with the advance in Ingot, although list prices for Manufactured Copper remain unchanged in the Eastern market.

Pig Lead.—Sales have been reported here to the extent of about 750 tons common domestic for delivery during the balance of the year. Some lots went at 3.40¢ for November, but the greater portion of the business was in December delivery at 3.42½¢ @ 3.45¢. At this writing the offering is moderate, and while consumers manifest extreme indifference, the demand from other quarters, along with more or less reserved offering, serves to keep the market quite firm in tone. Jobbers report the consumptive demands as extremely languid, nor is any substantial revival looked for this year either in Pig or Manufactured Lead. Prices for small lots are, meanwhile, firmly maintained at last week's quoted rates.

Spelter.—The purchases of this metal have been confined chiefly to single carloads at about 3.70¢ for ordinary Western brands deliverable here during the next six weeks. In volume the business was moderate and the demand was very tame. It is stated, however, that very few smelters will take orders at current prices, stating that their probable output for the balance of the year is closely sold up and that present prices leave no margin of profit. Hence 3.80¢ is asked for January and later deliveries, although moderate quantities have been closed out for earlier delivery at the price above quoted. Jobbers' rates for moderate retail quantities rule at 4¼¢ @ 4¾¢ for ordinary Western Spelter, with the usual advance on special brands.

Antimony.—Dealings have been on a very moderate scale, yet the demand remains sufficient to maintain a fair degree of steadiness in prices.

Tin Plate.—The most marked feature of the Tin Plate market has been a fairly active demand for 100 lb Ordinary Cokes for delivery during the first half of next year. Enough was done in this line to bring about a pretty good volume of business. Interest in futures does not, however, by any means come up to the average for this season of the year. Spot dealings have been moderate, and prices in no case show any quotable improvement. Still they are firm enough to warrant the conviction expressed by many authorities in the trade that absolute rock bottom has been touched, at any rate for this season, and that, therefore, any future movement will be in an upward direction. Stocks in the hands of consumers and retail dealers are known to be of the narrowest description. Consumers are only purchasing according to their necessities, and are entirely disinclined to anticipate their requirements to any extent until the trend of tariff legislation in the matter of Tin Plates is assured. For these reasons a big revival of interest is looked for so soon as importers, producers and buyers know exactly what are the new conditions to which they will have to adapt themselves. When such assurance is obtained the return of good business is looked for. But for the rest of the year nothing more lively than the present perfunctory trade is generally expected. Importers' orders for shipment are believed to have been somewhat larger latterly; but the receipts from the other side for some months have been very much below the average, importing merchants having been influenced by the same conservative sentiments operating with the consumers. As a result, jobbers complain of a difficulty in obtaining prompt filling of assorted orders, and much hunting from place to place has marked the trade of late.

Sheet Iron.—The immediate requirements of consumers of Galvanized Iron have been apparently filled to a large extent, and as the output has somewhat increased the market for this material shows greater ease. Stocks are being replenished, and there is, therefore, now less risk of any famine. Prices are, if anything, firmer. Black Iron is extremely dull. Mills have in several instances arranged for the placing of their whole output well into next year, and consequently jobbers find little interest being taken in this material. Prices are nominally firm, but spot cash or other inducements might secure concessions on quoted rates from the majority of dealers.

Chicago Report.

Scrap.—The consumption of Old Material continues to increase, as idle Iron works get into operation. Scrap Steel is the only commodity in this line that is wholly neglected. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....

Anthracite. — Some weakness in prices had begun to develop in this market under the influence of very mild weather, but it speedily changed when a severe cold spell set in throughout the Northwest and at the same time a formidable strike took place on the Lehigh Valley Railroad, threatening to curtail the supply of coal. The market now is firm. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill.	$5.85	$6.10
Milwaukee, Wis.	5.85	6.10
Kansas City, Mo.	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb.	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak.	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis.	7.35	7.60
St. Paul, Minn.	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo.	9.05	9.30
Leavenworth, Kan.	9.05	9.30
Omaha, Neb.	9.05	9.30

THE CONSOLIDATED LAMP & GLASS COMPANY, Pittsburgh, Pa., have just closed negotiations with the Fostoria Shade & Lamp Company, Fostoria, Ohio, for the purchase of their plant and business. Arrangements have also been made for the purchase of the business of the Wallace & McAfee Company, Limited, Pittsburgh.

THIS WEEK two Sheet mills at the plant of the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, will be laid off, and other departments will be closed down unless an agreement is reached with the Amalgamated Association on the wage scale governing Sheet mills.

CONDITION OF THE

Hardware Trade.

AS the latter part of November usually witnesses a diminution in the volume of trade it is not a matter of surprise that at the present time there is no increase in business. It is, however, a matter of congratulation that there is little, if any, falling off, trade being characterized by a fair activity in view of all the circumstances. There is certainly a better feeling prevalent and more confidence in the early resumption of a normal activity. The policy pursued by merchants of limiting their purchases to early requirements is still adhered to, and with perhaps nearly as much conservatism as during the past few months. Stock orders are given sparingly, but dealers are purchasing frequently with a view to completing their assortments, being content, however, in nearly all cases to carry less goods than usual. Prices are without important change, the market being fairly steady with the exception of some staple goods, such as Nails and Wire, in which there is a perceptible downward tendency. The financial condition continues to improve, and it is pleasant to note that comparatively few failures are reported. There was some apprehension a few months ago that the condition of business and the financial stringency would result in a good many failures in the trade, and perhaps among retail merchants, but fortunately these fears have not been realized, and with the lapse of time there is less to apprehend in this regard.

Advices from Chicago.—The Shelf Hardware jobbers report business to have improved a little during the past week, owing to the prevalence of cold weather throughout the Northwest, but it is still much under the normal volume. Merchants are fairly well stocked now on seasonable goods, and their orders are only small and evidently to cover sudden calls. Importers of Tin Plates represent their trade interfered with to an increasing extent by domestic Tin Plates, which are not only offered at lower prices, but on which better terms are given than customary in the importation of such goods. The movement is confined to small lots, but there is a fairly steady trade, in business of that character. Heavy Hardware jobbers are having a better demand in their line, not only in Iron and Steel, but also in winter goods. Material for bob sleds and other seasonable articles has been moving much more freely during the last ten days than at any previous time this fall. Collections are quite fair.

Notes on Prices.

Wire Nails.—The downward tendency in the prices of Wire Nails, which has been perceptible for some time, still continues, and on round lots at mill the market is represented by the quotation of $1.15 to $1.20. Some of the mills are holding to the latter figure, but there is little difficulty in placing attractive orders at the lower price named. In view of the desire of manufacturers to book orders and the active competition which prevails among them, relatively low prices are made on comparatively small lots, and a good proportion of the business consists of orders from the smaller jobbers and large retailers. The volume of business is only fair, but most of the mills are kept moderately busy. Small lots from store in New York are quoted at $1.55 to $1.60.

Advices from Chicago.—Business in Wire Nails is moderately active outside of Chicago, but not so much has been done in the city during the past week. Manufacturers are trying to hold the market at $1.30 to $1.32½, Chicago. But these prices have been shaded by some of their competitors, who seem to possess special facilities in low transportation rates. Jobbers quote small lots from stock at $1.45 to $1.50.

Cut Nails.—The Cut Nail market shows but little change during the past few weeks, the volume of business remaining moderate and prices pretty evenly maintained on a basis of 95 cents for carload lots at mill. This quotation is not, however, rigidly adhered to and prices have reached a point where some of the mills are not netting over 90 cents. The market in the West seems to be on the whole in a better condition than in the East and prices are more firmly maintained. In view of the unsettled condition of business some of the mills are not in operation, but there is on the whole a larger production of Nails at the present time than for some months. Small lots from store in New York are quoted at $1.20.

Advices from Chicago.—A continued good movement is reported in Cut Steel Nails, the best trade being, as heretofore, with points in the South west, now accessible by very low rates. These rates will run until early in December, and meantime the merchants o that section are stocking up heavily. Very good sales are also being made in the Western section of the country, especially in localities which can be reached by water from Wheeling. Prices on factory lots now run from $1.15 to $1.20, Chicago, according to the character of the order. Small lots from stock are selling at $1.30.

Barb Wire.—The demand for Barb Wire continues only moderate and the market is described as sluggish. Quotations are somewhat irregular and are represented by $2.15 to $2.20 for carload lots of Four-Point Galvanized at mill, the former figure being more readily obtainable than a week ago.

Advices from Chicago.—Trade in Barb Wire has not shown any increase since last report, but the demand seems to be fairly steady within the contracted lines that have prevailed for so long. The demoralization in prices reported in other parts of the country has not yet reached this locality, probabably because the orders coming up are not large enough to make it an object to cut prices in order to capture trade. The center of disturbance recently seems to have been in the South. Prices on factory lots of ordinary Galvanized Wire continue at about $2.40; carload lots of Glidden, Waukegan and Baker Perfect are selling at $2.50. Small lots from stock continue to be quoted at $2.55, but jobbers are doing but little in consequence of the increasing efforts of manufacturers to take the retail trade.

Market Wire.—The market on Plain Wire is suffering with other lines and lower quotations are developed. The greater part of the business is done at net prices instead of list and discount, and figures are being quoted which are lower than ever before. The decline in the price of the raw material contributes largely to this result, as does also the active competition between producers.

Cordage.—The Cordage market is quiet and the demand light. Prices, in sympathy with lower quotations on Hemp, have recently been tending downward, and are now quotably lower than a few weeks ago. It is reported that pure Manila Rope has been sold recently and is still obtainable at 7⅛ cents per pound. Sisal also has touched 5¼ cents a pound, and in round lots is also obtainable at this price. The market is thus represented by the following prices for large lots, f.o.b. factory or New York, the prices given being subject to a discount of 1½ per cent. for cash:

	Per pound. Cents.
Manila, 7-16 in. diam. and larger	7¼
" ⅜ in	8
" ¼ and 5-16 in	8½
" Tarred Rope	7
" Hay Rope, Medium	7½
Sisal, 7-16 in. and larger	5¼
" ⅜ in	5¾
" ¼ and 5-16 in	6¼
" Hay Rope	5¼
" Tarred Rope	4¾
" Medium Lath Yarn	5
New Zealand, 7-16 in. and larger	5¼
" ⅜ in	5½
" ¼ and 5-16 in	6
" Hay Rope	5¼
" Tarred Rope	4¾

Glass.—During the past week the Plate Glass Manufacturers' Association having the central selling agency at Pittsburgh was dissolved, and the selling agency was abolished. Window Glass factories continue to start up, the present capacity being equal to 785 pots, as against 182 pots reported in our issue November 2. The demand is not brisk, and it is reported that card rates have been shaded very materially, especially where money was necessary for factories to meet obligations. At the present time there appear to be no available quotations on any kind of Glass which would hold good under all circumstances.

Old Metals.—But little improvement is manifest in the market for Old Metals, and prices show as yet no upward tendency. Scrap Iron, however, commands a little more attention, although the demand is still very light. During the last few days inquiries are said to have come in more freely, and for certain lines a somewhat more improved demand is reported to exist. Purchases are, however, almost invariably in very moderate quantities for the supply of pressing requirements only. Quotations, New York delivery, are as follows :

Heavy Copper	℔ lb 6⅜¢
Light and Tinned Copper	℔ lb 6¼¢
Heavy Brass	℔ lb 5¼¢
Light Brass	℔ lb 4½¢
Lead	℔ lb 3¢
Tea Lead	℔ lb 2½¢
Zinc	℔ lb 2½¢
No. 1 Pewter	℔ lb 14¢
No. 2 Pewter	℔ lb 6¢
Wrought Scrap Iron....℔ gross ton	$9.00 @ $10.00
Heavy Cast Scrap.....℔ gross ton	9.00 @ 10.00
Stove Plate Scrap.....℔ gross ton	.... @ 5.60
Burnt Iron (delivered at mill) ℔ gross ton	.... @ 5.00

Old Rags, Paper, &c.—Business has taken a somewhat better turn in the market for Old Rags, Paper, &c. More activity is noted in the demand for Paper stock than has been the case for some months. Yet the trade is still far below its average level, and no return to normal conditions is looked for much before the first of the year. Western paper mills are busy, and the majority of those in the East are picking up again. Prices show little change from those quoted last week, as follows:

No. 1 White Rags	℔ lb 3¼ @ 3½
No. 2 White Rags	℔ lb 2¼ @ 2½¢
Mixed Rags	℔ lb ¾¢
Blues and 3ds	℔ lb 1 @ 1¼¢
Hard Sized White Shavings	℔ lb 2¼ @ 2½¢

Hemp Twine	℔ lb 2¼¢
Manila Rope	℔ lb 2½¢
Jute Rope	℔ lb 1½ @ 1¾¢
Mixed Rope	℔ lb ¾ @ ⅞¢

Old Rubber.—The market for Old Rubber presents no features of interest. Prices continue low, being about as follows in New York:

Car Springs, ton lots, ℔ lb.	.... @ $0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	.... @ .03
Rubber shoes, less than carloads, ℔ lb	0.02¼ @ .03⅛
Large Hose, ℔ ton	.... @ 9.00
White Wringer Rolls, ℔ lb.	.... @ .04¼
White Syringes, ℔ lb	.... @ .05

BOAS BROS., 233-235 Greenwich street, have ceased to sell their Adamant Enameled Ware on joint agreement with Lalance & Grosjean Mfg. Company and St. Louis Stamping Company. This line of goods is of German manufacture.

Trade Notes.

THE MICA MFG. COMPANY, 89 Fulton street, New York, issue a folder describing some of the specialties in mica of their manufacture. One page gives illustrations of Mica Canopies for gas globes of various patterns. There are also Mica Canopies for lamp chimneys, Smoke Bells, Protectors for silk shades &c. Among other special goods are Mica Screens, Argand Chimneys and the like. A very large variety of goods are illustrated and described and particulars of price and sizes are given. This firm likewise sell Mica by the sheet, and in the circular a price-list of Mica in this form is given.

TINNERS' MACHINERY & SUPPLY COMPANY, 9 Cliff street, New York, distribute a circular illustrating and describing the Excelsior Patent Oval Former. A full account is given of this tool, which is made with 2 inch rolls and 1¾ inch rolls, both sizes being 31 inches long. On the back of the circular are testimonials from very prominent sheet metal workers, who refer to the excellent work of this Oval Former.

NINETY TONS of Black and Galvanized Sheets are kept out of the market each day in consequence of the recent destruction by fire of the plants of the Irondale Steel & Iron Company, Anderson, Ind, and the Whittaker Iron Company, Wheeling, W. Va.

A COMPANY has been formed and active steps taken toward the erection of a Sheet mill plant near Saltsburg, Pa., to consist of four light mills. A. Gourley, superintendent of P. H. Laufman's Sheet mills, at Apollo, Pa., is the leading spirit in the enterprise.

J. W. FISKE, 39 and 41 Park place, New York, has recently manufactured for the Hotel Waldorf a number of Iron Vases to contain flowers, shrubs, &c., to be placed around the building just inside the street walks. They have been made from special designs, and are not to be sold to any other hotel in this city. The vase represents an acorn cut in two horizontally, this emblem being a portion of the Astor coat of arms. The acorn rests on the rustic stump of an oak tree. It is also made with a square base to set low.

THE fourth Sheet mill of the Cambridge Iron & Steel Company, Cambridge, Ohio, was put into operation last week. This mill had been idle many weeks in consequence of dullness in the market. Revival of trade in Galvanized Sheets caused its resurrection. This company now have two galvanizing pots running steadily.

J. P. TURNER, 40 and 49 Cortlandt street, New York, who puts up Lightning Rods of all kinds, also Weather Vanes, Bannerets, Finials, &c., says he has no cause for complaint as regards trade. He is busy at present with a dozen houses in a North River town, and will commence on a large hospital in Elizabeth, N. J., at once, in addition to other work in hand. Among some satisfactory contracts just finished he mentions the Lightning Rod equipment for the two power houses and tall chimneys of Third Avenue Cable Road in this city. Edison Building in Newark and a cathedral in Jersey City, N. J.

P. W. SMITH, an English manufacturer recently arrived in this country, has, it is announced, leased the long abandoned Champion Saw Works, at Beaver Falls, Pa., where he will start an enameling works for the production of Enameled Steel House Decorations.

THE TINWARE FACTORY of Bridgeport & Co., Louisville, Ky., was burned recently. The loss was $60,000, covered by insurance to the extent of $45,000.

THE SALEM MINERAL WOOL COMPANY, Salem, Va., have erected a new factory in place of the one destroyed by fire last year.

It Is Reported—

That on the 7th inst. fire broke out in the Hardware store of William Hunton, Granger, Texas, and entirely consumed the stock and building. The stock was valued at $1600, with insurance for $1000. Loss on building, $500; no insurance. The origin of the fire is unknown.

That almost the entire business part of the town of Latham in Butler County, Kan., was destroyed by fire on the morning of the 6th inst. Among the heaviest losers by the fire were the Winfield Hardware Company.

That Mason & Dale's Hardware store was considerably damaged by smoke and water in a fire at Bowmanville, Man., on the 6th inst.

That E. N. Falke has opened a new Hardware store at 811 Monroe street, Toledo, Ohio.

That burglars broke into C. M. Jones' Hardware store, at Ripley, N. Y., on the 8th inst., and carried off Revolvers, Knives and Razors to the amount of $150.

That in a fire at Memphis, Tenn., on the 13th inst., the stock of the Schmalzried Hardware Company suffered to the extent of $35,000. The insurance is $28,000.

That the firm of Heacock & Durfee, Gloversville, N, Y., dealers in Hardware, have dissolved. Mr. Heacock will continue the business alone.

That in a fire in the Phœnix Block, Concord, N. H., on the 11th inst., the stock of Hardware of Thompson & Hoague was damaged, mainly by water, to the extent of $15,000. The firm have opened a retail store in their wholesale establishment on Depot square, and will conduct the business there for the present.

That Arnold & Whitmore have entered the Hardware and Implement business at Ludlow, Ill.

That the store of C. Schnepff, Elkport, Iowa, was recently damaged by fire.

That G. W. Weston is closing out his Hardware business at North Branch, Mich.

That F. D. Woodworth, dealer in Hardware, Stoves, &c., Onondaga, Mich., has sold out to J. H. Strong.

That the Rockford Hardware Company, Rockford, Mich., have dissolved.

That R. Edmunds & Son, Warren, Pa., are out of business. They have been succeeded by T. O. Slater.

That Hamilton Welton is intending to enter the Hardware and Implement business at Paragon, Ind.

That Edward Thomas has purchased a half interest in the Hardware store of Herbert A. Wolcott, Carthage, Mo., and hereafter the firm name will be H. A. Wolcott & Co.

That A. A. Suppigar, of the firm of Kreige & Suppigar, Hardware dealers, Edwardsville, Mo., has sold his interest in the firm to J. C. McKitrick.

That C. W. McMahon has sold his interest in the Hardware business at Center Junction, Iowa, to his partner, Herbert Mackrill.

That H. Stonebrook and Theodore Thome have opened a Hardware store at Nashville, Ohio.

That the firm of Hancock & Boyes, Hardware merchants, Emerado, N. D., have dissolved.

Price-Lists, Circulars, &c.

PITTSBURGH BRASS COMPANY, Pittsburgh, Pa., and 36 Park place, New York: illustrated catalogue and price-list of Piano, Banquet, Vase, Table and Bracket Lamps. The book is divided into several sections, each class of goods by itself, to facilitate choosing what is wanted. There are a number of metal and onyx Tables, both with Lamps and without. Also an assortment of Shades and Shade Holders for Piano and Banquet Lamps, together with decorated Glass Shades for Table and Hand Lamps.

THE UNION HARDWARE COMPANY, Torrington, Conn., and 95 Chambers street, New York: Ice Skates. An illustrated price-list shows their Lock Lever Skate in various finishes, Lock Lever Union Extension Skates, Ladies' Lock Lever Skate, Ladies' Lock Lever Union Extension Skate, Ladies' Wood Top Skates, Donoghue Racing Skate, Union Skate Sharpener, &c.

THE BOURKE MFG. COMPANY, Youngstown, Ohio: Ventilating Sash Lock and Fastener, Diagonal Sash Lock and Fastener, Nonpareil Window Cleaner, Extension Handle Socket, Excelsior Bar Cleaner and Floor Scrubber and Dryer. A catalogue illustrates these goods, with descriptions and list prices.

JOHN ROBBINS MFG. COMPANY, 58 Kneeland street, Boston, Mass.: Badges, Medals, Plates and Checks. A catalogue gives 40 pages of illustrations of Badges and Medals, including aid and athletic Badges; Badges for army corps, bicycle and boys' clubs, for policemen, constables, detectives, firemen; fire alarm box Tags, sporting Medals, &c. These goods are made in solid gold, silver or nickel, and special designs are furnished when desired.

The New Tin Plate Tariff.

The clause in the tariff bill that was made public this week, affecting tin plates, proposes to change the duty from $2\frac{3}{10}$ cents per pound, as it exists under the McKinley tariff, to 40 per cent. ad valorem. This alteration from a specific to an ad valorem duty has aroused a great deal of opposition among tin plate importers, and there are very many reasons why the former method of imposing a tariff according to weight, in this particular article, should be adhered to. It is not a question of the amount of duty so much as a question of the way in which it is levied that is severely criticised. For certain theoretical reasons the ad valorem duty is the preferable, for it varies according to a changing market. The practical objections, however, are many and great, and are especially formidable in this article of tin plates. The existing duty of $2\frac{2}{10}$ cents per pound may be roughly stated as equivalent to from 75 to 80 per cent. ad valorem, so that the present duty is a reduction of about one-half. At present the wholesale market for plates is, let us say, 10 shillings and 6 pence per box for 108-pound Bessemer cokes, at Swansea, this being equivalent to $2.45, so that the duty per box will be 98 cents, as against $2.37 at present. On the higher grade of plates the difference would be proportionately less as the price advanced. Melyn plates, for example, are now quoted at the equivalent of $3.15, in large lots at Swansea, for 108 pounds, which, under the new duty, would pay $1.26, as against $2.37, the same as in the case of the cokes.

Objections to Ad Valorem Duty.

Without attempting to analyze all the objections that may be urged against an ad valorem duty, there are a few principal reasons that may be pointed out. In the first place, it is necessary to know the value of the goods at the time of shipment, and unless the customs inspector is an expert in tin plates he must rely upon the invoice valuation. In the larger ports of entry, like New York, the importations are so extensive that the inspectors may, perhaps, be fair judges of tin plates, and know the difference between the best and poorest grades, so that a manifestly false valuation on the invoice would be detected. But in the case of plates shipped in bond to interior custom houses where plates are infrequently received the customs inspector might readily pass the highest grade of plates invoiced as common cokes without knowing the difference. Under the present system of weights such a falsification is impossible, for there is no more difficulty in determining the exact weight of tin plate than any other article of merchandise, and the duty being dependent solely upon the weight there is no means of evading it unless by collusion with the inspector. It is also pointed out that tin plates are contracted for a long way ahead, in some cases extending over a year. With an ad valorem duty importers would hesitate a long while about making contracts, and if they did so would be careful to name so high a figure that they would be protected against any ordinary fluctuations in the market. The necessity of this will be understood when one considers the variation in the tin plate market and bears in mind the fact that the duty is paid according to the market value at the time of the shipment of the goods. Tin plates, for instance, that would be sold to-day for delivery 12 months hence, might in an extreme case vary $1 a box in price, which would be equivalent to 40 cents advance in duty. It is needless to go into all the details of the argument against ad valorem duties in this case. Those who are familiar with the tin plate trade know how very great are the opportunities for deceit, and how difficult it would be for the duty to be honestly levied and collected if any attempt were made to evade it. In connection with the new tin plate clause, much interest attaches to the change in the tariff on black sheets, which have been reduced to nearly one-third of the present duty. This puts a premium on the practice of dipping plates in this country as opposed to manufacturing them from the bar. . With free tin and the duty cut 60 per cent, on black sheets, it is manifest that the business of dipping plates will be a profitable industry here, while the manufacturer, with actual protection of say one cent a pound, will find it hard work to compete.

Highgate Sanitary Museum, London.

Rather more than a year ago the local board of Hornsey, one of the suburban districts of London, originated a permanent exhibition of sanitary appliances for the benefit of property owners and householders, as well as of sanitary engineers and plumbers. The experiment has proved a striking success, judging from the wide interest it has evoked: and the institution bids fair to become the parent of many similar exhibitions in England. A correspondent of an English journal who has recently visited the Highgate Sanitary Museum (as it is called, Highgate being included in the Hornsey district) gives some particulars respecting it, which will be of interest to our readers. The museum, he reports, contains a valuable and instructive collection of modern sanitary appliances, which must be of universal benefit to those interested in such things. It has grown rapidly during the first year of its existence, until at the present moment it consists of seven large rooms. It has a total floor space of nearly 5000 square feet, and contains upward of 1000 exhibits. Water is laid on, and the appliances are shown in operation. There are several working models, some of which are made in glass so that the action may be easily seen. There are also machines for testing cement, earthenware pipes, water fittings, bricks, macadam, &c. Specimens of the highest class of plumbing are exhibited, as well as object lessons in the shape of old and defective traps and joints. Arrangements have been made, it is stated, for lectures on sanitary science for the forthcoming winter, some of which were given last season, having been very much appreciated. The museum, which is a free institution, has been visited by thousands of persons during the year.

English Heating of Railway Cars.

The heating of railway carriages is a matter in which England and European nations generally are admittedly very backward. Considering the progress which has been made in the construction, lighting and comfort—in other respects—of the European cars, it has always been a matter of wonderment to the American traveler, and even to many natives themselves, that the only approach to heating in the winter season is by means of the old fashioned foot warmer, an article which should by this time have taken its place on the curiosity shelf alongside the old time warming pan of our grandmothers, and the *chauf pied*, the little box of lighted charcoal that the French countrywoman used to carry to church to keep her toes warm during the sermon. Reports from England speak, however, of a new departure in this respect on the part of the Midland Railway Company, who have adopted a more scientific system of heating on their line from London to

Scotland. The apparatus consists of pipes running round each car and connecting with the engine, where hot water is supplied and propelled by steam pressure, so as to be kept in constant circulation. Other lines are said to be contemplating the adoption of a similar plan.

Mixing Dampers.

The introduction of the so-called hot and cold duct system in hot blast heating where a fan is employed has developed numerous designs in dampers for mixing the air at its common point of discharge from the two ducts to the connecting flue. By this system hot air is conveyed in one duct and cold air in another to the mixing damper, which must then operate to admit air of the two temperatures in varying relative proportions, but always of the same total combined volume—that is, the hot air must be shut off in exactly the same proportion as the cold air is admitted, and a mixing chamber of sufficient size must be provided to prevent the direct discharge to the room of separate currents of air of greatly differing temperatures. There at are present in use several different styles of mixing dampers that are incorrect in design, in that they do not in all positions allow of the discharge of such volumes of hot and cold air as to maintain a constant resulting volume. The simplest arrangement must, of course, consist in forcing through the cold air duct fresh air from out of doors without imparting to it any heat whatever, thereby avoiding the necessity of a tempering coil or any special main mixing damper on the primary heater. If this method is followed, however, it becomes absolutely necessary that the mixing damper shall be so constructed as to shut air tight against the cold air supply when it is necessary, as in the coldest weather. On the other hand, it must be possible to supply only cold air, without mixture, to a room when desired. In some of the early arrangements of this system the area of the cold air supply was made only one-half that of the hot, so that it was impossible to get a mixture having cold air in greater proportion than one part cold and one part hot. It was found that upon days when the thermometer stood at 40° or above outside it was impossible to keep exceptionally protected and sun lit rooms, or those over the boilers, cool enough to be tolerated. Hence the necessity of making the area of cold air supply equal that of the hot air.

Thermostatic Control.

While the simplest method of control of temperature is, of course, by the manipulation of the mixing damper by the occupants of the respective rooms, yet much more positive results, with the avoidance of over or under heating, may be secured by operating the dampers entirely by thermostats in the rooms. If this method of control is adopted, however, it becomes necessary to temper the air in the cold air duct. Most of the thermostats now being applied act either to open wide or close tight the mixing damper, thereby alternately changing from a volume of all hot air to a volume of all cold or cool air. This is at present the greatest objection to this system of control, for there is no opportunity for the damper to remain longer in one position, and there is, of course, liability to noise in the continued operation. It is, therefore, at once evident that the air in the cold air duct must have a temperature only slightly less than that of the room being heated, otherwise there would be serious results in the form of objectionable drafts, due to the sudden admission of a large volume of exceedingly cold air. Recent developments point toward the general use of a form of thermostat operating by expansion of fluid, which shall be progressive and not intermittent in its operation.

Time to Look for Better Business.

It is a queer sort of philosophy, says *The Iron Age*, that does not recognize conditions as they exist. It is more singular still that credit should be expected for the profound act of shutting one's eyes and refusing to look. Yet this is being done by persons connected with the iron trade who fancy that they possess some influence as leaders of opinion. For many weary months, so many that we dislike to count them, trade has been so bad that it could hardly be worse, and yet there are individuals to be found, and of some pretensions to leadership, who persistently ignore the distress into which manufacturers and merchants have been plunged and tell them in effect that matters are not really bad, but to keep up their spirits, as times will surely be better by and by. This is a Micawber like spirit, merely waiting for something to turn up. It is not the spirit of an alert business man keenly alive to the influences prevailing at the moment and studying how he can best take advantage of them and rise above them. When business is poor such a man realizes it, acknowledges the fact and endeavors to put himself in shape to endure it. There is nothing to be gained by his being falsely told that he is mistaken in his views, that he will soon find affairs very much improved, and that then he will laugh at his apprehensions of trouble.

We believe that manufacturers are to-day not much in need of advice how to act. Those who hardly knew what to do when hard times so suddenly chilled them have been driven by the force of circumstances into the only course possible. They have retrenched in every way and in directions which at one time would not have been deemed open for such action. Expenses have been curtailed which seemed to be rigidly fixed. Arguments as to costs by sellers of materials have been wholly ignored, and prices have ruthlessly been beaten down, making such producers in their turn grapple with their own difficult problems. Without concerted action, and with no preconceived theories as to a permanent lowering of values, the whole country has nevertheless proceeded in that direction, and to day we find ourselves to have been participants in a revolution. It is possible that a reaction may be inspired by causes now wholly invisible which will again force prices on a higher plane, but it seems to us the part of wisdom to base no hopes on such a change.

Accepting values as they exist to-day, that manufacturer or merchant who is able to adjust his views most quickly to the new order of things will reap the greatest benefits. In many lines possible tariff changes have already been anticipated. Perhaps most commodities have fallen in price as low as, if not lower than, prospective reductions in duties might have forced them to go if a new tariff had been put into effect over night. If this is the case, there is no reason why business men generally should not feel confidence in existing values and purchase freely to cover their known requirements. The worst having been prepared for, the general interests of the country are just so much better off, as the reductions in duty when made are found to fall short of what had been expected.

With the revision of the tariff discounted, so that it is no longer a bugaboo, and with the currency question happily settled on a sound basis, thus checking the flow of gold abroad, there is nothing to prevent a revival of trade except the lack of confidence, which was so rudely shaken during the past spring and summer. If the philosophers of optimism and cheerfulness can stimulate the growth of confidence, now is the time for them to come forward, but the people have probably lost faith in such blind leaders who did not recognize calamity when brought face to face with it.

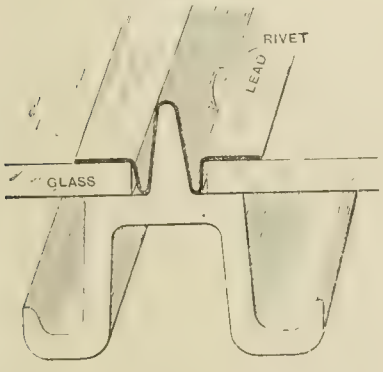
The Brooklyn, N. Y., Board of Education have decided to establish a manual training school in that city. The old High School building will be employed for the purpose and equipped with the most modern appliances for manual training. A salary of $3000 a year has been allotted to the principal and $7500 more will be spent for assistants.

The journeymen plumbers, gas and steam fitters of Local Union No. 57 in Columbus, Ohio, opened their trade school last week with a good attendance of members. The first subject taken up was: "Which is the best method to produce the most practical results in hot water circulation in kitchen stoves, ranges and boilers?" Several designs were sketched upon the blackboard by different members, and the subject give rise to a general discussion of much profit. The next subject to be taken up will, it is announced, be the important one of ventilation.

ROOFING AND CORNICE.

Forms of Glazing Bars.

The Pennycook Patent Glazing & Engineering Company of Glasgow, Scotland, make a specialty of constructing roofs of iron and glass for large buildings. One form of glazing bar used by the company is shown in Fig. 1. This bar is of solid iron and is adapted to a span of 9 feet. The construction is such that no putty is required for glazing, the sheet lead being secured to the bar by riveting, and then bent over the glass. Among the advantages claimed for this form of bar are that as the lead only is exposed to the weather no painting is required; that the condensation channels can be cleaned out from inside the roof without removing the glass. As there are no screws or nuts used scaffolding may be placed on top of roof without injury to the bar.



Forms of Glazing Bars.—Fig. 1.—Solid Iron Bar.

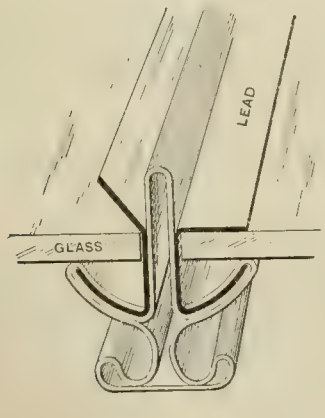


Fig. 2.—Sheet Metal Bar.

Another form of bar, which can be used in connection with sheet metal skylights, is shown in Fig. 2. This bar is made from two pieces of sheet metal, so constructed as to slip together and form condensation channels. Two strips of sheet lead are placed between the parts of the bar, and are so arranged as to be bent over the glass, thus forming a water tight joint. In Fig. 3 is presented a view of a wooden bar, which can be used for greenhouse work. The strips of sheet lead are secured to the bar by nailing, and are to be bent over the glass to form the joint.

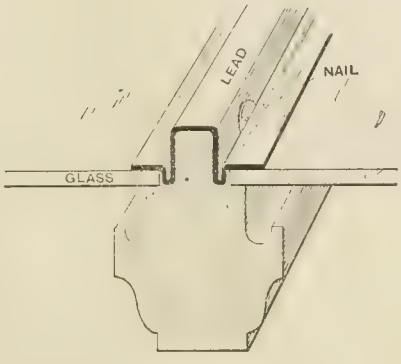

Fig. 3.—Wooden Bar.

FLASHINGS.

A NEW ROOF recently placed on the Indiana State House, Indianapolis, weighs some 900,000 pounds less than the one it has replaced. The old roof was of slate, of which there were about 60,000 pieces, each weighing 16¼ pounds, or 975,000 pounds in all. The new roof, which is of copper, weighs but 75,000 pounds. The placing of a new roof was necessary on account of leaks in winter from snows melted by steam pipes.

THE London *Engineer* mentions a new departure which has been adopted in the East in the way of mitigating the heat so much complained of in structures roofed with corrugated galvanized iron, &c. The method employed has been to place a layer of diatomite or kieselguhr composition, hitherto successfully employed for steam boiler covering, between the outer iron and an inside lining of thin wood or other suitable material. Recently the *Straits Times* reported that a large church erected in the Sepoy Lines, at Singapore, and opened by the Acting Governor of the Straits Settlement, was covered with composition made of Skye diatomite.

THE CATALOGUE just issued by J. M. Robinson & Co., Cincinnati, Ohio, for the year 1894 is an exhaustive presentation of their sheet metal working machines. More especial attention is given to cornice brakes, with which the name of the firm is associated. Their improved double eccentric cornice brake is illustrated, thoroughly described and its operation shown in bending various forms. Various other forms are noticed, including their box bending range and safe makers' brake for heavy work. It is impossible, however, to enumerate all the goods in the catalogue, which is very thoroughly illustrated. Among the machines, however, are gutter formers, bending machines, punching presses and dies, foot presses, V crimping and corrugating machines, &c. The sheet metal trade will be interested in obtaining copies of the catalogue, which is a pamphlet of convenient size, containing 112 pages.

THE NEW EMPIRE SLATE COMPANY were incorporated at Albany, N. Y., on November 29, to quarry and manufacture slate in Granville, Washington County. The directors are Hugh Williams of Middle Granville; Gilson S. Whitson and William H. Kirtland of New York City, and the capital is $50,000.

Lamp Explosions.

The Imperial Commission which was appointed in Germany some time ago to inquire into the causes of explosions of petroleum lamps, has, after exhaustive investigation, recently presented a report. From a copious collection of evidence the commissioners came to the conclusion that scarcely 1 per cent. of the total lamp explosions have been occasioned by attempting to extinguish the lamps by blowing down the chimney. The majority of the explosions were occasioned by special circumstances, such as knocking over, or letting fall the lamps, rapid movements, or holding aslant, whereby frequently ignition of the vapors in the interior of the oil reservoir or chamber is occasioned.

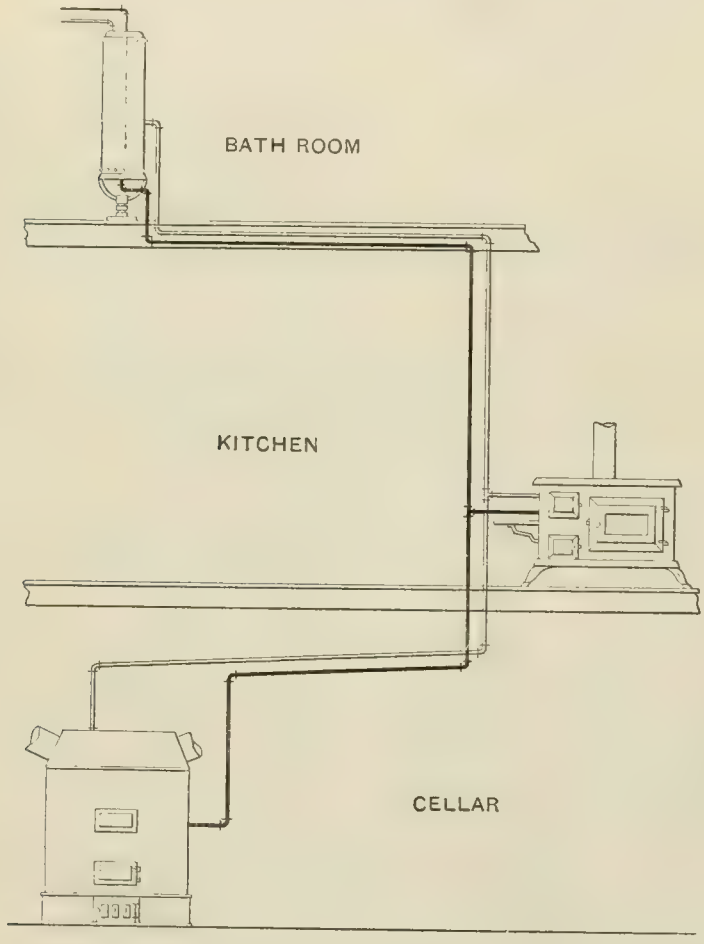
The *Journal of the Society of Chemical Industry* gives the following rules for the prevention of explosions, which, if observed, would obviate the risk of such accidents: 1. The lamp must have a heavy foot with a base as broad as possible, so that it cannot tip over. 2. The oil reservoir ought preferably to be of metal, rather than of glass or porcelain. 3. The well-fitting chimney must be adjusted so that no side drafts of air can reach the flame. 4. The burner-ring must be firmly fixed. 5. The wick ought to be soft and not too thick, also of a width such that it can be easily drawn into the holder. 6. The reservoir ought to be filled up completely before using the lamp; during the filling up no flame ought to be in the immediate neighborhood. 7. The lamp must always be kept clean. 8. The extinguishing of the lamp ought to be effected, after lowering the flame to the level of the burner, by blowing down the cylinder, not directly, but from one side, a kind of side-blast. The direct blowing into the cylinder is to be avoided. 9. The burning lamp ought not to be exposed to a draft. If this cannot be avoided, though, since the lamp must be carried about, then it must be protected from the draft by interposing a piece of paper or cardboard, &c.

As a result of the settlement of the sheet scale the works of the Moorhead-McCleane Company, sheet iron manufacturers, Pittsburgh, Pa., will probably resume in a few days' time. The firm have secured a number of orders recently.

THE LETTER BOX.

Reversed Circulation.

From H. R , *Pottstown, Pa.*—Having seen many knotty questions in *The Metal Worker* I send you herewith a sketch of one that beats the best. A party had a range connected to a circulating boiler in the usual manner, which worked all right except it did not give as much hot water as was needed. He then ran a pipe through the heater in the cellar, being careful to give it the proper elevation as it passed over the fire, then continued the flow and return pipes back and connected them at the range, as shown in the sketch. Each one works splendidly, independently of the other, or if the water coming from the range is the warmer, but when the fire in range is reduced the circulation is reversed between the range and the boiler. The hot water enters the bottom of boiler and returns from the side, and continues to circulate in that manner until the fire is again increased, when the proper circulation is again established. What causes this, and what is the remedy ?



Reversed Circulation.

Note.—We submit this case to the consideration of our readers. From the statement that the circulation is natural with either singly there seems little cause for the unusual change and no room is left for the supposition that the flow pipe was connected with the bottom of the coil, which otherwise might account for the reversing.

Determining Water Pressure.

From P. C., *Quebec, P. Q.*—In *The Metal Worker* of October 28 I see the request from "H. E. M." for a simple method of computing the pressure of water from pipes at different elevations. The answer is: "Multiply the depth in feet by 0.434." Does this apply to pipes of any diameter, or only to pipes of certain diameters ? In other words, would a pipe, say, 50 feet high and $\frac{5}{8}$ inch in diameter give the same pressure on the pressure gauge as another pipe of the same hight, but of 6-inch diameter ? What I do not clearly understand is this: Does the diameter of pipe make any difference in reckoning the pressure ? If so, please explain how it should be reckoned.

Answer.—One of the most difficult things to understand in dealing with fluids is that the pressure per square inch or for any other fixed area depends upon the hight of the column above it, and is entirely independent of the shape of that column or its size. If we took a pressure gauge and sunk it a mile in the ocean it would record the same weight or pressure as if we connected it with a 1-inch pipe a mile high. In the former case there is a column of water of thousands of square miles in area, and in the latter case it is less than a square inch in area. Water presses in all directions equally, and if a 1 inch pipe of, say, 100 feet hight is connected with a box, every square inch of the bottom of that box will record the same pressure, and if the pipe were 6 inches in diameter the pressure on the bottom of the box would be exactly the same. As an aid to understanding this our correspondent can call to mind the familiar illustration of the hydraulic pump. In that case a considerable pressure is exerted on a small stream of water, the fraction of an inch in diameter. When this comes into the main body of the pump, its power is multiplied as many times as the area of the larger chamber contains the sectional area of the small stream of water.

Size of Wire Bundles.

From W. Y. R., *Brooklyn.*—Will some reader of *The Metal Worker* tell me why wire is put up in 63 pound bundles ? There must be a history connected with it. Wire is still sold by the stone in some cases. Is a 63 pound bundle supposed to be a 5-stone package ? If so it should weigh 70 pounds, as a stone is 14 pounds. Some older members of the trade ought to be able to give this information.

Note.—We hope this inquiry will receive attention, as it affords opportunity for some interesting history about past customs.

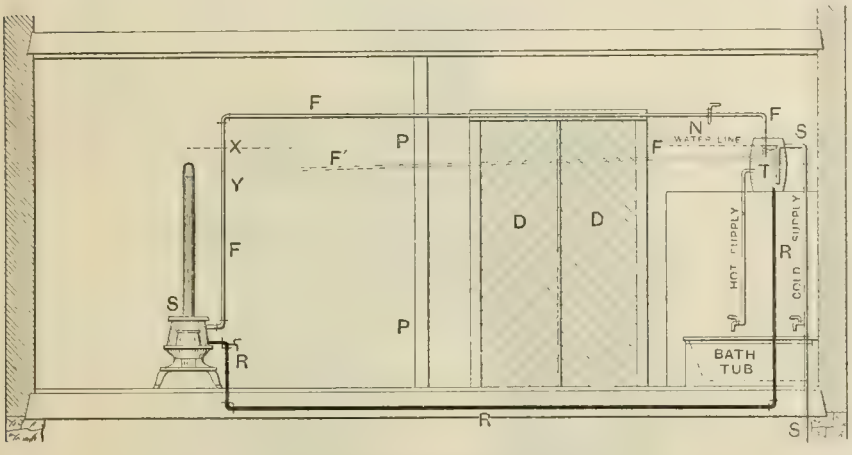
IX vs. IC Tin For Hot Air Pipes.

From Y. A. M., *Delaware.*—In "Cæsar's" letter in *The Metal Worker* of November 25, I saw a comment on the value of IX over IC tin for hot air pipes. In our shop we formerly got a great deal of heavy IC tin from the canning factories and used it for making hot air pipe. These sheets were not good enough in quality to stamp into tops and bottoms for cans and were so thick that when formed into can bodies they would not fit into regular tops and bottoms. Being so unusually thick and well coated they made a good stiff furnace pipe that would not collapse when handled, even when it was not swedged. That such tin makes as good pipe as IX tin I think "Cæsar" would not dispute. But when pipe made from the flimsy IC plates that have been washed rather than coated, and which must be swedged to hold its shape, is compared with an IX tin pipe there is no doubt as to the lasting qualities and length of time the latter will keep bright. This gives the

IX tin a superiority over the IC which has led the architect, whatever value his opinion may have, to go further and insist on having IXX tin for both hot air pipes and flue linings where good work is desired. The difference in the loss of heat from the two kinds of pipe is no doubt a matter of opinion rather than of proved information. There is, however, among the furnacemen I have met, a well established belief that IX tin loses less heat as well as makes a more durable pipe than IC tin.

Defective Circulating Plan Proposed.

From C. W. B., *Fresno, Cal.*—I was called upon during the past week to make an estimate on a job, which I have endeavored to bring out in the illustration. The work was to be done in a fire engine house and the plan as out lined is the idea of the engineer, who knows it will work. I declined to do the work in the manner proposed, for the reason that I am as positive that it will not work.



Defective Circulating Plan Proposed.

The tank T is an ordinary barrel supplied with cold water through an ordinary ball cock, and I suppose the supply is continued down to a point near the bottom of the barrel, as indicated, but did not climb up to examine. The water is heated at present by a coil in an ordinary heating stove. The stove is located on the outside of the wall in the rear of the bathroom and the job works satisfactorily as now connected. It was desired to heat the water from stove S in sketch, as fire has to be maintained in this stove through the winter. A ¾ pipe R was to be taken from the bottom of tank T, run down below floor and across under floor to stove S, a distance of 30 feet. Thence through a coil and back to T through ¾ pipes F F F, as indicated, through partition P and above double doors D D. The end was to enter T below the water line, as shown. The distance from water line to point N on return pipe is about 14 inches. The engineer says it will work if that distance is 12 feet. I told him it was bad practice to bring this return pipe down below the floor and then back up to stove, thus trapping it, but the job would work if he could get the flow pipe F in properly. But if he wanted this job to work he would have to raise his tank high enough so that he could connect as shown by dotted line F' from a point on flow pipe F, as at Y. This pipe would have to be above the doors, and as this would raise the tank above the ceiling I say that the only effect the connection proposed by him could have would be that steam would be made in F F above point X level with water in T. Steam would flow over, possibly carry some water with it, and make a commotion in tank T. There would be no circulation and the whole business would be unsatisfactory. My friend says that there is a force developed when this water is heated which will drive this water over any little obstruction of this kind, and does not limit it to 14 inches, but is willing to go 12 feet. I have set up the claim that hot water circulation is due to gravitation, and have never yet seen water circulate successfully through traps, air pockets, &c. I told my engineer friend that I should make a little sketch of his proposition and send it to better authority than I claimed to be. I trust you will find time and space to present your views on this particular case.

Note.—The opinion of our readers on this job will, no doubt, be gladly received by our correspondent. His conclusion that the job, as laid out, will not work is correct. The best plan is to raise the barrel so that the flow pipe will enter it below the water line, as he suggests. If the barrel cannot be raised, then the flow pipe must run as indicated by the dotted lines F' F'. If the barrel had a tight head in it, and an expansion tank, with the supply pipe and ball cock in it, was located above the point F, there would be no difficulty in the circulation, and the barrel would serve merely as a storage tank.

Stereotype Metal.

From D. H. F., *Saginaw, Mich.*—I would like to inquire through *The Metal Worker* how to make stereotype metal, how it is kept in good order and how it would be damaged?

Answer.—The different stereotyping houses, we believe, have their own private mixtures, for after a firm have been in this business some time they discover what they think are advantageous modifications of old formulas. The following are some formulas for stereotype metal: 9 parts lead, 2 antimony, 2 bismuth. Another one is: 16 lead, 4 antimony, 5 tin. A third one is: To every 6 pounds of lead add 1 pound of antimony. A cheap and simple way to make stereotype metal is to melt old type, and to every 14 pounds add about 6 pounds of grocers' tea chest lead. The metal can be cleaned by throwing in a little piece of tallow and stirring it with a ladle. Any admixture of zinc will spoil the metal.

An Area Trick.

From H. D., *Chicago, Ill.*—Please answer through *The Metal Worker* if a square 8 x 8 inches, containing 64 square inches, could be cut or divided so as to measure 65 square inches?

Answer.—Our correspondent refers no doubt to an old trick by which an apparent area of 64 inches is changed into 65 inches. Of course it is impossible to make any real change of the sort. A piece of paper 8 inches on a side and with square corners will contain 64 inches, neither more or less, and no clipping and readjusting of parts would ever make any difference in its size. By suitably dividing the surface, cutting it diagonally and moving the two parts along the area is apparently changed, but the hallucination is, we believe, due to the fact that the divided squares along the diagonal lines are each less than a square inch. We do not recall at the moment just what the size of the diagram is, or how it would be divided, but the principle is as we have stated.

Location of Air Supply.

From SNIPS, *East Hampton, N. Y.*—Is it absolutely necessary to have the cold air box to furnace on the north or west sides of a building when the prevailing winds in the locality during the winter season are from the southeast and southwest? Even under more favorable circumstances is it necessary? Why should a 10 x 14 register be marked by a furnace manufacturer to be used with a 10-inch round pipe when the pipe is only 78 inches in capacity and the 10 x 14 register has a capacity of 93 inches? Why would not 9 x 14 do, which has a capacity of 84 inches? I submit these questions to the furnacemen who read the Letter Box department, and hope that they will express themselves.

Two Chimneys to One Boiler.

From SUBSCRIBER, *Henryville, N. Y.*—Looking over the letter of "F. L. W." of Plankinton, S. D., in *The Metal Worker* of November 11, I send him the following suggestion: If he will build a round elbow at the base of the chimney the size of the pipe, and taper the upper end of the elbow to the shape of the chimney, he will not have any trouble with the draft, according to the experience I have had. The main thing is to get the column of heated air and smoke started up the flue without the retarding influence that it gets by striking abruptly against the back of the chimney.

The cost of insurance against accidents to workmen in Switzerland, as provided by a recent law, is to be borne as follows: Half by the employers, a quarter by the State and a quarter by the workmen.

STEAM AND HOT WATER.

Sylvester Phineas Pierce.

The firms of Pierce, Butler & Pierce Mfg. Company and S P. Pierce, Sons & Co., Syracuse, N. Y., have issued the following memorial notice upon the death of their president, S. P. Pierce:

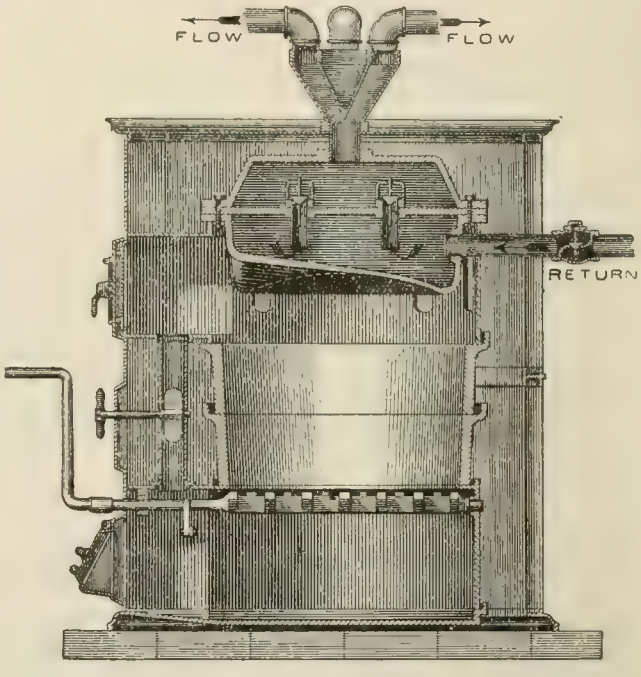
Our president, and the head of our house, was born in the little hamlet of Sanquoit, town of Paris, Oneida County, New York. He was the fifth of a family of eight children of Dr. Spaulding Pierce and Abigail Bacon, a representative couple of the sturdy New England stock which settled the wilderness of Central New York, then regarded as the far West, Dr. Pierce coming from Plainfield, of the Connecticut Valley, and his wife a native of Dedham, of the old Bay State. Dr. Pierce settled in Paris, Oneida County, and was a practicing physician of the old school, covering a large area of the early settlements of the time. He died when the boy Sylvester was but 12 years old. Financial reverses just previous to his death left the family in such circumstances that Sylvester soon found it necessary to make his own way in the world, and obtained employment in the village store. Afterward for two years he was a clerk in the store of Jay Hathaway of Rome, N. Y. Experience by day and study by night gave him a business education, and he soon gained a reputation as an expert accountant. From Rome he went to Utica, where he was employed in the dry goods store of Theo. S Gould, and later in the crockery establishment of Ransom Curtis. Observations made when traveling through the country in the service of this concern decided Mr. Pierce to locate in the village of Syracuse, and in 1839 he came here and opened a crockery store, removing in 1840 to the present site, where for 53 years Mr. Pierce has been the head of the business. From the village store grew a large importing and jobbing house, which became famous throughout the State and one of the leading establishments of our city. With the introduction of gas lighting Mr. Pierce added chandeliers to his business and started a small shop devoted to gas fitting and piping. From this beginning sprang a business which rapidly developed and led to the establishment of the firm of Pierce, Butler & Pierce, and later to the incorporation of the Pierce, Butler & Pierce Mfg. Company. Through all of these years of business life scrupulous honesty, steadfast integrity and a high order of business sagacity have characterized all undertakings in which he engaged. He leaves us and this life not only with the respect of all who have known him, but with the deeply fixed love and veneration of all those who have been connected with this gentle, kindly, true hearted man.

THE PITTSBURGH HEATING SUPPLY COMPANY, contractors for hot air, steam and hot water heating apparatus, have purchased the machine works at 229 Olive street, McKeesport, Pa., and expect to operate extensively in that line of business. The company will conduct a general steam fitting and furnace supply business.

The Caswell Hot Water Circulator.

We present in the accompanying illustrations views of the Caswell hot water circulator being put on the market by F. K. Caswell & Co., Hartford, Conn. In Fig. 1 a sectional view is presented, showing the position of the circulator and its connections with flow and return pipes. Fig. 2 is an enlarged sectional view through the circulator itself, showing its construction. The principle embodied in this heater is of more than usual interest, as the circulation described by the manufacturers is forced instead of being the result of gravity acting upon columns of water of unequal weight. We print below a description of it, furnished by the manufacturers:

"In this system the hot water is forced through the pipes and radiators by a low steam pressure and the cold water drawn back to the heater by a powerful vacuum. The action of the Caswell hot water circulator, which is shown in the accompanying illustration, is as follows: It consists of a circulator, which is placed over the fire in a portable setting, this circulator being divided into two chambers by a diaphragm. Connecting these chambers are four tubes closed at the top by small check valves. The upper chamber is connected with pipes leading to the radiators and expansion tank, while to the lower are connected the return pipes. Between the return pipes and the lower chamber a check valve is inserted, allowing the water to enter the chamber only. As the water in the lower chamber is heated a slight steam pressure is formed between the surface of the water and the bottom of the diaphragm. When the total pressure on the water reaches an amount equal to the weight of the vertical column of water in the risers plus the frictional resistance to circulation, action similar to that in the cylinder of a steam engine takes place, the water line being depressed and the water forced up to the radiators. As soon as the pressure in the lower chamber is relieved by the flow of the hot water the cold water from the return lifts the check valve and enters the circulator. The steam is instantly condensed, thus forming a vacuum, which draws the cold water back from the radiators to be reheated and redistributed as before. The Caswell hot water circulator is always put in on the open tank system, which insures absolute safety. In the second size, which has a capacity of 600 square feet direct radiation, the total power with which to effect a circulation is no less than 330 pounds for each pound of steam per square inch. It will readily be seen that the resistance limits the power generated, for as soon as the



The Caswell Hot-Water Circulator.—Fig. 1.—Sectional View through Apparatus.

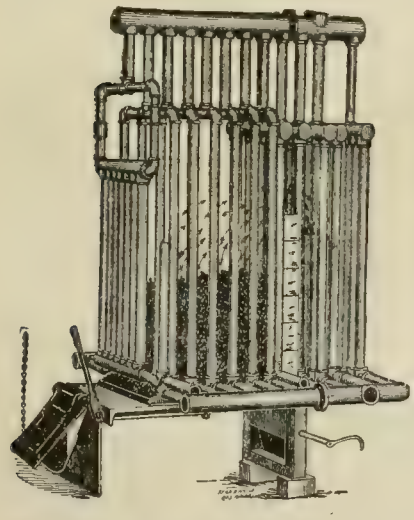
Fig. 2.—Enlarged View of Circulator.

power overbalances the resistance pulsation takes place and the pressure is at once relieved. In this heater the circulation is not continuous, but pulsating. Therefore the amount of heat furnished to the radiators depends directly upon the frequency of the pulsations. This depends, of course, on the fire, and can be regulated from one every half minute to one in nine or ten minutes. Forced circulation also insures rapidity of action and consequently high temperature. With forced circulation no pipes larger than for steam heating are required, most work being supplied with 1¼ inch. It has been demonstrated that ¾-inch pipes can be used with success even on horizontal runs of over 60 feet, but their use involves a waste of power without any corresponding gain."

We understand that the system has been subjected to severe tests of many months' duration, with very satisfactory results. The Caswell hot water circulator is made in portable form only, and in five sizes, having a capacity ranging from 325 square feet to 1200 square feet of direct radiation. It is provided with improved revolving grates, dust flue, double section cast iron fire pot and the new delivery turret, shown in Fig. 1, which is said to insure an equal distribution of water.

Phelps Ideal Hot Water Heater.

The accompanying illustration is a skeleton view of the Phelps hot water heater, manufactured by the Sanitary



Skeleton View of Phelps Ideal Hot Water Heater.

Plumbing Company, Oscaloosa, Iowa. All the principal features of the apparatus will be understood by an inspection of the engraving. The surface is seen to consist principally of vertical tubes connecting with headers at the top, and at the bottom with short horizontal tubes leading to headers. The upper sections finally converge into a single header, running the length of the heater. The fire wall at the back of the heater gives an indirect draft, so that the products of combustion are brought into contact with the entire surface of the boiler. It is particularly pointed out that the direct heat strikes all the surface, and therefore, that its efficiency is especially high. Being made of pipe all the joints in the heater are screwed. The pipes are tested to 600 pounds pressure. The pipes are so put in place that they can be cut out and new ones inserted without disturbing the rest of the heater, by any plumber or fitter with the ordinary pipe fitting tools. It is said that the Ideal will run 12 hours without replenishing and has been run for 24 houre in ordinary winter weather with the cheapest grade of unscreened coal. It is claimed that the combustion is so excellent that there is no trouble from smoke or soot, and that it will burn cheap slack, while at the same time being adapted to the economical burning of hard coal. These heaters are made in eight sizes, adapted to carry from 350 to 3000 feet of radiation, exclusive of mains.

HEATING NOTES.

R. D. Jackson, 42 Dey street, New York, is quite well pleased with the number of Electric boilers he has put on the trade this fall, and states that satisfaction has attended their use in every case.

W. M. Mackay, 236 Water street, New York, has arranged to sell and carry in stock a full line of Eureka automatic air valves. He also sells the different valves made by the Mackay Mfg. Company, 66 James street, Newark, N. J.

A little pamphlet distributed by the New York Central Iron Works, Geneva, N. Y., relates to the Dunning steam and hot water heating boilers. Many illustrations are shown of this well known apparatus and the special features of the boiler pointed out. Price lists and tables of sizes are also given. The company deserve much credit for recently donating a church fair in aid of the St. Franc's De Salle's Church, Geneva, N. Y., one of their portable steam heating boilers, on which they put a valuation of $500. E. N. Squires, secretary of the company, was undoubtedly largely instrumental in bringing this about.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

E. Joy of Syracuse, N. Y., has recently completed the installation of a steam heating plant, using eight Gorton boilers, for the United States Government post at Sackett's Harbor, N. Y.

Blake & Williams, 197 Wooster street, New York, have been engaged for some time on work for the Government at Governor's Island. Heating apparatus has been put in working order and four No. 3 Gorton boilers have been added.

Spicer Bros. are busily engaged in replacing the old drainage by a new system of sanitary plumbing in the town house at Fairfield, Conn.

Contracts have been made with John Kelly and A. A. Sanborn of Somerville, Mass., for the heat ng and ventilation of the Bingham School addition at that place.

Frank Grover of East Rochester is doing the plumbing for the new town hall at Salmon Falls, N. H.

The City Council of Worcestor, Mass., at a recent session received several petitions for the extension of the water service of the city. An order was passed authorizing the Superintendent of Public Buildings to put in a new ventilating apparatus in the police building at Waldo street, on plans recommended by D. B. Goslin, to cost $2500. They also passed an order for an extension of the water service to several streets.

A. A. Sanborn & Co., Boston, Mass., recently installed in the Ludlow Building in that place, a No. 16 Sectional Exeter steam boiler, the job involving 2000 feet of radiation.

A new heating apparatus is to be placed in Officer Pinkham's reception room at North Andover Mass., which will also be used to heat the Selectmen's office and the court room above.

The Barron Steam Heating Company, at 43 Dey street, New York, are engaged in installing a Bronson brick set steam boiler to heat an apartment house being erected by D. Ritchie on Eighty-second street, New York.

J. H Cogan & Co , Augusta, Maine, recently installed Exeter radiators in the following buildings: City Hotel and Weever's Restaurant, as well as in six residences at the place named; Hotel Rumford, Rumford Falls; three residences at Ellsworth as well as residences and stores at Rockland, Gardiner, Waterville, Farmingdale, Fairfield and Norridgewood, Maine.

The Bridgeport Steam Heating Company of Bridgeport, Conn., have secured the contract for placing a Gurney hot water heating system in the residence of Mrs. Colonel Vincent Collier, at Rowayton, Conn.

H. Kennedy, New Bedford, Mass., is heating the St. Hyacinth Church, using the Exeter ornamental steam radiators.

The Board of Regents of the University of Washington will receive plans, designs and specifications for the erection of a university building up to February 17, 1894, at the People's Savings Bank, at Seattle, Wash. One hundred and fifty thousand dollars has been appropriated for the building, which is to be provided with the most approved apparatus for heating and lighting, and a well arranged water supply and system of plumbing, drainage and ventilation.

Three large steam heating and plumbing contracts have been awarded Hardwicke & Co. of Niagara Falls, N. Y. The first is for the steam heating and plumbing for the new residence of James Davy, on Pine avenue; the second the fire extinguishing apparatus throughout the new building of the Rodwell Mfg. Company, and the third the steam heating for the Pacific Hotel.

Mullarkey & Senior have just completed the contract for gas fitting in the Nathan Littauer Hospital, at Gloversville, N. Y., and the management have accepted the work. For piping the building 2000 feet of pipe was used, and there are 380 lights. The contractors are now beginning the plumbing work, and 2 tons of iron soil pipe have been unloaded for the start.

J. S. Ladd & Co. have the contract for putting in the steam heating boiler in the Congregational Church at Raymond, N. H.

O. S. Mills & Co. have the contract for putting the heating apparatus in the new school building at Tunkhannock, Pa. The work will be done under the personal supervision of B. H. Shook.

The plumbing house of Rourke & McDonough, at Knoxville, Tenn., secured the contract for plumbing for the new Hattie House over two bidders from Cincinnati, three from Columbus, Ohio, two from Louisville, one from Nashville and one from Chattanooga. The contract amounts to something in the neighborhood of $9000 or $10,000.

PLUMBING and GAS FITTING.

Domestic Electrical Work.—II.*

By W. A. W.

MULTIPLE BELL CIRCUIT.

In the previous chapter was illustrated a simple single bell circuit. The next step will be a circuit with two or more bells operated from a single push button. Where a house is too large, or so constructed that one bell cannot with certainty be heard in all parts, it is often necessary to use a number of bells on one circuit, all of which will ring at the same time. In a house having a hall and stairway, and where two bells will be sufficient, one should be placed on the casing of the stairway well hole, so that it can be heard in the front part of the house both up and down stairs; the other should be located in the rear part of the house.

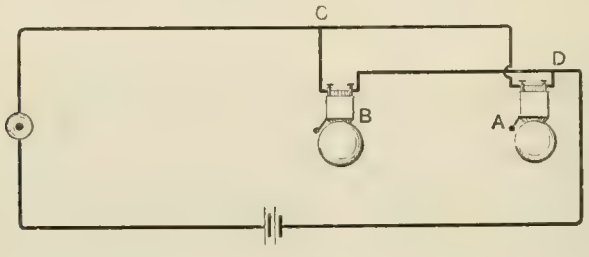


Fig. 2.—Two Bells Operated by One Push, Connected in Multiple Arc.

Fig. 2 shows the method of connecting bells in multiple arc, and is considered by many the most satisfactory way of operating two or more bells on one circuit. In this case run the wire from push button to bell A. Run a wire from bell B to battery and from battery back to push button. Connect a wire to opposite binding post on bell B, and splice to wire previously run from push to bell A, as shown in Fig. 2 at C.

To make the splice cut away the insulation on the main wire about ½ inch and scrape bright and clean, then cut away the insulation for about 2 inches from the end of splice and scrape; wrap this end around the bared space of main wire tightly, keeping the coils closely together, as shown in Fig. 3. This will insure a good metallic contact and will also prevent the splice from oxidizing and thus destroying the necessary metallic contact.

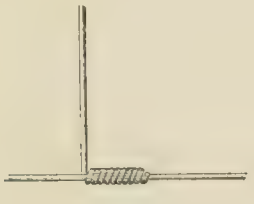

Fig. 3.—Splice for Connecting Branch to Main Wire.

To proceed with the wiring, connect a wire to the other binding post on bell A and splice to main wire running from bell B to battery, as shown at D in Fig. 2. On this circuit three cells of battery should be used to obtain a good sharp ring from the bells.

In Fig. 4 is shown the common (and the writer believes the best) practice of connecting bells in series—*i. e.*, wiring from one bell directly to the next, and making all but one single stroke bells. This latter precaution is necessary, as the entire current passes through each bell, and unless the adjustment and tension of the armature springs were exactly alike in each bell (which is practically impossible), the vibrations of the first bell would interfere with the others, and as a consequence none of them would ring. Any ordinary electric bell can be changed to a single stroke very readily, as shown in Fig. 5. A and B represent the binding posts of bell; C is the magnet; D the regulating contact screw; E the armature, carrying the hammer, and F the armature spring.

In the construction of the ordinary vibrating bell, the current is carried from the binding post A to the magnet, and from the magnet to the iron frame of the bell, thence through the armature to the contact screw D, and from there to the binding post B. By this arrangement the circuit is broken every time the magnet attracts the armature by separating it from the contact screw. The circuit being broken the magnet no longer attracts the armature, and the spring draws it back and again brings it in contact with screw D, whereby the circuit is again closed and the armature is again attracted as before, and so on.

In order to change a bell of this description to a single stroke, all that is necessary, as will be seen, is to disconnect the wire from the contact screw D and connect direct to the iron frame in such a manner as will leave the contact screw D entirely out of the circuit, as shown by dotted lines in Fig. 5. By this change, when the armature is once attracted it will remain there until released by some other means, which, in the arrangement of bells just described, would be by the one vibrating bell put into the circuit.

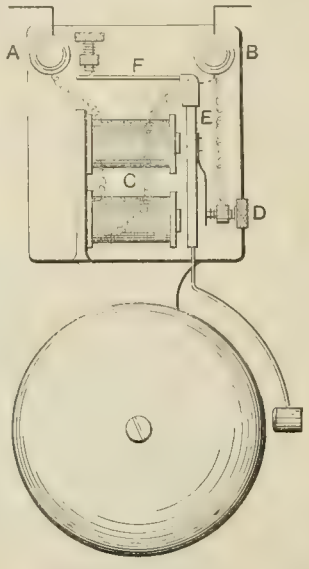

Fig. 5.—Method of Changing Vibrating to Single Stroke Bell.

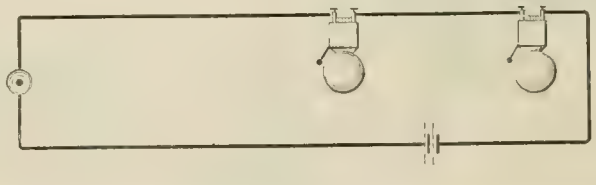

Fig. 4.—Two Bells Operated by One Push, Connected in Series.

Necessity of a Plumbing Inspector.

The following communication from a committee representing the plumbers is taken from an Indianapolis, Ind., daily paper:

Having noticed the controversy that is going on in the city papers in regard to the plumbing inspector, we wish to say to the public, from a standpoint of experience, that it is one of the most essential offices in the city; an office that ought not by any means to be abolished. As a rule people have not the proper conception of what it takes to make a first-class conscientious plumber. If we had all first-class men it would not be necessary for us to have an inspector, but such is not the case. We have men who profess to be plumbers who have been barred by the inspector, who will, if the office is abolished, go to work at once. There are some master plumbers who will employ them. Does the public want this class of men to do its work? If so, abolish the office. It is absolutely necessary that we have an inspector as

* Copyrighted, 1893, by David Williams.

a general safeguard. We, as a people, profess to be a progressive people in Indianapolis. What progress will be attained to abolish such an important office as the one in question? It will be laying low one of the most important sanitary regulations that has ever been passed by this city; lower than sand in water, and it will never make another effort to rise to the top. While we are on top we should stay in that position.

The office was created for a laudable purpose; it has done good, to our personal knowledge at least, if not to the public in general. It will continue to accomplish much good if left alone and competent men are placed in the position. We have good men who can fill this place with credit and profit. We, as experienced men, could, if necessary, unfold to public view some unheard of circumstances which exist in this city and which would shock public sentiment beyond measure and cause an investigation to be made for the health of the occupants of certain buildings. Such work as this was done without an inspector.

We repeat it again that people in general do not realize what has been done and what changes are being wrought by the inspection of all work. We have a building inspector; why not have a plumbing inspector? It has been proven that the office is more than self sustaining; certainly that is not the reason some want it abolished. All work as it is now put in is properly ventilated. The stacks are run high enough to give draft sufficient to carry away all odor that necessarily arises from this class of work.

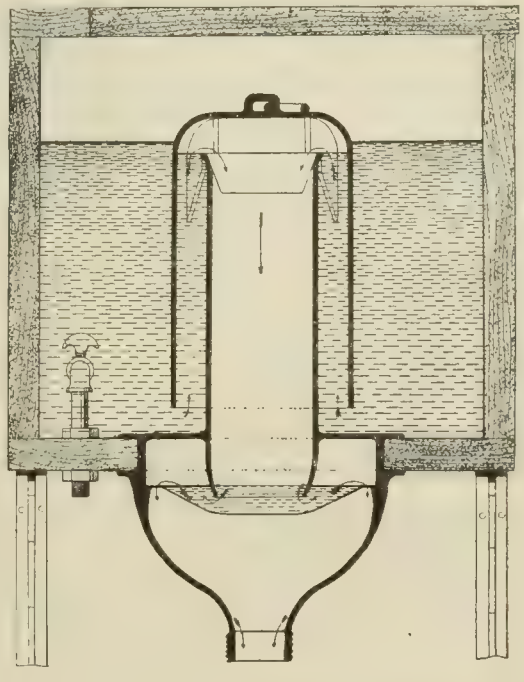
We think it would be well for the citizens and council to look at what New York has done in regard to this question. The State Board of Health was moved to investigate what sanitary plumbing meant, and found when properly done that it was one of the greatest sources of good health, and when improperly done one of the most deadly and disease breeding sources of evil, consequently they appealed to the State Legislature to enact a law regulating the trade of plumbing. A man professing to be a plumber must go before a board of practical plumbers appointed for the purpose of examining such applicants. If they pass they are given a certificate; if rejected they are not allowed to work any more than would a rejected medical student if rejected by a college faculty. We need just such legislation as that in our State. If the City Council repeals the ordinance it looks to us as though that body has not the proper conception of public good, and has not inquired into the merits of the office; and because it will help to straighten out the complication of having an inspector serving and another appointed.

What would this city be without gas inspectors? The master plumbers call them into consultation on jobs of any size, do the work according to what they say, and all is harmonious. If their existence depended, as does the plumbing inspector, upon skill and intelligence, some one would probably question their right to office. While we recognize gas inspectors, will it not be more important that we have a plumbing inspector to check dissemination of diseases which are constantly coming up to be checked? May it please our honorable body, the City Council, not to repeal the ordinance.

HENRY ECKHARDT, Bethlehem, Pa., plumber, is working on a number of contracts in his line of business. He is engaged in placing all modern improvements in the sanitary plumbing line in the two new residences for Wolle & Kemmerer, on the Allentown road, and in the new building of School Director William B. Shaffer, in West Bethlehem, and in the new residence of William Renner, on Linden street, B.

The Yeteve Automatic Syphon Tank.

The Walcott-Hurlbut Company, 175 and 177 Lake street, Chicago, are introducing the Yeteve automatic syphon tank, which is herewith illustrated. The syphon used in the tank is an adaptation of the Field-Waring patents with Poore's breaking device to flushing closets and urinals. The syphon consists of an annular intaking limb, and a discharging limb, at the top of which is an annular brass lip or mouthpiece, the bottom of which is tapered to a less diameter. The discharging limb has a brass cup suspended under the lower end of it. The syphon is brought into action (the tank being filled) by means of a small stream of water flowing over the annular mouthpiece and falling free of the sides of the discharging limb. As soon as the lower end of the discharging limb has been sealed by the filling of the brass cup, the falling stream of water gathers up and carries out with it a portion of the contained air, thus producing a slight rarefaction. This causes the water to rise and flow over the mouthpiece of the discharging limb, causing more rarefaction; this continues until the syphon is brought into full play. On the tank being emptied to the bottom of the intaking limb the flow is checked and air enters the discharging limb and the syphon is vented ready to start again as soon as the tank is filled.



The Yeteve Automatic Syphon Tank.

TRAPS AND VENTS.

HARRY SALYER has opened a new plumbing shop at Valparaiso, Ind., on College Hill, in the Salisbury Building.

A LOCAL PAPER makes the following inquiries in reference to plumbing in Leominster, Mass.: "How does it happen that with all the sanitary improvements that are being made, this town has no inspector of plumbing? There is no class of work that needs closer watching than plumbing. Not that the plumbers are dishonest, but the class of work they do demands care, and a careless mistake may cost lives. Let us have a competent man to look after this branch of the work."

A NOVEL SIGN, or rather attraction to his place of business, used by a plumber in Long Island City, L. I., is an arrangement of soil pipes and water closets on the roof of his shop.

W. J. KENNEDY & CO., plumbers, of Putman street, have opened an office in the new Fletcher Block, on Medford street, Somerville, Mass.

THE MASTER PLUMBERS' ASSOCIATION of Providence, R. I., held its customary monthly meeting recently. The meeting was presided over by the president, P. Tierney, and considerable business of a private nature was transacted. After the meeting had adjourned the members took possession of the banquet hall, where an excellent supper was served. The association had for its special guest Inspector of Plumbing Reuben S. Bemis, who gave the members an idea how the department was to be managed and what the relations are between his department and the trade. Mr. Bemis' remarks were listened to very attentively, and from the remarks made by several who were present the city had made a happy choice in the inspector of plumbing.

STAFFORD & WARD, Jacksonville, Fla., have got the contract for putting the plumbing in good order at the St. James Hotel, and have a large force of men at work.

THE SECOND ANNUAL SANITARY CONVENTION of the State of California will be held at San José on Monday, April 16, 1894, being the day preceding the annual session of the California State Medical Society.

PRESIDENT EYANSON and Secretary Clark of the Master Plumbers' Association of Philadelphia have addressed a letter to Captain Walton, chairman of Councils' Committee on Highways, requesting him to name a time when a committee of master plumbers can appear before the committee to protest against the passage of a pending ordinance regulating the repaving of streets opened by plumbers and the depositing of a sum of money with the city treasurer to insure the city that the street will be kept in repair. The

plumbers contend that the bill will enable anybody or everybody to tear up and repave the streets by merely depositing a nominal sum with the city treasurer for two years.

DANIEL SULLIVAN is the plumbing inspector of Long Island City, L. I., and reports a good grade of work being done in that neighborhood.

W. BRODIE, 131–133 Verona avenue, Long Island City, L. I., keeps a representative plumbing and steam fitting shop, and in addition runs a full line of hardware, household utensils and stoves. At present the plumbing department is not so busily engaged as is the steam and hot water department. He is installing heating plants in several residences, hotels and greenhouses near by.

CORNELIUS C. CROWLEY, the inspector of plumbing at Clinton, Mass., has opened his office in the town clerk's office.

E. ASPINALL, 98–100 Beekman street, New York, importer of and dealer in plumbers' materials, has recently added to his stock a line of Steel Clad baths, made by the Steel Bath Mfg. Company, Detroit, Mich., and New York.

PRESIDENT ADAM SCHNEIDER and Secretary Bonesteel of the Master Plumbers' Association of Cleveland, Ohio, are preparing a bill for presentation at the next session of the Legislature. The bill will provide for a thorough examination of all plumbers and of all who contemplate embarking in the plumbing business.

BURGLARS recently got into J. W. Carter's plumbing and gas fitting establishment, at Greenfield, Ind., and blew open the safe. It was totally destroyed, and the concussion was so terrific that it shook the goods from the shelves and counters. There was but little money in the safe.

THE BOSTON TRADE have recenly been favored with an announcement sent out in the form of a card, 1 x 2 inches, which reads as follows:

MAURICE ALEXANDER LYNCH.

10½ pounds.
October 18, 1893.

P. J. Lynch, the well known manager of the Dececo Company's Boston store, is responsible for this.

A vessel sailed from San Francisco for Havre, France, last week, carrying the first full cargo of tallow ever shipped from the Pacific Coast.

On Wednesday, November 22, the first steel merchant vessel ever built in Maine was launched at Bath. She is the twin screw steamer "City of Lowell," built for the Norwich & New York Transportation Company, and designed by A. Cary Smith of New York. The vessel is a magnificent example of a modern Sound steamer. She is 336 feet long, 49 feet molded beam, or 66 feet from guard to guard amidship; will draw 13 feet of water when loaded and steam 20 knots an hour at the least, with a possible 22 knots. The hull is unusually strong, the frames being steel angle irons covered with steel plates $\frac{2}{16}$ inch thick. The decks are of steel covered with thick pine. The "City of Lowell" is a twin screw boat with triple expansion engines of 26, 40 and 64 inch cylinders, 36 inches stroke and 4500 indicated horse power. Steam will be supplied by six Scotch return tubular boilers, built for a working pressure of 165 pounds.

Management of Men and Manufacturing Industries.*

SECOND PAPER.

Engineering the Establishment of Competitive Manufacturing Enterprises.

BY THOMAS D. WEST, SHARPSVILLE, PA.

In days of sharp competition, the starting of new enterprises soon places upon the shoulders of its managers and investors a weight they had not figured on carrying, and all sentimental ideas of self importance and there is "millions in it" vanish long before dividends are declared.

Could the struggles of late enterprises to get a foothold be fully outlined we could not fail to have volume after volume giving recitals of trials. Could the principals in them have foreseen what they had to go through, with the chances to be taken ere they could establish a paying business, there would have been much hesitancy before starting in and a great probability of their not having done so.

The writer having fought through two such undertakings within the past five years, the first being lost by fire, should be in a position to know from experience some of the difficulties attending the establishment of a business open to free competition, an element most all new enterprises have to figure on combating.

Procuring Proficient Employees.

Of the many struggles to be met and mastered there is none more serious than that of getting a works filled with competent, faithful employees having qualifications such as are necessary to fill the many different characteristic lines of work called for in their business.

I know that there are those who do not believe it, but nevertheless such is true. There are industries which it may take from one to three years to procure the character of employees they would like to see filling all posts of duty, and one factor almost all new enterprises should specially figure on at the start is that of not being compelled to rush out work to the full capacity of their plant.

Go Slow the First Year.

The endeavor to do this will often entail serious loss financially. There are few whose character of manufacture will admit of such proceedings without loss, but with almost all it is much the better plan to go easy for the first year and be under as few obligations as possible in matters of manufacturing their product.

In first starting business the quality and quantity of an employee's daily output is to be considered. A new firm will, by having new appliances, &c., have their own customs and standard they will desire to see adopted and achieved. No matter if the mechanic or employee did do the same character of work in his last place their standard is not yours and you want the benefit of modern arrangement and tools and the work done to your idea.

If your plant is rushed your men will know it and in nine cases out of ten you will find yourself placed in the position to shut up shop or let the employees, to a degree, establish their own notions of the customs and standard to be adopted.

No one but an experienced manager knows how difficult and expensive it is to undertake to change the customs, day's work and standard in a workshop after it is once established.

If in first starting up a firm could be assured of filling all its positions with men having the character and qualifications they would like them to have, and if it were not necessary before procuring one good man to discharge in some cases a dozen, business could be figured different, and the rushing of the plant to its full capacity, turning out the quality and quantity desired profitably, could be much more satisfactorily relied upon.

Taking the employees' side of the subject, it is also better for them that the starting off of a new plant should go slow, for it gives all more room to work, a better chance for the overseer to assist them in systemizing and becoming accustomed to their labors, and should the employee at first not manifest the ability required, business not being rushing the overseer can permit the man hanging on a little longer to see if he can make any success of him, and often eventually thereby making a reliable man that can stay as long as he may desire; otherwise he might be walking the streets looking for work.

Endangering Life and Breaking Machinery.

A factor to be also considered by the employer and employee in starting a new plant is the much lessened risks taken in persons being injured where there is much new machinery with green hands to run it by going slow the first year.

It is much better for the overseer to have ample time to watch and educate employees in the use of tools and machinery than to have them all crowded together with a go-as-you-can principle, injuring themselves and breaking the machinery.

Testing New Machinery.

Another good reason why it is advisable for new firms to figure on going slow the first year is to test their machinery. The plant is yet to be built that for the first year did not discover many weak points in its appliances and machinery that required shut downs and time to strengthen and repair. If rushed with work things will be found to go wrong that would not have given any trouble could there only have been the time spared to humor and nurse them, for new machinery often requires such treatment in order to have it run and act well just as much as a sick child.

Financial Troubles.

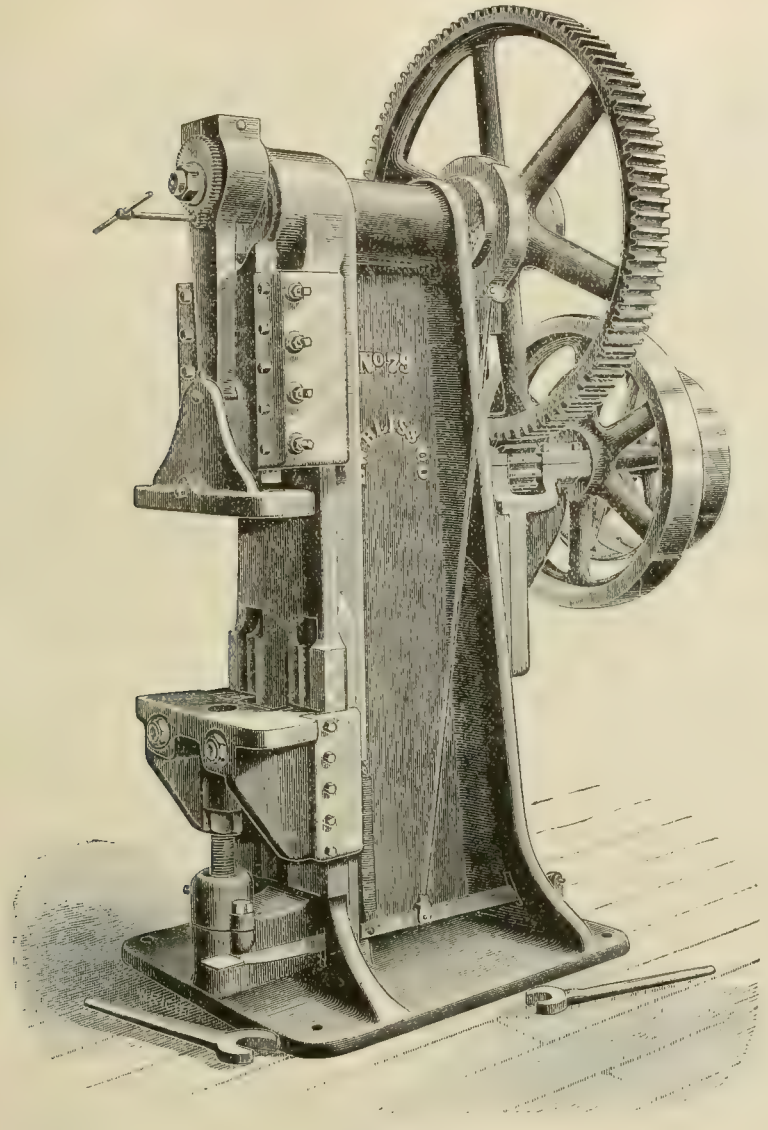
As a general thing a plant will be more sure of making money by going slow the first year than by attempting to drive the plant to its utmost capacity, and it is pretty sure to be the case that more money is laid out to put up the buildings and place machinery ready to start than was figured on, and the establishment often finds itself left with a very small working capital. If with such it is attempted to rush business the first year the chances are that the plant goes under, or is involved in difficulties from which several years of profitable work may extricate it.

A firm cannot survive many blunders, and the attempt to rush business the first year is generally to try a risk. "Be sure you are right, then go ahead."

* Read before the Civil Engineers' Club of Cleveland, Ohio, September 12, 1893.

The Bliss Reducing Power Press.

The engraving shows a long stroke press designed by the E. W. Bliss Company of Brooklyn, N. Y., for redrawing, shaping, trimming and other operations on deep sheet metal articles. It is provided with a screw adjustment for the table, which permits the use of dies varying greatly in hight, and also has an eccentric device in the pitman which facilitates making the finer adjustments required for the tools. The press is provided with an automatic clutch controlled by foot power, so as to have the slide stop automatically at the top of the stroke, unless continuous strokes are wanted, in which case the foot is kept on the treadle. The machine is made with or without gearing. For broaching castings or forgings where a very slow movement is required it is frequently constructed with back gearing of much greater ratio than shown, in which case a friction clutch on the driving shaft is used instead of automatic clutch on the crank shaft. The press, as shown in the cut, weighs about 8200 pounds, has a maximum distance between bed and slide of 15½ inches, an adjustment for this space of 10 inches and a stroke up to 8 inches. The ratio of gearing is one to seven and a half and the number of strokes usually made per minute 40.

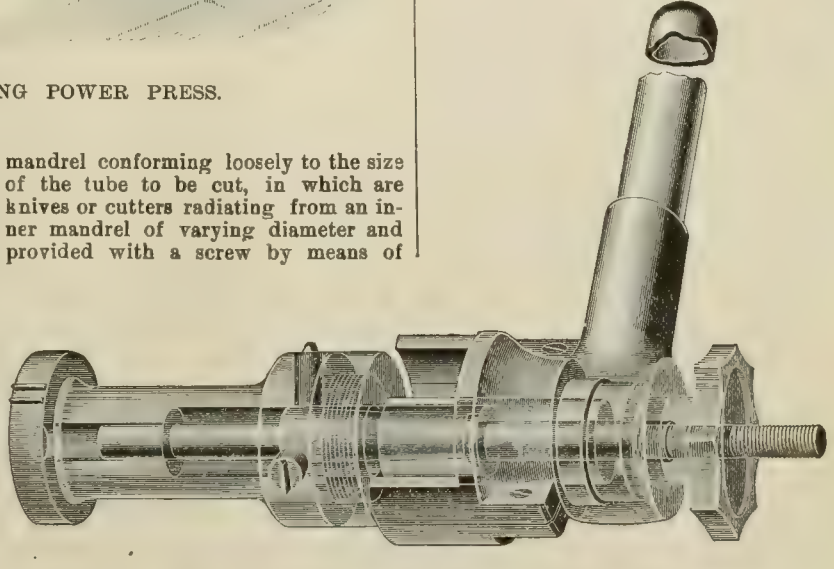


THE BLISS REDUCING POWER PRESS.

The Le Vasseur Boiler Tube Cutter.

This tool is intended for cutting out old boiler tubes or flues for renewal or otherwise, and for trimming off new flues or cutting pipe. It consists of a mandrel conforming loosely to the size of the tube to be cut, in which are knives or cutters radiating from an inner mandrel of varying diameter and provided with a screw by means of which the knives may be fed out as the cut in the tube progresses. These knives are attached by dovetail grooves in the mandrel.

In operation the tool is placed in the tube with the knives at the point to be cut; the tool is then revolved by means of a ratchet handle and the nut is held stationary, which gradually draws the inner mandrel toward the handle, thus bringing the larger diameter under the heels of the knives and throwing them out against the inner wall of the tube, the operation continuing in this manner until the cut is completed. When the nut is run back to its original position the mandrel may then be pushed from the handle and the knives drawn down into their sockets and the tool removed. This cutter is made by the Gouverneur Machine Company of Gouverneur, N. J.



THE LE VASSEUR BOILER TUBE CUTTER.

Experiments are progressing at the large Falun copper mines in Sweden for the purpose of extracting zinc in its pure state. There are considerable deposits of zinc ore in that district ; and in case the experimental working leads to a regular manufacture, Falun will be the first place in Sweden where pure zinc has been produced.

Announcement is made that the Republic of Nicaragua is about to bring suit in the United States courts against the embarrassed Nicaragua Canal Construction Company for failure to fulfill their contracts with that Government. The reasons given are that no work has been done on the canal for a year and that the company have gone into the hands of a receiver.

An official report has been received in Washington from the special agent sent by the Government to investigate the gold discoveries in Minnesota. The agent reports that he is firmly convinced that the district in the vicinity of Rainy Lake is distinctively a mineral country. In the quartz of Township 71 the mineral is deemed very rich, and the land has been withdrawn from settlement.

A British trade contemporary lays stress upon a noticeable feature that has recently developed in the engineering trades of the English Midlands—namely, the demand from Russia for machinery and plant for iron and steel making. Some important contracts have been lately forwarded and others are now in hand for rolling mill machinery of the most improved kind, showing the growth of enterprise in the direction of the manufacture of steel and iron in the dominions of the Czar.

TIN PLATES.

The Morewood Company's Tin Plate Works.

The Morewood Company are now getting in shape their new tin plate works at Gas City, Ind. For some time they have been running the coating department, but results have not been satisfactory, owing to frequent delays in receiving supplies of black plates, some of which have been purchased from American makers and some imported from Wales. Meantime the erection of rolling mills has been pushed, and these will shortly be in operation, after which there will be no interruption to the company's business for lack of essential materials.

The establishment of this plant at Gas City is wholly due to the enterprise of the president of the company, J. H. Rogers, one of the foremost manufacturers of tin plate in Wales, operating two large works. For some years Mr. Rogers had foreseen that the United States would eventually engage in the manufacture of tin plate, and contemplated making a venture on his own account. Some two years since this idea developed into a determination, and he visited this country to survey the field with that object in view. Early in 1892 he decided to locate at Gas City, but in the meantime put up temporary coating works at Elizabethport, N. J., which are now being removed to Gas City. Contracts for the building and much of the machinery were let in the spring and summer of 1892, but ground was not broken for the foundations until October. Since then work has been pushed as rapidly as consistent with the erection of a good plant on a thoroughly substantial basis. The buildings which have been erected are all strictly fire proof, having steel frames and metal roofs and sides. They are equipped with the best machinery adapted to the manufacture of tin plate, among which are found numerous special machines devised by Mr. Rogers for the rapid and easy handling of materials.

At present seven tinning stacks are in operation, but within a month three more will be at work. Of these there are three that exclusively run on ternes, while the others can vary from bright to ternes, according to the requirements of the trade. The pots used are not new, being principally of the kind invented by Mr. Rogers' father

For months Mr. Rogers visited meat and fruit packers and other tin plate consumers, getting their criticisms of the ordinary plates and finding out what was demanded. The personal contact with the consumer convinced him that tin plate makers were altogether on the wrong track in trying to make their plates as cheaply as possible.

In the pickling, annealing and rolling departments old methods are dropped as much as possible. Here every effort is made to economize labor and insure rapidity of operation. Pickling vats are filled, agitated and emptied by ingenious machinery. Annealing furnaces are operated by a mechanical charger. The rolls are arranged on a plan not hitherto known in this country. There are four cold rolling mills in which the trains are set in parallel rolls run by gearing from a common engine. In other works the practice is to set the rolls in a straight line. There are numerous reasons advanced by the Morewood Company in favor of their method, in which they follow the latest and most improved practice in the best Welsh mills. The hot rolling mills now in course of construction will at first comprise four mills, but it is expected that four more will be added between now and next summer. For the present tin plate slabs will be purchased, but it is the intention of the company to erect steel works at an early day to make their own steel, and thus control the quality of their material as far as possible.

The brands adopted by the company thus far are as follows: F. W. B. This is the heaviest coated roofing plate. J. H. R. is the next grade of terne plate, and is of Worcester grade. H. C. B. is the Lily grade of terne. P. T. L. is a terne, and is the grade with which the exposition buildings in Philadelphia in 1876 were roofed. R. H. J. is a bright plate intended for the use of canners of meat, fish, fruit, &c.,

These statements are subject to some qualification, in view of possible action upon the tariff question. If the duty is not disturbed it is the intention of the company to push extensions of the plant steadily forward until it becomes the largest in the world. In the arrangement of their buildings this has been kept in view, and plenty of room has been kept for that purpose. The inclosure comprises over 50 acres. It is in one of the best gas districts in Indiana, where the pressure is constant at nearly 300 pounds. Railroad connections are afforded by the Panhandle branch of the Pennsylvania system.

SCRAP.

MARSHALL BROS., Philadelphia, rolling mill proprietors and tin plate manufacturers, have recently received a 36-inch trimming shear from the Leechburg Foundry & Machine Company, Pittsburgh, Pa.

A WESTERN SCIENTIST is visiting Eastern tin plate manufacturers with the object of selling a new method of tin plating which he declares will revolutionize the manufacture in the direction of simplicity and cheapness of production. He is reported to be asking $10,000 for his invention.

THE DEADLOCK which has existed for more than three months at the works of the Pontymister Tin Plate Company, Pontymister, South Wales, still continues. The Newport Chamber of Commerce recently offered their services as arbitrators in the dispute, but P. S. Phillips, the proprietor, declined their mediation. He stated that he had offered to take back such of the men as he required on terms similar to those ruling in other works in the neighborhood, but if they declined to accept his offer he should at once proceed to start the works with outsiders, who were only too anxious to obtain employment.

THE GLOBE TIN PLATE COMPANY have been incorporated at Chicago for the manufacture of tinned and terne plates. The incorporators are James Spruce, William Killmer and Henry C. Gager. A manufacturing plant will, it is stated, be erected at Hammond, Ind., at a cost of $32,000.

THE WESTERN TIN PLATE COMPANY, Belleville, Ill., have commenced operations with one set of Morewood pots. The company use American black sheets exclusively.

THE BRITISH TIN PLATE MARKET at the middle of this week was again depressed, orders being scarce and prices weak and irregular. Over 20 Welsh tin plate works are idle, and the major portion of the rest are working only part of their capacity. Stocks, nevertheless, are piling up. Last returns show 258,000 boxes in Swansea, or about double the normal amount for this season, and dealers in London and Liverpool are reported to hold immense stocks of plates.

Trade Training for American Boys.

The following able article, demonstrating the need of a more efficient system of trade training for American born lads, by means of trade schools or other similar methods, by which definite and practical manual instruction may be imparted to them, in order to enable them to compete with imported labor, is reprinted from a recent issue of the *Pratt Institute Monthly*, the organ of that famous Brooklyn institution:

In the *Century* for September is printed a summary of the statistics relating to pauperism and crime prepared for and shortly to be issued by the eleventh census. These figures show that the number of white male prisoners in all the prisons, penitentiaries and reformatory institutions of the United States in 1890 was 52,894, and of this number 38,156, or nearly three-fourths, were native born. Of the total number of prisoners 31,426 had learned no trade whatever, and of these 31,426 no less than 23,144 were native born. In other words, three-fourths of those who had become criminals through lack of occupation were Americans. These are startling figures.

For years the mechanical trades of the country have been steadily passing from the hands of American born workmen into those of foreigners. As a result of this change the labor organizations of the present day are to a large extent made up of and controlled by foreign born workmen. These organizations, led by the fallacious and suicidal principle that the greatest advantage to the individual workman depends upon keeping down the number of men in the trade, have adopted and forced upon employers a system of rules limiting the number of apprentices to one or two, or, in the most liberal cases, three apprentices to one employer. As the inevitable tendency of modern

industrialism is to concentrate a large number of employees under one employer, it will readily be seen that in many of the trades this limitation is practically prohibitive. Add to this the fact that the conditions of mechanical operations to-day allow no natural place for the apprentice, that he is at the best barely tolerated and left to take his chances and pick up his trade, and it becomes evident that we have absolutely no system of supplying new material to this great army, and that the American boy is practically prohibited from learning and consequently from following a trade.

Along with this selfish and wrong headed policy observed by the trade unions is the thoroughly inconsistent one of receiving into their ranks, without protesting, every immigrant who calls himself a workman, no matter how freshly arrived or how deficient in training. Mere introduction by an acquaintance is sufficient to secure entrance to most of the unions, and the new member is forthwith entitled to the assistance and protection of the organization. This is the means of turning native born youths away, and has, undoubtedly, resulted in lowering the character of work done in the building trade, as well as in deteriorating the intelligence and character of the workmen. The narrow minded, prejudiced foreigner, fresh from the restrictions and repressions of the Old World, with its natural tendencies to socialism and anarchism, is hardly the citizen to be cultivated to the exclusion of the American born, American schooled youth brought up among the liberalizing influences of free institutions. And yet this is precisely what we are doing. With one-fifth of our entire able bodied population engaged in the mechanical arts, we have no organized means of recruiting this immense body from our native population. The result of this deplorable lack is twofold: 1. To add to the ranks of the already overcrowded occupations of clerks and salesmen, and, 2, to produce that startling increase in the criminal classes shown in the above quoted statistics. To lads brought up in enforced idleness and turned upon the world with no means of earning a livelihood, vice and crime are ever ready temptations; and the men who should be filling their places as honest American workmen find their way to the prisons and reformatories. This shutting out of our youth from their legitimate opportunities is, in fact, not only working negative harm, but also breeding positive and active evil. The actual impossibility of obtaining a trade training in the large cities through the old channels is strikingly illustrated by the case of a young man arrested in Chicago a few years ago upon some trifling charge. When asked why he committed the offense, he confessed that it was in order that he might be sent to the reformatory, where he could obtain that opportunity of learning a trade which he had in vain tried to find elsewhere.

These are the straits to which the most mechanically ingenious, the most inventive people in the world are reduced in the field which their proclivities and traditions would seem to make peculiarly their own. While welcoming the poor of all lands to their shores with open handed hospitality, and permitting them unrestricted freedom to practice their crafts, they have allowed the birthrights of their own sons to be filched away.

In the early days when the mechanic arts were in their infancy, the unformed state of society often resulted in the tyranny of one strong man over the many. To-day the workers in this field have reached another phase, the tyranny of the many over the individual—a tyranny much more fatal to moral strength and the virtues of character than ever was the older form.

The Effect of a Perpetual Wages Scale for Iron Workers.

If the proprietors of rolling mills and the Amalgamated Association of Iron and Steel Workers should finally agree that the existing scale of wages be made perpetual, only to be changed by three months' notice from either side, the beneficial effect will be so far reaching that the subject is worthy of notice in advance, and all interested should make earnest efforts to bring about such a state of affairs. The present result of negotiations has given great satisfaction in the industrial parts of the central States, but there will be still greater cause for gratification if the perpetual scale is adjusted.

The prevailing opinion among manufacturers and others whose interests are allied to the iron and steel industries is that greater stability in business will result; that there will be less fluctuation in values and an absence of that speculation in stocks of material which the present arrangement encourages. Under existing conditions, the annual July scare in regard to the probable outcome of wage conferences produces an unnecessary agitation in commercial circles, and everything runs at high pressure during several months before the time approaches, only to be followed by a distressing calm and policy of retrenchment on the part of buyers in case an amicable settlement is reached.

Consumers of rolling mill products are anxious to make certain that their orders will be filled to cover a few months' requirements in case of a lockout, and they place specifications early with jobbers or dealers, who in turn crowd the mills to their utmost capacity; but if the lockout does not take place cancellation of orders usually follows and business is thrown into a generally unsatisfactory state.

Under the new arrangement there will be a greater certainty that operations of rolling mills will continue with regularity during the year. The manufacturer will know that his stock of bar iron, sheet iron or other material which he uses can be replenished by giving a week's or ten days' notice to his jobber, and he will not have to borrow money to lay in stocks as a safeguard against July strikes. Jobbers of Chicago and the Northwest will not be compelled to place contracts for spring and summer delivery for material which they expect to sell in the fall, the quantity of which they can only guess at, as the sales throughout that territory depend, in their extent, very much upon the weather. During past years this scare has reached even small consumers in isolated territory, and cases are common where a tinner or blacksmith has placed his order for a few bundles of iron many months ahead for the sole purpose of being prepared against labor troubles. From these rivulets of commerce rivers grow, and the effect grows with the increasing volume of business. The jobbers speculate on the number of small consumers who are holding back their orders, and thus the ups and downs are caused.

Under the proposed changed conditions orders will be distributed over longer periods, and more stability to business will result. All concerned will be benefited, not omitting the iron worker, for he himself will soon concede that he is far better off if he only works four days of a week the year around than if he made full time for six months and was idle the balance of the year.

While discussing this subject the writer would ask, Why cannot the arrangement be made still more secure by making the scale perpetual and sliding? The 1½-cent card rate may soon be as absurd as the 2-cent card rate has been in the past. Now is the time for a permanent adjustment. The scale is settled until April 1, 1894; when the average selling price of bar iron or sheet iron is known for the intervening period let that price govern the ensuing three months' scale of wages, and so during the year, and, for that matter, for all time. A committee of workmen could meet a committee of manufacturers every quarter, and there would be little trouble in reaching a satisfactory agreement.

Official Report on U. S. Cruiser "Columbia."

Rear Admiral Belknap, president of the Trial Board, reports to the Secretary of the Navy in regard to the recent official trial of the United States cruiser "Columbia," that the mean speed of the ship for two runs over the measured course from Cape Ann to Cape Porpoise, under forced draft, with an average air pressure of $\frac{9}{10}$ inch, carefully calculated and corrected for tidal flow, was at the rate of 22.80 knots per hour. The board finds that the "Columbia" fulfills the contract requirements in every respect, and regards the vessel as possessing qualities of steadiness, seaworthiness and ready obedience to helm in a marked degree. Only the best material and most thorough workmanship, says the report, could have produced engines and boilers of such notable performance. In conclusion the board expresses the opinion "that, in the 'Columbia,' the service and the country have a vessel that, as a type of superior construction, advanced enginery and great speed, marks an epoch in modern cruiser design and building." The result of the official speed trial insures a bonus for the "Columbia's" builders, the Cramps of Philadelphia, of about $350,000.

Samuel C. Wentworth, superintendent of the Walworth Mfg. Works in South Boston, Mass., who died November 27, was born in New Hampshire and for 25 years was identified with Hayden, Gere & Co., at Haydenville, Mass. In 1883 he removed to Boston, to take charge of the Walworth Works. He was prominent in Masonic circles.

October net earnings of the Reading Coal & Iron Company were $358,358, being the largest net earnings for any month in the history of the corporation. It is nearly $50,000 in excess of that of October, 1892, although the ruling prices of coal at that time were 10 to 15 cents per ton higher. The company's colleries produced in October, 1893, 860,928 tons of coal, an amount only once before exceeded.

Plans are afoot for a consolidation of the surface street railroads of Brooklyn, N. Y., with an aggregate stock of $55,000,000.

THE RETAIL STORE.

The Hardware Club of New York.

I. DESCRIPTION OF PREMISES.

We give herewith detailed drawings, engraved from the architect's drawings, showing the ground plans of the premises which the Hardware Club will occupy in the near future. They are located in the upper portion of the noble Postal Telegraph Building, at the corner of Broadway and Murray streets, and were arranged specially with a view to their accommodation. Owing to law suits, fires, strikes and other delays the completion of this structure has been interfered with, but February 1 is now named as the time when the club authorities can take possession and prepare the apartments for occupation.

THE BUILDING.

As originally intended the edifice was to be 13 stories high, but as the result of negotiations between the governors of the club and the Postal Telegraph Company, a fourteenth story has been added for the use of the club, and above it a mezzanine floor for storage, and above this an extensive addition on the roof for culinary purposes, the help's dining rooms, &c. The proprietors of the building have taken pleasure in meeting the views of the club in a most liberal spirit, arranging the rooms as desired, and giving the whole an elegant finish, thus adapting the premises perfectly to the purposes of the club. In view of this fact the club would practically be no better off if they had projected and erected the building themselves, renting that part of it for which they have no use. Outside of the portion reserved for telegraph and club purposes the remainder of the building will be divided into offices.

When the club is installed in its new home it is safe to say that the members will feel amply repaid for the delay in carrying out the project in the completeness, luxury and extent of the provisions for their comfort. The conditions of the club are such also that no re-establishing of themselves in larger quarters will be necessary in consequence of subsequent growth and expansion for a long time to come. The governors and committees, under the advice of accepted authorities in positions of responsibility in the best dining clubs of the metropolis, have very sagaciously provided for the present and anticipated future needs.

It will be remembered by those familiar with the subject that when the decision was made to enlarge the scope of the membership, reserving to the Hardware and related trades the government of the club, the direction of its policy and the control of its action, gentlemen connected with other lines of business were made eligible for membership. This step was taken with a view to providing better facilities than would have been possible except with a large revenue. It was believed that very many desirable persons could thus be secured as members, and the correctness of this view has since been demonstrated by the applications which have been received for membership from many gentlemen unconnected with the Hardware and kindred lines. The great majority of the members are, however, connected with the special branches of trade for which the club is specially intended.

The building itself is centrally located in the territory in which the Hardware and Metal trades are mainly concentrated, and is also conveniently accessible to a large number of the members of the club who are bankers, financiers, lawyers and merchants identified with other lines, city officials and prominent professional men in different walks of life. Situated as the club is on Broadway opposite the City Hall, it is easily reached by surface lines and elevated railroads, and is conveniently accessible to ferries, and is also but a few minutes' walk from the terminus of the New York and Brooklyn Bridge.

From the roof of the structure, which is covered with cement walks similar to those on the street, is afforded an inspiring view of both the North and East rivers, with their enormous commerce, of the harbor and lower bay, of the Narrows, forts, islands, &c. Following the course of the East River the Long Island Sound can be distinctly seen, while the famous Palisades of the Hudson are equally near. The building itself has been constructed of the best materials in the most substantial manner, and is a splendid example of modern architecture and improved appliances for the comfort and convenience of those who are especially concerned.

The opinion is expressed by an official of one of the best known dining clubs in the city that when the plans determined on and now in course of execution are consummated, the appointments and facilities of the club's quarters will be excelled by none in New York. While essentially a dining club, it will be possible to obtain a meal there at any time during the day from 7 a.m. until 7 p.m.

Entering the building from the street one will have a choice of six luxurious elevators which run to the top of the structure. Two of these will be express elevators, making their first stop at the eleventh story. Stepping from any of the elevators one finds himself in the main hall, which is 94 feet long, and one end of which opens out into a fine balcony on the Broadway front of the building.

MAIN HALL.

It is intended to make the main hall a leading feature of the club's quarters. For a considerable distance it is 14 feet wide, but near the front at the Broadway end, as shown in the plan herewith, it becomes 22 feet. It may be said here that the entire floor will be of stone of a reddish color. The hall will be carpeted or strewn with rugs. Settees, chairs, &c., will be distributed at intervals, the walls will be hung with pictures, and the whole court made very inviting and effective. Near the entrance to the hall proper on the Murray street side will be the office, with an official in charge.

COMMITTEE AND RECEPTION ROOMS.

At the left of the hall is what may be termed a reception room, 21½ by 19 feet in dimensions, while beyond it is another room, 22 by 15 feet in size which can be used as a committee room. Both rooms are suitable for a number of uses, among which may be mentioned their adaptability for trade meetings, such as are often held in places of business, hotel parlors &c. On proper notice it will no doubt be feasible to obtain one of these rooms for such purposes, and should the meeting be protracted luncheon, dinner and supper can be expeditiously served there. Merchants will thus be free from interruption and can satisfactorily attend to the matters for the adjustment of which the meeting was called.

LIBRARY.

To the right of the hall, as shown in the plan, is the library, the greatest dimensions of which are 28 x 28 feet. This will be luxuriously fitted up with easy chairs, rockers, lounges, &c. The leading commercial, news and trade papers will be kept on file, and facilities given for correspondence or other use of the members. Here, also, it would be desirable to have for reference as complete a line of catalogues, price-lists and other trade literature as it may be feasible to collect. This room, overlooking the City Hall Park and having a southern exposure, with a view down Broadway, is not likely to prove unattractive.

LADIES' DINING ROOM.

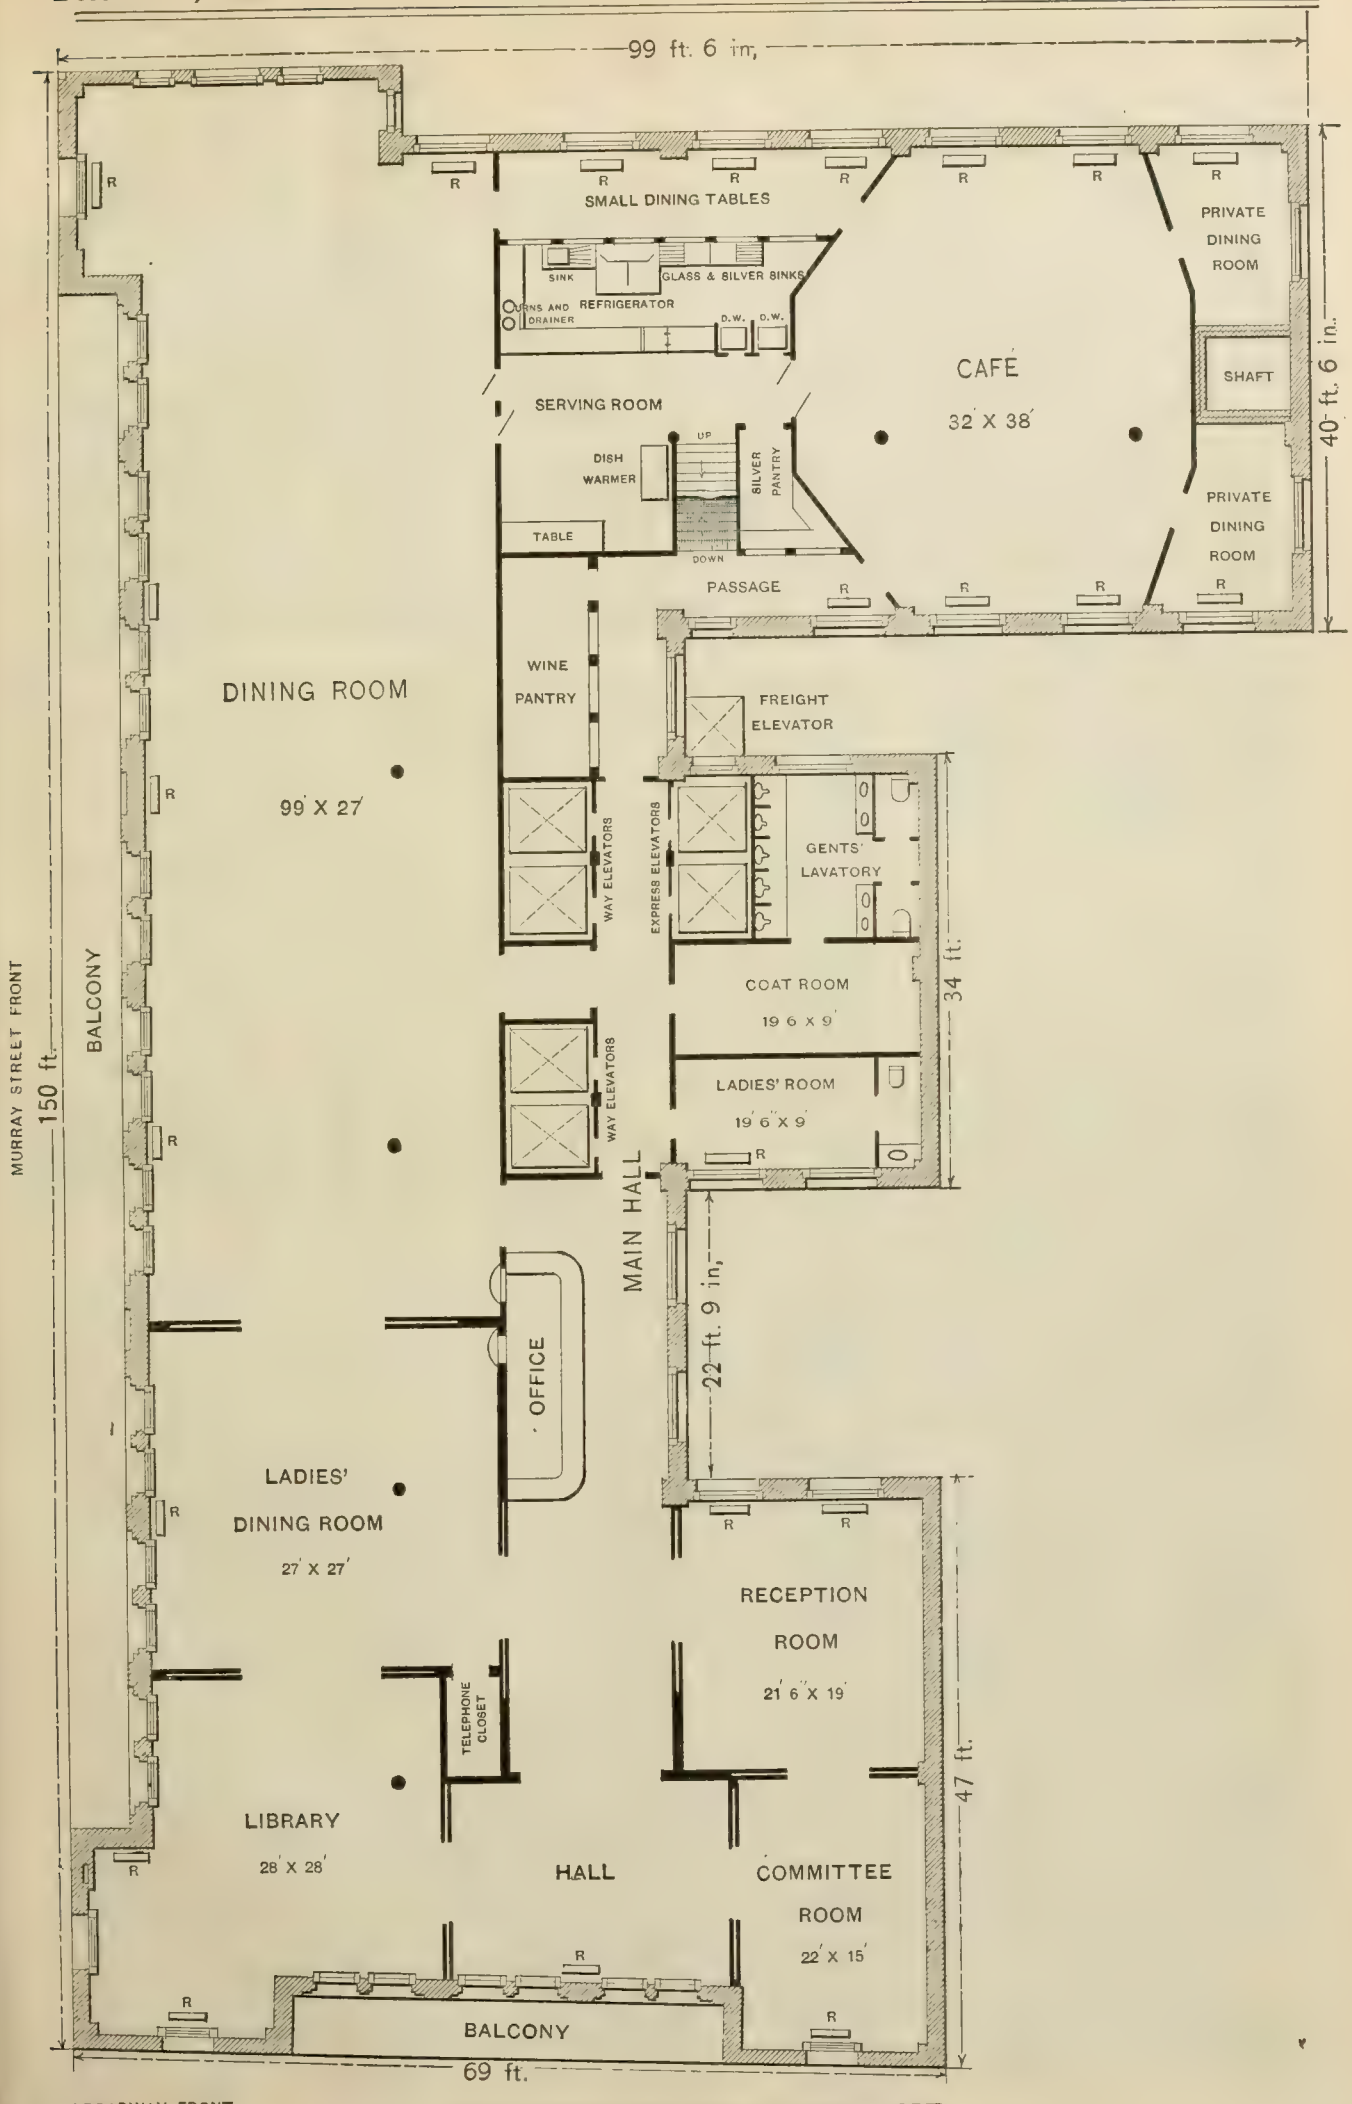
Between the library and the main dining room is the ladies' dining room, the size of which is 27 x 27 feet. The principal entrance to this room will be from the large hall. It will be remembered that the original plan in regard to these premises did not contemplate having such a room, as the amount of space available did not permit it. The enlargement of the project, however, by which the kitchen and other apartments connected with the preparation of food were put in the structure on the roof, permits this important addition to the outfit of the club, the members of which will thus have a suitable place in which to entertain the lady members of their families when in the vicinity. It is needless to say that this will supply a long felt want, owing to the scarcity of such conveniences in a purely business district.

TELEPHONE.

It will be observed that between the ladies' dining room and the main hall the telephone closet is located. The importance of this adjunct will be appreciated, and with the long distance telephone members of the club will be in communication not only with houses in the city and vicinity, but with places out of town within a constantly enlarging circle.

THE DINING ROOM.

The main dining room will have an ample capacity, being about 99 feet long and 27 feet wide. It has been estimated that this room will comfortably accommodate about 300 persons at one sitting. There are four principal entrances to this room, not to mention those leading to the serving and similar rooms. The office, it will be seen, also opens into it. In this spacious room the annual club dinner will probably be served. With the floor richly carpeted and the furniture harmonizing with the ma-



THE HARDWARE CLUB OF NEW YORK.

hogany cabinet work with which the whole premises will be trimmed, and with the extensive outlook to the South, there will be little to desire in the way of comfort and elegance. Light will be furnished from electric incandescent burners, and heat through radiators, the location of which is indicated on the diagram. Above the ceilings will be a spacious air chamber, through which air will be forced to counteract the superfluous heat during the summer months. All meal orders will be written and instantaneously transmitted through pneumatic tube service to the *chef* in charge of the preparing room. This will save much valuable time to the waiters. A glance at the diagram will discover how close contact with the serving room, silver, glass and wine pantries is secured. The table furniture will be in keeping with the character of the club as regards china, silver, glassware, linen, &c. The order for the linen, which will be of special design and will contain the club's monogram, has already been given

BALCONIES.

Before leaving this part of the building the balconies on both the Murray street and Broadway sides should not be ignored. The aggregate length of both is 156 feet; the depth 4½ and 5 feet, respectively. They are easy of access, and in suitable weather will prove an excellent place in which to sit and chat. In the summer the windows will be equipped with awnings to afford protection from the sun's rays.

CAFÉ.

Continuing the circuit, the *café* is reached from the large dining room through the passage beyond the serving room, which is 7 x 28 feet. Presumably the majority of *café* patrons will go directly to that room on reaching the club floor through the main hall, which will be the principal thoroughfare for that purpose, but the hall or court above alluded to adds to the convenience and accessibility of its location. It has been suggested that in this passage one or more tables can be placed at any time for an overflow from dining room or *café*, or for any who may prefer the isolation and seclusion thus obtained. Being near the western windows, the outlook, with a view of the North River, is an admirable one. The *café* itself is an eight-sided room, the greatest dimensions of which are 32 x 38 feet. Here a hurried or an informal meal can be enjoyed with greater freedom than would in the nature of things be expected in the main dining room.

PRIVATE DINING ROOMS.

It is about settled that the two irregular shaped rooms seen in the diagram beyond the *café* can be best utilized for private parties. Each is about 16 feet long and 8 feet wide, and if they are much sought after it is suggested that it may be necessary to charge a small amount for their use, with the purpose solely of insuring an equitable distribution of the privilege, unless some more satisfactory method can be devised.

The coat, cloak and retiring rooms occupy the whole central wing of the building in which the two express elevators are. Here also are the lavatories, closets, &c. These conveniences are, it will be observed, ample. A freight elevator adjoining this wing will be devoted exclusively to the transportation of stores, packages, &c.

SERVING ROOM.

This room, it will be observed from an inspection of the diagram, is well situated for the uses for which it is intended. There are several means of ingress and egress, and a number of pantries for silver, glass, wine, &c. Two dumb waiters also will connect these rooms with the mezzanine floor and kitchen above.

MEZZANINE FLOOR.

The mezzanine floor is located just above the serving room and under the kitchen, but isolated from both except as reached by the staircase, by which access to the roof is also gained. This floor, as indicated, will be used mainly for storage.

KITCHEN.

The diagram of the kitchen practically explains itself. In a dining club the kitchen is, of course, of prime importance. An inspection of either the plan or the room itself will convince our readers that it is exceptionally complete. If things do not run smoothly in that department it will not be owing to the lack of modern labor saving devices and the requisite paraphernalia.

II. THE MANAGEMENT OF THE CLUB.

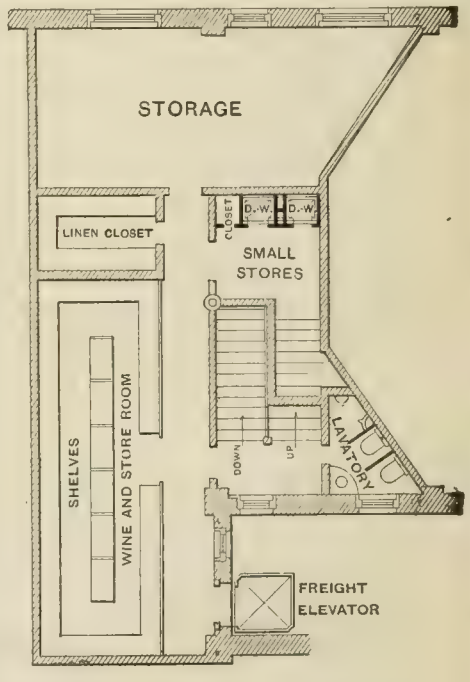
The foregoing description and the accompanying illustrations will make it evident that the premises of the club are a fitting home and center for the trade of New York and vicinity, as well as for manufacturers and merchants in other parts of the country. In this connection it is pleasant to report the hearty support which is given to the project not only by Hardwaremen doing business in the city, but also by many representative manufacturing and jobbing houses in other parts of the country and by not a few retailers. Manufacturers and jobbers of New England, Pennsylvania, New Jersey, and adjacent States are well represented, as are also some of the largest jobbing houses in the West. Among the members are also many identified with the extensive exporting interests which center in New York, and it is expected that this class of trade will be largely represented in the club. This membership is regarded as especially desirable, as it will tend to bring manufacturers directly into contact with the many resident buyers of foreign houses and with the great export commission houses who have so influential a part in the distribution of American products to all parts of the world. The presence in the club of representative bankers, lawyers, city officials and others in various branches of trade more or less closely related to Metal interests will give the club character and strength. While the number of members already exceeds 300, it should be remembered that comparatively little effort has been made to induce persons to join the club, and the limit which has been assigned to the membership will no doubt soon be reached.

FURNISHING THE CLUB.

The matter of furnishing the apartments of the club is now receiving the careful attention of the House Committee, which consists of Messrs. McCARTEE, VARICK, BISSELL, VAN GLAHN and W. H. WILLIAMS, *ex-officio*. This work will be recognized as one calling for exceptionally good judgment and taste and for which the committee is well qualified. The plans contemplate furnishing the club with an elegant and complete outfit. In the meantime the Finance Committee, consisting of Messrs. WALKLEY, OGDEN and HAYDEN, is giving attention to the financial side of the matter with a view to providing the ways and means for the carrying out of the project.

CLUB FACILITIES.

Many of the members connected with the trades to which the club is especially devoted unquestionably regard it with favor in good measure because of the opportunity it will afford for acquaintance with other persons in the trade, as it will bring them together in a very pleasant way. This, however, is only one of the advantages which the club will possess, and besides the very useful purposes which it will thus serve there are more substantial ways in which it will be of advantage to those connected with it. Many of the members will undoubtedly find their business interests promoted by the opportunity which the club will afford for meeting with the trade in the city and many outside of it who will make the club their headquarters while in town. Merchants in the city will also find the club a very convenient and pleasant place to take their customers and others with whom they may have business relations, who by their introduction may be made at home in the club and given the privileges of membership for a



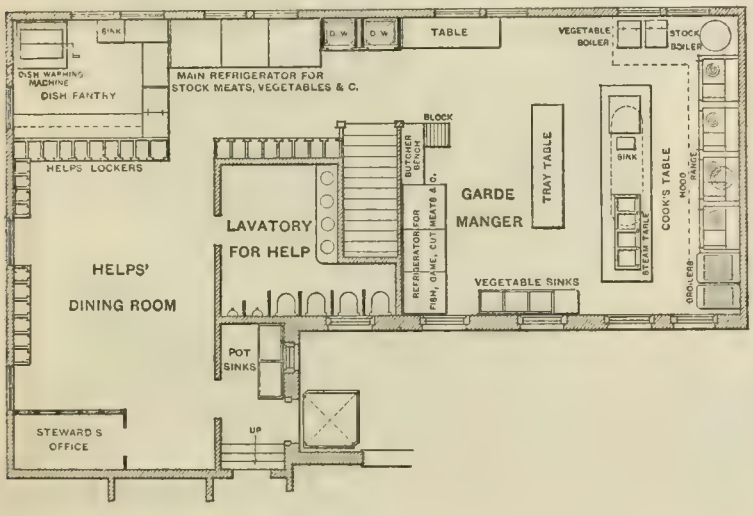
The Hardware Club.—Mezzanine Floor.

time. The rules relating to this matter have not been formally determined, but it is safe to assume that they will give the members all reasonable facilities in this direction, and thus make the club supply a want which has for a long time been felt. A similar privilege extended to non-resident members will enable them to introduce other members of their firm to the club, thus giving them an opportunity to enjoy its conveniences while they may be in the city. The carrying out of the plans which have been formed will render the club more and more a rendezvous for non-resident manufacturers and merchants who desire to keep in touch with the trade and appreciate the advantages offered by the organization. At the club can be received letters, telegrams, packages, samples, &c., appointments made and interviews had, with a certainty of always meeting at a common center a large number of persons who otherwise would have to be sought in their places of business. Arriving in town, hand packages, wraps and baggage can be left if desired, the soil of travel removed, and a meal partaken of at any

time during the day. This may occupy much or little time at the convenience of the member, while pending the preparation of the meal the intervening time can be occupied in various ways not possible at hotel or restaurant. It has, indeed, been suggested by one who looks at the thing in a very practical way that the saving to those visiting the city frequently in their hotel bills will soon more than cover the amount of the dues. Those in charge of the interests of the club recognize the desirability of having as large a non-resident membership as possible with a view to making the club as thoroughly representative of Hardware and Metal interests as possible. The more adequately and fully the trade is thus represented in the membership the more attractive and useful the club will be made.

THE DINING ROOM AND CAFÉ.

While the club will serve social purposes in a very pleasant way and be of practical business advantage, it must be remembered that it is primarily a dining club, and that it is at the noon lunch or dinner that the members will



The Hardware Club.—Kitchen.

principally be brought together. Very much of the success of the club will unquestionably depend on the attention which is given to this matter and the practical way in which the views of the members in this regard are met. It is obviously desirable that the bill of fare should be sufficiently comprehensive to enable those who desire an elaborate dinner to obtain it of the very best quality and at reasonable charges, and that others who are accustomed to take a much less formal meal shall be able to obtain it as at least as moderate a price as elsewhere and amid all the comfort and elegance of the surroundings of the club. There is undoubtedly a wide difference in the practice of merchants in this regard, some devoting a considerable time and making a substantial meal at noon, while others prefer a very simple lunch, which is not infrequently hurried. Organized as the club is for the convenience of its members, it will be necessary for it to be conducted in such a way that these diverse views may be met and all be enabled to enjoy the privileges of the club without expending more than the usual amount for lunch or dinner.

If the plans of those in charge of the interests of the organization are carried out with the wisdom and success with which they have been elaborated, it is safe to say that after the club has been in operation for a time, the trade will wonder how they ever got along without it.

XIII. VIEWS OF WILLIAM H. WILLIAMS.

A representative of *The Iron Age* called on William H. Williams, the efficient president of the Hardware Club, and was favored with the following remarks in regard to the scope of the club and the position it will assume in the trade:

It is pretty good evidence of the desirability and utility of the scheme for having here in New York a representative Hardware club that your journal, which has never encouraged visionary or impracticable enterprises, has given to the club a consistent and unwavering support since the idea was first suggested. There are many reasons for the existence of such a club which will occur to your readers, a few only of which I will mention. Many of the great industries centered here in New York have their boards of trade or exchanges where those interested meet daily either for the transaction of business or for the exchange of useful information; but the Hardware trade, which certainly is a most important industry not only in New York, but throughout the country, has never enjoyed such advantages. For obvious reasons the products and commodities in which it deals cannot well be marketed through the medium of an exchange of the character of the Produce, Cotton or Stock exchanges, but those who conceived the idea of having a Hardware club were at the time deeply impressed with the desirability of having a common and daily place of meeting, where we could get better acquainted with each other, where information affecting the various interests relating to the trade might be exchanged, and members might meet their local customers or those with whom they have business relations who are temporarily stopping in the city; where, in fact, mutual interests might be organized effectively for the common benefit of all. The most practicable means of accomplishing this seemed to be through the medium of a lunch or dining club, and the more the idea has been considered, the more confidence those who have originated it have in its feasibility. At the outset two things became apparent: 1, That such a club would be useless, or nearly so, if conducted on any other than a first-class basis, and, 2, that as the center of our trade here in New York is in close contiguity to other departments of business it would be advisable to associate with us such of the leading bankers, professional and business men in our vicinity as would be willing to join our club for the purpose of having a comfortable and satisfactory place to lunch, at the same time retaining for the club in its name and purpose the essential characteristics of a trade organization. These objects, we confidently believe, we shall attain in the really palatial home which the club has secured for itself in the new Postal Telegraph Building. A competent and well qualified House Committee has given much attention to the details pertaining to all the appointments of the club, and I am sure the membership will be proud of their club when it is fairly settled in its permanent domicile. I am very glad to see that so many gentlemen connected with our trade who only visit the city occasionally are associating themselves with the club as non-resident members. They will certainly find it a convenient place for meeting their New York friends and acquaintances, while the advantages in other respects that it will afford them during their sojourn here will, I am sure, be keenly appreciated. As an evidence of how firm a hold the idea of having such a club has upon the Hardware trade I need only refer to the fact that during the trying season through which we have just passed, which has scarcely been paralleled in the history of the country, we have not only held, but have increased our membership, and that, too, without having any regular meetings or any place for holding such meetings. In common with all the members of the club, I feel grateful to *The Iron Age* for its hearty co-operation, and am pleased to think it will find its reward in the abundant success of the enterprise which it has so generously fostered.

The Well-Informed Clerk.

WM. H. MAHER.

A firm in an enterprising town in New York lately advertised for a clerk to take charge of their grocery department, and among the qualifications necessary was this:

"One who has taste for reading the trade journals with a view to being well informed."

It would seem as if every merchant and every clerk would be only too glad to avail himself of every help in the way of education, and particularly so in the direct line of his business or employment.

One source of information is the trade journal, wherein are gathered items regarding the goods handled in the special branch of trade to which the journal is devoted, discussions upon trade matters, suggestions as to trade points, drawn from the experience of others, and gossip as to the world of business.

It matters not how thoroughly one is posted as to his own trade and locality, there is never an issue of his trade journal that will not contain that which he can read with interest as well as profit. If this is true of the merchant how much more generally it will apply to clerks!

It is the one encouraging feature to the ambitious young poor man of the present that his competitors in the ranks are so superficial, so anxious to shine to-day, and so antagonistic to hard work. A large number, a large proportion are "graduates" of a school system that teaches a smattering of everything from drawing to Greek, and teaches nothing thoroughly. The "graduate" has a fine sense of his own ability and importance and rests upon this. His place in "society" is of much greater importance to him than his position in the store, and so much of his time is taken up with his social

duties he has no hours to spare for reading either trade journals or anything else.

There is usually in the same store a young man who is too insignificant to have a place in "society." His mind is too warped to enjoy the small gossip that occupies the mouths of his more expansive companions, and his business occupies his thoughts during all his waking hours. He is the one clerk who sees the weekly trade journal; not infrequently he digests its contents better than does his employer. He thinks over the things he reads and assimilates them—makes them his own, and in due course of time is referred to by all around him for this or that bit of information.

As a salesman he is able to explain in an intelligent manner why things are thus and so. Buyers see that he knows his business and they like to trade with him.

When goods are called for that are not kept in stock, or may never have been kept in stock, he knows about them, can show where they are weak or strong, and can advise with his employer as to whether it would be wise to add them to the stock or not.

His greater knowledge of everything about the goods helps him to remember prices better, and he is hourly consulted by his associates about points in which they are uncertain. Whatever changes are made in the force he is sure of his place until the day comes when he has a store of his own or is given an interest in the firm.

It is not the brilliant fellow that succeeds. When he does he is the exception. It is the plodding man, who is thorough, careful, intelligent.

When I was a salesman on the road and, upon entering a store, saw the trade journal unopened, circulars and price-lists unread, I always knew I might ask good prices with safety. On the contrary, where I saw the trade paper open at the desk I felt my way carefully to discover what prices I might get.

To-day the trade journal has a much more distinctive field than it had 20 years ago; it is less a mere price-list and more an intelligent friend. No merchant can afford to discard its help, and no clerk should miss the opportunity of going to the school that it conducts for his benefit. But this article is not written to increase the circulation of trade journals; it is to emphasize the benefit of being a well informed clerk. Trade journals are one medium through which he can inform himself, and they ought to induce him to try further fields of reading.

One of the best salesmen that I ever met was one who always carried an educational book in his gripsack; when he had to wait for a delayed train or had an hour to spare at the hotel he had his book in his hand.

I found him a pleasant companion and so did his customers. He was respected and liked by all who knew him, and deserved the success that came to him later. He was a well-informed man; interested in everything worth a man's thought, with no time to waste over billiards or barrooms or worse things.

One of the high salaried men that called on me from New York had the faculty of picking up the latest story and repeating it to perfection. He was equal to many men on the stage. But if I asked for specific information about an article in his line he could not give it; he had the sample and there was the price; he could tell a good story and was free in paying for refreshments, if you would have them, but beyond this he had nothing.

I was not surprised when his employer told me that he would be allowed to resign at the end of the year. Said he: "He sells less each trip. Everybody likes him and speaks well of him, but each time they see him they buy less of him."

I thought I understood the reason. Stories are good in their way; cigars and wine influence some, but, after all, men think, "business is business," and they want to buy of a man who understand his goods from A to Z.

It is for this reason that merchants are looking around either for well-informed clerks, or for those of such frame of mind that they will inform themselves as they grow in business. If the desire is there the rest will follow.

Twenty-five years ago a young man worked in a stove store next door to me. He worked hard, too, for he had to run stoves out and in, black stoves, set them up, and do anything and everything needed to be done. Shops in those days kept open till 8 o'clock every evening, and were opened early in the morning. But this young man found time to study up everything connected with stoves and tin. By and by, with a very few hundred dollars and some credit, he opened a shop to make tin cans, and to-day he is at the head of the largest factory of this kind in all the world.

He read and studied "with a view to being well informed," just as the New York advertisement wants a young man to do, and his information became valuable capital.

The young man of to-day should take courage and press on in the same direction. Well-informed men are needed, always will be needed, and will always get to the top.—*Trade.*

Pittsburgh Mammoth Lamp Fount.

The Pittsburgh Brass Company, Pittsburgh, Pa., with New York office 36 Park place, are offering the Mammoth lamp fount herewith shown. The lamps are made in three sizes, the largest size, known as No. 3, being shown in the cut. This fount, it is stated, holds over 8 pints of oil, sufficient to yield a brilliant white flame for over ten hours. All sizes of founts are furnished with an indicator, represented by the dial in Fig. 2. The pointer of the dial is attached to a spiral brass ribbon, incased within a brass tube. A float on the tube engages with the ribbon and turns the pointer as it rises or falls with the oil. It is explained that the dial shows at a glance not only when the fount is full, thus removing danger of overflowing when filling, but also indicates the exact quantity of oil in the fount at all times. The founts may be stood on the base or used in connection with a harp. It is claimed by the makers that the lamp gives a large amount of light, that it is clean and easy to manage, that it does not break chimneys, and that it burns a long time without refilling.

Fig. 1.—Pittsburgh Mammoth Lamp Fount.

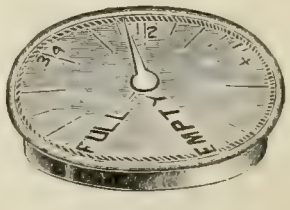


Fig. 2.—Indicator Dial.

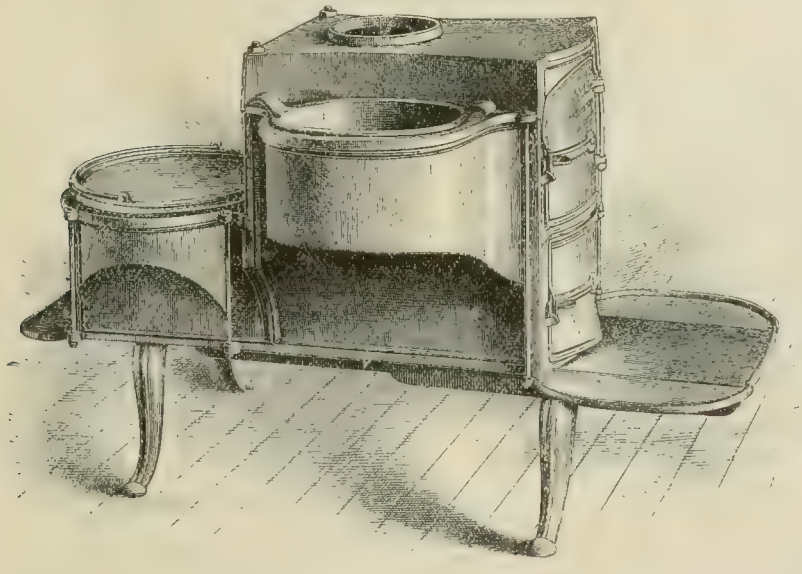
Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until December 15 for work on the United States Custom House and Post Office Building, St. Albans, Vt., the work to include the roof construction and roof covering. Drawings and specifications may be obtained from the Superintendent at St. Albans or of the Supervising Architect at Washington.

Japan is to have a National Industrial Exhibition in 1895, to be divided into seven sections, namely: Industry; art and art industry; agriculture and horticulture; marine products; education and science; mining and metallurgy, and machinery.

STOVE TRADE NOTES.

The Conant Stove.

We are indebted to the Fuller & Warren Company, Troy, N. Y., for the photograph of an old stove from which the engraving here presented was made. The company state that the stove illustrated is at present the property of a customer named G. W. Tillotson of Northfield, Vt., and they write for information as to the date the stove was made. It has on each side of the body an oval boiler hole, in which fits a kettle. The products of combustion pass under and around the kettles, thus heating them on all sides. There is a hearth at each end of the stove as well as a door at both ends of the fire box, so that a fire can be had under the large griddle as well as under the oven and kettles, the latter being provided with cast iron covers. When the stove was new Mr. Tillotson states that there were several reducing rings for the large griddle hole, bringing it down to about 7 inches. The oven has a door at both ends.



General View of a Conant Stove.

With regard to this stove, which was made under Conant's patent, we take pleasure in presenting the following extract from the Vermont *Historical Magazine*:

In 1820 John Conant erected the furnace in the village of Brandon, Vt., the first blast of which was made in October of that year. At this furnace was cast the old Conant stove, the first made in the State and a great invention for the time, and which was the wonder of the farmer's kitchen, and sold in all the villages around and abroad till the more convenient rotary came in for competition. It was the first stove we ever saw—our father bought one and brought it home as a surprise—and never was anything brought into the house that created such an interest. It was the inauguration of a new era in the culinary kingdom. The pleasant old fire place with the swinging crane of well filled pots and kettles, hearth spiders with legs and bake kettles and tin bakers to stand before the blazing logs and bake custard pies in—all went down at once and disappeared before that first stove, without so much as a passing struggle. We do not know whether there has been one kept in the State to this day.

Since the above was in print we have received the following from John A. Conant, son of John Conant: "You are right in saying that the old Conant stove was the first cooking stove made in the State. Stoves with ovens but without boilers, &c., had been previously made to some extent.

"The State was being supplied with cooking stoves previous to 1819 by a house in Troy, N. Y., who had their castings made in Philadelphia. The Conant stove, and others that soon followed, took the place of the Troy pattern.

"The first Conant cook stove was made in the autumn of 1819, castings for the same having been obtained from the Pittsford Iron Works. The work of erecting a blast furnace in Brandon was going on at the same time, and resulted in supplying a superior quality of iron for stove making. Unlike most of the furnaces, the castings for stoves, potash kettles, and almost every variety of iron castings were made directly from the brown hematite ore of the regions. The business proved a success and was prosecuted by father and sons for a period of 30 years, and was the life of the town."

ODD PLATES.

Fuller & Warren Warming and Ventilating Company received from the commissioners of the World's Columbian Exposition a blue ribbon premium for their school warming and syphon ventilation, which they exhibited. The firm are distributing *facsimiles* of these ribbons to their friends in the trade.

The Pittston Steel Range Company is the name of the concern organized a short time ago at Pittston, Pa., for the manufacture of steel ranges. The company have secured temporary quarters in a building on South Main street, where machinery is being installed as rapidly as circumstances will permit. We understand, however, that the company are negotiating for the purchase of a piece of ground on the west side, where they contemplate erecting a large foundry. The board of officers consists of Dr. Joseph C. Reap, president; Dr. George B. Reap, secretary and treasurer; James Kennedy, manager and superintendent of the foundry department, and John Brown, superintendent of the mounting department. Mr. Kennedy spent the greater portion of his life in the foundry business, and brings to his new position a practical experience which eminently fits him for the place. He learned his trade in the Exeter Machine Shops, West Pittston, and was for a number of years foreman of the Pittston Stove Works.

An attractive folder with deep red borders reaches us from the Barstow Stove Company of Providence, R. I. On opening the folder we find the statement that "this talk about business depression is getting to be an aged chestnut," the idea being forcibly conveyed by a sample chestnut fastened in its proper place on the cardboard by means of a thread. After this the reader is requested to get a new subject, and Thanksgiving Day is suggested as one appropriate for discussion. In this connection reference is made to the thousands of turkeys that will be roasted in Barstow Bay State ranges on that day, and "by the way," says the folder, "don't you need one or two Bay States in anticipation of the trade which precedes this holiday?"

The Schneider & Trenkamp Company of Cleveland, Ohio, have issued from the press a neatly printed and well arranged catalogue and price-list of Reliable gas stoves, which they manufacture in great variety. This is the seventh annual catalogue which the company have issued, and in their announcement to the trade they say that nothing has been spared in remodeling the entire line of Reliable goods to make them first class in every particular. Among the numerous improvements which they have made for the coming season, particular attention is called to the fact that all Reliable Junior stoves will be made with a lay down tank, for which there will be no extra charge. In the early pages of the catalogue 11 reasons are given why the Reliable generator is the best, following which are various illustrations of the device named. Directions for ordering repairs for Reliable Process stoves are presented, together with a price list and suggestions with regard to the proper manner of taking care of a generator gasoline stove. The Reli-

able Process for 1894 is first illustrated and described, followed by other leading specialties which the company manufacture. These cover a wide range and include constructions adapted to meet all reasonable requirements. Attention is also given to paint burners, plumbers' furnaces, individual burners, gasoline and oil torches, stewpans, steam cookers, sad iron heaters, gas radiators, parlor gas grates. &c. A telegraphic code, followed by several blank pages for purposes of memoranda, complete the work.

F. & L. KAHN & BROS., Hamilton, Ohio, send us a postal card, on the back of which is an illustration of the F and G series of the Estate Oak heating stove. The manufacturers refer to these goods as the "World's Fair Winners," they having received awards at the World's Columbian Exposition. The stoves are made with jointless ash pit and screw registers, and are offered the trade in 28 different styles and sizes.

M. A. MURRAY of Cold Spring, N. Y., one of the customers of Rathbone, Sard & Co., has lately shipped an Acorn stove to France.

THE RICHARDSON & MORGAN COMPANY, 92 Beekman street, New York, report a satisfactory trade on both Puritan ranges and Cyclone hot air and hot water apparatus during the fall.

E. C. MUCKLE, superintendent of the furnace and range department of Janes & Kirtland, 110 Beekman street, New York, reports an unusual demand for their line of the Beebe ranges and furnaces. They have a large force at present engaged and their foundry is taxed to its utmost capacity.

ONE OF THE MANY ADMIRERS of the Michigan Stove Company is T. J. Welch, Colchester, Ill., who has adapted the famous song "After the Ball" to reciting the merits of the Garland stove. The story is told in clever verse and is all about an old man's early love affair that turned out disastrously through his failure to appreciate the merits of the Garland stove. The "she" of the story wanted one of these famous cookers, but he resisted and got some cheap thing instead. The poor girl died within a year and the old man was left to the companionship of regret and the cheap stove. We quote the chorus that ends the three verses:

After the dinner's over, after the baking's done;
After the neighbors leave, after the friends are gone;
Many a heart is aching, many a wild thought rove;
Many the hopes that vanished for lack of a Garland stove.

THE COLD WEATHER prevailing in Northern New York is proving a great help to the stove business. The manufacturers of stoves at Albany, N. Y., report business as being fair. They expect it will receive a great impetus if the cold weather continues.

MANUFACTURING at the plant of the Perry Stove Company, Albany, N. Y., is moving along briskly, and the force is busily engaged in turning pig iron into the fine brand of goods known as Argand stoves and ranges.

PRESIDENT JOHN F. RATHBONE and Vice-President Grange Sard of Rathbone, Sard & Co., Albany, N. Y., are members of the Citizens' Committee of that city recently organized to promote the purity of elections and convict the perpetrators of ballot box frauds.

PRESIDENT JAMES E. ROACH of the State branch of the International Molders' Union, addressed Molders' Union No. 2 at Albany, N. Y., November 24, on the condition of the molders' trade throughout the State. He said he had received reports from all the unions in the State and they showed that work was slow, foundries employing small forces and working on short time.

VAN LEYEN & HENSLER of 149 Jefferson avenue, Detroit, Mich., favor us with proof impressions showing some of the work they have recently executed in different branches of engraving, of which they make a specialty. This concern is well known among the leading stove manufacturers of the West for the very creditable work which they have produced in the way of illustrations of stoves, ranges and heaters. Our readers will be able to judge in some measure of the character of the work turned out from an inspection of the catalogues issued by such houses as the Peninsular Stove Company, Detroit Stove Works and the Michigan Stove Company, all of Detroit.

THE ART STOVE COMPANY of Detroit, Mich., have been doing a very good business with the Home Laurel range, which they placed upon the market early in the season. It is a high class six-hole construction of rich ornamentation, and combines the modern features of utility and durability. Among the points of merit to which the company refer may be mentioned large, deep fire box, improved duplex grate, large draw hearth, capacious ash pan, patent oven door kicker, nickel plated open shelf, satisfactory flue construction and nickel panels on the oven door, carrying medallion tile. The company report general business as good, and state that they are now working upon new patterns for next season's trade. They propose to bring out an entirely new line of stoves and ranges which will be second to none.

THE CORTLAND HOWE VENTILATING STOVE COMPANY of Cortland, N. Y., are the subject of a very complimentary article which appeared in the Cortland *Standard* for November 15. It is entitled "Laurels of a Year," and describes at some length the record of medals and premiums awarded the company for their ventilating stoves during the recent past. The record begins with the award of a gold medal at the Triennial Exhibition of the Massachusetts Charitable Mechanic Association, held in Boston in October and November last year; then follows reference to the award at the World's Columbian Exposition, premiums at various New York State fairs, and then winds up with a list of scientific experts who have examined and indorsed the stove.

THE QUICK MEAL STOVE COMPANY, St. Louis, advised us that their new style Quick Meal gasoline stoves would be ready for shipment on December 1. They have booked seven carloads for shipment on that date, and expect to increase it by several more. Their catalogue is in the hands of the printer and will be ready for mailing to the trade in a very short time.

THE EXCELSIOR MFG. COMPANY, St. Louis, Mo., are sending out an announcement in the shape of a small circular of a brilliant red color, calling the attention of the trade to the fact that Christmas is coming. They follow up this information with a few remarks concerning their Charter Oak toy stoves, which are guaranteed to operate perfectly. Many dealers are ordering samples for window display, and, while the stock is still in good shape, the Excelsior Mfg. Company urge dealers to order early, as the next few weeks will cut down their stock very materially.

COL. JAMES A. SEXTON of the firm of Cribben, Sexton & Co., Chicago, will shortly be found at his old desk puzzling over the details of the stove business. For four years he has been serving his country as postmaster of Chicago, and according to common report he has done it well. He has had a hard time trying to leave the office, having resigned on March 7 last, but complications arose over the appointment of a successor, which delayed the acceptance of the resignation until a few days since. An editor, Washington Hesing of the Chicago *Staats Zeitung*, steps into his shoes. For some time Colonel Sexton has been talking of his longing to get back into the stove business, and to be freed from the trammels of an official position, but we are privately of the opinion that he won't find quite as much enjoyment in the stove trade in its present condition.

THE MICHIGAN STOVE COMPANY favor us with one of their famous "Shut-the-Door" bull dogs. This sign must be a terror to the small boy who never shuts the door. We have also received from the company a huge card, evidently intended as a mammoth postal card. The reverse side is a vivid scarlet, on which are printed interesting references to Garland stoves and ranges.

THE FULLER & WARREN COMPANY of Milwaukee and Chicago issue a very neat illustrated circular, printed in two colors, calling attention to their Stewart stoves, of which they say more than 2,000,000 are in use. A portrait is printed of P. P. Stewart, the originator of these stoves, who began to make them in 1831. The stoves referred to are the P. P. Stewart base burner improved for 1893, the new Splendid Stewart base burner, and four styles of P. P. Stewart stoves with round and square sheet iron bodies.

H. RENDTORFF & Co., 16 Lake street, Chicago, are displaying on their sample floor specimens of the Weir Stove Company's new Glenwood H range. This range is a distinct departure from the usual style of decoration. Instead of nickel plated or polished edges this range has black edges, with nickel plated corners inserted. These corners are on the top, hearth and oven shelf. They brighten up the range, in strong contrast with the black body, and the general effect is very pleasing. Messrs. Rendtorff & Co. are pushing the sale of their 1893 Ideal Oak, which they offer in four sizes.

THE BRAND STOVE COMPANY of Milwaukee are closing their Chicago warehouse, but will probably maintain an office in the latter city. They find that with their foundry in Milwaukee they are sufficiently close to make shipments promptly to their Chicago trade. De Witt Van Evera will attend to Chicago business, as heretofore.

EDMOND RAFTERY of Rathbone, Sard & Co.'s Chicago house has spent the past month in Colorado for the benefit of his health, making his headquarters at Glenwood Springs. At last accounts he was able to walk 20 miles a day with ease, so that he seems to have regained his vigor.

The Prepayment Gas Meter.

The following is a portion of a paper read by Geo. Keillor before the North British Association of Gas Managers:

As requested, I have prepared a few notes on the prepayment meter system, with the view of bringing the subject before you for discussion; but having had these meters in use for only about a year, I am afraid my short experience may be of little service.

This prepayment adaption to the ordinary meter may be said with truth to be another step in the right direction. The system has already been rewarded with very great success; and it is rapidly finding favor among the poorer class of gas consumers. By this arrangement, "a long felt want" has been supplied. It is indeed a friend to the poor, and completely eclipses the old, but true, saying "Short accounts mak lang friends."

I may here state that at a meeting of my directors held in March, 1892, I had a meter fitted up in the secretary's office by which it was shown how a pennyworth of gas could be bought and afterward consumed. The chairman expressed great satisfaction with the arrangement, and said he considered the coin meter to be the best invention he had yet seen for the poorer class of consumers, and to keep gas companies from making bad debts.

A short time after this 12 of these meters were ordered, so that I might experiment with them. These have now been thoroughly tested; and I am pleased to inform you the results were very satisfactory, and also that my anticipations, formed with regard to the quantity of gas consumed and the corresponding pennies in cash boxes, have been more than realized. I may, however, state that I had very grave doubts as to the meters possibly being troublesome to consumers, by the light going out at a busy moment, or that the slot arrangement might get out of order, and so pass a greater quantity of gas to the consumer than the money value in the cash box; but in practice I find these apparent doubts and inconveniences entirely disappear. The consumers get so well acquainted with the working of the meter, and the time their one, two, three or more pennies' worth will last, that they like the system, and are put to no inconvenience whatever. On one occasion only had I to take in a meter which ceased to give light; the cause of which was found to be a penny stuck in the slot—the penny having been, by some youth, hammered into an irregular shape—which necessitated our taking the cover of the meter off. Makers should therefore enlarge the slot a little, as it is not necessary for it to be the exact size to admit the coin.

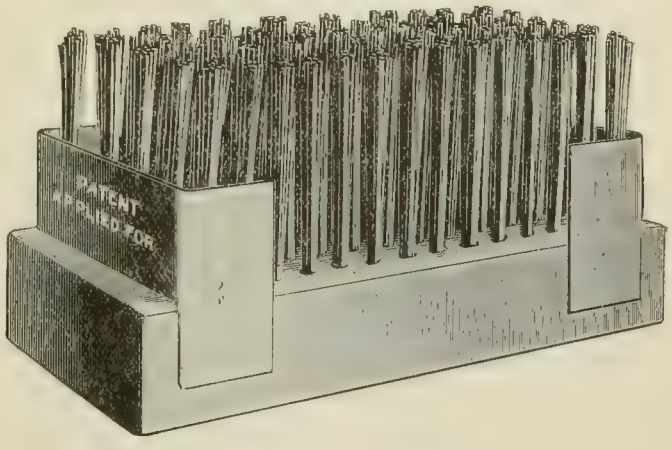
When ordering these 12 meters it was not my intention at first to press for new consumers, and, of course, we had no applications for them. But it occurred to me that rather than give them out to new consumers to commence with, I might select 12 ordinary small consumers, who were all more or less in arrears, and, consequently, would have been more than likely to have their gas supply cut off. Rather than do this, and very probably lose all, I used some liberty with these defaulters by way of making an experiment with the prepayment meter. Most of them were glad to get such a meter, while several others absolutely refused to allow their meters to be shifted, and declared if such were done they would commence using oil. Notwithstanding these remonstrances I insisted on having the meters put in, and, strange to say, on making our periodical calls three months after we did not find oil in use, neither did we find the cash boxes by any means empty. On the contrary, nearly double the quantity of gas had been paid for than would have been consumed by the ordinary meter, and this without a word of complaint. One consumer remarked: "I doubt you have given me a stick to break your own back with. You will not get me overcharged this time as you did the three corresponding months last year. I have only put in a few pennies each time I needed light, and that was no oftener than I could help." However, on reading the meter, the inspector considered that if the pennies in the box agreed with the number of feet registered, the gas company would have no reason to complain, and the consumer also was, apparently, well satisfied. The result was 12 shillings in the box, as compared with 7 shillings and 6 pence the corresponding months complained of.

I have now only to say that gas companies and corporations ought to give notice, by advertising or otherwise, to all proprietors, architects and builders, that when erecting new buildings or when altering old ones, the gas company will supply automatic meters, to be fitted into all workmen's houses. Also that when architects specify the plumbing and gas fitting work, it should be specially mentioned in the specification to the effect that a meter and suitable gas bracket will be fitted up complete by the gas fitter, after which the gas company would send an official to instruct the tenants as to the working of these prepayment meters. In Nairn, among other buildings, I did the architectural work in connection with a block of houses where there are 12 tenants. In the specification of plumbing and gas fitting work it was specified that one automatic gas meter must be fitted complete into each house, the meter to be supplied by the gas company and fitted in by the contractor. I knew very well that none of these tenants had any intention of using gas when they rented these houses—most of them, in fact, informed me they did not want the meter placed. But on discussing the matter with them, I said it was a part of the gas fitter's duty to fix these meters and that they had just better allow them to be put in in the ordinary way. I also took the opportunity of saying that perhaps the first time they were out of oil, or it might be a lamp chimney got broken, they might for a change put the value of the new lamp chimney in the slot of the meter, and by so doing they would come to see how handy and ready the gas is when obtained in this way compared with oil. I remarked that ultimately I expected to see an ornament on each of their shelves in the shape of an oil lamp.

Well, whether you believe the system to be just as successful as I do or not—a great deal of which success depends on gas managers themselves—there is one thing certain, that the cleanliness, readiness, and easy purchase of the light by this system will go on finding favor among the poorer classes; and I most certainly recommend the system wherever gas is used. And, further (more especially in small towns), I would say, should this class of consumer not get the opportunity to use gas by this system we shall be guilty of what I am afraid we too often are—viz.: "standing in our own light."

Steel Wire Brush.

This steel wire brush for cleaning castings is made by the S. Obermayer Company of Cincinnati, Ohio. It will be noted that there is a sheet metal strip inserted in each end of the block and which by the protection it affords the wires adds to the durability of the brush. It is stated that the wire will not break, and that it will wear down to the block.



STEEL WIRE BRUSH.

Last year about 1,250,000 tons of cotton seed were crushed in the United States, from which were extracted 1,000,000 barrels of oil. A Southern journal shows where the bulk of this product goes, as follows: Chicago pork packers buy 300,000 barrels, most of which is made into lard. Maine sardine packers use 20,000 barrels. Between 50,000 and 100,000 barrels are consumed by various soap makers. Between 200,000 and 300,000 barrels go to Europe, where it is made into "butter."

Unemployed workmen are flocking from the small towns and country districts into the large cities, hoping to get work. As in most of the cities it is a difficult matter to provide for their own unemployed, this fact is naturally a cause for complaint. New Orleans, Pittsburgh and Indianapolis are among the cities suffering from this invasion.

TRADE REPORT.

The Iron Market.

The shock which the Iron trade has received through the publication of the Wilson tariff bill has staggered even those who were ready to admit that the industry could stand a conservative readjustment of rates. It has startled them out of their fancied security.

The belief is gaining ground, however, that the bill has no chance of passing as at present framed, because it attacks indiscriminately interests in sections of the country whose loyalty to the framers of the bill must be retained to carry it through.

The immediate effect upon business cannot help being bad. The early date named for its going into effect must act to deter buyers from covering spring and summer requirements. It seems likely to confirm purchasers all along the line in a policy of keeping supplies down to the minimum.

A heroic effort is being made on the part of some of the Southern furnaces to advance the price of Pig Iron. The chief basis for this standing out for more money seems to be that considerable sales have been made lately, and that they include speculative purchases. Whether this advance will be actually secured depends upon whether other producers in the South and in Northern districts will see fit to cover the current demand at old prices. As yet no serious disposition has been shown to follow the leadership of the large companies in question.

Pig Iron.—Reports of additional sales of Southern warrants to speculative buyers are current in the New York market. Some of the leading Southern producers are making an effort to secure better prices, but in this market no advance has yet taken place, since a good deal of cheap Iron is still offering. We quote: Northern brands, $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

The demand for Pig Iron is not specially urgent in the Philadelphia district, but consumers are getting so short of stock that orders are more frequent, if not large. It is thought that there will be a pretty active business after the turn of the year, as stocks are unusually low and requirements will probably be larger than they have been during the past six or eight months. At the present moment, however, there is no trouble in placing orders at the lowest figures of the entire year, although there is no pressure to sell and less chance for concessions than there was some time ago. General quotations for Philadelphia or near by deliveries are about as follows:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

The most important occurrence in the Chicago market has been an effort of some large Southern companies to put a check to the lowering tendency in prices by asking an advance of about 50¢ ℔ ton. Quite a number of foundries making specialties are getting ready to start in December, while general jobbing foundries are almost all again in operation, although working only part time or with part of their force. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.50 @ $16.00
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25
Southern Coke, No. 2	11.85 @ 12.10
Southern Coke, No. 3	11.10 @ 11.35
Southern, No. 1, Soft	11.85 @ 12.10
Southern, No. 2, Soft	11.10 @ 11.35
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.25 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

Pittsburgh advices indicate no improvement in the Pig Iron market since last report. Prices, if anything, are a shade weaker, due largely to some recent sales of Valley Iron, at a heavy loss to the seller, and at prices much lower than any Pittsburgh makers care to accept. While it is true that more Pig Iron is being consumed now than at any time since July, it is also true that there has been a large increase in production, owing to the recent blowing in of several stacks in the district. Quotations are as follows, for cash: No, 1 Foundry, $12.50 @ 13; No. 2 Foundry, $11.50 @ $12.

The increase in the volume of business in Southern Pig Iron markets keeps up well. During the past week it was much larger than in the preceding week. An advance of 25¢ ℔ ton is asked and obtained for spot and early future delivery, and a still further advance would have to be paid for delivery next spring. Furnaces have recently sold more Iron than they have made, and there is some scarcity in one or two favority grades. There is nothing doing in No. 1 Foundry, and scarcely any movement in Charcoal Iron. Quotations are given as follows:

Southern Coke, No. 1	$12.25 @ $12.50
Southern Coke, No. 2	11.00 @ 11.25
Southern Coke, No. 3	10.50 @ 10.75
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—For spot stock and on deliveries running during the balance of the year, prices have been well maintained on the basis of about 20.65¢. Speculation has remained almost at a standstill, and regular operators, as well as outside interest, seem to have virtually withdrawn pending the fate of the new tariff bill. The jobbing and consumptive demand has also been on a moderate scale, but the best information on the subject goes to show that steady inroads have been made upon spot stocks, and that the distribution exceeds the combined total quantity afloat and the importations since the McKinley duty went into effect. Along with the fact that stocks in Europe have been steadily increasing this would suggest more than a bare possibility of some lively speculative movement in the event of the present duty being removed. Estimates as to the present supply of Pig Tin in this country vary from 2500 to 5000 tons, including several hundreds of tons now in bond. The lesser figure is, however, generally taken as being nearest the mark. Jobbers' prices for small lots remain unchanged at the rates quoted last week; namely, 21½¢ @ 22¢ ℔ lb for Straits Pig and 22½¢ for Banca.

Copper.—No large sales of Lake Superior Ingot have been reported or even rumored, but brokers have been supplied with orders to bid stiff prices, not only on Exchange contracts, but on actual Copper for near future delivery. In some quarters it was claimed that 5,000,000 lb or any part would have been taken at 10¢. Elsewhere *bona fide* bids of 10⅛¢ for moderate quantities were turned down. On the Metal Exchange a trade was recorded involving 50,000 lb, for delivery during the latter part of December, at 10⅛¢, but reliable information went to show that several prominent producers were willing and ready sellers at that rate for delivery during the first quarter of next year. There is a "bullish" tendency to make the most of all the best features prevailing, but enough legitimate demand exists to give the market a good tone. Jobbers report an improvement in the

demand over the previous week, and inquiries received by them tend to be of a more important character. Quotations for small retail quantities are given at 11¢ for Lake Superior Ingot, 10½¢ Ansonia grade Arizona, 10¢ Ansonia grade casting.

Sheet Copper.—The interest in Manufactured Copper is good for the season of the year and prices have stiffened. Stocks are low with both jobbers and consumers, and it is believed that the conditions exist for a good trade after the turn of the year, when consumers are able to arrive at the probable extent of their wants for spring business. Meanwhile, prices remain unchanged per list, but dealers are not eager to take much forward business on the present basis, anticipating an advance in rates in the near future.

Pig Lead.—There has been somewhat freer offering, due partly to slow condition of trade latterly and partly to some uneasiness over the provisions of the new tariff bill, which proposes to reduce the duty on Lead. Under the weight of the two circumstances selling price has dropped to 3.40¢. Carload and larger lots have been offered at that rate for delivery up to the balance of the year. At the present there seem to be no buyers at above 3.35¢, and few at over 3.30¢. The market thus has a weak as well as a dull appearance in the face of all the bullish speculative manipulation and argument that has been brought into play during the past two weeks. The general consumptive demand shows no signs of greater activity, jobbers reporting business in this metal as exceedingly dull. American Pig in small lots, less than a ton, is quoted at 4½¢ @ 4¼¢ ℔ lb.

Lead Pipe and Sheet.—Business in Manufactured Lead and Plumbers' Supplies is of the slightest nature. Nor is any material improvement looked for until the spring. List prices in the East are still nominally held to with firmness, but it is an open secret that shading of rates can often be secured on desirable orders.

Spelter.—Under the influence of good demand from Western consumers, along with about average buying in this city and vicinity, the market shows better form and closes quite firm. Single carload lots of ordinary Western went at 3.75¢ @ 3.85¢ for prompt and near future shipment. The latest sales were at the higher price. That is now bid, and in remote instances offers were made as high as 3.87½¢ for ordinary deliveries. Spelter, in fact, after a long period of neglect, appears to have again attracted the attention of speculators for some more or less occult reason. For moderate jobbing quantities of Western Spelter the quotations are 4½¢ @ 4¼¢ ℔ lb, with only fair demand.

Tin Plates. Business has been uneven and somewhat slow, and the market is bare of any particularly encouraging features. Spot goods are taken in small quantities only as immediate requirements dictate, and interest in future deliveries appears to have slackened down. Sufficient jobbing business in the way of spot sales is, however, moving to keep the trade from anything approaching stagnation. The total volume of negotiations for the week, however, hardly approaches the average for this season of the year, and as the season for stocktaking and adjustment of accounts is approaching, it is hardly likely that any tangible revival of interest will develop until this annual duty is accomplished. The proposed Tariff changes, too, will probably serve to still further depress the trade until it is known exactly what the ultimate arrangements will be in regard to the duty on Tin Plates. The proposal as it at present stands is generally regarded in the trade as a most mischievous one—namely, to charge an ad valorem duty in place of a specific tariff, thus leaving a wide margin for fraud and misrepresentation, and involving a complete revolution in the business methods and arrangements of the trade.

It is strongly believed that the clause of the Wilson bill relating to Tin Plates will not pass the Legislature in its present form, but the fact of the proposal having been made, and that there is a probability of its being carried into effect, will operate as anything but an encouragement with the trade. Uncertainty and want of confidence must prevail to the depression of business until the matter is settled. Imports of Plates continue to be on a very moderate scale, notwithstanding the extreme lowness of prices on the foreign market, which would, ordinarily, be an inducement to American importers. Prices are soft, although showing no radical change. Later in the week some very good sales of Coke for future shipment were reported. Consumers are, however, remarkably backward in placing their respective orders in view of probable tariff changes making material alteration in values of Plates in the near future.

A cable despatch from London to *The Iron Age*, dated November 29, reports the British Tin Plate market as dull. Prices were weak and irregular, and orders scarce. Many works are idle and others only partially employed. Liverpool quotations for Plates were at follows:

IC Charcoal, Alloway grade	12/6 @ 13/
IC Bessemer Steel, Coke finish	11/3 @ 11/6
IC Siemens " " "	11/6 @ 11/9
IC Coke, B. V. grade, 14 x 20	11/3 @ 11/6
Charcoal Terne, Dean grade	11/ @ 11/3

Sheet Iron.—Black Sheets are almost entirely neglected. Jobbers and consumers appear to have secured sufficient stock to last them for some time to come, and this condition, combined with the recent settlement of the Sheet scale and the subsequent starting up of some further mills, has given softness to prices. Black Iron can without much difficulty be obtained even in small lots at anywhere from 2½ % to 10 % lower than quoted prices, provided spot cash or other inducement be offered. Galvanized Iron continues in good demand. An augmentation of production has obviated all present risk of scarcity in this material. There is now no difficulty experienced by jobbers in getting their orders filled promptly at the mills. Prices are firm at last week's quotations.

Chicago Report.

Scrap.—Considerably more business is doing in Old Material, but receipts from the country are large and prices are weak. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—The volume of business is disappointing. The recurrence of mild weather suddenly changes the tone of dealers and consumers. Labor troubles on the railroads are also being adjusted and there is no apprehension of shortage of cars. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

Japanese trade with the United States, according to a late statement issued by the Japanese Customs Bureau, is increasing more rapidly than it is with England, France or Germany.

CONDITION OF THE

Hardware Trade.

Business during the past week has been without material variation in volume except the falling off which is expected at this season and during the last days of the month. The market has been characterized by a somewhat more hopeful tone, and manufacturers and merchants have been making their plans for a more vigorous conduct of their business. While the volume of trade has not increased, inquiries in regard to future shipments and the placing of orders for spring delivery have been more frequent, which was regarded as an indication that things were resuming their normal course. The announcement of the new tariff bill, however, with its large reductions in the duties on the many lines of Hardware and related goods, will, it is appre hended, have the effect of unsettling business and checking the improvement which was beginning to make itself apparent in trade circles.

Advices from Chicago.—Shelf Hardware jobbers report a somewhat better condition of business. Not only are orders a little more numerous, but collections are also improving considerably. Shelf goods are going out in larger volume, as well as seasonable goods. The demand for Snow Shovels and other winter supplies, Skates, Sleds and holiday goods generally has been very fair during the week. There is also increased movement in Sheet Iron and Tinners' Stock. Owing to the sustained winter weather, no material change is reported in the price of Shelf goods. Manufacturers seem to have produced in sufficient quantities only to meet the regular demand, and are, therefore, not pressing sales of accumulated stock, as in some other lines. Heavy Hardware keeps up fairly well, owing to the demand for Iron and Steel coming in from both large and small consumers. There are indications of an improvement in the Carriage trade, and a few orders have already been entered for Carriage material for spring delivery.

Notes on Prices.

Wire Nails.—The market has developed no special features of importance since our last review. The demand is only moderate, but the aggregate is considerable, as the low prices which are ruling induce many dealers to purchase such Nails as they require in the near future. Quotations continue on a basis of $1.15 to $1.20 for round lots at mill, the former figure being usually obtainable on good orders. Carload lots delivered in New York are quoted at $1.35.

Advices from Chicago.—The heavy purchases of Wire Nails continued during the past week, but as navigation on the lakes has now closed, the movement will probably be light from this time. There are, however, inquiries for delivery in January, February and March, but manufacturers hesitate to quote so far ahead. Prices dropped to a little lower level during the active trade of the past week, but with the change to all rail delivery an effort is being made to keep prices at the equivalent of $1.30, Chicago. Small lots are now selling at $1.40 to $1.45 from stock.

Cut Nails.—The condition of the Cut Nail market is unsatisfactory, but prices are not quotably lower than last week. The market is represented by the quotation of 95 cents for carload lots at mill, though this figure is shaded and orders can be placed at 90 cents. Small lots from store in New York are quoted regularly at $1.20.

Advices from Chicago.—A fair trade is in progress in Cut Steel Nails, with continued good shipments to the Southwest. Wheeling Nails are again being quoted in this market quite freely, but thus far little business has resulted, as the local makers appear to have a firm grip on the trade. Prices on factory lots are quoted at $1.15 to $1.20, according to the character of the order, while small lots from stock are selling at $1.25.

Barb Wire—In view of the unsatisfactory condition of the market and the extremely low prices which are ruling, some of the manufacturers are practically withdrawing from the market for the time being, refusing to meet the prevalent figures. The competition, however, continues active and prices are low and weak. We continue to quote $2.15 to $2.20 for car lots of Four-Point Galvanized at mill.

Advices from Chicago.—The demand for Barb Wire is of a light character throughout the Northwest and manufacturers appear to be getting most of their business from the South and Southwest. Competition for this business has been keen, but so far it has not affected the local trade. Carload lots of Galvanized are quoted to purchasers in this vicinity at $2.40, while jobbers quote small lots from stock at the old rate of $2.55. Heavy transactions have taken place in Plain Wire at lower prices than ever before made in this vicinity.

Skate Sharpener.—The Union Skate Sharpener, manufactured by the Union Hardware Company, Torrington, Conn., is listed at $3 per dozen, subject to a discount of 30 per cent. to the retail trade.

Climax Lamp Stove.—The Climax Lamp Stove, which is manufactured by Clarence M. Kemp, 101 North Frederick street, Baltimore, Md., is sold to the trade, without the lamp, at $48 per dozen, net.

Brass Nails. — The Just Enough Brass Nails, manufactured by the Grand Crossing Tack Company, Grand Crossing, Chicago, are sold at 50 cents per carton of 20 papers.

Novelty Scraper.—Smith's Novelty Scraper is manufactured by Fernando B. Smith, Canton, Ohio, and is sold at 75 cents per dozen, or $7.20 per gross, net, f.o.b. Canton.

Universal Brace.—The Universal Brace, manufactured by the National Mfg. Company, Wilkesbarre, Pa., is sold at a discount of 20 per cent. from the following list:

	Sweep		
	6-inch.	7-inch.	8-inch.
Nickel plated, per doz.	$33.00	$36.00	$39.00
Black enameled, nickel plated trimmings, per doz.	30.00	33.00	36.00

Glass.—The dissolution of the Plate Glass Manufacturers' Association, to which reference was made in our last issue, has resulted in an open market, and manufacturers of American Plate Glass are in a position to accept orders at any price they may individually choose. There is a reported decline in prices from factory of 20 per cent. American Window Glass is being sold from factory at 85 and 20 per cent. discount for Single Strength and 85 and 20 and 5 per cent. discount for Double Strength. In face of a declining market something like 200 additional pots are reported as having gone into operation since our last report. French Window Glass is still quoted at 75 and 10 and 5 to 80 and 5 per cent. discount. It is too early to surmise what reduction the proposed tariff would make in the selling price of imported Glass, or to what extent it would affect American Glass manufacturers.

Old Metals.—The market for Old Metals continues tame at a low range of prices. Scrap Iron is, however, selling more freely, chiefly in small lots for immediate use. Prices are firm at about last week's quotations—namely, for New York delivery:

Heavy Copper	℔ lb 6¾¢
Light and Tinned Copper	℔ lb 6¼¢
Heavy Brass	℔ lb 5¼¢
Light Brass	℔ lb 4½¢
Lead	℔ lb 3¢
Tea Lead	℔ lb 2½¢
Zinc	℔ lb 2½¢
No. 1 Pewter	℔ lb 14¢
No. 2 Pewter	℔ lb 6¢
Wrought Scrap Iron ℔ gross ton	$9.00 @ $10.00
Heavy Cast Scrap ℔ gross ton	9.00 @ 10.00
Stove Plate Scrap ℔ gross ton	.... @ 5.60
Burnt Iron (delivered at mill) ℔ gross ton	.... @ 5.00

Old Rags, Paper, &c.—The demand for Paper Stock has improved, sales and inquiries being reported as increasing. Prices rule steady at about the following quotations:

No. 1 White Rags	℔ lb 3¼ @ 3½
No. 2 White Rags	℔ lb 2¼ @ 2⅝¢
Mixed Rags	℔ lb ¾¢
Blues and 3ds	℔ lb 1 @ 1¼¢
Hard Sized White Shavings	℔ lb 2¼ @ 2⅝¢
No. 1 White Book Shavings	℔ lb 2 @ 2⅛¢
No. 2 White Book Shavings	℔ lb 1 @ 1⅛¢
Light Book Shavings	℔ lb ¾¢
No. 1 Mixed Shavings	℔ lb ¾ @ 1 ¢
No. 2 Mixed Shavings	℔ lb ½ @ ¾¢
No. 1 Printed Books	℔ lb 1 @ 1¼¢
Ordinary Mixed Books	℔ lb ½ @ ¾¢
Newspapers	℔ lb 3-5¢

No. 1 Manila Paper	℔	1 @	1⅛¢
No. 2 Manila Paper	℔	⅝ @	¾¢
Bogus Paper	℔		⅝¢
Common Paper	℔	¾ @	1⅛¢
Straw Chips	℔	⅛ @	⅝¢
Binders' Clippings	℔	⅛ @	⅝¢
Jute Butts	℔	1⅞ @	2 ¢
No. 1 Jute Bagging	℔	1 @	1¼¢
Mixed Bagging	℔	¾ @	1 ¢
No. 2 Bagging	℔	½ @	⅝¢
Hemp Twine	℔		2¼¢
Manila Rope	℔		2½¢
Jute Rope	℔	1½ @	1¾¢
Mixed Rope	℔	¾ @	⅞¢

Old Rubber.—The market for Old Rubber is of a very restricted character, prices ruling low. The following quotions represent about the values, New York delivery:

Car Springs, ton lots, ℔ lb.	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@	.03

Trade Notes.

THE VIENNA STAMPING & ENAMEL WORKS, at Porter, Ind., whose proprietors failed during the summer, have been sold to new parties. Arrangements are being made to resume manufacturing operations.

THE ALASKA REFRIGERATOR COMPANY of Muskegon, Mich., started work in their factory on the 23d inst., after an idleness of four months. This is claimed to be the largest plant of its kind in the world, and the resumption of work gives employment to a great many hands.

THE GRAND RAPIDS REFRIGERATOR COMPANY, Grand Rapids, Mich., in a neatly gotten up circular to the trade state that their factory is and has been running full time, ten hours a day, six days a week. The company suggest that the trade send in their orders early so that they can make up the identical sizes desired. Last season, they explain, they were caught with a large stock of the wrong sizes on hand, which they refer to as having been unsatisfactory to themselves and their customers. Reference is also made to the fact that the company were awarded three gold medals and a special diploma at the World's Fair for the excellence of their Refrigerators.

THE IRONDALE ROLLING MILLS, at Anderson, Ind., which burned recently, will probably not be rebuilt there. Indiana papers report that the offer made by Middletown, Ind., in the next county to that in which Anderson is located, has been accepted. The rolling mill company are to take $10,000 in lots, and get in addition to this $40,000. They agree to erect a plant that will employ 400 men. Thirty days will be given in which the money is to be paid over.

THE FACTORY AND STOREHOUSE of the T. New Mfg. Company, Avenue B and Twentieth streets, New York, were completely destroyed by fire on November 27. The firm are manufacturers of tar, felt and asbestos roofing.

Chicago is reported as suffering from a regular fire insurance famine. So many insurance companies have been crippled by large damage claims of late that big business concerns find it impossible to obtain all the insurance they desire to carry.

The Chicago Master Plumbers.

The Chicago Master Plumbers held their regular meeting at their hall, 197 Madison street, Monday evening, November 27. T. B. Bryson & Son and Alexander M. Cameron were inducted into membership in the association. There was considerable discussion on the question of having manufacturers of plumbing goods give a guarantee of one year for the perfect working of their goods when properly installed. The members of the association were unanimously in favor of having this result brought about. A communication was received from the Illinois Humane Society requesting a donation of $5, which was complied with. Secretary Murray was requested to use his best endeavors to secure a photograph (cabinet size) of all the deceased master plumbers of Chicago, whether they were members of the association or not. The photographs, when secured, are to be properly grouped and placed in appropriate frames. Those having photographs of deceased master plumbers are requested to communicate with Secretary A. W. Murray. It was announced that a committee from the Real Estate Board would be present at the next meeting and discuss matters pertaining to the care of plumbing work in vacant buildings. Some of the members were of the opinion that, as the World's Fair was over, the high license demanded of plumbers should be reduced to the former rate. Through the kindness of the various manufacturers and dealers in the different articles required by the plumbing trade, who promptly responded to Secretary A. W. Murray's request by sending him circulars and catalogues, a valuable feature has been added to the library of the association. These circulars and catalogues have been properly numbered and indexed, so as to be of easy access to the members of the association, and are generally used.

THE CHICAGO stove trade now moves up and down with the weather. Every cold snap brings in a flood of orders, but as soon as the winds shift to the south business falls off. Merchants have laid in such slender stocks this year that mail orders are likely to run fully up to the average, unless the weather ceases its vagaries and settles down to a long period of mildness.

The deplorable waste of natural gas continues. A well drilled recently near Greenfield, Ind., was wrecked by the pressure of gas, and by last accounts a flow of gas estimated at 30,000,000 cubic feet a day was rushing out unrestricted, the owners being totally unable to get it under control.

Plenty of capital is said to be ready for carrying out a rapid transit system for New York City as soon as the commissioners come to a decision on the plan to be adopted.

A most curious dinner, so far as regards the place in which it was consumed, was given in Brooklyn last week, when 108 persons, guests of the Brooklyn City Railroad Company, were entertained inside of the big chimney of that company's newly constructed power house. The chimney, which is 300 feet high, is the loftiest in New York State and one of the highest in the world, and forms a very conspicuous feature of the Williamsburgh district of the city of Brooklyn.

Price-Lists, Circulars, &c.

BLAIR MFG. COMPANY, Springfield, Mass.: Lawn Mowers, &c. A handsomely printed catalogue illustrates with descriptions and prices the Easy, Archimedean high wheel, Hercules high wheel, Bay State, style B, Lawn Razor, style B, Leader, style B, Archimedean horse-power and the Mohawk, style B, Lawn Mowers; California Lawn Sprinkler, Revolving Turf Edger, Lawn Rakes, Model Lawn and Garden Roller and Lawn Sweepers. The manufacturers remark that for the first time during the 15 years they have been engaged in the manufacture of Lawn Mowers and Lawn specialties they now present under one cover a complete list of the different styles of Lawn Mowers, &c., of their production; and that their line of Mowers includes both front cut roller and rear cut side wheel machines of varying hight of wheels and number of revolving knives. The point is emphasized by the makers that in the manufacture of Mowers they apply the principle of exact duplication of different parts of the finished product, by tools and fixtures specially designed and adapted to the work to be done; and that as a result they are able to produce Mowers of superior mechanical construction at the lowest possible cost. It is further stated that they make but one quality—the best—and that any product of their works is warranted to be the highest grade of its kind; also that no order is too large or too small to receive their careful attention. Their European agents are Markt & Co., New York, London and Hamburg.

SILVER & Co., 20 Warren street, New York, and 304-310 Hewes street, Brooklyn: Household Inventions. Large illustrated circulars show Fruit Strainers, Egg Beaters, Soap Cups, Measuring Glasses, Flour Bin and Sifter, Gas Burner Stoves, Spirit Stoves, Steam Cookers, Cooking Crock, Display Stands, Yankee Roach and Beetle Trap, Coffee and Tea Pots, Novelty Gas Heaters, Royal Roasting and Baking Pans, &c.

GEORGE CHASE, 107th street and First avenue, New York: A reduced price-list, under date December 1, 1893, relates to best White Washita, Washita mounted in polished cases, Green Paper grade, and Arkansas Stone. In addition are Arkansas, Scotch and Hindostan Dental Wheels, Regarding Chase's Green Paper brand of Washita Stone, it is remarked that the Stone is carefully selected as to its cutting qualities, being of a soft, even, fast cutting grain.

FLORENCE DISPLAY FIXTURE COMPANY, Geo. H. Bennett, proprietor, 204 Lake street, Chicago, Ill.: Store Display Fixtures. One catalogue illustrates their regular line of standard fixtures, which are always carried in stock. These include Stands, Cutlery and Plate Glass Brackets, Post Bands for iron columns, over counter fixtures, fixtures in shape of letters, &c. Another catalogue shows new and accurate designs of fixtures, the leaves being secured by silken cords to allow the addition of extra leaves. The manufacturers state that their work is all first class and absolutely original. They are prepared to make designs for any style of window or display. The plates in this catalogue show elaborate and handsome designs of fixtures, many with electric lights in them.

THE COLUMBIAN SILVER FLAT WARE COMPANY, Unionville, Conn.: Solid Columbian Silver Flat Ware. The goods made of this substitute for solid silver include Knives, Forks and Spoons. The ware is described as being nearly as white as sterling silver and it is stated that with as careful use as sterling silver it will outlast any flat ware on the market. It is claimed that the knives are as good cutters as solid steel Knives, and that they never show any rust, and that they can be sharpened at any time. The manufacturers warrant the goods manufactured from the metal 25 years to wear as white as sterling silver, to hold a temper equal to silver, and never to show any signs of rust. Illustrations of the goods are shown in various patterns.

LUDLOW-SAYLOR WIRE COMPANY, St. Louis, Mo.: United States Wire Mats and Matting. The Mats are made in regular, circular and irregular shapes. The Matting is made in 50 and 100 feet rolls, 16 to 48 inches wide, or wider if desired. It is explained that rolls can be cut to any required lengths by cutting one wire in two places; that it rolls up close, is elastic, flexible, cleanly, of heavy wire, and that it is so woven as to form a good scraping surface in any position. The point is made that remnants can be worked into regular sizes of domestic Mats.

GRAND CROSSING TACK COMPANY, Grand Crossing, Chicago: New goods. An illustrated pamphlet is devoted to 5-cent goods put up by this company, including Hammer Carpet Tacks, Claw Handle Carpet Tacks, Bonnie Blue Tacks, Bill Nye Brad Box, Just Enough Brass Nails, Double Enough Cobblers' Nails, Wood Keg Carpet Tacks, Gilt Nails, Centum Carpet Tacks, Austral Steel Tacks and House Tacks.

LABOR EXCHANGE.

The Ad Valorem Tin Plate Duty.

While opinions in the tin plate trade differ widely on the question of the advantage or otherwise of reducing the present import duty on that class of material, the entire trade appear to be unanimous in condemning the unwisdom of the proposed change from a specific to an ad valorem tariff. Investigation among importers, jobbers and consumers has elicited a general chorus of disapproval of the action of the Ways and Means Committee in proposing to return to a practice which was abandoned at the earnest solicitation of the trade in 1875 on account of its complete failure up to that time. The practical objections to an ad valorem duty in the particular case of tin plates, as we pointed out last week, are many and weighty, however just and equitable such an arrangement may be in the abstract. When it is considered that an accurate appraisement of tin plates by inspection is practically impossible, even by those most intimately acquainted with the trade, the temptation to fraud and misrepresentation which a duty based on estimated value presents is only too obvious. Apart from any question of high or low tariff, the Wilson bill, in this particular aspect, urgently requires modification, and it is to be hoped that the remonstrances of those best qualified to offer an opinion will be effectual in causing the tariff on tin plates to be made specific before the bill becomes a law.

Misplaced Blame.

In a neighboring city stands a large steam heated building, the heating apparatus having been placed in it a few years ago by a firm of merited reputation for this class of work, and who, in prosperous times, do a large business. It is stated that when the apparatus was first erected both the contracting firm and the owner of the building were much pleased with the job, as in all respects it worked satisfactorily. The plant is of the two-pipe, gravity return variety, and occupants of the building aver that when completed and for a considerable time after it was put in regular service the circulation was good; that the apparatus worked without noise, and that the numerous offices in the building were uniformly warmed. Now the very reverse prevails throughout the building. The noise of the water hammering in the pipes is especially annoying. People who occupy or visit the building and who are unable to perceive the true cause of the existing imperfections unjustly blame the firm that put in the apparatus; whereas, the secret of all the present trouble lies in the unequal settling of the building, which has materially changed, and in some parts completely reversed the inclination of nearly every run of pipes in the building. These pipes are supported by substantial hangers; but no matter how good they may be, if hangers are themselves not firmly supported, the results described may be expected in many steam heating jobs.

A Precaution.

It is not enough to say that people who are inexpert in heating work should not, as they generally do, too readily challenge either the ability or integrity of contractors when, after a time, heating plants work imperfectly. The example given above is one of many existing in all American cities. Heating contractors cannot guard against the settling of buildings in whose construction they have had no part, and are liable to have their most accurate work thus rendered more or less imperfect; but steamfitters ought to bear constantly in mind the fact that they run this risk, and remember that as it does no harm to give a greater inclination to pipe runs than would be needed could absolute stability in structures be relied upon, and as such inclination costs nothing, the greater they can make it within reasonable limits the less will be the risk that subsequent settling of buildings will so diminish the inclination as to interfere with proper working. By following this rule they may often escape blame, which, though it may be totally unjust, is not on that account to be viewed with indifference as affecting their reputations and business.

Help for the Unemployed.

A good deal of serious thought is being given to the very grave question of how to take care of the unemployed during the coming winter. In every community there are many men who are initiating measures looking toward relief. Naturally the different boards of trade are taking the matter into their hands. While, of course, local circumstances must govern the action of such bodies, it would seem that some interchange of opinions ought to take place between their representatives. A good many very important questions of common interest might be very profitably discussed. Delegates of the boards of trade of the great divisions of the country should assemble at such convenient points as Philadelphia, Chicago, Denver and Nashville, to exchange estimates of the magnitude of the misfortunes which they must soon alleviate, and discuss the best and safest methods of reducing distress among the worthy to a minimum. It needs only the invitation of a few leading chambers of commerce or boards of trade to bring about such gatherings, which might do so much good.

Fire losses of the United States and Canada recorded for the month of November keep up the distressingly large figures which have been shown by each month of this year. According to the New York *Journal of Commerce* they amounted to $11,493,000; bringing the total for the year up to the enormous sum of $144,340,000, which will be equivalent to about $156,000,000 for the year, or $24,000,000 in excess of last year's losses. There were 212 fires in November of a greater destructiveness that $10,000 each, 11 of which were over $100,000 and eight over $200,000. This terrible record of fire waste is unparalleled since the great Chicago conflagration, and is out of all proportion with the country's growth.

There appears to be some disposition on the part of the Franklin fund trustees in Boston, Mass., to modify their original and most laudable decision in regard to the disposition of that fund. Pressure from certain influential quarters is, it is said, being used to induce the trustees to expand their views so as to give the proposed institution more of a general educational character, in the way of a technical or manual training college, instead of a trade school pure and simple. It is to be hoped that the Franklin Fund trustees will adhere to their original decision. A definite training in a certain trade, and not a smattering of a number of trades, is what is most needed by the "young American mechanic," for whose exclusive benefit Benjamin Franklin bequeathed the money now available under the terms of his will.

A circumstance, which is quoted as an illustration of the effects of hard times, is that the sales of postage stamps in New York in November were less by nearly $50,000 than those in November, 1892.

Western Freight Discrimination.

Adverse discrimination by local railroads, says *The Iron Age*, has been a long standing complaint of Northern producers. Some of the Eastern railroad systems have yielded to the pressure steadily applied by their local patrons and have made equable rates on commodities manufactured along those lines, but Western managers have been stubborn, and such concessions as they have made up to this time have only been aggravations. There are signs now, however, of a radical change in this policy. Intimations have been given from influential quarters that on at least important business originating at Chicago the interests of the local producers are to be more carefully regarded than has thus far been the case. Whether the policy thus to be changed will have a wider bearing and will characterize Western roads generally cannot now be foretold, but there is good reason to expect a movement of this kind to be somewhat general within the limits of the great traffic associations having their headquarters at Chicago. A change in this respect may bear heavily on the distant producers who are now favored with disproportionately low freight rates on through shipments, but they will have no real ground of complaint if the change is made, especially if local producers are merely put on a perfect equality with themselves.

The persistent refusal of Western managers to put local producers on an even footing with outside competitors in reaching markets further west or northwest shows how deep seated a certain practice can become in railroad management. The growth of manufactures has been very rapid at Chicago and other Western points within the past five years. Commod ities are now manufactured in abundance which at that time were largely supplied from other sections of the country. Having supplied local requirements, these commodities seek a market for the surplus, which is naturally further west and northwest. They are confronted, however, with the fact that under certain moss-grown arrangements their own local roads prorate with lines from competing producing districts on such terms as to give their competitors a much lower rate than they can secure to the same points. This is particularly true in pig iron, but also applies to bar iron, nails, and in fact to iron and steel commodities generally. To reach Western or Northwestern markets manufacturers at Chicago or other points in that vicinity must pay from 25 to 50 per cent. more freight than their competitors on such business pay for that part of their haul over the same track and, perhaps, in the same train, drawn by the same engine. This policy is a relic of the days when manufactures in Indiana and Illinois were confined to the local demands of the community and those States were almost exclusively consumers of staple goods. Freight rates were then devised to meet the conditions existing in the local jobbing trade and, perhaps, were satisfactory at the time. Now, however, both jobbing and manufacturing interests have outgrown the arrangements then made and have long since been ripe for a change.

The plea for fair treatment made by these interests is one that appeals to everybody's sense of justice. There are territorial advantages which ought to inure to the benefit of those located in that territory. A distant producer must expect to be handicapped to some extent in endeavoring to secure business in competition with them. Perhaps he may have compensating advantages in cheaper materials or labor, so that he can overcome the natural difference in freight and offer his product at an even or lower rate at the very door of the local manufacturers. Surely he ought not to complain if he is obliged to pay the same freight rates as those manufacturers when he goes further on and competes with them in territory beyond.. This is the point for which many Northern manufacturers have been long contending. The day may come when they will expect their local roads to go further and give them special rates so as to exclude outside manufacturers. Their attitude would then be indefensible from a rational standpoint. But their present demand to be placed on merely an even footing with distant competitors is just and reasonable.

Rules and Regulations.

BY FOSSIL.

Statutory laws are supposed to be the product of an aggregation of human wisdom and made for the general good, but in some cases they fail to accomplish their intended purposes, or, worse, become like

> "The gun which, aimed at duck or plover,
> Recoiled and kicked the owner over."

In like manner the rules and regulations of domestic or business life can only be proven good or bad by experiment, and it often happens that a modification or abrogation is necessary. The ability to do this makes modern law—unlike that of the Medes and Persians, "which altered not"—of plastic matter and kaleidoscopic construction, so that it may be molded at will or made to assume varied forms to different eyes.

We have an idea that, allowing the inflexibility of those Medo-Persian laws, Daniel, had he a political pull or a good lawyer, might have been acquitted, or failing that, been cast into a den of muzzled lions. Any modern attorney would have discovered that toothless or dead lions were in keeping with the letter of the law.

Coming back to those rules which may be established by that autocrat, the boss. We must concede their necessity subject to circumstantial changes. "Denis," said the boss mason, "I notice that you are a little slow in getting to work, also that your hod is always empty some minutes before quitting time. Now we will have this rule, to start and stop work promptly on time. Drop everything when you get the signal for closing, but give me full time previous."

Next day the clock struck twelve when Denis was on the ladder with a hod of mortar, and remembering the rule, he then and there dropped it, which caused the boss to remark, "We'll put into the rule, except when you are on a ladder." A rule which won't always work is better than none at all and a lack of system is always injurious and often dishonest. The workman who is dilatory or given to "sogering" is like procrastination, which we read is the "thief of time," and if in addition he wastes or loses material, the boss will be likely to rule him out of the shop.

We can conceive of a system, not universally prevalent, which compels a faithful attendance to business in its hours, care in the use and disposal of tools, so that they may not be lost in the chaos of the shop, or left behind at the end of an outside job, and an avoidance of that forgetfulness which must send the helper back for a missing article, while the jour takes it easy at the expense of the customer. There is sometimes a looseness in keeping the account of stock and time on a job, which may result in a disputed bill, for while the customer "can't see where all that went to," the dealer, lacking a system enforced by strict rules, is in poor condition to explain.

We all admit that a code of laws for shop affairs is desirable, but many employers will not take time to make them and their business is run in an erratic manner. It is not necessary that a shop should look as though a cyclone had struck it. Order in everything should be enforced, and to this end there should be rules and regulations.

A Bunsen Burner.

Every one, says an exchange, should have a Bunsen burner in his kit, as it is such a handy little thing and very simple and easy to make. It is simply a piece of brass or other tube about ½ inch in diameter and 5 inches long and then put in a little bushing in one end so that it will just slip down on a gas burner so as to bring the jet about 1 inch from the bottom of the tube. Drill four ¼-inch holes about half way between the bottom to the position of the jet in the tube; this brings the air holes below the flame.

The principle is that the heated gas rushing up to the flame above causes a draft in the tube and the external air rushes in through the openings below the flame, combines with the gas, becomes heated and aids in combustion the same as in the blow pipe. It is very nice to put a piece of brass tubing outside of the Bunsen burner with holes drilled to correspond with the holes in the burner and then the amount of air can be adjusted by turning the outer piece the same as is done in the old tin pepper boxes with the holes in the cover; in this way the air can be adjusted to the burner, as it is best to have the gas at full head unless a very heavy pressure is used. This outer tube can be very readily applied and will be found very handy in many cases where a stationary flame is wanted.

California's Midwinter Fair, to be opened at San Francisco on January 1, gives promise of being a highly successful venture. Twenty-five nations have appointed commissioners and will be represented by important exhibits, and many of the most striking objects from the Chicago World's Fair are being transferred to Golden Gate Park. So many applications for space have been received that the directors are hard put to it to find accommodation for all who desire to exhibit there.

THE TIN SHOP.

Pattern of Flaring Article—Oblong Bottom and Round Top.

From C. D. W., *Willimantic, Conn.*—Can the pattern of inclosed article be obtained by the method shown in Fig. 321 of "The Metal Worker Pattern Book?"

Answer.—The pattern referred to is for a flaring article the top of which is round and the bottom of which is oblong, with semicircular ends. The round top is less in diameter than the width of the oblong base. The pattern can be obtained as shown, or by triangulation, as desired. In Fig. 1 is shown the side elevation and plan as inclosed by our correspondent, to which has been added the end elevation. S is the center from which the round top is described, while the semicircular ends are struck from R and T as centers. The elevation is placed so as to correspond with the plan, as indicated by the lines A M, G R, F T and E N. The part of oblique cone of which one of the ends of article is composed is indicated in plan by P*a* O*a* N O P T, and in elevation by C D E F. One of the triangular sides is shown in plan by O P Q, and in elevation by F C G. The article can be said to be composed of two ends and two sides.

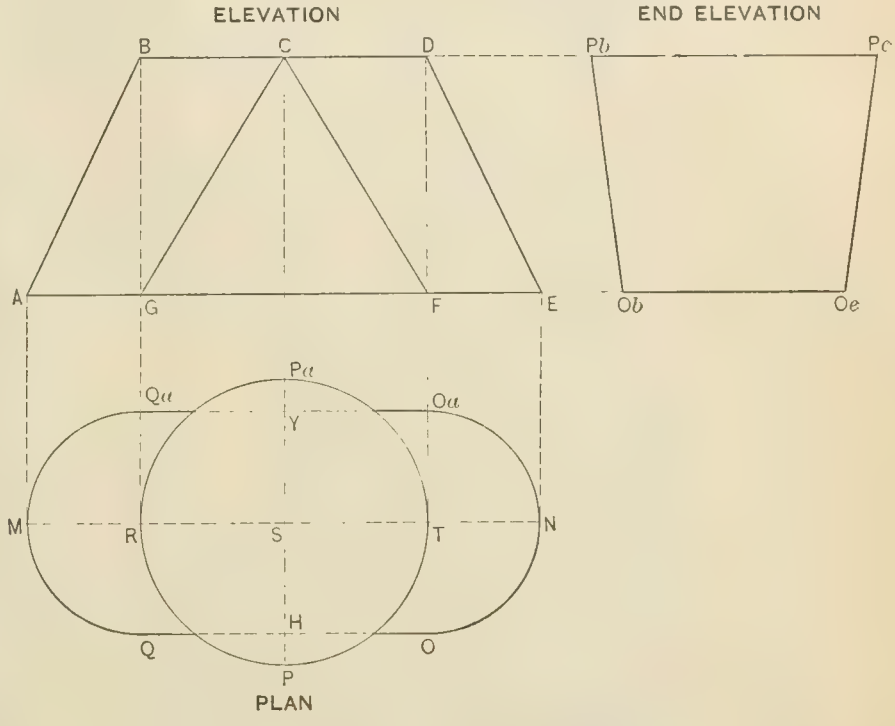

Fig. 1.—Plan, with Side and End Elevations.

To obtain the part of pattern indicated in plan, Fig. 2, by P*e* T*e* N*e* O*e* Divide P*e* T*e* into any convenient number of equal parts, as shown by the small figures. With Z*e* as center, and the points in P*e* T*e* as radii, strike arcs cutting S*e* T*e*, as shown, and from the points thus obtained in S*e* T*e* erect perpendiculars cutting C*d* D*d* of elevation.

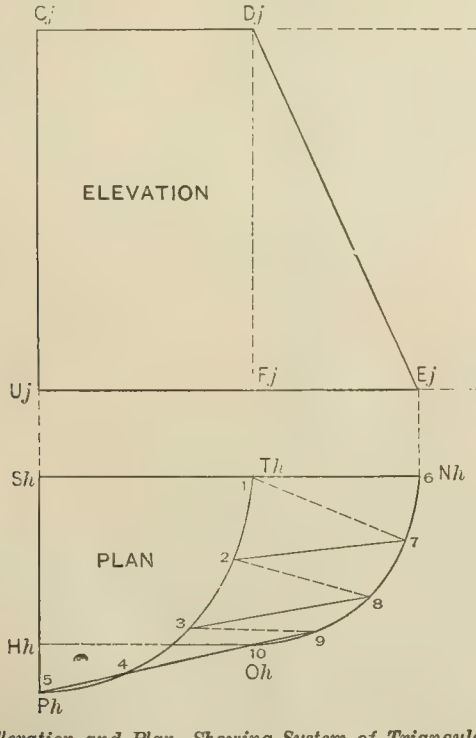

Fig. 3.—Elevation and Plan, Showing System of Triangulation.

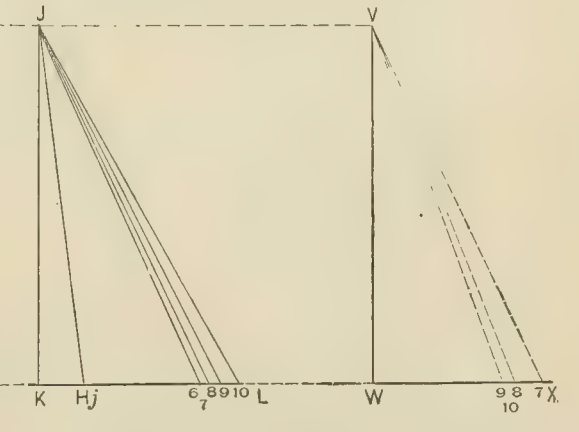

Fig. 4.—Triangles Represented by Solid Lines in Plan.

Fig. 5.—Triangles Represented by Dotted Lines in Plan.

PATTERN OF FLARING ARTICLE THE BOTTOM OF WHICH IS OBLONG AND THE TOP ROUND.

Prolong the side line D*d* E*d* of elevation indefinitely in the direction of J*f*. Through the points C*d* F*d* draw a line, which produce until it meets D*d* E*d* prolonged to the point J*f*. Then J*f* is the apex of an oblique cone in elevation, of which C*d* D*d* E*d* F*d* of elevation is a part. The apex of this cone is shown in plan by Z*e*. From J*f* as center strike ares corresponding to the points in C*d* D*d*, as indicated, and from the same center strike similar arcs from the points in F*d* E*d*, produced by the lines drawn from C*d* D*d* to J*f*.

The arcs from the upper set of points are to receive the stretchout in the fol-

lowing manner: From J*f* draw any line meeting the upper arc, as J*f* P*g*. Set the dividers to the space used in stepping off the plan, and, commencing at P*g*, step from arc to arc, and through the points thus obtained trace a line free-hand, as shown. From each of the points thus obtained draw lines cutting side of article, as shown on plan by H*e* O*e* P*e*. The other part of pattern, as indicated on plan by P*f* O*f* N*e* T*e* Y*f*, can be obtained in a similar manner or by duplication, as indicated by T*g* P*k* Y*k* O*k* N*g*. The pattern when constructed as shown would require two pieces for the article, the seams being P*h* T*h* and O*h* N*h* of plan into any equal number of parts, and connect the points in P*h* T*h* with those in O*h* N*h*, as indicated by the solid lines. These lines represent the bases of triangles, the altitude of which will be equal to the straight hight of the article. For a diagram of the triangles representing

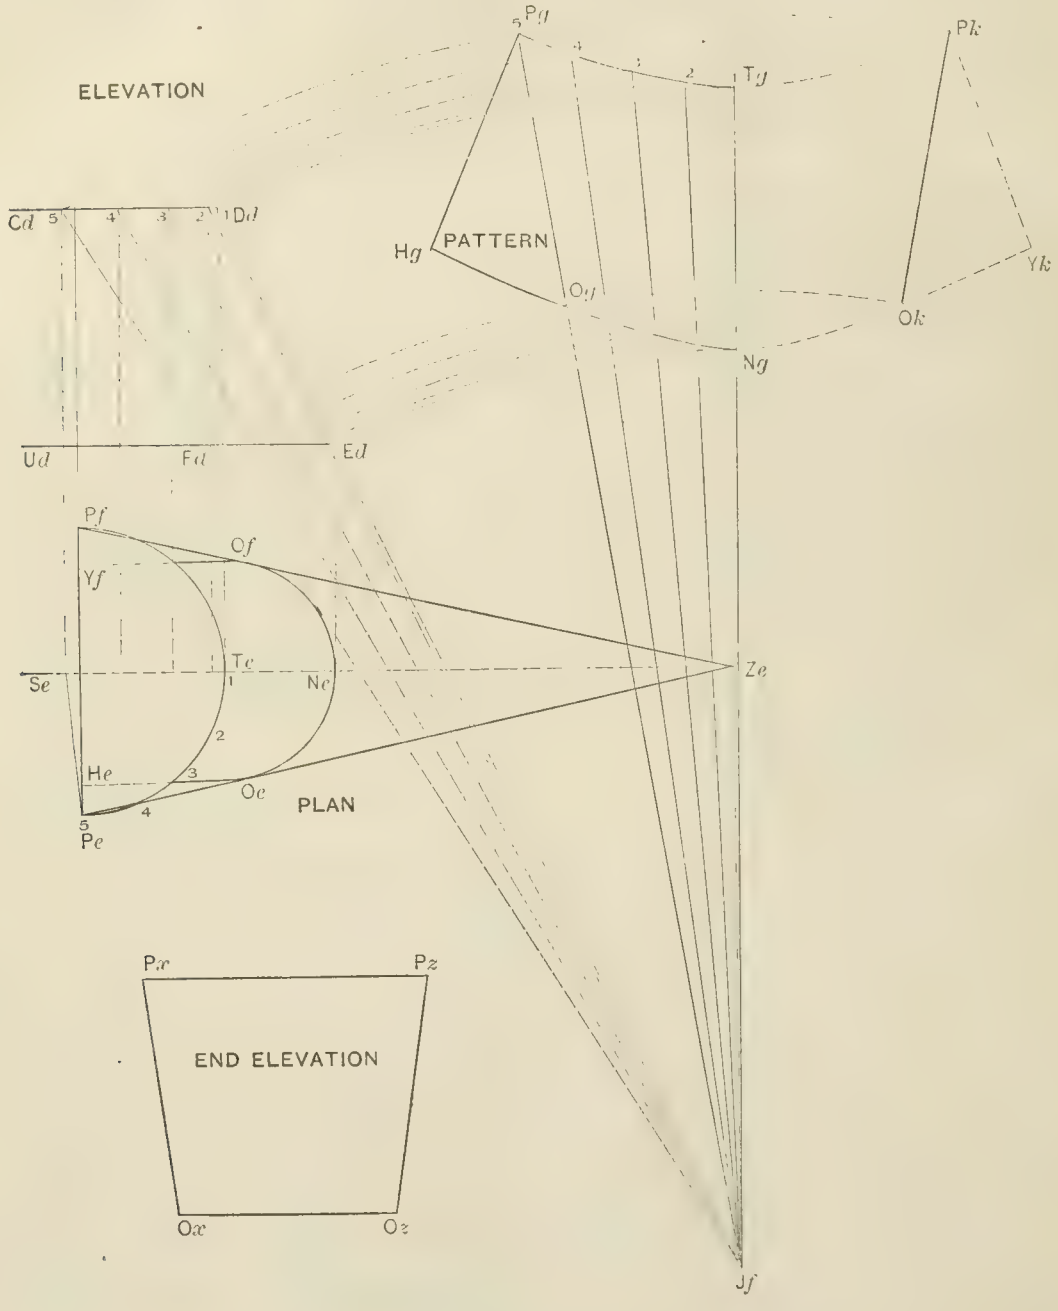

Fig. 2.—Method of Obtaining Pattern from Part of an Oblique Cone.

PATTERN OF FLARING ARTICLE THE BOTTOM OF WHICH IS OBLONG AND THE TOP ROUND.

the lower set of arcs, when a line drawn through these points of intersection will form the lower edge of the patterns, as shown in O*g* N*g*. Then P*g* T*g* N*g* O*g* is the pattern for part of article shown on plan by P*e* T*e* N*e* O*e*. With P*g* as center, and P*z* O*z* of end elevation as radius, describe a small arc in the direction of H*g*, and with O*g* as center, and O*e* H*e* of plan as radius, describe another small arc cutting the one just struck. Draw P*g* H*g* and H*g* O*g*. Then P*g* H*g* O*g* is the pattern for the half of

at the sides, as indicated in Fig. 1 by P H and Y P*a*.

In Figs. 3, 4 and 5 is shown the system by which the pattern can be obtained by triangulation, and for convenience in drawing the triangles the plan and elevation have been enlarged. As shown in Fig. 3, the quarter plan is only necessary for obtaining the necessary triangles for describing the pattern. The hight of the article being known, the elevation is not required, but can be drawn if desired. Divide

the solid lines in plan erect the vertical line K J in Fig. 4, equal to the hight of the article, as indicated by U*j* C*j* of elevation. Then at right angles from K lay off a base line, and on this set off distances, measuring from K, equal to the lengths of the solid lines drawn across the plan in Fig. 3. Thus make K 6 equal to T*h* N*h* and K 7 to 2 7 of plan, and so on. Also set off from K the distance H*h* P*h* of plan, as shown by K H*j*. From the points thus established in K L draw lines to the apex J.

If the triangles shown in Fig. 4 were each cut out separately and placed upright on the corresponding lines in plan their hypotenuses would give the distances between points in the base and top as if measured on the finished article. It must be evident that the same measurements can be obtained from the diagram itself.

The next step will be to construct a diagram of triangles that will give the cross distances between points in the base and top, as indicated by the dotted lines in plan. This diagram is constructed in a similar manner, as shown in Fig. 5. Draw the right angle V W X, making V W equal to the straight hight of the article, and from W set off on W X the length of dotted lines in plan. Thus make W 7 equal to T*h* 7 and W 8 to 2 8, and so on. From the points thus established in the base draw lines to the apex. The hypotenuses of the triangles thus obtained will give the distance from points in the base to points in the top, as indicated by the dotted lines in plan.

In the quarter pattern shown in Fig. 6, P*k* T*k* represents the stretchout of the top P*h* T*h* of plan, Fig. 3, as O*k* N*k* does the stretchout of O*h* N*h* of plan. The distances in pattern represented by solid lines are obtained from radius equal to T*h* 2 of the plan, strike a small arc, as shown, and intersect it with another from point 7 of pattern as center with J 7 in Fig. 4 as radius, thus establishing the point 2 in pattern. Proceed in this manner, using alternately the hypotenuses of the triangles in Fig. 5, the spaces in plan of base O*h* N*h*, the hypotenuses of the triangles in Fig. 4, and the spaces in the plan of top, P*h* T*h*, in the order named, and as above explained. The resulting points, as indicated by the small figures in the

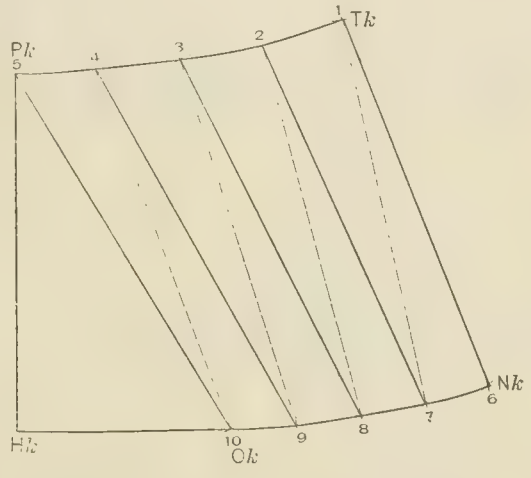

Fig. 6.—Quarter Pattern Obtained by Triangulation.

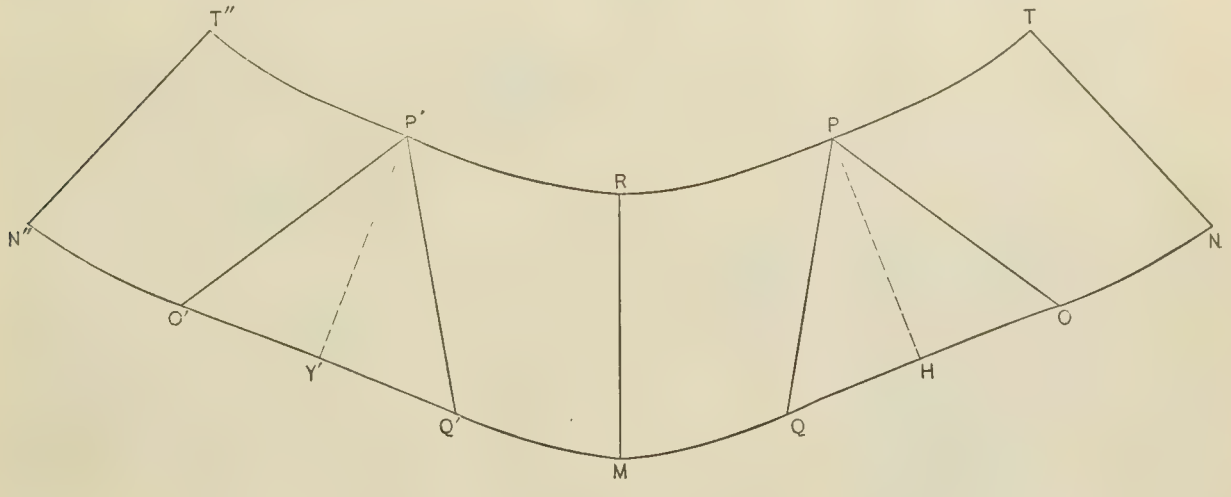

Fig. 7.—Pattern for the Article.

PATTERN OF FLARING ARTICLE THE BOTTOM OF WHICH IS OBLONG AND THE TOP ROUND.

the diagram of triangles in Fig. 4, and the distances represented by dotted lines are obtained from the diagram of triangles in Fig. 5. Then to describe the part of pattern indicated in plan, Fig. 3, by T*h* N*h* O*h* P*h* H*h* proceed as follows: Draw any line, as T*k* N*k* of pattern, in length equal to J 6 of first diagram of triangles, or, which is the same thing, D*j* E*j* of elevation. From N*k* of pattern set off a distance equal to N*h* 7 of plan, striking a short arc, as shown. From T*k* of pattern as center, with radius equal to V 7 of the second set of triangles, intersect this arc with another, thus establishing the point 7 of pattern. From T*k*, with pattern, will be points through which the pattern line will pass. These lines may be traced freehand or by bending a strip of metal to the required shape and scribing round it. For the pattern of triangle P*k* H*k* O*k* of pattern, with O*k* of pattern as center, and O*h* H*h* of plan as radius, strike a small arc in the direction of H*k*. With P*k* of pattern as center, and J H*j* of Fig. 4 as radius, describe another small arc intersecting the one just struck. Draw O*k* H*k*, H*k* P*k*, thus completing the quarter pattern.

In Fig. 7 is shown the pattern for the entire article, corresponding to the plan in Fig. 1. If it was desired to have the article made from two pieces with the joints on the sides, P′ R P H Q M Q′ Y′ would be the pattern. Or, if the article was to be made from two pieces with the joints on the ends, R P T N O H Q M would be the pattern. It will be seen that the pattern for the entire article can be obtained by duplicating P T N O H in the order shown.

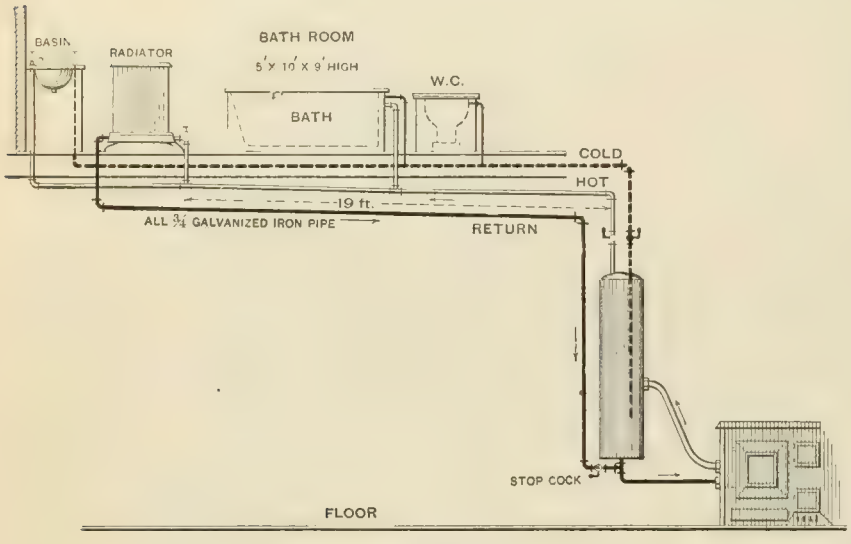
In a small lock factory in Wolverhampton, England, employing but six workpeople all told, their united ages amount to 336 years. They have worked at the factory 52, 48, 41, 36, 33 and 23 years respectively. Such a record, justly observes the *Ironmonger*, is not to be met with every day.

Idle miners in Northern Michigan are said to be becoming desperate. Thousands of them, who have had no work since spring, are, with their families, in a state of destitution ; cold and disease having lately added to their sufferings. Governor Rich has invited the mayors of the principal cities in Michigan to meet in Detroit with the view of taking action to relieve the distress. From indications it is believed that 10,000 to 15,000 will have to be fed and clothed until spring, as none of the mines can start much before that time.

THE LETTER BOX.

Fails to Heat.

From R. J. M., *Dover, N. J.*—I am a young plumber and apply to the Letter Box for assistance to get proper heat from the fixtures shown in the illustration. The bathroom contains 450 cubic feet of space and has a cast iron radiator with 16 feet of surface connected with a 40-gallon kitchen boiler. The pipes are all ¾-inch galvanized iron except that to the lavatory, which is ½ inch. There is a Detroit valve on the radiator and a stop cock on the return at the bottom of the boiler to stop circulation in summer. When the job was put in operation this fall it failed to heat. One evening I attended the fire from 7.30 until 10 o'clock, and while steam came from both of the lavatory faucets the water in the radiator did not become more than tepid and the boiler in the kitchen did not get hot below the hot water connection from the range. It is a 40 gallon boiler setting not more than 2 feet from the range. I was compelled to use square bends, as the customer wanted a neat job and has all of the piping arranged on a board. I am at a loss to know why the job will not work. The pipe from the radiator ought to act as a circulating pipe and keep the radiator hot, and with a good fire there should be no trouble at the boiler. The pressure of the water supply is ample to fill all the fixtures. When I found the radiator would not heat I shut it off and since then the customer reports that he can only get the water in the boiler hot enough to scald when he has a roaring fire. Can the difficulty be in the water back? I have done a number of plumbing jobs, but this is the first that has given me any trouble, and I cannot locate the cause, but hope to get some explanation through *The Metal Worker*.



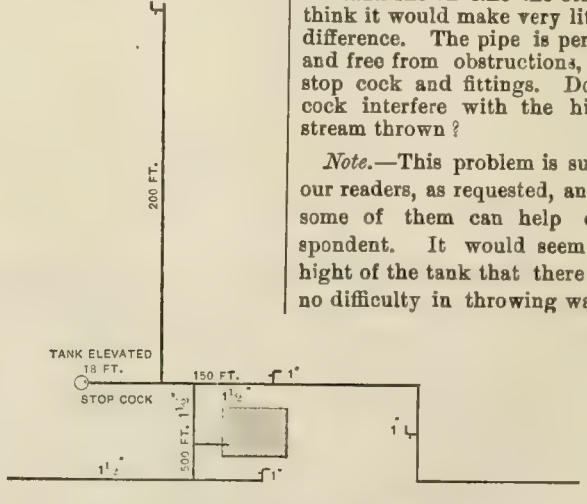
Fails to Heat.

Note.—It is likely that some of our practical readers can help this correspondent. The failure of the radiator to heat is probably because it is air bound, as no mention is made of a pet cock or air valve in the radiator. To put one in the radiator at the top should remove all trouble in heating. If there is a burr on the pipe it would obstruct the flow of water through it to some extent. The failure of the boiler to heat when the radiator is shut off, except when there is an extra fire, points to lack of water back capacity, or some defect either in the water back or the two pipes connecting with it. Provision should be made for an unrestricted flow of water, of the full volume of the pipes, through them and the water back. If the water back used has a partition cast in it this may extend too far, or the mold may have "broken down" and reduced the water way, or if the wires and rods used to support the core have not been removed they might produce the same result. Under such circumstances the circulation would be of such small volume that a large body of water could not be heated quickly, and under heavy firing steam would readily be produced. If the water back is small and so located in a small fire chamber that ashes accumulate quickly and the draft of the smoke and gases is away from it, a large supply of water could not be heated. The arrangement of the pipes, as shown in the illustration, presents no defects in principle, and the trouble must arise from some fault in the piping.

Difference in Stream Thrown.

From E. D. S., *Newman, Cal.*—I would like to hear from *The Metal Worker* and its readers what causes the difference in the hight of the stream of water that is thrown from the two tanks described. The illustration gives a plan of the location of a 5000-gallon tank that is 6 feet high and which rests on a frame work that is 18 feet above the ground, and of a house and stop cocks at different points on the grounds. A 1½-inch pipe leads from the bottom of the tank to the ground, where it divides and runs to the points shown, where 1-inch stop cocks are used. On attaching a ⅝-inch hose, using a nozzle with a $\frac{3}{16}$-inch aperture, there is not enough force to throw water to the top of a carriage. In another place a tank that is 4 feet deep and only 9 feet above the ground, with a 6-inch pipe in the bottom that tapered to 1½-inch pipe near the ground, would throw water three times as high as the stream from this one. Would it increase the hight of the stream thrown to fix the outlet from the tank shown like the other one? I think it would make very little, if any, difference. The pipe is perfectly clear and free from obstructions, except the stop cock and fittings. Does the stop cock interfere with the hight of the stream thrown?

Note.—This problem is submitted to our readers, as requested, and no doubt some of them can help our correspondent. It would seem from the hight of the tank that there should be no difficulty in throwing water to the top of a carriage unless there is a considerable obstruction of some character to create friction and reduce the pressure. To change the pipe from the tank to a tapering pipe would make no radical difference in the stream. Bends in pipes, especially ells, reduce the press-



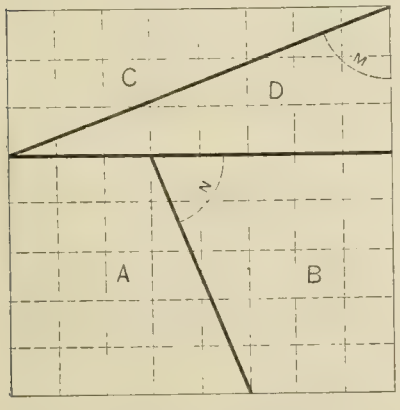
Difference in Stream Thrown.

ure of the water much more than is generally believed. The bends in our correspondent's case may have something to do with his trouble.

An Area Trick.

From H. N , *Philadelphia, Pa.*—In *The Metal Worker* of December 2, "H. D." makes inquiry relative to an area trick in which a square 8 x 8 inches, equaling 64 square inches, is cut up in such a manner as to measure 65 square inches. I inclose square of same size, and how it can be called a "hallucination" is beyond my comprehension, as when the parts are rearranged it consists of 5 x 13 inches, which is equal to 65 square inches.

Answer.—This problem, though an old one, is particularly interesting, because the error is not readily detected. We are indebted to our correspondent



An Area Trick.—Fig. 1.—*Square of* 64 *Square Inches.*

for a card from which we have constructed the accompanying diagrams, Figs. 1 and 2, and will explain wherein the defect lies. Fig. 1 shows the square, 8 inches to a side, drawn to one-quarter scale, while Fig. 2 shows the parts rearranged into a rectangle of the dimensions 5 x 13 inches, or 65 square inches. We have lettered the several parts so that it may be seen in the second diagram how they are placed. Apparently, as we have said, the four parts fit together in the rectangle, making it 5 x 13 inches, and, in reality, that is the outside measurement. But the extra inch is taken out along the middle

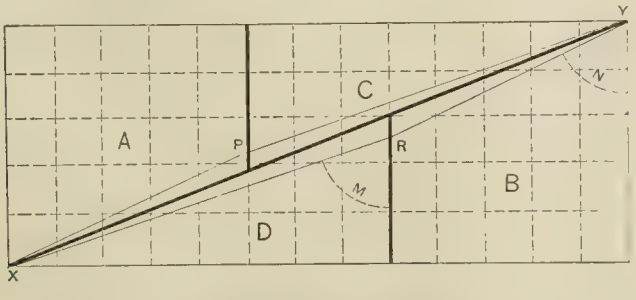


Fig. 2.—*Rectangle* 5 *by* 13 *Inches.*

line X Y, the variation, however, from the true line being so slight that in an ordinary cardboard diagram it would not be noticed. If the line X Y, which represents the edges of the parts A and C and D and B, were straight and continuous there would be no room for the missing inch. As a matter of fact, however, it is not a straight line. In other words, the angles in the corners of B and D, marked respectively M and N, are not equal. This can easily be proved by cutting out such a diagram and placing the part B over the part D, when it will be seen that the corners are not exactly alike, though they are nearly the same, M being slightly larger than N. It will also be seen in a full size diagram that the diagonal lines do not cut the sections evenly. The dotted lines X P Y and X R Y illustrate, in an exaggerated way, the point that we have mentioned, and the space included within X P Y R X would be equal to 1 square inch in a full size diagram accurately drawn.

Since writing the above we have received from a correspondent, G. L. Hayes, Middletown, Conn., a diagram giving a similar solution of the area trick, that is, telling how the square should be cut to produce a rectangle 5 x 13 inches.

Sweated Joint.

From J. R., *Norwich, N. Y.*—Will *The Metal Worker* please explain the process of burning together two lead pipes with a copper bit ?

Answer.—The ends of the two pieces of pipe should be made perfectly square, then cleaned and tinned. If the joint is to be made in an upright position, it is somewhat easier than in a horizontal position. While both ends of the pipe are thoroughly heated they should be accurately joined together so that the bore of the pipe will not be obstructed The hotter the two pipes are previous to their being joined together, the easier it will be to sweat the joint. After the pipes have been joined a hot copper is moved around the pipe at the joint slowly, so as to produce sufficient heat to make the solder on the two ends of the pipe fuse. It is not necessary that the copper should be tinned or that that portion of the copper which is tinned should be used on the joint in doing such work. In some cases, instead of the ends being perfectly square, one end of the pipe is slightly countersunk, and the other end tapered to fit. In a horizontal joint this enables the work to be more readily accomplished.

Electric Tank Filling Alarm.

From H. L. R., *Hannibal, Mo.*—I notice in *The Metal Worker* of November 18 a description of an electric device for telling when the tank is full of water by means of a float valve. I made a similar device, which I used some four years ago, for accomplishing the same end, which I think was simpler than the one your correspondent describes. I made permanent connections, running one wire from the bell in the first story to the sheet lead lining of the tank, to which it was soldered, another wire from the bell to the battery, and a third from the battery to a bent iron rod, which was screwed fast on the outside to the wood of the tank, but not touching the sheet lead, and bent over the top and down in the tank to the level to which we wished the water to come. When the water rose to this point it would complete the circuit and ring the bell.

Note.—Our correspondent sends a sketch with his description, but the simple device is so clearly explained that no illustration it necessary to understand it.

Material for Furnace Smoke Pipe.

From J. B. W., *Lexington, Ky.*—What material is the most durable to use for a furnace smoke pipe that passes over the top of a furnace inside of the casing, galvanized or black iron ?

Answer.—One of the results to be obtained in galvanizing iron is to protect it from rust, and this object is secured providing the iron is not subjected to such a degree of heat as to cause the zinc coating to fall off. In the case of a smoke pipe placed within a furnace casing, it is possible the heat would be so great as to remove the zinc coating from the iron, and if such was the case there would be little difference in durability between galvanized and black iron after the former had been subjected to heat.

A thorough cleansing of the streets of London is carried out every week. Commencing at midnight on Saturday it continues without intermission until 9 o'clock on Sunday morning. All carriageways are swept daily, frequently twice in the day. Courts and alleys are daily cleansed, and washed with jet and hose twice a week. Altogether nearly 4,000,000 gallons of water are used yearly in the work. These operations cost the city the sum of $188,886.

There has recently been introduced in England a new vegetable material called flexus fibra, which is said to possess in a satisfactory degree the properties of the finest leather, being particularly supple and flexible, and taking a polish equally well with the best kinds of calf. It appears to be a flax derived material, suitably prepared and oiled, so that to all appearance it really is leather.

Sudden cold in the West has caused great suffering, owing to the scarcity of coal which exists in nearly every part of the interior. In many parts of Kansas and Oklahoma coal is entirely unobtainable.

PLUMBING and GAS FITTING.

Domestic Electrical Work.—III.*

By W. A. W.

VARIOUS CIRCUITS.

Fig. 6 shows a single bell circuit having three pushes, located at front, side and rear door. Fig. 7 shows a circuit with two bells and three pushes, the bells being arranged as described in Chapter II. Both bells ring from either push. In Fig. 8 is shown an arrangement of bells, which is frequently very convenient, whereby either bell can be used at pleasure. This arrangement is particularly desirable for physicians or any one likely to have night calls. By using a two-point switch, as shown at A, either bell can be thrown into the circuit. Thus, by placing the regular door bell, say, in the hall, another can be placed in the chamber. By throwing the switch over from point 1 to point 2, as shown by the dotted lines, the hall bell will be thrown out and the chamber bell thrown into circuit.

This arrangement will, no doubt, suggest numerous uses to which it can be put to advantage besides that just described. Where it is intended to awaken a sleeping person an automatic drop should be used, which, when the push button is once pressed, automatically closes the circuit and keeps the bell ringing until the person intended to be awakened again hooks up the drop. When using the automatic drop an extra wire must be run so as to make a complete circuit without the push button after the bell has once commenced ringing. When the automatic drop is not used simply omit the wire B and connect C to D, which makes the arrangement first mentioned.

Among the many uses to which electric bells can be put, their use in the dining room should not be overlooked. By its use a servant may be called to the table without attracting the slightest attention, quite a contrast to the old fashioned clanging bell placed directly on the table and which is likely to attract more attention from those gathered about the board than from the servant for whom it was intended. The fittings for dining room bells can be purchased in combination so as to be operated by the foot pressing a push in the floor or by a neat little spring clamp push button provided with ten yards of flexible silk conducting cord, which can be slipped on the edge of the table by the side of the hostess and pressed by the finger without attracting the slightest attention from any one.

Another very useful little instrument is the electric buzzer. In places that are usually very quiet and where the ringing of a bell would be an annoyance, or where a person requires, for instance, to be called away from his desk without attracting any particular notice, the buzzer is invaluable. It operates on the same principle as an electric bell. A popular instrument of this kind can be purchased in the shape of an old fashioned beehive, not larger than 3 x 3 inches and which can be adjusted to emit a musical and pleasing hum instead of the harsh rattling sound which some of the earlier instruments of this kind made. In looking over the catalogue of any first-class dealer in electrical house goods a wide awake person will find a multitude of things which he can bring to the attention of customers with profit to himself and pleasure to the purchaser.

Philadelphia Master Plumbers

The Master Plumbers' Association of Philadelphia, Pa., are engaged in the work of securing an agreement from the dealers and manufacturers of plumbers' supplies to conform to the spirit of the Baltimore resolutions. This is the result of the recent visit of President Finnerty of the National Association, who in an address called attention to the great benefit that has been derived from a mutual agreement for the protection of the plumber. He also gave a brief account of the increasing strength of the National Association from the continual addition of new local associations. The proportions that the main body has now assumed give it a prestige that becomes an advantage to all of its branches as an inducement to be set before plumbers who are not already members to take steps to form local bodies.

A MEDAL WAS AWARDED by the World's Fair to the Smith & Anthony Company of Boston, Mass., for their exhibition of Sanitas closets and traps. Their exhibit was inclosed with a handsome railing and was artistically arranged on a carpeted floor. A Sanitas closet was shown in working order that had been divided through the center and a plate of glass cemented to the edges. By this means the operation of the closet was exposed so that it

could be readily understood, and it was examined with interest by many outside of the plumbing profession.

Plumbing Regulations of Clinton, Mass.

Through the favor of C. C. Crowley, Inspector of Plumbing at Clinton, Mass., we are enabled to give a set of regulations governing plumbers and plumbing under the Massachusetts law:

SECTION 1. The Board of Health may license persons to engage in or work at the business of plumbing, provided they have passed satisfactorily the examination required by law.

SEC. 2. No person shall work at or engage in the business of plumbing unless he shall have first obtained a license and shall have registered his name and place of business in the office of the Board of Health. And notice of any change in the place of business of a registered plumber shall be immediately filed with said board, except in the case of a person working for a licensed plumber.

SEC. 3. Every plumber before doing any work in a building, shall, except in the case of repairing of leaks, file at the office of Inspector of Plumbing, upon blanks for that purpose, notice of the work to be performed, with plans and specifications of the same, and no such work will be done in any building without the approval of said inspector.

SEC. 4. Every building used as a dwelling in which plumbing arrangements are to be placed shall be supplied with a water closet for every 15 persons, conveniently located and constantly supplied with water. All water closets constructed after the passage of this by-law must be supplied with water from a special tank or cistern not used for any other purpose, unless permission has first been obtained from the Board of Health to use other fixtures. It shall in all cases be connected with the general or common drain pipe of the house. The use of pan closets is prohibited.

SEC. 5. Every water closet shall be provided with a local vent, the material of which shall be copper, cast iron or galvanized iron. The diameter of this vent shall be for one closet not less than 2 inches, for two and not more than four closets not less than 3 inches, and for any number exceeding four such increased diameter as said board may direct. It shall be carried upward and into a heated flue provided for the purpose, or into the kitchen chimney. In either case it must be entered above the highest opening in the said chimney, or in such other manner as the said board may direct.

SEC. 6. When it is necessary to lay soil pipe under the ground, it shall be of a quality known as "extra heavy" pipe. The pipe passing through the walls of the building, and to a distance outwardly of at least ten (10) feet from inside face of foundation walls, shall also be "extra heavy." All cast iron pipe must be sound and free from holes and other defects, of a uniform thickness and of not less than the weight specified below for the corresponding diameters, and before use shall be thoroughly coated inside and out with coal tar or an equivalent substance.

External Diameter.

ORDINARY PIPE.

2 inches, 3⅓ pounds per foot.
3 inches, 4½ pounds per foot.
4 inches, 6½ pounds per foot.
5 inches, 8 pounds per foot.
9 inches, 10 pounds per foot.

EXTRA HEAVY.

2 inches, 5⅓ pounds per foot.
3 inches, 9½ pounds per foot.
4 inches, 13½ pounds per foot.
5 inches, 17 pounds per foot.
6 inches, 20 pounds per foot.

SEC. 7. Drain and soil pipes through which water and sewerage is used and carried shall be of sound iron when within a building and at least four (4) inches in diameter. They shall be securely ironed to walls or laid in trenches of uniform grade or suspended to floor timbers by strong iron hangers, or as the said board may direct. The space between these hangers shall not exceed ten (10) feet. They shall have a fall toward the drain or sewer, and soil pipes, shall be carried out through the roof, open and undiminished in size, to a distance of not less than two (2) feet above the roof, or more, if the said board shall so direct. Changes in direction shall be made with curved pipes and all connections with pipes shall be made with Y-branches.

SEC. 8. All vertical branch lines of soil pipe twelve (12) feet or more in length must extend up through and two (2) feet above roof, undiminished in size, or more than two feet, if said board shall so direct, or they may be connected with main soil pipe above the highest plumbing fixture. All branch lines of waste pipe fifteen (15) feet or more in length, must be carried up through and two (2) feet above roof or into main soil pipe above highest plumbing fixtures. When two or more fixtures such as sinks, bowls or baths are used in one line, the waste pipe must be of iron, and not less than two inches in diameter. All pipes must be four (4) inches in diameter where they pass through the roof.

SEC. 9. Every drain pipe shall be supplied with a suitable trap placed with a brass clean out at or near the point where it leaves the building. There must also be provided an inlet of at least four (4) inches in diameter for fresh air to enter the drain in house side of trap. This inlet is to be carried to the outer air, opening at such a distance from the nearest window as shall be satisfactory to said board, and where it cannot possibly contaminate the cold air box of a furnace.

SEC. 10. The plumbing of every building shall be separately and independently connected with the public sewer, where such sewer is provided, or with a proper and sufficient drain thereto outside of the building, and if a sewer is not accessible, with a proper cesspool.

SEC. 11. Rain water leaders must never be used as soil waste.

SEC. 12. Sewer soil pipes or waste pipe ventilators shall not be constructed of brick, sheet metal or earthenware, and chimney flues shall not be used as such ventilators.

SEC. 13. Joints shall be run with molten lead, packed with oakum, thoroughly calked and made tight. Connections of lead pipe with iron pipes shall be made with brass ferrules properly soldered and calked to the iron. The lead pipe must be attached to the ferrule by a wiped joint.

SEC. 14. All connection of lead waste and vent pipes shall be made by means of wiped joints. The joints between the soil pipe and water closet shall be made by means of a brass or lead connection.

SEC. 15. Every sink, basin, bathtub, water closet, slop hopper, and of each set of traps or other fixtures, shall be furnished with a separate trap, which shall be placed as near as practicable to the fixture that it serves. Traps shall be protected from syphonage or air pressure by special air pipes of a size not less than the waste pipe, but air pipes for water closet traps shall be of not less than two (2) inch bore. Air pipes shall be run as direct as practicable, and shall not be of less than four (4) inch bore where they pass through the roof. Two or more air pipes may be connected together or with a soil pipe, but in every case of connection with a soil pipe, such connection shall be above the upper plumbing fixtures of the building.

SEC. 16. Waste pipes from refrigerators or other receptacles in which provisions are stored shall not be connected with a drain, soil pipe or other waste pipe unless such waste pipes are provided with traps suitably ventilated, and in every case there shall be an open trap or sink between the trap and refrigerator.

SEC. 17. Pipes and other fixtures shall not be covered or concealed from view until approved by the inspector, who shall examine the same within two working days after notice that they are ready for inspection. When necessarily placed within partition walls, soil and waste pipes must be covered with wood work so fastened with screws as to be readily removed. In no case shall they be absolutely inaccessible.

SEC. 18. No steam exhaust or drip pipe shall connect with the sewer or with any house drain, soil pipe or waste pipe, but blow off pipes may discharge into a suitable tank or condenser, from which a suitable outlet to the house drain may be provided.

SEC. 19. A suitable grease trap must be placed under the sink of every hotel, restaurant, eating house or other public cooking establishment.

SEC. 20. Plumbing must be tested with the water test by the plumber in the presence of an inspector of said board, and all defective joints made tight. Defective pipe discovered must be removed and replaced by sound pipe.

SEC. 21. All material must be of good quality and free from defects. The work must be executed in a thorough and workmanlike manner.

SEC. 22. Every building situated on a public or private way, court or passageway, in which there is a public sewer, and every building connected with any sewer shall have sufficient water closets connected with the sewer and shall not have a cesspool or privy, except where in the opinion of the board it can be allowed to remain temporarily.

SEC. 23. Any license granted under these by-laws may be revoked by the said Board of Health at its pleasure.

SEC. 24. The fee for a license for a master or employing plumber shall be $2; for a journeyman plumber it shall be 50 cents. Said fee to be for the use of the town.

SEC. 25. All by-laws, rules and regulations inconsistent herewith are hereby repealed.

Boston Master Plumbers.

Official information comes to us that the master plumbers of Boston and the master plumbers of Boston and vicinity at a recent meeting appointed their annual Ball Committee. The committee have secured for the evening of January 9, 1894, Odd Fellows' Hall, in which the annual concert, supper and dance will be given. On the morning of the same day the State Convention of Master Plumbers will be held in Boston. It is anticipated that the cities and towns throughout the State will send a large number of delegates, accompanied by their wives and daughters. It is expected that many of the visitors will stop over for the ball in the evening. With this information at hand it is not too early to say "Happy New Year" to the Boston plumbers.

TRAPS AND VENTS.

KENDRICK VALVE & WASHER COMPANY, Syracuse, N. Y., issue an illustrated catalogue and price-list of their specialties that will be appreciated by the plumbing trade. Among the goods noted are plumbers' soil, gas fitters' cement, valve and plunger leathers, cup leathers, packing of various sorts, hose washers, boiler washers, special washers for plumbers' brass work, &c. The illustrations show a variety of cup leathers, valve leathers, valves, &c.; also pipe hooks and straps.

THE WALLACE PLUMBING SUPPLY & SPECIALTY COMPANY, LIMITED, are a new house who have recently opened an office in the Betz Building on Broad street, near Market, Philadelphia, Pa. As their name implies, they will make a specialty of plumbing goods of the higher grade and quality.

PITTSBURGH BRASS COMPANY, 36 Park place, New York, and Pittsburgh, Pa., show in their illustrated catalogue of plumbing goods, recently issued, a very handsome lavatory set known as No. 35. It was on exhibition at the World's Columbian Exposition. The materials used in its construction are brass and onyx, both slabs, the 21 columns in frame supporting slab and the tapering legs being of rich Mexican onyx. The metal parts, of brass, are finished with a heavy gold plate. In this set a square bowl is shown, although oval or round bowls can be furnished if desired. The size of the slabs can also be varied to suit purchasers. This set is of unique design and very attractive appearance.

IT IS REPORTED that the manufacturers of sanitary ware at Trenton, N. J., have recently made a cut of one-third in the price of their goods to dispose of the stock on hand.

CHARLES E. REDELL and B. G. DOSCHER started business recently under the firm name of Redell & Doscher, 114 Church street, Charleston, S. C., where they are engaged in doing tin-

smithing, gas fitting, plumbing, &c. Mr. Doscher is a graduate of the New York Trades School, which he speaks of with much enthusiasm for the assistance it gave him. Mr. Redell is the tinner of the firm and both of the partners were formerly in the same shop.

JAMES WALSH, JR., 444 North Fifth street, Philadelphia, Pa., makes a sweeping challenge for his Challenge double seat steam valve, and directs the attention of the public to it by attaching several brooms to a sign which hangs over the sidewalk with the conditions of the challenge upon it.

G. WAGNER is a salesman from the Phillips Mfg. Company, 219 East 34th street, New York, who never fails to impress the plumber favorably with his line of specialties.

THE COMMITTEE ON ACCOUNTS of the city government of Portland, Maine, has decided that the office of plumbing inspector is unauthorized by the city ordinances and has refused to pay his salary. This official was created by the Board of Health last July, after the passage of the plumbing ordinances, to see that they were properly carried into effect. The Committee on Accounts has discovered that the appropriation for the Board of Health is running short, and in order to continue its effective work during the winter more money will be needed.

A MEXICAN EXCHANGE says the subject of the sanitation of the City of Mexico is just now receiving from the press and public the attention it deserves. Mr. Orozco's plan of keeping the city sewers continually flushed with clean water has now been divulged to several local engineers of prominence, who have unanimously approved it and declared it both simple and practicable.

THE plumbing and tinsmithing establishment of Walter C. Mott, on Caroline street, Saratoga Springs, N. Y., has been sold to Edward Fitzpatrick, James Fitzpatrick and Michael Foy, all experienced men, who will hereafter conduct the business.

CLARK BROTHERS, plumbers, at 217 South Twelfth street, Philadelphia, Pa., have recently added a brass foundry to their manufacturing plant. Two of their specialties are the Acme soil pipe plug and the Acme testing and disinfecting apparatus, which is used for testing the soil pipe of a plumbing system. Mr. J. Clark is secretary of the Master Plumbers' Association of Philadelphia.

W. P. OGILSBY, a plumber, at 1017 Walnut street, Philadelphia, Pa., recently purchased filters from the Wallace Plumbers' Supply & Specialty Company of Philadelphia for use in the residence of Clark Merchant, 1615 Walnut street, in the city named. They will be connected with the service to the building to filter all the water that is used in the house.

IN THE ERECTION of the Betz Building, at Philadelphia, which is an office building of modern character, of extraordinary hight and innumerable stories, no lavatories were placed in the different offices. Now workmen are engaged in cutting holes through the various walls through which to run waste and water pipes, in order that the occupants of the offices may have the convenience of lavatories. The thickness of the walls makes this a tedious job, and in some cases this work required as many days as it was thought hours would suffice to accomplish the same result. Another trouble experienced is in not being able to avoid the iron girders that are placed in the building, and frequently, after considerable time has been spent in cutting holes, it was found necessary to begin operations in another place.

CARVER & HOWELL are a new firm of brass finishers at 1819 North Fifth street, Philadelphia, Pa., who will make a specialty of plumbers' brass work. They are issuing a four-page circular of plumbers' goods.

AN EXCHANGE gives the following account of how a plumber got ahead of the corporations: There was a novel case before an alderman a few days ago in which the Steam Heat Company were applicants for a search warrant to examine a plumber whom they suspected of heating his residence with steam manufactured by the Steam Company, and for which they received no pay. It appears that the property occupied by the plumber was formerly a residence of a steam heat company official, and he had to make connections with the steam mains, but on leaving had caused the pipes to be plugged. The plumber removed the plugs After a little detective work on the part of the steam company a search warrant and a policeman caused an admission from the plumber that he had tapped their main. It is understood that the affair is to be settled.

W. H. MORTON, plumber, has opened a store at 259 Main street, Malden, Mass.

THE Clark & Wellington Plumbing and Tinning Company of Bridgeport, Conn., have filled a certificate of organization at the office of the Secretary of State.

JOHN N. MCLEAN is visiting the plumbers of Chicago in the interest of the E. P. Gleason Mfg. Company of New York. This trip is devoted entirely to pneumatic and hydraulic pumps, though gas and electric lighting fixtures may be incidentally talked over.

Gas Engines in Germany.

The last report of Frank H. Mason, Consul-General at Frankfort, Germany, contains the following:

Prominent among the economies which have been introduced during recent years in Germany is the use of gas motors in place of steam engines in all the smaller forms of manufacture where the motive force required does not exceed 75 to 100 horse-power. At the Frankfort electrical exposition of 1891 most of the dynamos were driven by gas and caloric engines, and the display of these motors at that time was almost as varied and interesting to the general public as that of the electrical apparatus to which they were technically subsidiary.

The statement is made that there were in operation in Germany at the time referred to, about 18,000 gas motors, aggregating a motive force of about 60,000 horse-power, since which time, by the gradual cheapening of gas as a result of careful saving of tar, ammonia, and other subsidiary products of coal distillation, the number has increased to about 25,000. The improvement in economy in these motors has been remarkable. The Lenoir machine, the best known as late as 1861, used 1235 cubic feet of gas per horse-power per hour, while at the present time small motors only consume 28 feet, and large motors as little as 23.75 feet. As the cost of gas ranges from 95 cents to $1.36 per 1000 feet, and 21.2 feet of gas will run a 16 candle incandescent lamp an hour, which figure is reduced to 17.6 feet in large plants, it readily appears that this motive power is very economical for the smaller forms of manufacture, and especially for electric lighting by isolated plants.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

WESLEY LYNES, one of the progressive plumbers of Johnstown, N. Y., has recently installed the steam heating plants in two large school buildings at that place, using four No. 6 Gorton boilers.

J. J. WADE & SON, 298 Dearborn street, Chicago, have the contracts for plumbing in the addition to the Equitable Building, Washington and Dearborn streets, and the Champlain Building, State and Madison streets. The Wade accessible sewer flushing system is to be used in the above work, and the Wade patent wash basins and syphon jet closets in the Equitable Building.

THE WALCOTT-HURLBUT COMPANY, 175 and 177 Lake street, Chicago, furnish all brass goods used in connection with the plumbing in the huge Stock Exchange building now going up at La Salle and Washington streets. T. W. Potts & Co., 40 State street, do the plumbing.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, are to supply hot water heating plants in the residences of M. W. Church, Edgewater; C. W. Leeming, Grand Boulevard, and Joseph Kipley, Forest avenue,

AMONG THE CONTRACTS for steam heating recently taken by the Theo. Jacobs Company, 72 and 74 Market street, Chicago, can be mentioned the following: Apartment building of F. Halla, Aldine place; apartment building of Herman Splinter, Belleplaine avenue; residence of A. M. Krause, 989 Milwaukee avenue; Nell apartment building, Orchard street and Garfield avenue; residence of J. J. Wade, Michigan avenue; Champlain Building, State and Madison streets. The American radiators are to be used in filling all the above contracts.

TWO No. 4 GORTON BOILERS were used by the Smith-Courtney Company of Richmond, Va., for heating a large church in that city.

THE BRIDGEPORT STEAM HEATING COMPANY will place the steam heating apparatus in the new Gem Theater, on Broad street, at Bridgeport, Conn.

J. C. F. TRACHSELL, 246 Arch street, Philadelphia, Pa., reports that his trade in hot water heating has increased in that section, and that the Gurney boilers have been used exclusively by him.

D. F. MORGAN has opened an office at 30 North Fifth street, Philadelphia, Pa., where he makes a specialty of steam fitting supplies of every character.

CLARKSON, SCOTT & Co., 118 Custom House place, Philadelphia, Pa., are about completing their large contract of heating the Holmesburg Prison. Among other contracts which recently occupied their time was the residence of Daniel Ball, at Sixteenth and Locust streets, where they used an O K steam boiler and Bundy radiators. The gymnasium building at Swathmore College is another contract which they are completing. They have recently heated the stable of W. Harrison, at Glenside, Pa., using the Mercer steam boiler.

GEORGE W. TILLOTSON has recently installed a new hot air apparatus in the Methodist Church, at Northfield, Vt.

T. J. HARNETT, Newtonville, Mass., has the contract for the plumbing at the Adams School.

SOME of the Massachusetts agents for the Richmond boilers who report a good trade this fall are George R. Estabrook, Springfield; W. S. Backus' Sons, Pittsfield, and E. E. Parker, Woburn.

THE CITY COUNCIL of Joliet, Ill., recently passed a resolution that the city clerk be directed to advertise for competitive drawings or plans for an eight-room school building to be erected in Ridgewood, at the corner of Jackson and Walnut streets. Said plans to provide for the heating of the school by steam.

DESERNO & Co., plumbers, of East Main street, Chillicothe, Ohio, have secured the plumbing and gas fitting contract at the handsome residence now being erected by George H. Smith on East Fourth street.

THE COMMISSIONERS OF PUBLIC GROUNDS AND BUILDINGS will receive separate proposals and plans for the erection of a steam heating plant for the new library and executive building, House of Representatives, and additions to the Senate Chamber, at Harrisburg, Pa., until December 12. Plans and specifications can be seen at the office of the architect, room 10, Capitol building.

JAMES T. KAY, Meriden, Conn., is doing the plumbing and heating on Henry Stockder's new house, also the plumbing on a new house which O. D. Penfield is building on Cook avenue.

RUFE BROS., manufacturers of heating apparatus at Doylestown, Pa., have recently made an addition to their plant of a new horizontal engine and boiler. The firm have the contract for introducing steam heat in St. Vincent's Orphan Asylum, in Philadelphia, and will also put steam apparatus into William E. Geil's new double house in Doylestown.

H. H. FERRIS of Ballston Spa, N. Y., has contracted with J. B. Thomas & Son, Milton avenue, for an Auburn steam heating apparatus for his house on Pleasant street.

THE BERLIN MILLS COMPANY, at Berlin Falls, N. H., have been awarded the contract for heating the new Green Block, in that town, and will use a Richmond hot water boiler.

ARTHUR CARON, Salmon Falls, N. H., has purchased a hot water heating apparatus of the Swamscot Machine Company, South Newmarket, N. H.

BABB, WITHAM & KELLY, Bangor, Maine, have recently finished plumbing the Everett T. Rich house, in Hammond street, built by Charles Smith. It has had a Volunteer heater put in which works to perfection. The plumbing work in this house is first class throughout. They are also doing a large amount of work on the Vanceboro Mfg. Company mills, at Guilford. The mill has been thoroughly piped for heating and 1000 feet of 3-inch water pipe laid for fire purposes, and the mill is being covered with corrugated iron. The work is in charge of Mr. Kelly of the firm.

A PREVIOUS NOTICE inferred that the residence of Clarence V. Gardner, at Cynwyd, Pa., had been heated by a boiler set by J. F. Boyer of Norristown, Pa. To correct this error we are informed that a No. 465 hot air furnace, made by the Fuller & Warren Company, Troy, N. Y., was used by Mr. Boyer to warm the building, and one of their double steel oven ranges is a feature in the culinary department.

IT IS REPORTED that Secretary Carlisle has ordered L. L. Benson, a sanitary expert of Kalamazoo, Mich., to make an examination of the United States Treasury Department building, at Washington, and submit a proposition for such improvements in the ventilation, sewerage and plumbing systems of the building as he may deem necessary.

THE BOARD OF ALDERMEN of Cambridge, Mass., have appropriated $2000 for the purpose of putting the Agassiz school house in a sanitary condition.

THE BOARD OF TRUSTEES of the Whittier State School, at Whittier, Cal., will receive bids up to December 23 for the plumbing, gas fitting and heating, tin and galvanized iron work and metallic roofing for a main cottage building for girls and an industrial building to be erected at that place.

THE DIRECTORS of the State Normal School for Deaf Mutes at Morganton, N. C., will award contracts for heating and lighting their building on December 13.

ALBERT LONGLEY will spent $35,000 in adding two stories to his warehouse building on South Water street, Chicago. The extension will require galvanized iron work plumbing and gas fitting.

THE NEW BUILDING of Snellenberg, the clothier, at Twelfth and Market streets, Philadelphia, Pa, is being heated by the Penn Engineering Company, who are using Keystone radiators.

CALLAHAN & CLAYTON, 44 North Second street, Philadelphia, Pa., are engaged in erecting a ventilating plant and dust carriers for a saw mill for W. H. Jackson & Son, at Salisbury, Md. They made all the sheet iron work used in the ventilating and heating plant at the Hotel Metropole for Thompson & Brothers, steam fitters, on Bread street. They are also engaged in doing the sheet iron work for the heating and ventilating plant which is being installed by Henry B. Pancoast & Co. at the Pennsylvania Hospital, on Locust street, Philadelphia.

THE NEW YORK STEAM FITTING COMPANY, 211 Centre street, New York, have been awarded the contract for heating the Trinity School, at Ninety-first street and Columbus avenue, New York. The building is five stories high and 75 x 100 feet, and will be heated on the plenum system, using Sturtevant fans and a horizontal tubular boiler made by the Vogt Bros. Mfg. Company.

S. J. MARSHALL, Kearney, N. J., has recently completed a contract which, he claims, is one of the best pieces of work in his section. It is a three-story building erected by William Evans. The first floor is arranged as a saloon and dwelling, the second for a ballroom and the third is a lodgeroom. It is heated by an Exeter steam boiler with Exeter radiators, which give excellent results in every particular. On the first floor there is a toilet room, with two of Mott's closets with tanks and two urinals with Mott's self-acting syphon tank, and in his dwelling is a bathroom with bathtub, lavatory and water closet, and a copper boiler and enameled sink in the kitchen. The second and third floors are provided, in addition to a toilet room similar to that on the first for men, with a toilet room for ladies, which has two water closets with automatic seat and tanks and a lavatory. The work throughout is said to have been done in the best possible manner and the best materials have been used. This is the third large and first-class job done by Mr. Marshall recently.

THE ILLINOIS HEATING COMPANY, 88 Lake street, Chicago, are to furnish steam heating plants in the two houses built for the Hecox estate, Austin, Ill.

THE THEO. JACOBS COMPANY, 72 and 74 Market street, Chicago, have the contract for hot water heating in the residence of H. R. Wilson, 4515 Grand Boulevard.

Impenetrability of Armor Plate.

BY A. TINKER.

With the exception of three years spent in helping to adjust a slight difference of opinion I have spent 37 years in the plate business. It has been mostly tin plate and with a light coating, nevertheless I have had some experience in testing armor plates, which occurred during the three years mentioned. Having been on duty as wagon guard, when the Quartermaster issued orders to lighten baggage it fell to my lot to be one of those detailed to go through the wagon train and select those articles which could best be dispensed with. The old quartermaster was a fire eater and had no sympathy for anybody who had a longing for a tree to get behind when the compliments became substantial and were passed with fervency and celerity. He made remarks which should be repeated to ladies in the original Greek when we found stowed away in one of the wagons a dozen vests of very heavy cloth, lined with a thick, soft flannel and having between these materials thin plates of steel which had been guaranteed of the genuine Damascus brand. These vests were originally bought for $15, but their true value could have been thoroughly tested by wearing one in a campaign against Jersey mosquitoes of the World's Fair size. When the old man's back was turned I hung one on a post to test it, with the idea that I would rather come home and brag than have my folks put flowers on the soldiers' monument for a hero who was lost in the wilderness. Well, I blazed away at it, and as I was examining it the old man came back to see what the row was, and on seeing the hole ordered me to put up two, which I did, with the same result, and the old man said put up another, and still I bored a hole, and again with the fourth I proved the quality of my old smooth bore. The old man was now laughing as loud as he had cussed before, and said, "Its a cold day for the cowards, put on more clothes," but the fifth vest stopped the ball, though it made a big dent. He told us to throw all of them we found away, observing that a fighting man's skin made a better soul case than such blasted contrivances, for it didn't inconvenience his movements, while if he wore enough of them "coward's delight" to protect him they would kill him anyhow.

An interesting World's Fair souvenir has been sent us by the Abbott Machine Company of Chicago. It is a *fac simile* of the great check issued Chicago Day at the World's Fair for $1,565,310.76, upon the original of which an Abbott punch was used.

STEAM AND HOT WATER.

American Comments on English Practice.—I.

By Percival H. Seward.

When we go into a residence fitted with a modern system of steam or hot water heating, including magazine boiler, damper regulator, automatic water feeder, and the several other appliances invented and introduced with the idea of making everything practically self acting, it is difficult to appreciate reasons for the adoption of any system requiring endless attention and preventing an appearance that is anything but ornamental. It is a fact, however, that in England at present buildings are being fitted up with appliances for heating which must be not only troublesome and expensive, but are anything but attractive in appearance.

This condition of affairs is not brought about so much by the objection to cost as by the feeling that "what was good enough for the old folks is good enough for me." Of course I am writing on the supposition that the reader is an American and therefore used to all the common, every day little conveniences which are still considered luxuries in Europe.

I had the pleasure of making a trip to England during the past summer, and being engaged in the business of steam and hot water heating, my principal line of observation and comparison was in that field. While there I saw a large number of different kinds of heating apparatus, and I think they fairly represented what may be considered the latest practice.

In all probability the majority of the readers of this article are familiar with steam and hot water heating, particularly that which is generally used for smaller buildings, residences, greenhouses, &c.

ENGLISH BOILERS.

The most popular class of boiler at present in use in England still appears to me to be what we call saddle boilers. These saddle boilers are now made, however, in such a way that they are vastly more economical than the older style and take up much smaller space in proportion to their heating capacity. The common saddle boiler has been substantially improved by the introduction of hoods, baffle plates, internal flues, check tubes, &c. The fact that vertical surface is much better for house heating boilers than horizontal seems to have been kept in view also. Formerly the circular top of a saddle boiler was counted upon as valuable surface when used as one side of the return flue, but I found that this has been done away with. The boiler is now made square on top and then used as a support for the brick work, as people in England are just as liable to clean the heating surfaces of a boiler once in five years as we are in America.

Portable boilers do not seem to be making much headway over there, although there are several styles lately brought out which seem to be bringing this class into favor. The only portable or independent boilers which I saw, larger than the little stove heaters in use here, were imported from this country. The English people seem to have a quiet hankering after brick set boilers, caused principally, I think, by their intense fear of fire, although, as we here know perfectly well, there is not so much danger from one of our modern portable boilers as from a brick set one.

PIPING.

Their principal medium for the distribution of heat seems to be cast iron pipe. Indeed, the extent to which this is used is wonderful to an American. Not only is it used for mains—I might say exclusively—but for radiation as well. I asked a prominent heating engineer over there why this was the case, and he said that the only way he could account for it was that the men are much more used to erecting it, and then their wrought iron pipes are not made so extensively and with such a degree of perfection as with us, while accurate, sightly fittings for the pipe, after it is made, are almost impossible to get. It seems to me to be with them a general rule to use cast iron pipe for all sizes over 2 inches in diameter, while it is often used for smaller work. I ventured the mild remark that there must be lots of trouble and annoyance in making the joints—my idea was derived from seeing plumbers making soil pipe connections—but was quite surprised when informed that it was much easier and more satisfactory than making them with wrought iron fittings. Wrought iron fittings caught my ear but after I had seen a few of these curiosities I did not dispute his opinion. I was the means of securing an order to one of our prominent steam fitting manufacturers for cast iron fittings, and I think if it was not for the annoyance caused by changing threads to agree with the English standard that we would be supplying the entire trade over there with pipe fittings.

I must say that heating contractors are severely handicapped in Europe, for the reason that they have to put up with such miserable appliances. To us they seem trivial, but impress one with their importance when you come to put up a job without them. Manufacturers here are daily receiving orders for such little things as radiator valves, air valves, fittings of all kinds, &c., and I predict that, unless the British manufacturer wakes up to the importance of listening to the cry of heating contractors for these goods, America will be supplying them exclusively, not to speak of radiators &c.

RADIATORS.

Radiators are another thing in which they have great room for improvement. For the same reason that they use cast iron pipes in preference to wrought iron, they use pipes and pipe coils in place of radiators. Just fancy going into an elegant parlor and seeing two 4-inch cast iron pipes running around the baseboard for radiation; yet this is what I saw as an example of heating put in a residence about three years ago. Of course, this is not general, but it would not be seen at all if they had radiators to use which for compactness and beauty of design could approach those we see and use in the United States. Cast iron pipes are all right for greenhouse work, but the line ought to be drawn at that when using them for radiation.

CELLAR PIPING.

I went into the cellar of one house and the system—allow me the expression—of mains put me very forcibly in mind of soil pipes as we are used to seeing them in cellars here. Most of the joints in this case were made with yarn and lead, or of the rust pattern, although one of the firms I visited showed me a rubber ring for use in making these joints, and which had been recently patented by them. To return to our cellar, however, the arms, as we would call them, were all of cast iron pipe, while the risers—this was one of their latest productions — and radiator stubs were wrought iron pipe. The valves were of American make, but the radiators were of their regular extended surface pattern, something similar in appearance to the Whittier radiators. Some of the radiators made in England now are cast in one solid piece and not in sections as we are used to seeing them. The ratings are by feet of 2-inch pipe which they are equal to, and not by their square feet of surface.

(To be concluded.)

Heard at the Air Valve.

An itenerant sends the following collected from here and there in the steam and hot water heating trades:

"I draw the line on chimneys less than 18 feet high for greenhouse heating," said the engineer of a house manufacturing hot water heating apparatus. He could just as well have gone on and said how many square inches of flue area were required by a square foot of grate surface, but he didn't, and I cannot supply the omission.

That the chimney plays an important part in all heating plants is shown by another authority who had to apply a remedy where a steam boiler didn't heat. He found a large old-fashioned open fire place in the room above the boiler, and the pipe from the boiler was run up the chimney just above the top of the fire place and stopped. The fire place rendered the chimney useless so far as the boiler was concerned, though it was large enough to use a ladder in cleaning it. As a fire was sometimes burned on the hearth, the fire place could not be closed, so the pipe was continued to the top of the chimney full size.

"Everything heats up fine but two radiators on one run of pipe," was the report on a steam job which had been carefully laid out by an expert. "I am sorry that the boiler is too small for the work, for I shall lose money in changing it," was the unpleasant reflection on the fault of the planning. On going to find the cause of the trouble, as proof that the boiler lacked power it was stated that "the pipe is hot right

up to the radiator, connection but there it stops." It was a return pipe system and a trap was made in both the flow and return by using too long a piece of pipe in connecting them after the pipe hangers and supports had been adjusted. The flow pipe was filled with hot water just far enough to keep steam out of the radiator. "Oh! that little rise and dip could'nt make the trouble, but I'll change it just to show you." It worked.

An enterprising hot water man thought a hot radiator out in front of his store one winter day would be a good advertisement. So he put it out and connected it with his boiler. The boiler had easily taken care of 800 feet of radiation distributed in his store and residence in zero weather. He found it necessary to shut off all of his indoors radiators to keep his outside radiator from freezing.

A well known authority observed: "I shall hardly be able to harmonize some of the statements I have made in the past with some of the practice employed in a new system of steam heating that I am perfecting, but the world moves and corpses do not. I have learned to understand the principles better and apply them more effectively." Here is an example of progress worthy of being followed, and is evidence that this man does not belong to that class of "people who never change their minds."

HEATING NOTES.

AN ADVERTISING CARD issued by H. R. Ives & Co., Montreal, Canada, bears a *fac simile* in gilt of a card announcing the medal awarded at the World's Columbian Exposition, Chicago, for the Buffalo heaters made by the firm. In an accompanying circular letter they speak of the excellent results that this boiler has given, and they also announce their facilities for furnishing architectural iron work of every description.

THE HERENDEEN MFG. COMPANY, Geneva, N. Y., have established a branch office at Philadelphia, at 1020 Betz Building, with E. K. Barr as manager. Mr. Barr will look after the interests of the concern in Philadelphia and vicinity and push the sale of the Furman hot water and steam boilers.

THE WORK on the Buffalo, N. Y., Steam Heating & Ventilating Company's works, which are in process of erection at Homewood Park, is progressing rapidly. The plant is claimed to be the most complete of its kind in the country. A large force of men is engaged in putting down the cement floors throughout the works. The glazing is nearly finished, and the works will soon be in condition for occupancy. However, the company do not expect to occupy their new quarters until after the first of the year.

THE HEATING AND PLUMBING TRADES will be glad to know that N. E. Frost, connected with the firm of Smith & Winchester, Boston, Mass., is the proud father of an 8 pound boy, who arrived Saturday, November 25. Mr. Frost has not yet decided upon the youth's future occupation, but says that judging from his voice at present, he is likely to become a tenor singer in grand opera.

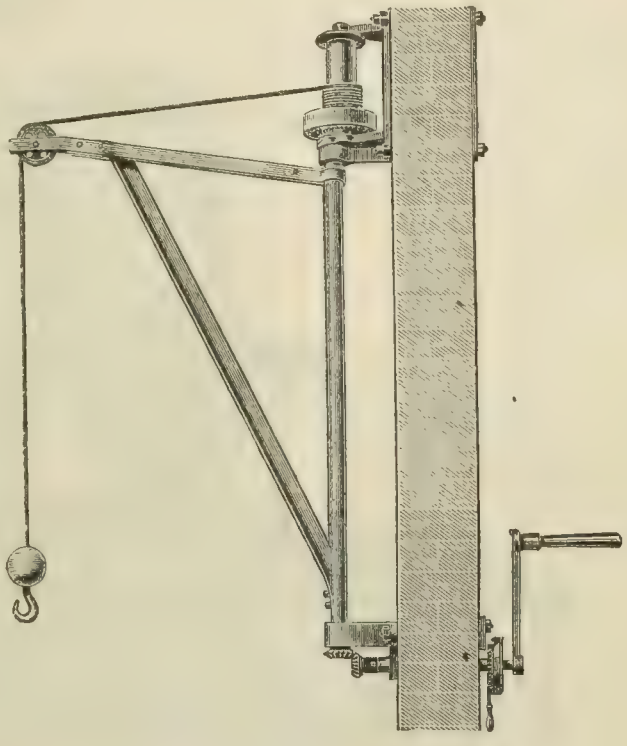
J. S. MAKIN, 54 North Second street, Philadelphia, reports a lively trade on the Monitor steel tubular heater, which is also made as a combination heater for heating with hot water, and is provided with the Monitor draft regulator. The double Monitor is a combination of two of the ordinary Monitors, and designed for heavy duty or for use in the early fall or late spring, when a fire need only be used in one of the furnaces. Quite a number of this style of the Monitor have been used and universal satisfaction given.

SAMUEL BURNS has recently returned from a trip through New England in the interest of the hot water goods made by Thomas Weathered's Sons, 244 Canal street, New York.

A Convenient Jib Crane.

The form of jib crane brought out by the Messrs. Abbott of Newark-on-Trent, illustrated in some of our English exchanges, is described as follows:

The brackets which support and hold the crane externally are bolted right through the wall. Below the foot plate



A Convenient Jib Crane.

are seen externally two bevel wheels. The spindle of the pinion passes through the wall and is worked by a handle inside the building. The other wheel is attached to a shaft working within the tubular upright of the crane, as in a sleeve. The head of this shaft is connected with a vertical winding drum within the grasp of the top external bracket, which, like the foot plate, is secured by bolts passed clean through the wall. Everything thus communicating between outside and inside is a close fit, admitting neither damp nor draft. The jib is supported by a stay. The whole gear is made of steel, and of varying capacities to lift from 2½ to 5 hundredweight, 10 hundredweight and 1 ton.

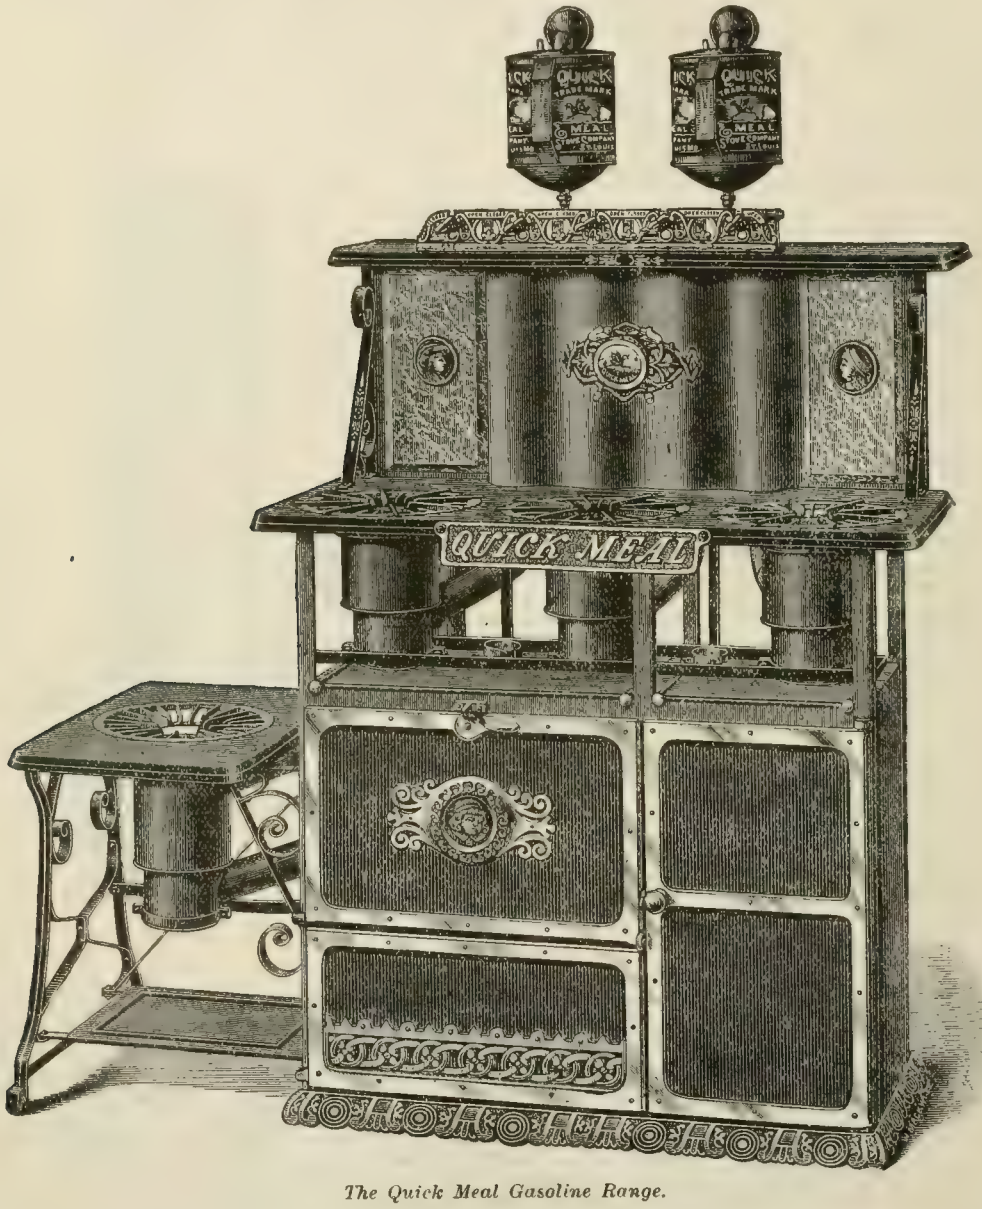
The handle attached to the pinion spindle being inside the wall, a valuable economy of internal floor space in the hoisting operation is afforded. For ordinary winding with the handle alone, a simple and convenient brake connected with the external drum gear can be put in action by a pull-rope hanging down inside the wall within reach of the hoister. But when the goods require careful treatment, and speed of lift is not required, a worm wheel can be added, which works with the utmost smoothness and which will hold the weight of goods in operation at any point where they are simply allowed to rest. This worm wheel works itself out of gear whenever the pressure of the load is relieved by its deposit at its destination. The spindle of the worm wheel, like all other portions of the crane, is fixed without any open orifice in the wall. The two smaller sizes of the crane are worked by the simple bevel gearing at quick speed. Nothing can be safer than the worm gearing, for the load will not run down if ever the handle slips off; but it is too slow in speed for ordinary use, unless where the goods being transferred are liable to damage from shocks.

M. Ghest of Paris has discovered, says an exchange, a new preservative composition which adheres strongly to iron, steel, zinc, copper and other sheathing metals. The preserving coating does not easily crack or peel, and sheets covered with it may be bent or twisted without showing any signs of cracking. The most violent vibration of bridges and viaducts is without effect. It is applied cold like ordinary paint. When dry, a layer of colored paint may be added if desired. Metal sheets, when covered with it, are proof against the strongest acids, such as hydrobromic, hydrochloric, hydriodic, sulphuric, sulphurous, nitric, &c. A brass sheet remained three months in a sewer, and afterward 36 hours in a bath of nitric acid, without the slightest change. Wood impregnated with this product is said to be insensible to change from water, damp or insects. Samples of oak, pine and porous woods have been buried for 16 months in damp earth without showing any signs of decay.

A great pool, or combination, of the lake shipping interests which center at Buffalo and West Superior has, it is rumored, been arranged.

The Quick Meal Gasoline Range.

The Quick Meal Stove Company, of St. Louis, Mo., have just brought out for the season of 1894 a gasoline range known as the Quick Meal, and presented in general view in the accompanying illustration. The range is of a size and completeness which renders it suitable for use in hotels or restaurants, and in other places where it is necessary to prepare food for a number of people. Under the top plate are three burners, while under the step is an extra strong one, with still another under the bake oven. The manufacturers claim that the strength of these latter burners is nearly equal to two of the top burners. Under the latter are removable pans for the purpose of catching the drippings from the vessels above. At the right of the bake oven is a warming closet fitted with three shelves. The range is strongly constructed throughout, the base being of cast iron, which the makers claim greatly adds to the beauty of the stove, while making it more substantial than would otherwise be the case. They also refer to the cast iron base as an innovation in this class of ranges. Another advantage of this form of construction is that the dust is kept from getting under the stove. The ornamentation includes nickel and tile, which form a strong contrast with the jet black japan finish. The back of the high shelf has marbleized panels, in which are inserted tiles in polished brass frames. The company state that the gasoline supply of the stove is ample, there being two independent tanks, one supplying three burners and the other the remaining two. The stove is referred to by the manufacturers as "the most beautiful, most substantial and of the greatest capacity on the market."



The Quick Meal Gasoline Range.

Aluminum is gradually coming to the front in many departments of industry. From a foreign exchange we learn that an officers' field canteen has been introduced into the German army, of which the whole of the cooking utensils, plates, cups, &c., are made of aluminum. The weight of the entire outfit for six persons is little more than 9 pounds.

The Colorado Irrigating Company have projected a canal to irrigate 1,200,000 acres of land in the Salton Desert of that State. The water will be conveyed from the Colorado River, the total length of the canal being about 400 miles, and the estimated cost $5,000,000. Should water be placed on the tract in question, its value would be raised to about $20,000,000.

Constituents of Smoke.

The Russian *savant* Lakline is of opinion, observes a foreign exchange, that the reason why efforts toward smoke prevention have hitherto met with so little success, must be sought in the fact that, while the gaseous constituents of smoke have often been determined, the solid and liquid portions remain but little known. When coal or lignite is burned the lighter products of combustion, especially those containing carbon and hydrogen, are given off under the influence of a high temperature. Their disengagement is complete or partial; and the same is the case with the solid carbides containing less carbon and hydrogen, and which, when the combustion is not complete, are drawn along with the lighter products. In such a case the carbonic acid, nitrogen and the remainder of the oxygen combine not only with the carbonic oxide, but also with the mass of unburnt substances and compounds of carbon, hydrogen, oxygen and nitrogen, carbon being set free in the state of soot, and all those substances forming the dark yellowish-gray substance called smoke.

In Great Britain the work of connecting all the lightships and lighthouses with the telegraph system of the country has been begun.

How I Learned the Trade.

BY A. N. D.

Serving the first six weeks of my apprenticeship, beginning the last week in August, had given me a pretty clear idea that a general notion prevailed that a boy could do as much as a mule, but was not allowed to kick, and reading one day while the impression was making itself felt the door of the shop opened, and "Loafing, as usual, you rat." greeted me, and I was told: "Come get a move on you and go with this gentleman and bring back the

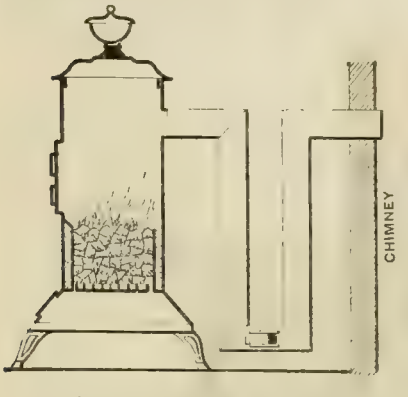


Fig. 1.—Stove Pipe Radiator.

package he sends." Right there I made two good friends, for before I could growl about being called a loafer the gentleman said: "A boy who reads *The Metal Worker* is never loafing, and if he reads it will never be a loafer," and taking him for a good fellow I started off. He asked me if I liked the paper. I said I never had looked at it before and did not know what it was. So he told me it is a paper that every apprentice should study, for instead of getting the ideas from only one shop and its jours it had a good many men all around the country sending in their ideas and asking for ideas on all sorts of work.

I told him I thought I would like to read it, but that I didn't have time to read at the store and the boss wouldn't let his copy leave the place, and I was going to ask him how to get it when he said that he had begun as I had and learned the trade, but now was on the road for a big house from which the boss bought, and as he traveled he picked up news and ideas which he sent in to the paper, and he thought he could get it sent to me easy enough if I would promise to study it and report to him whenever he came to town.

So I promised and he took my name, and the friendship thus made was one of the best I ever made. At first I looked at the pictures of all sorts of things and soon got the names of the makers of stoves, tinware, plumbers' goods and all that in my mind quite familiar, so that the talk I heard was not all Greek to me. Whenever I saw an old stove I looked to see who made it, and how it was made, and asked old Bill, our cyclopedia, why it was made that way, and he explained; but, while I understood, the way he murdered the United States language was simple slaughter, and I noticed the paper explained these things better. So while Bill helped me to understand the principle he said the paper put the polish on.

It wasn't long before I could go over a cook stove or heating stove and explain its construction, conveniences, operation and merits better than some of the salesmen, and they guyed me one day so the boss overheard and called me to him, telling me that no attention should be paid to such remarks, but to keep right on in the same way and I need never stand back for anybody.

As I could not do much in the shop and we were busy in the store, I often had a chance to sell stoves, and I told them the little sheet iron cylin ders with a brick lining and a cast base would work just as well, heat more space and burn less coal if, instead of running the pipe right into the chimney or right up the pipe hole, the pipe was run down to the floor first and then up to the pipe hole, as in Fig. 1, for then they would have more hot surface to heat with, both by radiation and by the air coming in contact with it.

I told them the door need never be opened except to add coal if a slide or register was put in the side of the pipe near the floor, which, when open, would take air out of the room, making it necessary for fresh air to enter, and at the same time checking the draft without cooling off all the upper part of the stove, which opening the door would do. Some said it wasn't pretty and wouldn't have it; others were not so much for style as for comfort and economy, and concluded a smaller stove would do, so the extra pipe didn't cost them more, and as the boss said he made more off the pipe than he did off the stove I talked for all I was worth.

I told them the same amount of coal in a sheet iron stove would heat a bigger room than in a cast iron stove because the sheet iron was so thin that it absorbed the heat from fire and passed it through to the room, and consequently so much heat was not wasted in the chimney. If they wanted a little better grade I always showed one that was an air circulator—Fig. 2. It had one sheet iron cylinder lined with fire brick setting on top of a cast iron fire pot, and outside of this was another sheet iron cylinder 2 inches larger in

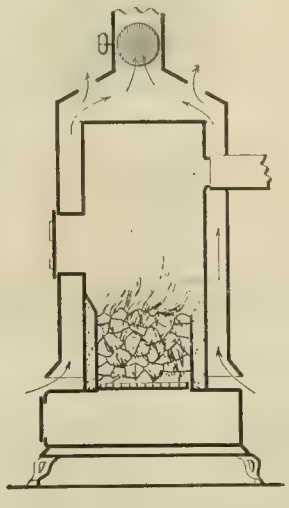

Fig. 2.—Air Circulating Stove.

diameter, made so that air went in between the two at the bottom, was heated, and then came out at the top into the room hot, keeping up a circulation and making all parts of the room warm nearly alike.

Sometimes these stoves had a pipe leading from the top to a register in the floor in the room above, which could be warmed nicely.

There was a damper in the heating pipe to stop off the hot air, when it came out of holes, arranged in a circle on the outer edge of the top, to the room in which the stove was placed.

Then we had another kind, better still, for in them was arranged a flue space under the ash pit and this was connected with the fire chamber by a flue at the back, so that by turning a damper the hot smoke had to go down this flue and all around the bottom back, to the flue and up on the other side of a partition in it to the smoke pipe and the chimney. In this way the fuel was burned slowly and all of the heat gotten out of it. This stove was also made as a circulator and to heat a room upstairs.

Being made of sheet iron the boss bought the castings and fire bricks and they were made in the shop, so I knew all about them and all that Bill knew; and my paper gave me a lot of hints about them, so they were my first loves and are yet.

I could not make them, but I made stove pipe, and by being a little careless and not knowing that a soft snap like making stove pipe could be made a heap of trouble, I made some with two big ends, some with two little ends, and Bill said some with both ends in the middle of the piece.

Well, maybe my arm wasn't tired before I got that lot of pipe right, but I learned a lesson I never forgot.

Prevention of Lamp Accidents.

In view of the numerous fatal and other accidents in England caused by petroleum lamps, the London County Council has lately issued a number of suggestions in regard to the construction and management of lamps, founded partly on recommendations by experts after investigation into the causes of accidents. These suggestions are divided into three groups. The first relates to the construction of lamps, and on this point it is strongly urged that the oil reservoir should be of metal instead of china, glass or other fragile material so commonly used, while it is further said that the wick should be inclosed in a tube of thin sheet metal open at the bottom and reaching almost to the bottom of the oil reservoir. Then it is recommended that every lamp should have a broad, heavy base and a proper extinguishing apparatus. The heavy base is an important matter as tending to prevent the upsetting of lamps, for the upsetting is one of the most fruitful causes of serious accident. Special attention is directed to the management of wicks, and as to extinguishing it is recommended that after the wick has been lowered till there is only a small, flickering flame a sharp puff of breath should be sent across the top of the chimney, but not down it.

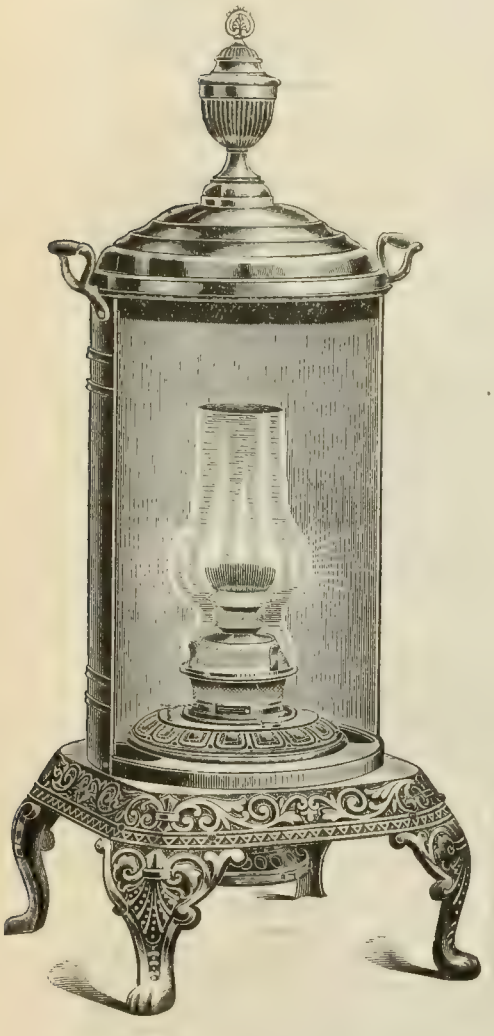
The colored enameled iron which is now being introduced in Europe is produced, according to a French journal, by dipping the iron sheets into an enameling liquid composed of 24 parts, by weight, of borax, 6 of soda salts, 15 of boric acid, 25 of washed sand, 12.5 of feldspar, 3.5 of saltpeter and 3 parts of fluorspar. The plates are dried and fired and the coloring is imparted by adding metallic oxides as desired.

A San Francisco firm have just ordered 25,000 tons of coal from Tonquin for use by California railroads. Tonquinese coal has for some time been in use in the French navy with excellent results.

THE RETAIL STORE.

Browne's Lamp Heating Stove.

The Breitting Metal Ware Mfg. Company, Huron and Sedgwick streets, Chicago, are manufacturing a recently patented oil lamp heater which is herewith illustrated. It is intended to be used for cooking and heating, as well as for light. The hight of this heater is 40 inches over all, while the diameter is 12 inches. The lamp is partly encircled by a highly polished tin reflector which fits into an opening in the base. Cold air is admitted from the floor, heated, and discharged at the top, causing a circulation of heated air in the room. The B. & H. lamp is used, which not only perfectly consumes oil without odor or smoke, but also provides a very brilliant light. The urn and top are nickeled, and in every respect the heater is handsomely finished.

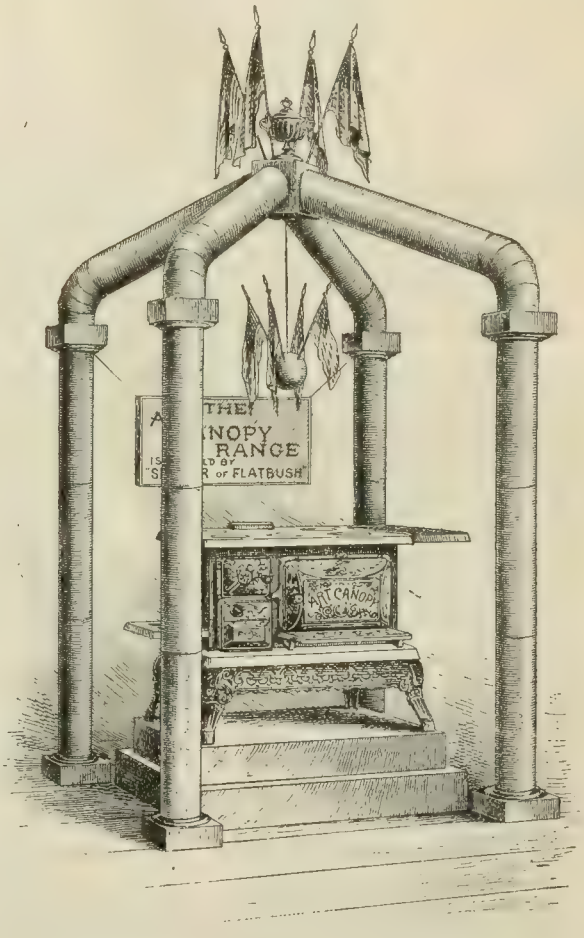


Browne's Lamp Heating Stove.

W. L. ADAMS has bought the stove, tin and plumbing business of F. W. Clarke, at Rome. N. Y., and will run it in future as Adam's Stove Store.

Donations to Fairs.

Our readers are familiar with the annoyance to which merchants are subjected in connection with requests for donations for fairs given in aid of charitable societies. We give herewith an account of the method adopted by an enterprising house, which is referred to as rendering substantial assistance to the fair, while at the same time they derived considerable benefit from it through the advertising which was secured.



An Exhibit at a Fair.

J. J. Snyder & Son of Flatbush, L. I., were recently requested to contribute toward a fair held by one of the local churches, and set to work to devise some method by which the donation could be turned to their profit. As it was the beginning of the stove season and a proper time to bring such goods to the notice of the public, they presented an Art Canopy Range, one of the best they had in stock, and secured the privilege of mounting it to the best possible advantage. This was done as shown in the accompanying illustration by placing it on a platform in a conspicuous part of the hall in which the fair was to be held, the platform being covered with bright red and canary colored cheese cloth. Above and around the Range a pavilion was constructed of Russia iron stove pipe and elbows, with bases and capitals of galvanized iron, the latter being ornamented with brass plated stove pipe collars. The four pipes were held together in the center by inserting the ends in a galvanized iron box with wooden top and bottom. This, in turn, was surmounted by a large stove ornament encircled by American flags placed in holes in the wooden top of the box. From the lower side of the box a wooden ball was suspended, in which were small American flags. The pavilion was also draped with bunting, but not so shown in the cut. Hung from and between the two rear columns was a sign, neatly framed, on which was lettering announcing that the Range in question is sold by "Snyder of Flatbush," their usual firm designation in their advertisements.

One of the conditions of the donation was that the Range should be drawn for at 10 cents a chance. The firm furnished cards as follows, with testimonials printed on the back:

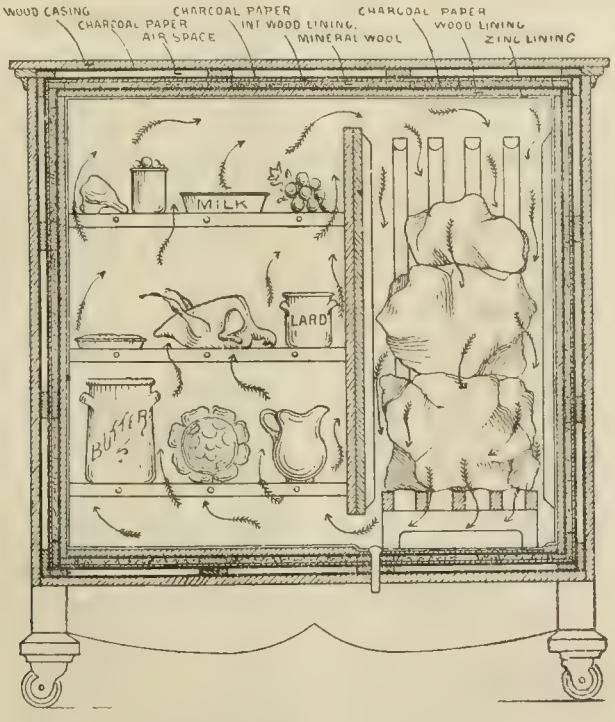
CHANCES, NOS ....
IN THE DRAWING FOR THE
"ART CANOPY" RANGE
AT THE FAIR OF THE
Holy Cross Cath. Church,
IN THE TOWN HALL,
SEPTEMBER 4th to 16th, 1893.

The trifling cost induced almost every person who visited the fair to

invest at least 10 cents, and thus several hundred testimonials of the Range given by residents were carefully carried to every section of the town. Although there were many articles on exhibition of tenfold greater value, nothing attracted more attention, and from the comments which the firm afterward heard they consider it the best advertising hit they ever made.

The Automatic Refrigerator.

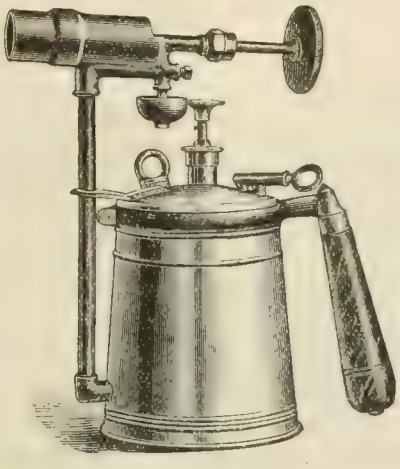
The Illinois Refrigerator Company, 909 Masonic Temple, Chicago, are manufacturing a new line of refrigerators. The illustration given herewith shows the distinctive features of the construction which has been adopted. It will be seen that the ice chamber is placed at the side of the provision chamber. The illustration also shows the manner in which the circulation of air is secured. The air in the ice chamber being colder and heavier than elsewhere, falls to the bottom and flows out under the partition into the provision chamber. The warmer air in the provision chamber flows over the partition into the ice chamber to take the place of the cold air passing out below. As it is cooled it falls. Thus a circulation is secured. The manufacturers state that as the vapors and odor from the food come in contact with the ice they are condensed and drawn off with the waste water from the ice. All the food being above the drip basin, it will be seen that no damage can result should the waste pipe become clogged.



Interior of Automatic Refrigerator.

The Quick Meal Adjustable Paint Burner.

The Quick Meal Stove Company, St. Louis, Mo., are putting on the market an adjustable paint burner, as shown herewith. The handle is adjustable, turning loosely on the brass band which encircles the tank, to enable the operator to throw the flame in any direction without exertion. The tank, pump, &c., are of brass, and the flame is referred to as being blue and very powerful, from 6 to 8 inches long. It is explained that for corners or places in wood work out of ordinary reach the burner will be found serviceable, as the flame can be thrown in any direction desired. The point is made that when the burner needs repairing it is not necessary to make a brazed or soldered joint, and that it is easily taken apart for cleaning and repairing. The burner is designed for the use of plumbers, painters, wood workers, &c.



The Quick Meal Adjustable Paint Burner.

Miller Oil Heater.

Edward Miller & Co., 10-12 College place, New York, and Meriden, Conn., are putting on the market a series of oil heaters, one of which is shown in Fig. 1. The Miller lamp, which is used, has two flame spreaders, one particularly adapted for heating purposes and one for lighting, although either can be used for the stove. The lamp is provided with an aluminum indicator, which will not corrode, for showing when the lamp is full. The lamp has a simple wicking and adjusting device, and no chimney is used with the heater, resulting in greater radiating power. The lamp rests on a heavy nickeled cast base, and is provided with a brass nickeled top. Top or bottom wick adjuster is provided, as desired. The heater cylinder is of Russia iron, with mica at the bottom, all resting on the body of the lamp. The point is emphasized that the cylinder is supported on and locked to the main body of the lamp instead of on the chimney gallery. After the cylinder rest is in place it is fastened on the lamp by an eccentric looking device. The heaters are made in five sizes and styles, designed to heat rooms from 8 to 14 feet square. By removing the cylinder and substituting a chimney, the lamp may be used for lighting purposes. Fig. 2 illustrates how the lamp is lighted with or without the chimney.

Fig. 1.—Miller Oil Heater.

Fig. 2.—Mode of Lighting the Heater.

Experiments are being made in Italy with light electric vehicles, somewhat larger than ordinary tricycles. The vehicles are equipped with a battery of ten cells, capable of yielding sufficient energy to propel them for from three to five hours.

STOVE TRADE NOTES.

Funeral Urns.

A friend of ours whose soul is lacking in the quality of reverence, and who does not believe that a custom or institution is right simply because it is practiced or exists, has had his profane attention directed to the style of ornamentation prevailing in heating stoves. One decorative feature has especially tormented him, and as a relief to his feelings he sends us the following gentle malediction:

I never knew until lately why it was I felt so sad at heart after visiting a store or warehouse where there was a lot of heating stoves. I thought it might be the chilling effect of the mass of cold iron, or the prevailing blackness of the stoves, or even the curious smell that distinguishes these pot leaded products of the foundry. But none of these explanations was at all satisfactory, and I long ago gave up the problem. The other day, however, when looking up a question in ancient history, I stumbled on an elaborately illustrated article on funeral urns, and then, of an instant, I understood what was the matter with the stove. Most of the (I believe you call them parlor heaters) are topped with a melody in cast iron, in careful imitation of the vase used by the ancients to hold the ashes of the dead. Of course there is a certain recondite relation between a stove whose purpose is to make ashes and an urn whose purpose is to hold ashes. And then, as we are somewhat apt to muse before a fire, a funeral urn is as good as a death's head to keep one's thoughts at a proper soberness.

Think again how suggestive a row of stoves on the platform of a hardware store is of an exhibit of old fashioned gravestones, both lines being equipped, one decoratively and the other suggestively, with these emblems of the funeral pyre; only the blackness of the stoves deepens still further the somber impression.

I wish some one among the stove founders would carry out the whole figure of mortality in its details. Have the stove legs broken sections of shin bones, the stove body skeleton ribs filled with mica, a cast iron skull at the top for a preliminary finish, and over it all one of those beautiful funeral urns. What better design for a good selling stove could the most querulous dealer wish for? It would be original enough to attract attention, which is the main feature, I understand, in wares of this order, and, furthermore, it should prove highly efficient as a heater. The frame work of the human body would offer not a half bad model for the frame work of a heating stove.

ACCORDING to some of the Milwaukee papers a meeting was recently held in that city between the representatives of the syndicates interested in North Milwaukee and the officials of the O. R. Luce Company of Kansas City, relative to a proposition of the latter to remove its stove manufacturing plant to North Milwaukee. The report states that several meetings with regard to the matter have been held during the past six months, and that while no definite arrangements have yet been reached, indications point to a satisfactory understanding in the near future.

Heating Stove Patents.

We present herewith the text of the decision of the Supreme Court of the United States in the case of the executors of Philo D. Beckwith, deceased, *vs.* the Detroit Stove Works:

SUPREME COURT OF THE UNITED STATES.

No. 64.—October term, 1893.

WILLIAM G. HOWARD and FRED. E. LEE, executors of PHILO D. BECKWITH, deceased, appellants, *vs.* The Detroit Stove Works.	Appeal from the Circuit Court of the United States for the Eastern District of Michigan.

(November 13, 1893.)

Mr. Justice Jackson delivered the opinion of the court.

This suit was brought by appellants' testator, Philo D. Beckwith, against the appellee for the alleged infringement of three letters patent, viz.: No. 123,142, issued January 30, 1872; No. 135,621, issued February 11, 1873; and No. 206,074, issued July 16, 1878, all for improvements in heating stoves, The defenses set up and interposed were that the patents were all void for want of novelty and patentable invention. Pending the suit, the patentee died, and the cause was revived and proceeded in the name of his executors. The court below dismissed the bill and complainants appeal to this court to reverse that decree.

The first patent, issued January 30, 1872, relates to an improvement in stoves, wherein an exposed fire pot section, cylindrical in shape and tapering downwardly, is fitted into the upper end of a hollow ash pit section. This fire pot has formed on the inner side of its lower end an annular flange on which the grate rests. The theory of the patent is that this flange, which may be cast on, or made separate from the fire pot, and riveted or otherwise fastened to it, is made of such a width that it will collect upon it a bank of ashes, which will have the effect of preventing undue expansion of the fire pot at the point of junction with the ash pit. Or, in other words, the collection of ashes on the flange will prevent such an expansion of the lower end of the fire pot as would cause it to leave its seat on the ash pit and expose an open joint at this point. The inventor stated in his application that he had found that the expansion of the fire pot is so great without the flange that the stove proves a failure; but with the flange cast on it at the point designated above, the joint will remain tight during the lifetime of the stove. The novelty involved in the patent consists entirely of the tapering cast iron fire pot with the annular flange or shelf formed on its inside lower end at the point where it joins the ash pit, and upon which flange the grate rests. The single claim is "the tapering cast iron section B with the flange or shelf c framed on it, as described and shown."

It was claimed by the appellee that this feature of the invention was so common in actual stove construction at the time the patent was issued as to be deemed obvious, and that prior patents, attaining the same results, had been granted which practically covered the same design or contrivance included in this particular patent. In support of this contention it was shown that a patent had been issued to Benjamin Brownell on September 18, 1868, for a soft coal hot air furnace, in which it appears from the drawings set out in the record that a tapering fire pot is one of the elements of his invention, although it is not described in the specification. The drawings also indicate, and it was established by expert testimony, that this tapering fire pot had a flange on the inside lower end, upon which the grate rests. At the trial a model of the Brownell patent was introduced in which it was shown that the model differed from the patent drawings in having the projecting flange at the lower end of the fire pot formed on the ash pit, instead of on the fire pot.

The appellee further showed that a patent was issued to A. Atwood, May 14, 1850, No. 7356, which has a flange projecting under the lower edge of the fire pot as wide as the outer rim of the grate. This flange is upon the ash pit and not upon the fire pot. A patent issued to Bush & Richards, No. 171,129, November 19, 1867, shows a construction like the Atwood patent, except that the fire pot is tapering.

It therefore appears in these three patents offered by the appellee in support of its contention that the invention of the appellants had been anticipated, that they contain a clear and accurate representation of the contrivance of the Beckwith patent; that even if the flange was formed on the ash pit instead of on the fire pot it was the equivalent thereof, because it performed the same function in the same way, and that the only function of the flange would be to collect a ring or bank of ashes at the base of the fire pot when the stove was in use.

If there is any material difference between the patent under consideration and those just discussed it is found in the width of the flange. The appellants lay particular stress upon the fact that the width of the flange in the Beckwith patent, which was to serve the primary purpose of permitting a bank of ashes to form upon it, which would have the effect of preventing the lower part of the fire box from becoming unduly heated—is greater than shown in the previous patents, but neither in the specification nor claim of the patent does the patentee indicate what shall be the width of this flange. The description of the invention is vague and indefinite and is not sufficient to enable those skilled in the art to construct it without experiment so as to attain the desired result. The width of the flange is a mere matter of degree, and if at the time of the invention the proper width of the flange to accomplish the purpose desired was known, then the patentee made no invention. If the proper width was not known at that time, it should have been described in the patent; as the patent is silent on this point, except that the drawings indicate that the width of the outside rim of the grate is the proper width for the flange, it can hardly be said under such circumstances that the vague and indefinite description of the width of the flange elevates it to the dignity of invention, for it has been shown that the stoves covered by the patents just discussed also had each a flange which performed the same function, although not specifically claimed in the patents. We think it is obviously apparent that the patent of appellants' testator has not only been anticipated, but that it is wanting in all of the elements of patentable novelty.

The next patent to be considered is No. 135,631, issued February 11, 1873. This patent is for improvement in wood stoves, and consists of the construction, combination and arrangements of the various co operating devices comprising the parts of the stoves by joining them together with short bolts or rivets, adapted to lugs or flanges, instead of long rods, which, when exposed to the fire, are liable to be burned off several times during the life of the stove. The claims are four in number, but the third is not claimed to be infringed. The general form of the fire pot is the same as in the former patent including the internal flange, which, it is alleged, now performs a triple function—viz., collecting ashes, as before; supporting the grate, as before, and securing the ash pit to the fire pot by means of bolts or rivets passing through holes in the flange. The three claims in controversy are as follows:

"1. The section A (ash pit) and section B (fire box), constructed and secured together by means of bolts or rivets, and the internal flange *b*, substantially as described.

"2. The sheet metal section C (body of the stove) fitted into the fire pot section B, and secured thereto by mean of bolts or rivets, substantially as described.

"4. The top plate or section G, secured to the section F by means of lugs and bolts or rivets, as set forth."

The first claim of this patent is the same as covered by the former patent of Beckwith, except that the fire box and the ash pit in the former patent were not bolted together. The second and fourth claims are also found in the prior patent, except that the parts are not riveted together, and the top plate, or section G of Claim 4 has in the older patent an annular depending flange entering the lower section instead of lugs. In the present patent the flange is shown riveted to the lower section.

It is shown conclusively by letters patent issued to J. H. Keyser, March 19, 1867, No. 62,961, and by No. 114,614, issued May 9, 1871, to Samuel Smith, and by patent No. 127,535, issued to H. Whittingham, that it was common to secure the various sections of stoves together by bolts and rivets, and unimpeached testimony shows that the Barstow Stove Company of Providence, R. I., since 1856, has made a stove in which a cast iron top and base are provided with lugs, through which holes are drilled for the purpose of riveting the sheet iron body of the stove to the top and base. These claims, in view of the state of the art, limited the novelty to the use of bolts and rivets, and it is too plain for discussion, or the citation of authorities, that this does not involve invention.

The third patent, No. 206,074, issued July 16, 1878, which the appellants claim has been infringed, contains two claims, both of which are in controversy, and substantially is for the invention of a circular grate having a thin closed portion, a thick open portion, strengthened by ribs, and with a toothed periphery opposite the open part of the grate. It appears from the record that a patent, No. 76,315, was issued to Mary E. A. Evard on April 7, 1868, which describes a grate with a closed back and open front, and the drawing in the patent clearly shows that the open front is thicker than the closed back, and forms ribs on the closed back. The only difference between this grate and the one under consideration is that the Evard one is rectangular to fit a rectangular fire box, while the Beckwith grate is circular to fit a circular fire box. The prior use of the elements contained in this patent are conclusively shown. The Rambler grate answers the first claim, except that both the open and closed parts are of the same thickness. The North American and Morning and Evening Star grates answer the first claim literally, except that they are rectangular instead of circular, and provided with holes in the plate part of the grate where the Beckwith grate has none. At the date of this invention it was common to make wood burning grates partly open and partly closed, with teeth at their ends, which serve exactly the same purpose as the teeth D of the patent. These grates are all used in cooking stoves, and are rectangular in form, while the Beckwith patent is circular in shape, but it cannot be maintained that there is any element of invention in making the grate fit the particular fire box of the stove to be constructed. To accomplish that end mechanical skill alone is necessary, and does not call for the exercise of inventive talent.

The appellants urge that the word "periphery" is a word of limitation confined to a circular grate. However this may be, it is conclusively shown that the Monumental grate, which was in public use for five years before application was made for the patent under consideration, contains all of the elements of the Beckwith grate, except that, being adapted for burning coal, it is cast in two pieces, while the Beckwith grate is cast in one piece. This does not involve patentable invention.

Our conclusions are that, as to the first patent, it was anticipated by prior patents, and is void for want of invention in not describing how wide the flange should be in order to accomplish the desired result. As to the second patent, it is void because the bolting or riveting together of sections of a stove was well known at the time of the invention, and the use of lugs with holes perforated through them was anticipated in other stoves and furnaces manufactured many years prior to the date of the patent. As to the third patent, it is void because the claims in it were clearly anticipated, and because it involves no invention to cast in one piece an article which has formerly been cast in two pieces and put together, nor to make the shape of the grate correspond with that of the fire pot.

Our opinion is that the judgment of the court below dismissing the bill should be affirmed.

Mr. Justice Gray was not present at the argument and took no part in the decision.

True copy.

Test:
(Signed) JAMES H. MCKENNEY,
Clerk Supreme Court U. S.

American Stoves Abroad.

Some idea of the impression that our modern heating stove makes upon the people to whom it is a novelty is gained from the following from the London *Ironmonger:*

Follows & Bate (Limited), Gorton, Manchester, engineers, are introducing some novelties in American slow combustion stoves. One of these is the Signal heating stove, for use in offices, shops, churches, chapels, public institutions, restaurants, schools, &c. It is finished throughout in the best manner, most of the decorative parts being nickel plated, while pretty medallion centers in porcelain ornament the panels under the top molding, and the body of the stove is surmounted with an elegantly designed vase, which has a semicircular base made of copper bronze. The stove is fed in the opening at the top under the semicircular base of the vase, which swivels on a stud. Not only is the front of the stove fitted with doors, but there are also doors at each side, this arrangement giving convenient access to the interior of the stove; and as all of them are covered with talc, the glow of the fire may be seen on three sides, thus presenting an appearance as nearly as possible approaching the cheerful brightness of an open fire place. The fire basket is very simply and scientifically constructed, and having rotary bottom bars, the contents can either be emptied into the ash drawer, or by slightly turning a key to and fro the fire can be gently disturbed without the necessity of using a poker. The flue is fitted with a regulating damper, and the stove is supplied with foot rests on each side, which are very neat and convenient; while a very handy contrivance, which can be used for boiling a kettle, is provided at the back of the stove. The Signal stove is constructed to burn hard or anthracite coal, or a mixture of ordinary coal and coke. Throughout all its parts the stove is most ingeniously constructed, and it is a very attractive specimen of the molder's art, the ornamental portions being of the best artistic design.

ODD PLATES.

THE WESTERN STOVE MFG. COMPANY of St. Louis, Mo., have removed their office and salesroom to their foundry and works, at the corner of Ninth and Dock streets, where they will be glad to receive their friends. The company have issued a circular letter calling attention to this change, and in connection therewith state that any orders with which the trade may be pleased to favor them will receive prompt attention.

REPORTS from Taunton, Mass., are to the effect that most of the foundries there located are working steadily and that the Weir Stove Company are very active in all departments filling orders.

THE PRESBREY STOVE LINING COMPANY of Weir, Mass., have commenced an addition to their works, which, when completed, will considerably increase their productive capacity.

SUPERINTENDENT MCFADDEN of the Auburn Stove Foundry Company, Auburn, Maine, states that the new styles and patterns of their stoves and ranges are proving very popular and that the works are in active operation filling orders.

A TRADE JOURNAL states that there are 246 applications for patents for stoves and furnaces awaiting action in the United States Patent Office.

GEORGE LEAR, Mount Vernon, N. Y., has enjoyed a good furnace trade this year, having set up 80 Cyclone furnaces.

A RECENT ISSUE of one of the Reading papers states that the Stove Mounters' Union has received its charter, and on November 19 the following officers were installed: President, George Fries; vice-president, William Kieth; treasurer, Edwin Houck; financial secretary, John Calhoun; recording secretary, George Lessig; trustees, J. L. Goodhart, John Smith and Thomas Dunn.

BUSINESS is said to be improving at the Clinton Foundry, Troy, N. Y., and a number of additional molders were put on November 27. The Empire Foundry is making casts three days in the week, but will soon be running the full quota of working days.

THE PERRY STOVE COMPANY'S foundry, on Van Rensselaer Island, Albany, N. Y., is now running with a full force, and orders are being received in a very satisfactory way. The management seem confident that the plant will run during the winter with a full force and on full time.

RATHBONE, SARD & CO., says our Albany correspondent, tell of a conversation between two men in front of their Acorn stove exhibit at the World's Fair. Two sightseers meeting there stopped and examined the stove display. One accosted the other, saying that he was a hoosier from Indiana. The other replied that he was a sucker from Illinois. They exchanged stove stories, and the Illinois man said: "My father moved from the State of New York before I was born to a part of the territory which is the State of Indiana; came all the way in a covered wagon with an ox team, and brought a Rathbone stove with him. I was born three days after Indiana was admitted to the Union. When I became old enough to have a home of my own I bought a Rathbone stove. Have bought one of Rathbone, Sard & Co.'s stoves since that, but still have the same identical stove I bought when I first started in life. How's that?"

F. M. BORDEN & BROTHER, 110 North Second street, Philadelphia, Pa., report a satisfactory trade in the Novelty line of goods, for which they are agents, and in repairs, which have been their specialty for years. They are now giving their attention to the goods which will be in demand next summer, and in addition to the new process vapor stoves, which they handle, they will have a line of both high and junior vapor stoves, with a generating burner, which they will run under the name of the Splendid Novelty. They will also be prepared to furnish the Challenge Iceberg refrigerators in various styles and finish. At present the oil stove trade is the most active with them,

Barler's Ideal oil heater and the Electric oil stoves, both finding great popularity with their trade.

THE YEAGER-HUNTER SPRING CITY STOVE WORKS, at their Philadelphia office, present, as one of their most popular attractions to the stove trade, the Queen Esther New Era range, a feature of which is a beveled edge plate glass in the oven door. The reception accorded this novel oven door panel has been highly satisfactory to the house. The panel is reported to be in high favor in the kitchens where it is used, as all that is going on in the oven can be plainly seen without chilling the contents by opening the door.

FRANK CAVANAGH, representing Roberts, Winner & Co., manufacturers of the Our Leader and Beechwood line of stoves and ranges, Quakertown, Pa., recently visited his friends in the trade at Philadelphia.

AMONG the kitchens that have been recently furnished with Clad's ranges and Clad's cooking utensils, manufactured by V. Clad & Sons, 117 119 South Eleventh street, Philadelphia, Pa., is the kitchen in the new extension at the Union League Club, the Hotel Metropole, the restaurant now being completed in the Betz Building and Kugler's restaurant, on Eleventh street, in which an oyster range of handsome appearance in full view of all the visitors to the place is made a feature.

FAITH, BELSON & Co., the stove house and repair dealers, at 229 Market street, Philadelphia, Pa., have installed a Magee combination hot air and hot water heater in their basement, which heats the entire building.

WM THOMSON, the Philadelphia representative of Orr, Painter & Co. of Reading, Pa., dispenses Sunshine all the year around to the stove trade.

H. FRICKE left the road for a few days and spent Thanksgiving at the Philadelphia house of the Keeley Stove Company, while Manager J. D. Hiestand made a visit to the foundry, at Columbia, Pa.

REEVES & HORNER, 42 North Second street, Philadelphia, Pa., in addition to being the agents for the March-Brownback Stove Company of Pottstown, Pa., make a specialty of stove repairs of all sorts, having laid out 8000 bins for the storing of these supplies. They have received a number of letters complimenting them on the promptness with which they fill orders.

VISITORS to the Pure Food Exhibition in the Industrial Art Building, Philadelphia, Pa., found the exhibit of Thomas, Roberts, Stevenson Company of stoves and ranges very interesting. Mrs. Rorer, the celebrated lecturer on cooking, used a gauze door range made by them in illustrating her lectures.

THE FOLLOWING ITEM is taken from the Minneapolis *Commercial Bulletin* of December 2: "By December 15 the stove trade for the winter will be practically over. In fact, it has now dwindled down to a practical end. The business season's trade has been anything but satisfactory. Only a small sorting has been done during the very season—October and November—when the best trade should have been enjoyed. A larger trade than usual was had in stove repairs and parts, showing that the consumers are making the old stoves last one winter longer than they would had times been better. Throughout the Northwest, as elsewhere, the stove trade is almost wholly confined to two fall months. Gasoline and gas stoves have cut down the spring trade in ranges to a mere fraction of the former volume. So the trade in heaters and wood and coal ranges will be quite dormant for another year."

DISPATCHES to the daily papers are to the effect that the Great Western Stove Works, at Leavenworth, Kan., have closed their plant and ceased, for the time being, the production of stoves and ranges.

THOMAS R. COOK, JR., who has had wide experience with both the stove trade and the builders, is busy making visits to explain the merits of the Clover Triumph range and the Triumph furnace made by the Philadelphia Stove & Iron Foundry Company of Philadelphia.

A RECENT ISSUE of the *Illustrated News*, published at Milwaukee, Wis., contains, under the title "A Silver Milestone," a very interesting account of the celebration of the twenty-fifth anniversary of the founding of the Brand Stove Company of that place. The article is illustrated with likenesses of Sebastian Brand, president, Julius Goldschmidt, vice president, and Fred. G. Brand, secretary and treasurer of the company. There are also given bird's eye views of the company's plant in 1868 and 1893.

E. D. PURVES, who is well acquainted with the stove trade in New Jersey, Delaware and Pennsylvania, is traveling that territory in the interest of the Fuller & Warren Company, Troy, N. Y.

WE ARE INDEBTED to C. Seabury of Southard, Robertson & Co., Water street and Peck Slip, New York, for a copy of a poster such as were distributed among the trade nearly 20 years ago. Both heating and cooking stoves are illustrated, the views being sectional, as well as general. One-quarter of the poster, which measures about 19 x 23 inches, is devoted to engravings of Elihu Smith's alternating parlor stove, which "was commenced in 1868, put into operation in 1870-71 and shown to the public from 1871 to 1875." The circular states that the stove was not patented until August 25, 1874. Another quarter of the circular is devoted to the Hecla, Dauntless and the Argand heating stoves, while the lower half of the poster is occupied by illustrations of cooks and heaters of unique styles and sizes. Among the names which are decipherable may be mentioned Smith's Troy Union cook stove, made both single and double, the Trojan Pioneer, the Capitol, Tocsin of Liberty, the Rainbow and the Pride of our Union. These are, for the most part, of the style generally recognized as step stoves, the elevated portion at the rear being utilized for baking purposes.

THE MASON & DAVIS COMPANY, 72 Lake street, Chicago, are enjoying an excellent demand for their combination coal and gas range. The number being sold is, perhaps, not so large as it would be if the times were better, but much satisfaction is expressed by the company that sales are as good as they find them, especially as this construction is not of the cheap class, but is intended for those with whom price is a secondary consideration. The Mason & Davis Company have built up a large business in all their goods by aiming to make something thoroughly reliable rather than cheap.

ROBERT ROBINSON & SON, 105 Lake street, Chicago, are making elaborate preparations for the next campaign in gasoline stoves and ranges. They have steadily increased their gasoline stove trade from year to year and confidently expect a heavier business next year than in any previous season. Their line will be a larger one and will include a process cabinet range. Solid brass burners will be used hereafter, to secure greater durability. Messrs. Robinson & Son also handle Red Cross coal and wood stoves and ranges and have besides built up a good furnace trade. They have had an unusually good business in furnaces this season, their sales running ahead of those of last year. This is remarkable, when the dullness in the building trade is taken into consideration. It is explained on the ground that the firm have been exceptionally fortunate in securing contracts for the renewal of furnaces that have been worn out.

A NOTICE IS ISSUED by E. D. Ransom & Co., Albany, N. Y., under date of December 6, informing the trade of the death of E. D. Ransom on November 12, and announcing that the business heretofore carried on under the above name will be continued. Brief reference is made to the foundry supplies of all kinds which they furnish.

Isaac C. Lewis, president of the Meriden Britannia Company, Meriden, Conn., died suddenly at his home in that city on Thursday, December 7, aged 81 years.

A call has been issued for a convention of tinsmiths and cornice makers of the State of Illinois, to be held at Bloomington, Ill., on January 1, 1894. The object is the formation of a State league, and a letter has been sent by D. B. Wheeler to those interested all through the State.

H. J. Nace, Third and Vine streets, Philadelphia, Pa., is one of the modern school of tin and sheet iron workers, who is up to all of the demands made upon his skill. He makes all kinds of sheet iron work and goods for business and manufacturing buildings and residences.

We have received from the Clayton Air Compressor Works, 43 Dey street, New York, a pamphlet entitled "The Widening Use of Compressed Air," being an article by Whitfield Price Pressinger, reprinted from the *Engineering Magazine*, and dealing with an interesting subject. As a means of power transmission it has been utilized to a considerable extent abroad, and the many purposes to which it is adapted are pointed out in the article referred to.

The total strength of the United States army on September 30, 1893, was 2144 officers and 25,778 enlisted men. For various causes the army lost 9456 enlisted men during the year and gained 9074 recruits.

The Commercial Cable Company have signed a contract with Siemens Bros. for a new Atlantic cable, to be laid next spring, between Ireland and Nova Scotia. It will be 2200 miles in length and will have the greatest known carrying capacity.

Certain localities in Ohio, West Virginia and other States are suffering from an acute visitation of the tramp plague.

TRADE REPORT.

The Iron Market.

As expected, the whole Iron and Steel trades are in a very comatose condition, nor is much improvement expected until the future is revealed, so far as the tariff is concerned. Reports are very conflicting, but on the whole tend in the direction that the Wilson bill will be forced through without serious amendment. Still, this circumstance deserves consideration on the other side, that the Washington correspondents proved pretty poor prophets lately when they foreshadowed the provisions of the Wilson bill and may be found erring again this time.

Welcome as an improved tendency would be, it is useless to deny that the incipient bull movement fathered by one of the Birmingham companies arouses little enthusiasm with other sellers and is not frightening buyers to any considerable extent. While it is to be sincerely hoped that it not a false start, the general situation does not encourage sanguine views very much. It is true that there have been speculative purchases, say 18,000 tons in all, 5000 tons of warrants having been transferred to England from New York and the rest having been bought in Philadelphia, also for English parties. Then the large Pipe contracts lately placed have led to covering, so that the sales have been heavy. But they have not filled up many sellers, who continue to offer Iron at the old rates. It is a fact, however, that further liberal Cast Iron Pipe contracts are in the market, say about 25,000 tons in all. On the other hand, the general foundry trade is very dull, and, for instance, in Chicago there have been requests for delaying deliveries of Iron.

Pig Iron.—In New York merchants and agents generally note a somewhat improved inquiry and a greater interest in the market, particularly as to the prices which may be fixed for next year's delivery. As yet, however, no advance is being asked by the majority of sellers, and a good deal of cheap Iron is being offered. Contracts for Cast Iron Pipe of some magnitude have been lately let at Washington and at Jersey City, and other work of a similar character involving somewhat large quantities is now or will be soon in the market. We quote: Northern brands, $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

There is no perceptible change in the Pig Iron market in Philadelphia. The supply, while perceptibly smaller, is nevertheless as large in proportion as at any time during the whole year. There is very little Iron wanted, and what is wanted can be easily secured at the old prices, and in some cases at a little less than that. Consumption is very light, and will be still lighter during the next 30 days, so that there is no incentive for placing orders ahead, and especially so while the tariff is unsettled. Asking prices are about as follows, with sales chiefly in small lots:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

Chicago advices intimate that while there is some movement in small lots of local and Southern Coke Iron, it is confined to the absolute necessities of consumers. Inquiries for good sized lots of Southern Iron have led to no business, on account of the high prices asked by nearly all the Southern companies. A discouraging feature of the situation at present is the decrease in shipments to consumers, who are to a considerable extent asking for postponement of deliveries on contracts. This shows a falling off in the foundry business, which for the past month or six weeeks had materially improved. Some sales of Charcoal Iron are reported at prices a shade under our quotations. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.50 @ $16.00
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25
Southern Coke, No. 2	12.15 @ 12.40
Southern Coke, No. 3	11.65 @ 11.90
Southern, No. 1, Soft	12.40 @ 12.65
Southern, No. 2, Soft	11.65 @ 11.90
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.25 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

The amount of Pig Iron changing hands in the Pittsburgh district is small, and prices are showing signs of weakness. The explanation given is that not enough Iron is being consumed and too much is being made, notwithstanding that production has been cut down to half. Where one consumer of Pig Iron can be found who is running his plant full time, ten can be found who are running to half capacity or less. Then, again, the stocks of Pig Iron on hand are very heavy, and as long as these conditions confront the market any betterment in price is believed to be out of the question. Quotations are as follows:

No. 1 Foundry	12.50 @	13.00	cash
No. 2 Foundry	11.50 @	12.00	"

There has been an almost complete cessation of Pig Iron buying during the week in Southern markets and no large contracts have been made for either long future or early delivery, but there have been liberal shipments on contracts recently made. The proposed new tariff is given as the reason for the restriction in buying, and no business of importance is anticipated for the present. There is more willingness to sell at the prices recently accepted for delivery until next April, or even longer, but it is useless to make the tender when there are no buyers, while, in fact, the recent sales have made the furnaces comparatively independent and there is no such urgency to sell as would cause lower prices to be accepted. There is little movement in Charcoal Iron, but it is not pressed for sale. Quotations are as follows:

Southern Coke, No. 1	$12.25 @ $12.50
Southern Coke, No. 2	11.00 @ 11.25
Southern Coke, No. 3	10.50 @ 10.75
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—Hardly anything has been done in the speculative branch of the market, and prices have remained almost stationary throughout the week. The uncertainties connected with the proposed revision of the tariff seem to be greatly responsible for the lack of animation. General trade conditions, however, are not without influence, since they suggest very conservative action. As near as can be calculated, the consumption here is well up to the average for this season, and it is calculated that spot stocks have been cut down to about 2500 tons, or less than the average amount. Purchases by jobbers and consumers have been on a moderate scale, however, and the demand at this writing is of very ordinary character. The design of the Wilson bill to remove the duty on Pig Tin is well received by the trade generally, and there is no doubt that whatever other feature of the measure may be modified before its passage, this provision will be carried through as proposed. Late dealings on the Metal Exchange were at 20.65¢ for spot and December delivery. Jobbers' prices for small lots are 21½¢ @ 22¢ ℔ lb for Straits Pig.

Copper.—Sales have been made recently of several million pounds of Lake Superior Ingot for future delivery, at 10½¢. The estimates range all the way

from 3,000,000 to 5,000,000 lb, exclusive of what may have been done *sub rosa*, as not uncommon, by the Calumet & Hecla Company, whose agents seem to prefer "mystery" to a plain statement of facts. If the truth were known, it would probably be found that the estimate given is below the actual amount of metal involved. On the Metal Exchange there has been a feeble effort in the direction of counteracting the effect of outside influences and a few "sales" were recorded there at considerably under the "street" prices. Waiving all the speculative doings, it seems very clear that 10½¢ is extremely inside price and that 10¾¢ @ 11¢ fairly reflects market value from sellers' point of view. Not as much as a rumor of large dealings in other Copper comes to notice, but the line of valuation has been raised to 10¢ upward for Electrolytic, and 9½¢ @ 9¾¢ for ordinary casting brands. The home consumptive demand is of moderate proportions, and it is not expected that sales will increase materially until well on into the first month of the new year, when consumers will have taken stock and satisfied themselves in respect of their financial standing. Prices for small lots are unchanged at last week's quotations, with a tendency to harden.

Sheet Copper. — Some fairly good transactions in Cornice Copper have been closed during the week, and a brisker movement is noted in the demand for spot material, which is presumably needed for the completion of some large building contracts in several localities. Jobbers' prices are inclined to stiffen in sympathy with the advance of Ingot; and, in any event, they appear more likely to advance than to recede in the near future should business be at all up to the average.

Pig Lead.—The market has remained almost stationary. New tariff proposals exerted a certain amount of sentimental influence, the bearing of which was in the direction of lower prices, but sellers have thus far made hardly any revision in their prices, and consumers are extremely indifferent. There is no difficulty in buying carload or larger lots at 3.40¢, delivery here this month or next. Bids above 3.30¢, the bullion quotation, are few and far between. In short, the market is looking rather weak and is positively dull at the present time. Jobbers' business is described as but a few degrees removed from stagnation, consumers displaying only the most languid interest in the metal. Prices are inclined to weakness.

Lead Pipe and Sheet.—Some interest in Lead Pipe has been evinced during the week, and a little more business, both spot and future, has been done, but the movement is believed to be only of a special and temporary nature. No change in prices is noted.

Spelter.—The market is much tamer than it was a week ago, and prices are, if anything, a shade easier. A few carloads of special brands were placed here at about 4¢, and reports from primal markets had it that Western consumers have purchased there recently at full figures, or the basis of 3.80¢ @ 3.85¢, Eastern delivery, for ordinary Western brands. There is no evidence of any particular pressure to sell, but the relation of supply and demand is slightly abnormal, and the prices above quoted would seem to fairly reflect present market value for ordinary brands. Jobbing price for small lots at store range from 4½¢ to 4¾¢ ℔ lb.

Antimony.—There has been a fair jobbing movement at about the former prices, otherwise the market remains flat.

Tin Plate.—Business in the market for Tin Plates has been of a strictly perfunctory character. The demand for spot goods has been small, and no difficulty is experienced in placing orders at former prices. Except for special sizes, and for some favorite brands of domestic Roofing Plates, few contracts have been made for future deliveries, and interest in all directions is for the moment very tame. Values have, moreover, a tendency to soften, particularly in the case of ordinary Cokes, which are in more liberal supply. The total volume of transactions for the week falls far below the average of December business, which is always more or less languid in view of the annual stock taking. This year, however, the computation of stocks will not, in most cases, be a very lengthy operation, as from all accounts consumers are carrying next to none at all. The actual cause of the dullness is more reasonably attributed to the disinclination of purchasers to lay in any unnecessary supply of Tin Plates, even at present low prices, in face of the probability of early tariff changes still further lowering values. The trade in general exhibit great uneasiness at the prospect of the imposition of an ad valorem duty in place of a specific tariff ; and it is believed that such an arrangement, if carried into effect, will operate to the benefit neither of the Government, the importers nor the consumers. The American Tinned Plate Manufacturers' Association met in semi-annual session at Pittsburgh on Tuesday, and decided, it is reported, that they would do no more work at their mills than is necessary until they knew the outcome of the coming tariff legislation.

A special cable dispatch from London to *The Iron Age*, dated December 6, reports on the British Tin Plate market as follows: In Tin Plate there has been hardly any business and the market remains flat. Prices are unchanged. Although makers appreciate the proposed reduction in the duty in the United States, they do not relish the ad valorem rate. Work has been suspended at the Waterloo works, Machen. Liverpool quotations for Plates were as follows:

IC Charcoal, Alloway grade	12/3 @ 12/9
IC Bessemer Steel, Coke finish	11/3 @ 11/6
IC Siemens " " "	11/6 @ 11/9
IC Coke, B. V. grade, 14 x 20	11/3 @ 11/6
Charcoal Terne, Dean grade	10/9 @ 11/

Sheet Iron.—The market for Black Iron continues extremely dull. The increase in production which has occurred of late has not met with any corresponding growth in the demand, and makers are seeking business actively without much success. Prices are marked down to the lowest level on record, and concessions in quoted rates are, without great difficulty, obtainable on fair sized orders. Galvanized Sheets are in ample supply, but the demand has not shown any noticeable increase. Prices remain steady at former quotations.

Chicago Report.

Scrap.—Consumers are purchasing Old Material steadily, but the quantity moving is not so large as in November. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3⅛¢
Pipe Lead	....	2⅝¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—Dealers report a larger demand from consumers and the market is steady. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

CONDITION OF THE

Hardware Trade.

THE volume of November business was certainly as large as could reasonably have been expected, and indicated a decided improvement in the general condition of trade. There continues to be a fair activity, though business still feels to a considerable degree the depression which has existed and is also restricted by the advance of the season, this being a time of the year when trade is usually quiet. Seasonable goods are moving freely, the demand being stimulated by the advent of cold weather, especially as many merchants deferred their purchases to a later date than usual. Holiday goods are also in request, but the demand is not as large as in more prosperous years. There is a good deal of inquiry by the large houses in regard to next season's orders and the disposition is shown to defer purchases. A good many orders are, however, being placed for shipment early in the year, and in some lines this class of business is referred to as nearly up to the normal volume. Up to the time when the Wilson tariff bill was announced there were evidences of a marked improvement in business and a much more confident tone than has characterized the market for some time, but the proposed reduction of duties has the effect of inducing an unsettled feeling, repressing trade, and leaving manufacturers and merchants in a state of not a little uncertainty. The prospect of a reduction in the tariff naturally makes the trade at large reluctant to purchase goods which they may be able to buy at lower figures in the near future, and there is a good deal of doubt as to the lines which will be thus affected and the extent to which lower prices will result. Manufacturers are also perplexed in the matter and in not a few lines are entirely at sea as to the effect which the proposed bill will have upon their interests, especially as it is not unlikely that some kinds of foreign Hardware which have not recently been sold to any extent in this country will be admitted in competition with American goods. The fact is that in not a few lines our manufacturers are not informed as to the European costs so as to figure definitely on the influence which the proposed bill would have upon their business. In many other lines, however, the manufacturers are aware of the disaster which the enactment of the proposed law would bring upon their business, and are naturally disposed to do little until they know the disposition which will be made of the bill. Opinions differ widely as to the prospect of its being enacted in the form submitted, many holding to the view that important modifications must be made in view of the injury which it would inflict on established industries. There is, however, general agreement that it will be for the good of the country to have the matter settled in one form or another at as early a date as possible, that the existing uncertainty may be removed and manufacturers and merchants be permitted to adjust themselves to the new conditions.

Advices from Chicago.—Trade shows some improvement as compared with last month, but it is still far below what it should be. It is estimated that sales are now from 30 to 40 per cent. below the customary volume of business at this season. The main demand is for seasonable and holiday goods, but general Hardware is steadily called for in small lots. The smallness of stocks in retailers' hands compels them to buy frequently, which is much to the annoyance of jobbers, who are obliged to break packages to meet the wants of such trade. Lead goods are lower, in sympathy with the decline in crude lead. Shot has been marked down to $1.40 for small sizes, and $1.65 for large sizes. Heavy Hardware jobbers have had an unusually heavy run of orders for sleigh stock, more than for several years past, caused by the abundance of snow throughout the Northwest and the prospect of a long sleigh season. In other respects Heavy Hardware has been less active.

Notes on Prices.

Wire Nails.—It is evident that the low prices ruling on Wire Nails have the effect of stimulating orders, and this influence, in connection with the general improvement in the tone of business, causes many merchants to purchase Wire Nails with more freedom than for some time past. Merchants are not, however, purchasing much beyond their early requirements, but the fact that stocks generally are depleted and broken increases somewhat the size of orders which are being given. Many buyers, however, are still holding off, as they do not care to purchase at all freely at the present dull season and with the uncertainty which attends the future course of trade. Prices remain as at our last review, at $1.15 to $1.20 for carload lots at mill, and manufacturers are refusing to make concessions from the lower of these figures except in very special cases. Buyers are watching the market closely, and are preparing to place their orders in case there should be reason to anticipate an early turn in the market toward higher prices.

Advices from Chicago. — All Wire Nail manufacturers report very large shipments for November. The Salem Wire Nail Company that month shipped 92,626 kegs from their Salem and Findlay mills, which is the heaviest month's product they ever turned out. December is expected to be a month of heavy shipments also. There are plenty of contracts to be filled, but there are also some sections of the country in which stocks were never so light at the beginning of the year, and from which orders are therefore anticipated in good quantities. Quotations for factory lots are continued at $1.30, Chicago. Small lots are selling at $1.35 from stock.

Cut Nails —We are unable to report any improvement in the Cut Nail market in the matter of prices, which remain as for several weeks past, at about 95 cents for carload lots at mill; this figure, however, being shaded to close buyers on good orders. There has been a fair activity considering the season and the condition of business in general, and the aggregate of sales during the past week or two has been fair. Small lots from store in New York are quoted regularly at $1.20.

Advices from Chicago.—The Cut Steel Nail trade is not so active as it has been, but manufacturers report a tolerably fair run of small orders, enabling them to keep in operation. Prices range from $1.15 to $1.20, according to the character of the order. Small lots from stock are quoted at $1.25.

Barb Wire—Low prices continue to rule in the market for Barb Wire, but there has been no further decline during the past week. Quotations are on a basis of $2.15 to $2.20 for carload lots of Four-Point Galvanized at mill. The demand is only moderate. The low prices ruling, while not inducing liberal purchases from the trade at large, enable the manufacturers, however, to dispose of a larger quantity of Wire abroad than has heretofore been the case, inasmuch as they are now enabled to enter some markets which have been supplied from German mills.

Advices from Chicago.—The year has now advanced to a point where orders for spring shipment of Barb Wire are beginning to make their appearance. Manufacturers of special brands are booking more or less business, and inquiries are reported for standard qualities. Manufacturers appear to be standing firmly at $2.35 to $2.40, Chicago, for Galvanized, and offers of heavy tonnage are stated to have been refused at a shade under the minimum quoted. Jobbers name $2.55 for small lots from stock, but are receiving very little business, as most of it is being handled by manufacturers.

Plain Wire.—Plain Fence and Market Wires, which have for some time been declining in price, have now touched a point considerably below anything in the experience of the manufacturers. For example, round lots of No. 9 Black Fence Wire can be bought at $1.40, with the usual advance of $\frac{5}{10}$¢ ℔ pound for galvanizing, f.o.b. vessel, New York, which of course means a correspondingly low figure at mill. A good deal of complaint is made by the manufacturers of the unsatisfactory volume of business even at the prices which are ruling. There is, however, an increase in the amount of Wire exported, as at ruling prices they are able to compete with German manufacturers. While the aggregate of this business is not as yet

large, the opportunity to dispose of goods in markets which have been out of their reach is referred to by some of the manufacturers as an encouraging sign.

Cordage.—The Cordage market is in substantially the same condition as for the past week or two, and the low prices recently referred to are still ruling. Reports in regard to the reorganization of the concerns connected with the National Cordage Company are current, but are not regarded by the trade as having any important or direct bearing on market values, even though coupled, as they are in some cases, with an intimation that an understanding as to price has been or will be reached by these and other manufacturers of Cordage. The present indications are that no serious attempt will soon be made by the manufacturers to agree as to production and prices with a view to controlling the market, as in the present condition of things this is not likely to be accomplished. Ruling prices are unquestionably low and leave but a meager margin of profit, and when an active demand sets in higher prices are likely to result.

Sad Irons.—The following net prices on the Sad Irons of Colebrookdale Iron Company, Pottstown, Pa., who are represented by Duncan K. Major, 103 Reade street, New York, are announced, terms 60 days or 2 per cent. discount for cash in ten days:

Crown Sad Irons:
No. 230. Plain Polished, $8.40 per dozen sets.
No. 235. Nickel Plated, $9 per dozen sets.
Extra Handles, $1.25 per dozen.
Extra Stands, 35 cents per dozen.
Common Diamond Sad Irons, 2¾ cents per pound.
The XX Tailor Irons—wide face, 4 cents per pound.
The XX Tailor Irons—narrow face, 4 cents per pound.
The XX German Tailor Irons, 4 cents per pound.
New England Pressing Irons, 4 cents per pound.
Chinese Laundry Irons, 6 cents per pound.
Chinese Common Sad Irons, 4 cents per pound.

Shot.—As a result of the decline in the prices of Lead, the following revised quotations on Shot are announced by the manufacturers under date December 4; terms, net 30 days, 2 per cent. discount for cash in 10 days:

Drop Shot up to B, 25-pound bag	$1.40
" " 5-pound "	35
Drop Shot B and larger, 25-pound bag	1.65
" " 5-pound "	40
Buck and Chilled, 25-pound bag	1.65
" " 5-pound "	40
Dust Shot, 25-pound bag	2.00
" 5-pound "	45

In lots of 2000 pounds and upward, taken at one time, a discount of 5 cents per bag (25 pounds) will be allowed. A special discount of 2½ per cent. will be given on lots of 1 ton and upward bought, invoiced and paid for at one time.

Curling Iron Heater.—The Ætna Curling Iron Heater, manufactured by Nicol & Co., 55 W. Washington street, Chicago, and illustrated in our issue of November 25, 1893, is sold at the following net prices:

No.	Per doz.
0. Without wire attachment	$1.75
5. With wire attachment	2.25

Glass.—The impression prevails that whatever tariff legislation may be enacted will not go into effect before June, 1894, and if such should be the case the price of Window Glass, or the wages of workmen according to the scale signed, would not be directly effected by the tariff. It is not improbable, however, that the prospect of a reduction of tariff will somewhat depress prices on Glass. Authorities state that the reductions proposed by the Wilson tariff schedule vary from 28 to 37 per cent. on Window Glass, while others estimated it at 50 per cent. Glass factories continue starting up; at the present time there is reported the equivalent of 1044 pots in operation. Prices on American Window Glass continue low, and there seems to be a disposition to make private prices rather than open quotations. Plate Glass is quoted by local jobbers at from 60 and 10 and 5 to 70 per cent. discount, according to size of Glass. It is understood that the regular quotations on French Window Glass of 75 and 10 and 5 per cent. to 80 and 5 per cent. discount are shaded in some cases. There is a limited demand for all kinds of Glass.

Old Metals.—The market for Scrap Iron is dull and weak, with prices at a very low level. The business that is passing consists of nothing beyond small lots for immediate delivery, and nothing in the nature of a general demand is in sight. Old Metals, other than Iron, on the other hand, have shown more movement during the past week. Inquiries and orders have come in more freely, and smelters and refiners appear to be busier than for some time past. Prices rule firmer, quotations for New York delivery being given as follows:

Heavy Copper	℔		7¢
Light and Tinned Copper	℔		6½¢
Heavy Brass	℔		5¢
Light Brass	℔		4½¢
Lead	℔		3¢
Tea Lead	℔		2¾¢
Zinc	℔		2½¢
No. 1 Pewter	℔		14¢
No. 2 Pewter	℔		6¢
Wrought Scrap Iron, ℗ gross ton	$7.00	@	$8.00
Heavy Cast Scrap, ℗ gross ton	8.00	@	9.00
Stove Plate Scrap, ℗ gross ton	4.00	@	5.00
Burnt Iron, ℗ gross ton	2.50	@	3.00

Old Rags, Paper, &c.—Paper Stock is fairly active, but the trade still continues much below the average for the season, and no material improvement is looked for until after the holidays. Quotations are as follows, delivered in New York:

No. 1 White Rags	℔	3¼ @	3½¢
No. 2 White Rags	℔	2¼ @	2½¢
Mixed Rags	℔		¾¢
Blues and 3ds	℔	1 @	1¼¢
Hard Sized White Shavings	℔	2¼ @	2½¢

Hemp Twine	℔		2¼¢
Manila Rope	℔		2½¢
Jute Rope	℔	1½ @	1¾¢
Mixed Rope	℔	¾ @	⅞¢

Old Rubber.—The market for this material is narrow and weak. Prices in New York are about as follows:

Car Springs, ton lots, ℔	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔	@	.03
Rubber shoes, less than carloads, ℔	0.02¼ @	.03⅛
Large Hose, ℗ ton	@	9.00
White Wringer Rolls, ℔	@	.04¼
White Syringes, ℔	@	.05

Trade Notes.

TINNERS' MACHINERY & SUPPLY COMPANY, 9 Cliff street, New York, are distributing among their patrons a neat and useful souvenir in the form of a vest pocket memorandum book for use during the ensuing year. It is 5¼ x 2¼ inches in size, bound in fine black leather, rounded corners, gilt edged, quadrille ruled, and contains 36 leaves. On the cover in gilt is the name and address of the company, while on the inside of the covers and fly leaves they allude to their line of goods, leaving the balance of the book free for memoranda.

KEARNS & RUDOLPH RANGE COMPANY, 1020 Arch street, Philadelphia, successors to the Kearns Wrought Steel Range Company, are directing attention to their Hot Water Stoves. Besides heating large quantities of water, it is pointed out that the tops of the stoves can be used for heating flat irons or doing small quantities of cooking.

THE GEUDER & PAESCHKE MFG. COMPANY of Milwaukee, Wis., drop into poetry this week in advertising their Cream City Flour Bin and Sifter. The poet's lines may be a little lame in construction and difficult to scan, but the sentiment is all right and must meet with the hearty commendation of our readers.

A SHORT TIME AGO we called attention to the fact that E. T. Barnum, manufacturer of Wire and Iron Work at Detroit, Mich., received awards at the World's Fair on Steel Prison Jail Cells, Grocers' Cheese Safes, &c., and now we learn that he has received other awards on Wire and Iron Fencing, Wire and Antique Brass bank and office Railing and Lawn Vases. The exhibit was made very attractive by the selection and arrangement of the goods, while the workmanship was of a high order.

JOSEPH DIXON CRUCIBLE COMPANY, 68 Reade street, New York, manufacturers of Pencils, Crucibles and Graphite products, note signs of improvement lately in their business, although not to so great an extent as could be wished. They have instituted some improvements and betterments at their works, and are prepared to promptly execute orders.

THE HUYETT & SMITH MFG. COMPANY, makers of Heating and Ventilating Apparatus, Detroit, Mich., report a material improvement in their business. For the last three weeks their works have been running on full time in every

department and the company are even behind with their orders. The prospects for a good winter trade are very promising.

THE NEW PLANT of the United Indurated Fiber Company, Lockport, N. Y., has commenced operations. The plant will soon be running full force and will employ 300 men.

A NUMBER of additional sheet mills of the Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, were started up last week.

THE GALVANIZING DEPARTMENT of the plant of the Whitaker Iron Company, at Wheeling, W. Va., which was not destroyed by the recent fire, is in full operation. As soon as the insurance on the destroyed buildings of the firm has been adjusted they will be rebuilt on a larger scale than before.

THE ALUMINUM SMELTING & REFINING COMPANY will shortly put in operation their smelting works, at Turner, in Kansas, a few miles west of Kansas City. It is stated that they will manufacture aluminum from native clay.

IT IS REPORTED that the sheet mills of the Britton Iron & Steel Company, known as the Lake Shore Mills, at Cleveland, Ohio, will be put in operation at once. It is intended to run the mills non-union.

THE NEW PHILADELPHIA IRON & STEEL COMPANY, New Philadelphia, Ohio, have been running three sheet mills for a few weeks past and will at once put others into operation.

THE SHEET MILL DEPARTMENT of the works of the Moorhead-McCleane Company, at Pittsburgh, which has been idle for some time, will resume operations within a few days, as a result of the agreement reached between the sheet manufacturers and the Amalgamated Association.

THE BROOKLYN PATENT SLATE TUB COMPANY were incorporated on December 6, at Albany, to manufacture Slate Tubs, Slate Mantels and Slate work of all kinds, in Brooklyn, N. Y. The directors are Ed. V. Brand, John S. Ladd, Wm. H. Daniell, F. J. G. Ladd and Albert Trignet of Brooklyn, and the capital stock $10,000.

D. A. HOPKINS COMPANY, Central Building, Liberty and West streets, New York, makers of Journal Bearings and Brass Castings for machinery, report an active business in their specialties. The firm's foundries, at 305–311 Tenth street, Jersey City, N. J., are quite busily employed.

THE WORKS of the East River Lead Company, 523 East Nineteenth street, New York, are busy in the production of Lead Pipe, Spelter and Solder, for which a better demand has recently developed.

IN a prominent announcement elsewhere of the Iron Clad Mfg. Company, 22 and 24 Cliff street, New York, some information, with an interesting illustration, is given of the well-known Iron Clad Milk Can.

THE CLEVELAND STAMPING & TOOL COMPANY, Cleveland, Ohio, issue a neat little publication, being a price-list of their Solid Steel Seamless Hollow Ware. On the first page is an illustration of their Solid Steel Spider, in the middle Seamless Griddles are illustrated and then their Seamless Broiler. Besides brief descriptions, tables of sizes and prices are given. A pretty effect is obtained by the red and black inks used in printing.

TRANSFERRING orders from the recently burned sheet mills of Wheeling to the mills at near by points in Ohio has made business lively in that line. The demand for galvanized sheets continues to hold good, the orders received being from all parts of the United States. This is regarded as a sure indication that building is going on at a lively rate. The use of this material for cornices and furnishings of buildings shows a steady increase.

THE ADAMS & WESTLAKE COMPANY, Chicago, issue a supplement to their No. 5 catalogue showing a large line of Brass Bedsteads, with prices and descriptions. A smaller pamphlet calls attention to a medal awarded by the World's Columbian Exposition for superiority of construction and excellence of finish and calls attention to some advantages and the care of Brass Beds.

THE STEEL CLAD BATH, manufactured by the Steel Clad Bath Company of New York, 447 West Twenty-sixth street, New York, and the Steel Clad Bath Mfg. Company, 85 West Congress street, Detroit, Mich., is the subject of an advertisement in another column, in which an illustration of the Tub is presented.

SCRAP.

NOBODY in the tin plate trade has ever known such low prices as those which have been current on the other side during the past few weeks. Yet, as an English trade journal points out, amid all the complaints of bad trade, it is astonishing to note the remarkable increase in the consumption. In 1882 the average price of IC coke tin was 18 shillings 9 pence, and the total quantity exported was 265,021 tons. In 1893 the average price is 11 shillings 6 pence, and the total exported (calculating the last quarter on the basis of the published figures) will reach about 402,240 tons. So that England is exporting 52 per cent. more in these bad times than in the good times of 1882, and the price is 38 per cent. less.

WALLACE, BANFIELD & Co., operating the Irondale Rolling Mills, at Irondale, Ohio, have placed an order with the Ellwood Iron Works of Ellwood, Ind., for two additional tinning pots and also two additional cleaning machines. When the erection of these has been completed the tinning department of the above plant will consist of six Morewood, two Thomas & White and two Ellwood tinning machines. The addition to these two tinning machines will increase the tinning capacity of the plant about 25 per cent., and it is the intention of the firm in the future to tin their entire output of black sheets.

KAHN BROS., 517–527 East Nineteenth street, New York, metal dealers and refiners, report a very gratifying improvement in business as having occurred within the last week or two. Their tin plate factory is busily engaged, turning out an average of 40 boxes of American roofing plates daily. Domestic black sheets are used exclusively and the firm are making a superior quality of genuine American ternes, for which they find an active demand.

THE HANDSOME BRANCH STORE which Merchant & Co. of Philadelphia have recently established at 584 and 586 Flushing avenue, Brooklyn, N. Y., is meeting with great success. The manager reports an active local demand for the guaranteed plates of the firm, namely, Merchant's Roofing and Alaska; as well as their cheaper grades of ternes—Empire, Hickory and Palm—and for the Sear ventilator. A full line of tinners' supplies is always kept in stock.

It Is Reported—

That Herman & Son, Hardware dealers, were burned out in a fire at Albia, Iowa, November 17.

That in a large fire at Hamilton, Ont., on the 22d ult., the Hardware stock of Peter Bertram was almost totally destroyed. Loss, about $20,000; insurance, $8000.

That W. L. Snow, plumber and dealer in Stoves, West Somerville, Mass., will add a line of Hardware to to his business.

That S. B. Spencer's Hardware store, at Maiden Rock, Wis., was entered by burglars on the 18th ult. Thirty Pocket Knives, two Revolvers and a lot of Table Cutlery were carried off.

That the Hardware store of J. E. Phillips, Porterville, N. Y., was burned out recently.

That the Hardware store of A. Scheff, 462 St. Clair street, Cleveland, Ohio, was entered by thieves on the 18th ult. The cash drawers were stripped of their contents and a large quantity of Hardware taken.

That Laughlin & Brown's Hardware store, at McComb, Ohio, was robbed on the 22d ult.

That the foundations for Charles E. Faeth's new wholesale Hardware store, at Sioux, City, Iowa, have been completed, and a large force of men have commenced work on the building proper.

That G. E. Piper has bought the Hardware stock of A. M. Smith, Silver Springs, N. Y.

That H. D. Blanchard of Boston, Mass., will on January 1 open a Hardware store at Vergennes, Vt.

That the Hardware store of W. C. Fluke, Clayton, Mich., was recently robbed. This is the second burglary within a year.

That W. R. Batley's Hardware store, at Hearne, Texas, was burned out on the 23d ult.

That the Hardware firm of Atchison & Knowlton, Newton, Kan., have been dissolved. T. B. Atchison will continue the business.

That McClure & Co., in the Hardware business at Buffalo, N. Y., have sold out.

That the Hardware and Tin firm of Schick & Bridanstein, Mansfield, Ohio, have dissolved partnership.

That O. P. Olson has opened a Hardware store at Ulen, Minn.

That P. Martinson & Son, Hardware merchants, Lake Park, Minn., have dissolved partnership.

That Heins, Rich & Co., in the Hardware business at Renville, Minn., have been succeeded by Heins & Co.

That M. I. Crosby's Hardware store, at Baldwin, Kan., was burned out on the 19th ult. Loss, $1500; insurance, $500.

That J. F. Johnston has sold out his business interests in the Hardware firm of Johnston & Farrar, London, Ohio, to his partner, Colburn W. Farrar. Mr. Johnston is the Mayor of London.

That G. A. Taylor has disposed of his Hardware business at Portland, Ore., on account of ill health.

That Wm. Haberman has bought the Hardware stock of I. M. Lyman, Concord, Neb.

That M. Quinlan and H. S. Latham have opened a Hardware and Tin store at Gray's Lake, Ill.

That burglars entered L. H. Kurtz's Hardware store, Des Moines, Iowa, on the 19th ult. and blew open the safe. They secured $55 in money and some valuable papers, some of them negotiable.

Price-Lists, Circulars, &c.

READING HARDWARE COMPANY, Reading, Pa., and 81 Reade street, New York: Supplement No. 4 to their 1891 catalogue. This is a book of 54 pages containing full size illustrations of a variety of new goods in genuine bronze and also a new line of fine Locks with flat and rabbeted fronts, for French windows, closets and doors having narrow stiles. The new patterns in solid bronze metal include complete lines of trimmings for Vassar and bit key Locks in scroll and circular fluted patterns. Eulalia designs and circular fluted door and window trimmings in wrought bronze are also shown. In addition to the supplement they publish an attractive 12-page pamphlet of iron goods in Columbian design. These goods are antique copper plated, which, the company state, is an entirely new method of finishing iron goods, requiring special patterns to obtain the desired results. This new finish is claimed to be very durable, and is referred to as presenting an appearance which closely resembles genuine bronze. The line of Columbian iron goods is limited to interior trimmings only. It comprises several Lock sets for inside doors, including sliding door Locks and Escutcheons, Door and Shutter Butts and a variety of small goods.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

A Specific Duty on Tin Plates.

At the close of last week it was announced that among the alterations decided on by the Ways and Means Committee in the original draft of the Tariff Revision bill, the proposed duty of 40 per cent ad valorem on tin plates was to be changed to a specific duty of 1½ cents a pound. This arrangement—at least so far as the substitution of a specific for an ad valorem tariff goes—is one that meets with the hearty approval of the tin plate trade in general, who, as we pointed out last week, were unanimously opposed to a tariff based on estimated value. The additional proposal that the new tin plate duty does not take effect until October 1 does not, however, command the same unanimity of approval. Opinions on this head are sharply divided. Domestic tin plate manufacturers will generally be glad of the postponement, which will give them a longer time wherein to adjust their business to the new conditions. Can makers and other manufacturers of tinware who are carrying stocks of any size will also be gratified at the extended opportunity afforded them of another season wherein to dispose of their goods at the present values. But many jobbers and importers and a large class of customers would prefer that the change should be made at an earlier date. They claim that postponement will certainly involve a continuation through next year of the present hesitating and unsatisfactory market, as no one will care to purchase beyond his absolute necessities, in view of the probability of cheaper material in the near future. The foregoing is, of course, based on the assumption that the Wilson bill will be passed as at present outlined.

Trade-Marks.

A decision of considerable interest to manufacturers and others using trade-marks has recently been handed down by the United States Supreme Court in the case of a suit brought by a firm of millers to restrain another firm of millers from using the word "Columbia" in connection with their special brand of flour. The court refused to grant the application of the plaintiffs, and denied their exclusive right to use the word "Columbia" as a trade-mark for flour; laying down, at the same time, the following comprehensive propositions as the sole rule and practice in the establishment of a valid proprietorship in trade-marks:

1. That to acquire the right to the exclusive use of a name, device or symbol as a trade-mark, it must appear that it was adopted for the purpose of identifying the origin or ownership of the article to which it is attached, or that such trade-mark must point distinctively, either by itself or by association, to the origin, manufacture or ownership of the article on which it is stamped. It must be designed as its primary object and purpose to indicate the owner or producer of the commodity, and to distinguish it from like articles manufactured by others.

2. That if the device, mark or symbol was adopted or placed upon the article for the purpose of identifying its class, grade, style or quality, or for any purpose other than a reference to or indication of its ownership, it cannot be sustained as a valid trade-mark.

3. That the exclusive right to the use of the mark or device claimed as a trade-mark is founded upon priority of appropriation.

4. Such trade-mark cannot consist of words in common use as designating locality, section or region of country.

The Blower System on Shipboard.

At the present time nearly a dozen of the ferry boats plying between New York and its adjacent cities are fitted with a special system of hot blast heating. The apparatus is so constructed that either hot or cold air, or any desired mixture of the two, may be supplied without change in volume. There is thus maintained in the cabin a constant moderate temperature, in marked contrast to the hothouse atmosphere sometimes encountered. The slightest pressure maintained within tends to prevent inward leakage of cold air from out of doors with its objectionable results. That the quality of the atmosphere is far above the usual standard in such apartments must be evident, for the fresh warmed air is supplied in large quantities. The same system, in a much extended form, is now under serious consideration for transatlantic liners, where fans would be provided both to supply the warmed air taken directly from out of doors and to remove the vitiated air from the confined spaces within. That such arrangements are more than desirable in the steerage is best evidenced by the general condition of steerage passengers. But its opportunity is not here alone, for there is yet room for improvement in the ventilation of the first-class cabins.

The Tin Plate Trade.

Some advantages derived from the establishment of a tin plate industry in this country have been strikingly manifested during the business depression of this year. Jobbing houses have been enabled to curtail their stocks of tin plates just as they have curtailed their stocks of other goods. Instead of purchasing large quantities, as they would have been obliged to do if importing, and thus having a considerable amount of capital steadily tied up, they have drawn on the manufacturers for just what was needed for an assortment from time to time. American manufacturers of tin plates have thus had to carry stocks for their customers in the same way that other manufacturers have been obliged to do in every time of depression or falling markets. It is an advantage so much appreciated that frequent reference is made to it by jobbers who are solicited to buy foreign tin plates. Within a few days a very large order has been secured by a Western tin plate works from a jobber, with the understanding that shipments are to be made in such quantities as are needed to supply his trade, with payments made accordingly. There is little question that the general depression in business has operated greatly to the advantage of American tin plate makers in this way, and that their trade has grown much faster among jobbers than would have been the case in the same period if money had been easy and the times prosperous. Manufacturers of tinware have pursued the same policy as the jobbers, but perhaps not to the same extent, as they could not run the risk of finding themselves suddenly out of stock.

It is proposed to hold a Workingmen's International Exposition in Milan, Italy, next year, which, if carried out on the broad lines contemplated by the promoters, with the co-operation of the Government, should yield valuable results. The exhibits are to be divided into three general classes, namely: Works, which will include products of individual workers, small industries, household work, products of co-operative societies, &c.; provisions, which will embrace the work of societies for mutual aid and improve-

ment, institutions, models, studies and material for showing how workingmen live, dress, &c., in various countries, as well as hygiene and bibliography in relation to workmen; and instruction, in which class will be displayed all matter relating to industrial schools and professional schools for different trades and callings. If sufficiently representative in its exhibits, such an exposition would be eminently instructive and useful.

The President of the Board of Education of Boston, in a recent address, congratulated his fellow citizens upon the fact that Boston has her system of public schools and kindergartens, and lately her public school of manual training; but what is now urgently needed, he said, is a school of practical training in the trades, such as the Pratt Institute of Brooklyn, the New York Trade School and other similar institutions furnish. Boston has now the most favorable opportunity for supplying this deficiency, if the trustees of the Franklin Fund adhere to their decision to use that fund in establishing a trade school for the benefit of the young mechanics of the Hub.

Plucking up Courage.

The West, says *The Iron Age*, was hit particularly hard during the financial flurry of last summer. Bank failures were more numerous by far than in the East or South. Business was therefore depressed more than in other sections of the country. Chicago, it is true, was abundantly supplied with currency on account of the World's Fair, which drew supplies from all sections, and St. Louis was almost phenomenally free from financial disturbances, but both cities suffered greatly through the prostration of general business in contiguous territory. Recovery has been very slow from this condition, but there are indications now of growing confidence in the minor industries, which form a very important part of the business fabric. Establishments which have been closed for lack of work and others that have stood idle since the bankruptcy of their owners are now getting into operation again. Their wheels may move slowly for a time, and but few workmen may be employed instead of the usual force, but that is to be expected. A great point is gained when the way opens for an actual start. A prostrate man gets on his knees before he rises. The fact that he can get on his knees, however, shows that he is trying to get up. It is just so with the manufacturers to whom we allude. Their efforts to run on part time or with partial force show that they have not lost all their business courage, and once having made a start they will not only acquire more confidence themselves, but will instill some into their neighbors.

While great operations will be checked until the uncertainties of tariff legislation are cleared up, there is, nevertheless, continual consumption or waste, which must be renewed. The country cannot come to a complete standstill with all the consumption stopped. The heavy curtailment of productive industries during the past summer and autumn cut down the stocks of manufactured goods in many lines to a point requiring almost an uninterrupted flow of those goods from loom or workshop through the hands of distributors to the consumer. Such a movement as this cannot be stopped unless the purchasing power of the people is absolutely cut off or factories get to running more generally and accumulate stocks in excess of the wants of the people. Neither of these contingencies is imminent. On the contrary, there is a decided probability that consumption will continue to increase, keeping pace with the gradual increase in output. This statement may be criticised by those who only draw comparisons between their present volume of business and that of the corresponding time last year, but it will be approved if comparisons are made on the basis of conditions ruling last summer and during the early weeks of autumn.

There is a disposition among Western business men to take quite a hopeful view of the situation, except perhaps those who are directly interested in iron ore mining. The rapid accumulation of money at the financial centers, surpassing anything previously known in the history of the country, is looked upon as affording a strong argument in favor of an early improvement in general business. The savings banks of Chicago, by concerted action, have reduced the rate of interest on deposits from 4 to 3 per cent. per annum, with the avowed object of discouraging further deposits and to force surplus money into business channels in which it will do more good than in the savings banks. At the same time important local projects are coming forward for the investment of capital, the promoters being inspired by the belief that this is a good time to launch them when money is abundant, the rate of interest is low, materials of all kinds are cheaper than ever before known, and labor is anxious to be employed. They argue that the time to make great improvements is when business is depressed and every advantage is on the side of the capitalist, instead of waiting until times improve and labor and material are in active demand.

The impression is also gaining ground that the new Tariff bill will be passed in the form in which it has been reported, but that modifications will be made in its most radical provisions. Whether this impression is well founded or is merely born of a spirit of excessive hopefulness, it is having an effect on quite a considerable class of manufacturers and business men, who are, therefore, eliminating the tariff question from their consideration of influences governing the course of trade within a reasonable period in the future. If they have accurately diagnosed the tariff situation, and the bill is amended as it progresses so that great interests are not seriously disturbed, there is no other obstacle barring the way to a rapid recovery of the ground lost by Western business interests in 1893.

The Fair Buildings Will Stand.

The World's Fair buildings at Chicago will not be torn down and removed as summarily as has been expected. The exposition authorities have made an agreement with the Park Commissioners, controlling Jackson Park, in which the fair was located, by which the latter release the former from all obligation to restore the park to its original condition. The exposition directory will pay the Park Commissioners $200,000 for the release and relinquish possession of the park on January 1. State buildings are, of course, not included in the transfer of property to the Park Commissioners, but all the great and small structures erected by the Exposition Company are transferred, including the Administration Building, Machinery Hall, Mines and Mining Building, the Terminal Depot, the Electricity, Liberal Arts, and Agriculture buildings; the peristyle and its annexes of the Casino and Music Hall, forming the great court of honor, which in architectural effect has never been equaled; the Transportation, Horticulture, Fisheries and Anthropological buildings; the Art Gallery, the Convent of La Rabida, the Shoe and Leather Building, Stock Pavilion, barns, band stands and pagodas. If any salvage is realized from the sale of material in these buildings in the course of time it will now inure to the benefit of the Park Commissioners. They can take plenty of time for this work and can await a more propitious period in which to offer the several structures for sale. When the fair buildings were in process of erection the exposition management intimated that a good round sum would be realized from salvage, but that hope was abandoned long since, and it was deemed inevitable that heavy loss would be incurred if the buildings were torn down during the coming year and the park restored to its old condition. In the contract just made there is a stipulation that the city of Chicago may be permitted to remove the Manufactures and Liberal Arts Building, if arrangements are made for its re-erection elsewhere.

A writer in *Le Génie Civile* shows that there is a difference in electric potential between the water and gas pipes in all houses, and that if one terminal of a telephone wire is joined to the water pipe, on lightly touching the gas pipe with the other a crackling sound will be heard in the telephone, indicating the passage of a current. When the telephone is replaced by the galvanometer the negative pole is found to be formed by the gas pipe, and the galvanometer deflection to be permanent and constant in amount during several months, with a slight daily variation. The currents are attributed to slow chemical changes. With the currents developed in these pipes the writer succeeded in carrying on conversation between two houses more than 100 yards apart.

Management of Men and Workshops.

THIRD PAPER.

General and Detail Duties in Conducting Manufacture.

BY THOS. D. WEST.

In conducting manufacture with concerns requiring a general manager with superintendents or assistants under him it often becomes a question with the former where his labors will end and the latters' commence. The division of official duties in any manufacturing concern is a very important element to properly adjust. The duties of each should be so clearly defined that should anything go wrong with work as it progressed, or the finished product be found at fault the hand of the general manager could at once be laid upon the assistant responsible.

To insure perfection in any line of manufacture this point must be rigidly enforced. The line must be drawn so fine that no possible doubt as to the one responsible should exist, for if for a moment an opening is left for one head of a department to wedge in upon another and by interference and conflict of authority cause confusion, just so soon may ill results be expected.

It is the general manager's duty to plan and set off in sections or departments the manufacture of the firm's product so that as it progresses it will be under the charge of men who are fully qualified to watch and govern every detail in the process of its manufacture.

The detail work for any line of manufacture is more or less a factor that must be closely watched to accomplich success. The superintendent or assistant can in most cases be an incessant worker, and then, with all his efforts, he may often find that things go wrong and mistakes are made. It is not necessary, in order to exhibit interest and press forward work to the most successful end, that he should run around browbeating and asserting his authority at every opportunity. Some of the most successful superintendents and assistants to be found are men who, when seen at their posts of duty, are often judged of by observers as "figure heads," men having "a soft snap;" paid a big salary for doing nothing. Little conception such critics have of the hard, tedious, exacting labor such men are often performing. They seem to think their labors should be exhibited by an herculean effort of the arms and legs, interspersed with occasional opening of a volcano trap to belch forth terrifying sounds. The quiet, unostentatious superintendent, or "figure head," as some would call him, well knows that to achieve success in the performance of his duty it is brains and not bluster that must be used, and the main secret is in giving strict attention to details. He may be required to use his legs some, but at the end of the day's labors his brains will require by far the most rest. The detail work a superintendent or assistant may do is not all conceivable to any mind other than his own. It is only the workman's physical efforts that are tangible to conception by all, and each are as distinct in their function of exhibiting labor as it is possible for mental and physical efforts to be.

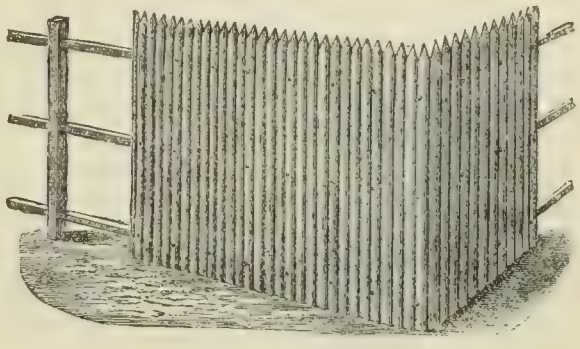
The daily details demanding attention may consist in deep thinking, designing, in directing, in inspecting and in educating or disciplining men. Altogether there may be hundreds of little things requiring study and concentration of the mind to insure desired results. They are a load which will not permit of rest in study or watchfulness. Its weight cannot be shaken off, sitting or standing. The mind must be impregnated with them so firmly that not a single item can escape having attention or be forgotten. The superintendent or assistant must know to the minute when his attention will be necessary to catch and correct errors in the manipulation of work which, from forethought, he conceives likely to occur. He will foresee and prevent accidents. The expected and the unexpected he will ever be on the alert for. Every person under his supervision is as easily controlled as the fingers of his hands. At any moment he knows what any individual should be doing. You cannot ask him a question that would betray ignorance of the doings of any man under his charge, or what is going on in his department. Surely such accomplishments are entitled to be credited as being no "soft snap." To be a good man for watching details is a very valuable quality to possess. It is equal to having power to design, to instruct, to dispatch work and get the best results out of men.

A man having all the above qualities combined is a very valuable superintendent or assistant. Too often are some of these qualities found very weak or entirely lacking. It greatly lessens a man's value if by keen thought and watchfulness he discovers details going wrong but lacks the force of character to properly oversee, reprimand and compel the wrongs to be righted.

The close watching of details in every manufacturing establishment by superintendent and assistants is akin in many respects to the duty of a general manager or president, the difference being that what he would lack in numbers would be more than made up by their importance and weight. Should one be neglected there is a chance of it bringing disaster or ruin to the establishment. With him lies the responsibility of the financial success of the firm. He must plan and study to obtain work, and then do the same to have it pass through the hands of his assistants in a manner to insure perfection in manufacture. He must be in touch with the outer world and know all that is going on, especially in his own line. If other competitors are able to undersell his firm, he must endeavor to make changes in his mode of manufacture that will admit of competition with a profit. All superintendents and assistants look to him for instruction and advice in all important transactions of their respective departments, and in all that is great and masterly concerning the establishment. He is the first to decree what shall be done, and is responsible for its enactment. Be he assistant, superintendent or general manager, he will find it is the little details of his duties that give him the most labor, and to insure success they must be as closely watched and attended to as the large and important ones.

Corrugated Fencing.

The engraving given herewith shows an application of corrugated galvanized iron, which is called in England "unclimable fencing." The engraving is from Frederick Braby & Co., 352 to 362 Euston Road, London, England. The fence is the ordinary galvanized iron, with one edge spiked, arranged to be set up on rails like a picket fence. It is made in all gauges, from 18 to 26 and from 2 to 10 feet in hight. It is fastened in place with cone head screws or nails with washers, and ranges in price in England from 20 cents to $1.40 per running foot, according to the hight and thickness.



Corrugated Fencing.

The regular monthly meeting of the Western Foundrymen's Association will be held on Wednesday, December 20, at 7.30 p.m., in rooms 702 and 703 Temple Court Building, corner of Dearborn and Quincy streets, Chicago. Hon. E. A. Wheeler of Sharon, Pa., will read an interesting paper on "Furnace *vs.* Foundry Practice." An amendment to the by-laws governing propositions for membership will be acted on. Secretary B. M. Gardner, 1437 Monadnock Block, Chicago, earnestly invites all foundrymen to be present, whether members or not, and to take part in the discussion.

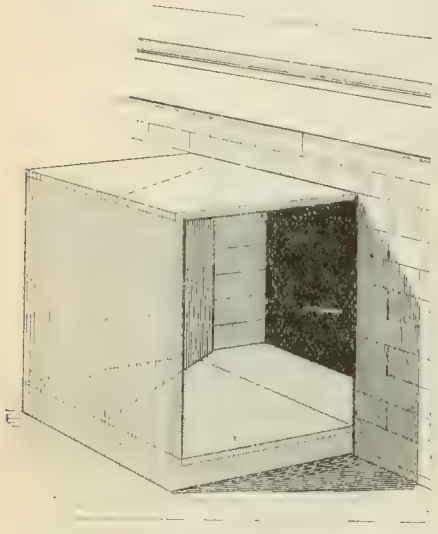
A dispatch from Williamsport, Pa., asserts that the anarchist, Auguste Vaillant, who has gained world-wide notoriety by his bomb throwing outrage in the French Chamber of Deputies, was a resident of that town last year. He was employed as a frescoer and galvanizer at the Backus Heater Works and is described as a rabid anarchist of a blood-thirsty type.

Walter Sellers of the Committee on Manual Training of the Board of Public Instruction of Camden, N. J., received word from the World's Fair Commissioners recently that three prizes had been awarded the exhibit sent from the Camden Manual Training School. The prizes were given in mechanical drawing, wood working and iron forging.

THE LETTER BOX.

Furnace Heats the Cellar.

From B. REEZE, *Odessa.*—In *The Metal Worker* of November 18 "C. E." wants a remedy for a furnace that heats the cellar. A little study of the A B C of it will enable him to supply an effective remedy. The furnace proper is simply a partition between the heat and the air within the casing to prevent the air from absorbing disagreeable things along with the heat. The jacket of the



Furnace Heats the Cellar.—Fig. 1.—*General View of Entrance to Cold Air Supply.*

furnace is a cage to hold the air near the heated surface and to direct it to the pipes that lead to the heating flues. He describes a good jacket, and as his furnace heats the cellar through it, he must have a pretty good plant. The furnace being conceded good, the trouble is with the air. If plenty of air passed through the furnace rapidly, the air would take up the heat from the furnace and carry it where it was wanted. It would seem to be a clear case of

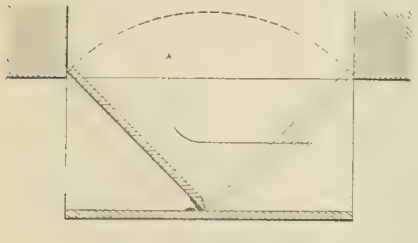


Fig. 2.—*Plan View.*

gasping for breath. If this is correct, open the window, give it air. If there is a cold air box, make it larger. It won't be a disadvantage to give it an area equal to the combined area of the pipes leading from the top of the furnace, for a damper placed in it will regulate the supply if it is attended to. It might be that the air goes right by your correspondent's cold air supply window. If it does, he must build a cover to this window, as shown in Fig. 1, projecting a foot or so, with only a top and a front to it, and hinged to the front there should be a door that will swing both ways and wide enough to strike the window on either side, as shown in Fig. 2. This will prevent the air passing and will insure the air entering the supply window no matter how it blows. A wire screen may be needed at each end to keep out leaves, &c. It may be that the furnace is "hide bound"—that is, the casing is too close to the interior parts. That is a constructive defect, but a greater air supply will help it. It is possible that the air that is heated cannot get out of the pipes because they are not properly connected with the heating flues, but more likely because the flues are too small and of improper shape. His remedy then is to put the registers in the floor downstairs and let the air through. To sum up, the fuel makes smoke and gas as well as heat. The furnace keeps the smoke and gas out of the air while it heats it. The air takes the heat and carries it off before it can heat the casing if there is provision for plenty of air to get in, get through and get out. If there are double sashes on the windows and no ventilating flues to let the air that is in the house get out and make room for warm air to get in, some outlet must be provided or air cannot get through the furnace to take away the heat of the fire.

Condensation in Chimney.

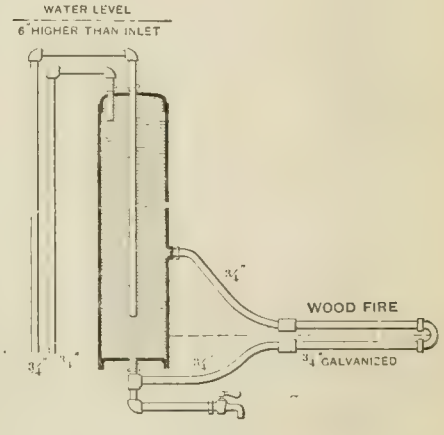
From C. S. S., *New Jersey.*—I would like to hear from the readers of *The Metal Worker* the cause and the remedy for black, sticky water running down a chimney that has a stone cap for several days succeeding a rain storm. The chimney has an old fashioned fire place and is about 2 feet square. No water can get in at the top.

Note.—The products of combustion, rising from any burning fuel, contain more or less vapor which condenses on coming in contact with a cold surface. The colder the chimney and the more smoke, &c., it receives, the greater will be the quantity of liquid condensed, even to the extent reported by our correspondent. The chimney in question is unusually large and would require a considerable fire to overcome the chilling effects of the atmosphere upon it in ordinary whether, while in rainy weather both it and the stone cap would naturally be kept at a low temperature. In rainy weather the smoke does not pass off freely, and the chimney being cold condensation is much more profuse. A remedy that has proved satisfactory in some cases is to run the stove pipe up inside of the chimney for several feet. The hot smoke pipe warms the chimney and delivers the smoke so high up that it passes off before the condensation takes place.

Is It Bad Circulation?

From L. P. F., *Fairfield, Vt.*—Please inform me through the Letter Box what causes bad circulation through the water front and boiler arranged as shown in the illustration. When the boiler was set the bottom of it had to be placed 4 inches below the water front so that the level of the water supply would be 6 inches higher than the inlet to the boiler. Water would not flow through the hot water pipe so I extended this pipe down 4 inches into the boiler, as shown; then a good flow of water was secured at the faucets. The water front is made of ¾-inch galvanized pipe, and is used in a wood stove.

Note.—There is nothing in the arrangement as shown that would interfere with circulation. The fact, however, that the level of the water supply is so little above the level of the boiler



Is It Bad Circulation?

inlet leads to the impression that the supply fails entirely at times, which would account for the water not flowing through the hot water pipe. It is not probable that any benefit is derived from extending the hot water pipe down into the boiler. In a wood fire a water front is exposed sometimes to an intense heat and again to a current of cold air, which would cause irregular circulation. If the loop end of such a water front was placed higher than the inlet and outlet end an accumulation of air or steam in it would make temporary trouble and noise, but any permanent trouble would be due to some more substantial obstruction in the pipes or connections.

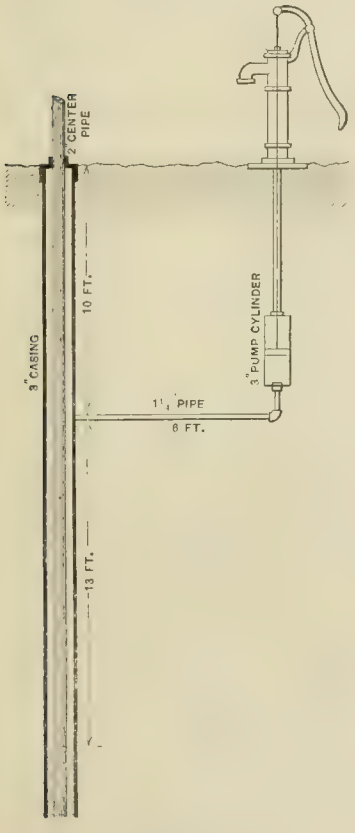
Two Chimneys For One Boiler.

From R. E. D.—Referring to remarks in *The Metal Worker* by your subscriber from Henryville, December 2, and by "F. L. W." of Plankington, November 18, would say, as I understand it, that "F. L. W." has con-

nected one fire to two chimney flues and he does not get good combustion. In an experience of many years I have never known one fire to burn well when connected to two flues, for the simple reason, as I understand it, that more heat passing up one flue causes a descending current in the other. If it was my job, and I wished to get the best possible result, I would make an easy connection to one flue and let the other stand idle.

Faulty Pump Suction.

From J. W. C., *Greenfield, Ind.*—I have a pump put on a well which draws water all right for a few strokes, then throws air. The pump suction, however, is air tight, so I am at a loss to account for the trouble. The piping



Faulty Pump Suction.

is set differently from anything I have ever seen. I inclose herewith a sketch. The water in the pipe is 23 feet below the surface of the ground.

Note.—The sketch which we have reproduced herewith shows a curious system of piping. We will be glad to have an expression of opinion on the cause of the failure of the pump. So far as we can interpret our correspondent's drawing, the 3-inch casing is plugged at the top with a 2-inch center pipe running down through it. The pump suction, however, comes in at the side of the casing 10 feet below the ground and 13 feet above the level of the water. It might be that with a 3-inch pump cylinder it would not take long to exhaust the water from the well below the limit of suction—that is, provided it did not run in again very fast; or it is possible that the center 2-inch pipe extends so short a distance below the surface of the water that when the air is exhausted in the pump cylinder it makes air bubble through from the inside pipe instead of raising the water to the cylinder. We doubt, however, if either of these are the correct explanations, as our correspondent is presumably familiar with pump work, and these causes of trouble would have occurred to him.

Steam Return to Top of Boiler.

From E. A. B., *Concordia, Kan.*—We are called upon to remedy a defect in a steam heating plant and would like the opinion of *The Metal Worker* on the change we propose to make. A manifold radiator is placed on the floor above a boiler that carries 60 pounds of steam and both pipes from the radiator connect with the boiler at the top. We intend to take the return from the radiator from the top of the boiler and connect it with the feed water supply to the boiler. Our customer thinks this change will make no improvement and that the job will still fail to heat satisfactorily.

Answer.—The change suggested will be all that is required to let the steam pass freely through the radiator and the pressure will aid rather than hinder the circulation, which is all that is required to heat the radiator thoroughly.

A Question of Pump Lift.

From J R., *Brooklyn.* — Will *The Metal Worker* please tell me how high a pump will lift water and the method of finding it?

Answer. — Theoretically, a pump should lift water to a hight of 34 feet, which is the hight of a column of water that will balance the weight of the atmosphere at the sea level. Practically a pump is doing good work if it lifts water 28 feet. Sometimes a lift of 30 feet is made, but, as a rule, a lift of over 25 feet is not attended with satisfactory results. The action of a pump is to create a vacuum, and the atmospheric pressure, which is 14.7 pounds to the square inch on the water to be raised, forces it to follow up the vacuum.

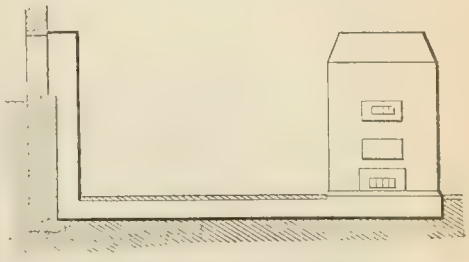
Remedy Wanted for Poor Draft.

From E. O. H., *Rock Valley, Iowa.*—Please give in *The Metal Worker* a remedy for a poor draft in a steam heating plant. The boiler is 10 feet long and has 18 tubes 3 inches in diameter. It is set in brick, with a half arch front, and is connected with a chimney that is 40 feet high. The chimney has two flues in it, each 16 inches square, that run clear to the top. A 16-inch round sheet iron smoke pipe runs 9 feet from the boiler to chimney, with a rise of 4 inches. The chimney is almost directly in front of the boiler.

Note.—From the fact that there are two flues in the chimney, a leakage between them may supply the capacity of the warm flue without the fire being benefited. If the brick work about the boiler has settled cracks may let in air with the same effect. Investigation will enable such trouble to be stopped if found. Our readers are invited to express their views on this subject.

Angles in Cold Air Boxes.

From J. B. W., *Lexington, Ky.*—The accompanying sketches represent two forms of cold air boxes for heating furnaces. In Fig. 1 the cold air box is arranged in such a manner that the bends are right angles. I have never observed that hot air would come out of



Angles in Cold Air Boxes.—Fig. 1.—Bends in Cold Air Box Made at Right Angles.

the outer opening of a cold air box when the bends were right angles, as shown in Fig. 1. On the contrary, when the bends are made angling, as shown in Fig. 2, in each instance I have noticed the hot air would come out of the cold air opening. Have any of the readers of *The Metal Worker* had a similar experience, and if so, what explanation can be given for a cold air

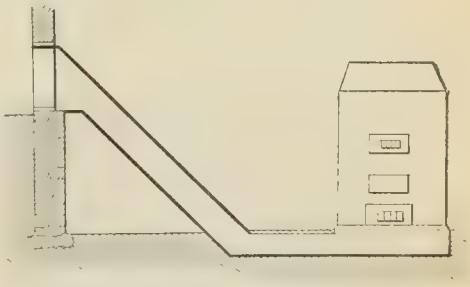


Fig. 2.—Bends in Cold Air Box Made Angling.

box constructed as shown in Fig. 1 operating in a more satisfactory manner than the one shown in Fig. 2?

Heating Bathroom from Kitchen Boiler.

From I. W. B. & S., *Gananoque, Ont.*—We are about fitting up a bathroom in our own house and would like some assistance. The main trouble is to heat the bathroom, as it is in a wing not heated by the furnace. The room is directly over the range and boiler in the kitchen beneath, and is 6 x 8 feet, with a ceiling 8 feet high. Cold water is supplied from a tank in the garret over the bathroom. We would also like some information on connecting hot and cold supply to bath and basin. We have done considerable iron pipe work, but have never fitted up a bathroom.

Answer.—The plan submitted by "R. J. M." in *The Metal Worker*, December 9, is a very good one, when all the details are correctly arranged. Other information on the same subject can be found in the Letter Box, October 7, September 30, September 9 and August 5. From reading these articles our correspondent can get information on all of the points he mentions.

PLUMBING and GAS FITTING.

Some Experiments on the Effect of Water Hammer.

The disastrous results that sometimes follow repeated water hammer in the case of house plumbing are well known, and several expedients are adopted for preventing it. The air chamber is the commonest means, but as air chambers become filled with water, devices have been introduced making use of rubber balls that would prevent the entire filling of the chamber with water. In view of the practical bearing of this subject, the paper presented at the last meeting of the American Society of Mechanical Engineers by Prof. R. C. Carpenter of Sibley College, Ithaca, N. Y., is more than usually interesting. Professor Carpenter is well known to many of our readers, having carried on experiments relating to radiators and other practical affairs. In the present investigation he was assisted by S. H. Barraclough and A. W. Wigglesworth, graduates of Sibley College.

The first set of experiments was made with a water hammer produced in a pipe 1½ inches in diameter by the sudden closing of an ordinary self-closing basin faucet, the pressures being taken by a Crosby indicator. The normal pressure in the pipe was 30 pounds per square inch. In the paper presented by Professor Carpenter are diagrams showing the variations in the pressures as recorded by the indicator for the experiments made under different conditions. In the first experiments there was an air chamber on the main some distance from the tap. This was afterward removed, and experiments were also made with the chamber filled with water. The result was that the smoothest curve and that showing least maximum pressure appears when the air chamber is used, while the most irregular card is produced by removing the chamber altogether. Filling it with water gave an effect intermediate between the other two. The vibrations after the initial shock were clearly shown in the indicator cards. The following table from Professor Carpenter's paper gives, essentially, the average pressures:

Tests were made with velocities varying from 3 to 9 feet per second, and under the following conditions:

1. With no air chamber on the pipe at all.
2. With an air chamber, capacity 320 cubic inches.
3. With an air chamber, capacity 40 cubic inches.
4. With a water chamber, capacity 320 cubic inches.

The result of the second series of tests is given in the following table:

Log and Results of Tests.

Water chamber.		No air chamber.		Small air chamber.		Large air chamber.	
Velocity.	Pressure.	Velocity.	Pressure.	Velocity.	Pressure.	Velocity.	Pressure.
3.92	152	2 92	98	3.92	94	3.70	50

...	..	8 35	270	..	.....	.....	..
. ..	....	8.55	270	.. ..	.. ..	.....	.....
..	...	8 55	277	.....	.. ..	.....	.....
..	. .	8.45	286	..	.....	.....	.....
..		8.60	289	.....	.....	.. ..	.....

In closing his paper Professor Carpenter says: "The present set of experiments does not pretend to have demonstrated any new principle, but, as was stated at the beginning, the amount of experimental work done on the subject is very meager, and these results may be of assistance to any one intending to investigate the subject more thoroughly; while they also may be of service to the hydraulic engineer, as showing the maximum possible pressure which can be produced by water ram, under circumstances similar to those surrounding this series of tests."

	Air chamber.		No air chamber.	Air chamber filled with water.
Static pressure..	29.5	28 5	27.5	28
No. of distinct blows.....	8	8	9	9
Maximum pressure	72.5	61.5	69.0	76.0
Minimum pressure.....	2 5	10	16	9
Time pulsations continue..	0.8 sec.	0.8 sec.	over 1 sec.	1.1 sec.
Pressure at end of one second...	36	34.5	36	36
Ratio of increase of pressure....	2.47	2.15	2.56	2.70

The tests above mentioned, though interesting, were not considered satisfactory, owing to the low velocity of the water in the main, the area of which was large compared with the size of the orifice. A new set of experiments was undertaken, therefore, in which the hammer was produced by suddenly closing a gate valve across the full section of a 2-inch water main. This gave much higher velocities than in the previous case, and showed more accurately the conditions prevailing in actual practice with water mains.

Domestic Electrical Work.—IV.*

By W. A. W.

FIRE ALARMS.

Another important use to which electric bells are well adapted is for fire alarm work. There are many large factory and other buildings in towns where watchmen are on duty at night that should be provided with some rapid means of communicating a warning of fire from different points in the building. In cities where the electric telegraph fire alarm system is used it is customary to place an alarm box near such buildings, but it is obvious, particularly in the case of high buildings, that in case the janitor or watchman discovers a fire in a remote part of the building valuable time must be lost in reaching the box and turning in a regular alarm, whereas if the building were provided with a private alarm, with numerous push buttons placed in the most accessible places, it would take but a moment's time to notify the fire department, and the time thus gained, together with the fact that the person giving the alarm could at once give his whole attention to extinguishing the fire, might avert a disastrous conflagration.

In installing a private fire alarm system only one wire is necessary between the building and engine house, the ground being used as a return. In advocating the use of the ground as a return, the writer does not wish to be understood as favoring this method over an all metallic circuit, for nearly all that is saved in wire must be made up by additional battery power to work a line of this kind satisfactorily. But experience has demonstrated that where a metallic circuit is used out of doors, especially when both wires are run on the same poles close together, the mischievous instinct of Young America will sometimes prompt them to throw pieces of light chain or fine wire over them, which, coming in contact with both wires, closes the circuit and gives a false alarm. Again, where wires run through trees the swaying of the branches may crowd them together and close the circuit, and these annoyances often are the cause of an otherwise valuable system being condemned as being more of a nuisance than a safeguard. In using the ground circuit these annoyances are avoided. The ends of the circuit should, however, if possible, be soldered to a gas or water pipe, which always makes the best ground connection. If these are not to be had an iron rod eight or ten feet long should be driven into the ground so as to be certain of a moist earth connection at all times.

Fig. 9 is a diagram of private fire alarm with ground return. P P P are the pushes in building, G the ground connections at either end of the circuit and B the bell at engine house. In Fig. 10 is illustrated a simple button three-line return call, with one set of battery, the bells to ring separately. Fig. 11 shows the use of the return call button. This makes the cheapest and at the same time a perfect

* Copyrighted, 1893, by David Williams.

return call system. This button has three connecting points and should be so connected that the line through the bells will be continous with the batteries left out of the circuit. By pressing the button the upper contact will be broken, while the lower will be closed, thus throwing the local bell out and the local battery into circuit, causing the bell at the other end of the line to ring. When the button is released the circuit on the local bell is closed, leaving it in position to be rung from the other end of the line.

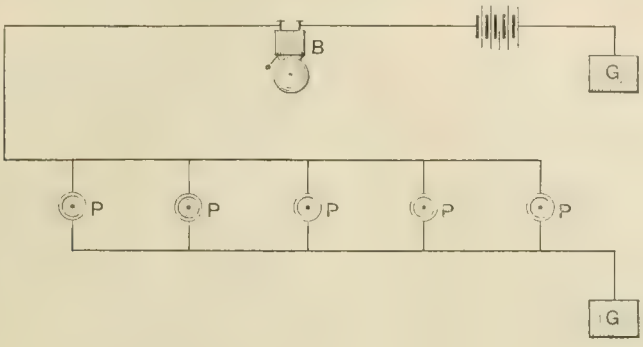

Fig. 9.—Diagram of Private Fire Alarm Circuit.

Plumbing Inspection Beneficial.

In a recent number of the *Canadian Architect* appears the following enumeration of the benefits that have been experienced as a result of inspecting plumbing work:

The by-law adopted by the City Council of Toronto some four years ago making compulsory the inspection by the city officials of all plumbing and drainage work, as well as alterations in existing work done in the municipality, is unquestionably one of the most valuable pieces of civic legislation that has marked the history of the city. Previous to the passing of this by-law the plumbing and drainage work throughout the city, even in the most expensive residences, was often done in a disgraceful manner, and in such a way as to prove injurious to the health of the occupants of the house. It was not unusual for drains to be laid without joints of any kind being made and in this condition covered up with earth and concrete, the character of the work being revealed when sickness entered the house. Under the present system work of this kind is no longer possible; the owner or his architect can demand from those who are to do the work a certificate from the plumbing inspection department that everything has been done in accordance with the provisions of the plumbing by-law, and unless the work has been done in this manner the department will not issue a certificate, and the owner may refuse payment. Another valuable feature of the by-law is that plans for the plumbing and drainage work must be filed with the plumbing department, so that in the event of defects developing in the work in the future the exact location of the pipes is ascertainable. A great deal of difficulty is often experienced in cases where alterations are required to work done previous to the passing of the by-law, as in such cases much trouble and expense is often necessary to discover the location of the drains.

TRAPS AND VENTS.

A NEW PLUMBING FIRM, at Jamestown, N. Y., is composed of Charles T. Taylor and Fred. Underwood, who will be found in the new Frederick Block, 110 East Second street. Both are young men, well and favorably known, and learned their trade in that city.

PRESIDENT EYANSON AND SECRETARY CLARK of the Philadelphia Master Plumbers' Association appeared before the City Council's Committee on Highways last Monday night in opposition to the ordinance requiring contractors and others who intend opening paved streets to deposit an amount equal to twice the cost of repairing the street as security, to be returned at the end of two years. The result is, the ordinance was referred to the Director of Public Works, the Chief of the Bureau of Highways and a committee from the Master Plumbers' Association, who will eliminate its objectionable features.

THE INSPECTOR of plumbing and sewers of Seattle, Wash., makes his report for the month of November as follows: Plumbing plans filed, 26; first inspections, 28; final inspections, 36; sewer permits issued, 5; houses connected with sewer, 7; sewers inspected, 16.

A NEW PLUMBING LAW to improve the sanitary condition of houses was recently submitted to the City Council of Meriden, Conn., by the local association of plumbers, steam and gas fitters. It was favorably received and referred to the Committee on By-Laws.

UNDER the management of the health office the City of Washington, D. C., has been placed in an excellent sanitary condition. Through the means afforded by an emergency fund of $24,000 appropriated by the last Congress a force of temporary inspectors was appointed, by whose agency a thorough and complete house-to-house inspection of the entire city and county has been made.

LOCAL UNION 2 of New York City of the United Association of Journeymen Plumbers, Gas Fitters, Steam Fitters and Steam Fitters' Helpers has elected five delegates to the convention of the State Union in Utica, the second week in January.

W. P. KENNEDY has moved his plumbing shop to 95 Bank street, Bridgeport, Conn.

THE JOURNEYMEN PLUMBERS' UNION recently petitioned the city council of Dubuque, Iowa, to adopt a system regulating the plumbing throughout the entire city and to appoint an inspector of plumbing to inspect all work done by licensed plumbers and who will see that the work is done in accordance to the system to be established by the city.

IN RESPONSE to a growing interest in high grade plumbing fixtures, Harry McQuade of Chattanooga, Tenn., who has been identified with the trade for 25 years, makes a display of fine goods at his store at Seventh and Cherry streets. He has recently received a large shipment of water closets, lavatories, enameled bathtubs and sinks from the J. L. Mott Iron Works of New York and the L. Wolff Mfg. Company, Chicago, and will make a specialty of these lines in future. He is agent for the Morgan filter, which is attached to the service pipe, several of which he has set with excellent results.

EUGENE LEIGHTON, formerly of the hardware firm of Arthur & Leighton and later in the plumbing trade, has again entered the business ranks of Fort Dodge, Ia. He occupies the rear of J. W. Ryan's hardware store, where he carries a full line.

C. S. BLAISDELL, York Corners, Maine, has contracted for the erection of an addition to his store, to be used as a plumbing shop.

AT THE CONVENTION OF DELEGATES of all the plumbers, steam fitters and gas fitters' helpers, recently held in New Haven with Union No. 21, to effect a State organization, the following State officers were elected: President, Thomas F. Bulger of Union 22 of Waterbury; secretary and treasurer, James Coyle of Union 21 of New Haven.

AN ASSOCIATION OF MASTER PLUMBERS has recently been organized in Cambridge, Mass., with the following officers: President, A. Baumeister; vice-president, Geo V. Eldridge; secretary, James A. Reid; treasurer, E. W. Clark. The object of the association is to secure better protection for the plumbers and proper enforcement of the plumbing laws.

PRESIDENT FINNERTY of the National Association of Master Plumbers is corresponding with the master plumbers of Long Island City, urging them to form a local association and establish uniform prices, which have been much demoralized.

PREPARATION is being made at Waltham, Mass., for the annual examination and registration of plumbers.

AN ORDINANCE providing for the creation of the office of plumbing inspector is under consideration by the authorities of Omaha, Neb. It provides that the inspector shall have a salary of $1500 per annum and that he shall have an assistant, who shall receive $100 per month. By the terms of the ordinance the plumbing department is divorced from the office of Superintendent of Buildings, and is made a separate department by itself.

CLERK BELKNAP of Rochester, N. Y., is now prepared to renew the plumbers' licenses. The State law provides that all certificates of registration expire Decemeer 31 of each year and must be annually renewed within thirty days preceding January 1 by all who remain in the business.

A World's Fair Story.

(From a Correspondent.)

Respectfully dedicated to the ——— Sanitary Company.

SCENE—Jackson Park, 1893.

DRAMATIS PERSONÆ.

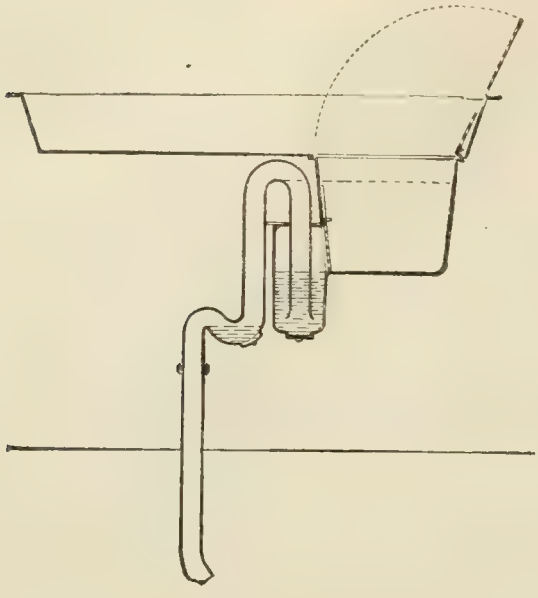
A Peekskill Military Academy School Boy (in uniform).
Some Citizens—of female sex—from "'Wayback."

Citizens (to Boy): "Say, can you tell us where we can wash our hands? Them basins in there has all got holes in 'em." [*Boy expires.*

What did the sanitary company do?

Sanitas Kitchen Sinks and Flushing Pots.

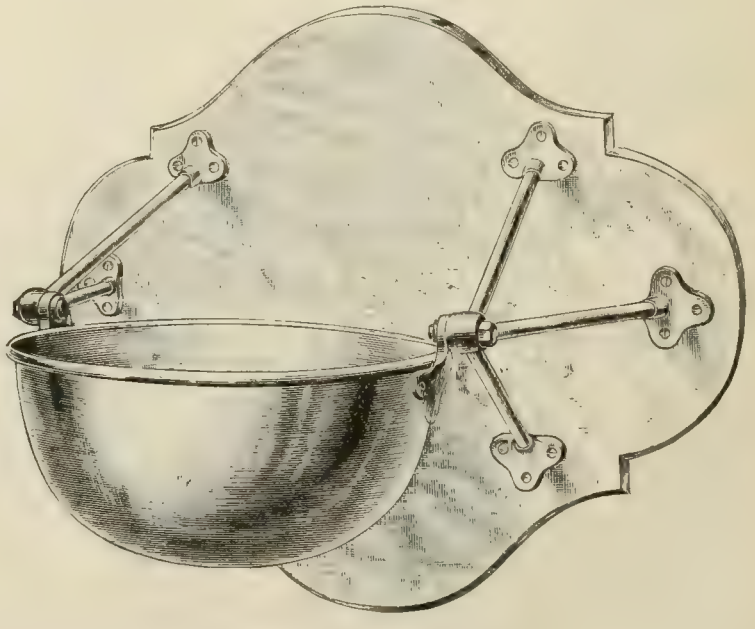
The accompanying cut shows the Sanitas kitchen sink and flushing pot made by the Smith & Anthony Company, Boston, Mass. A sectional view has been selected that the operation might be readily understood. The flush pot is so made that it can be used in connection with stone or other sinks as well as with a cast iron sink, as shown. In the bottom of the sink is a large opening covered by a hinged strainer. Beneath this the flush pot is fastened with a water tight connection. At one side of the flush pot, with a strainer that raises in a slot between them, is a trap of the Sanitas character, from the top of which the usual waste pipe runs and is trapped. This construction allows the accumulation of water until the solid matter is deposited and the grease has hardened on the top of the water. Then as the water rises to the syphon overflow the manufacturers say that a sudden addition of a few pints of water will start a syphonic action that will cause a rapid discharge of the contents of the flush pot, filling the full bore of the pipe and effecting a thorough scouring. The strainers prevent the escape of refuse to clog the pipes, and being movable give free access to all parts, relieving the task of cleaning from the objections that usually cause the work to be neglected.



Sanitas Kitchen Sink and Flushing Pot.

Tilting Wash Basin.

Pittsburgh Brass Company, Pittsburgh, Pa., and 36 Park place, New York, manufacturers of plumbers' supplies and specialties, are introducing a novel tilting wash basin, as here illustrated. It is designed largely for Turkish bathrooms, gymnasium baths and general athletic uses. The cut shows it so well that but little need be added except that it is made of extra heavy brass metal and nickel plated.



Nickeled Tilting Wash Basin.

THE PLUMBING SHOP of McGerey, Felthousen & Co., Buffalo, N. Y., was one of the sufferers in the great fire which broke out in that city on December 14. Their estimated loss is $10,000. The conflagration was caused by an explosion of natural gas, and a whole block of buildings was consumed.

NEW PUBLICATIONS.

HINTS TO PLUMBERS ON JOINT WIPING, PIPE BENDING AND LEAD BURNING. By John W. Hart. R.P.C. 1893. 311 pages. Illustrated. 6 x 9 inches in size. Published by Smith, Greenwood & Co., 19 Ludgate Hill, London, England. Price, $2.

The author is an associate of the Sanitary Institute and has received first honor medals for practical and technical work, and is instructor and lecturer at Goldsmith's Institute and Croydon County Polytechnic. The book contains 311 pages, including a well arranged index, and 184 illustrations. The preface states that it is not intended to be an exhaustive work and that some difference of opinion may exist on the "Hints" given. The introductory notes the advance made in plumbing in the last decade and points out that in spite of the discouragement met, most of the improvements have been suggested by the plumber. The

first 100 pages of the book are devoted to bending lead pipe, more particularly lead soil pipe and square pipe, such as is used for rain conductors. The main portion of the book is devoted to making different kinds of joints, underhand, upright and branch joints, on both service and soil pipes. One of the features of the suggestions on joint wiping is the recommendation that an iron be used, and that irons could be more generally used with benefit. Care in preparing the joint previous to any attempt to make it, is strongly recommended. Many different methods are shown for securing the pipe on which the joint is to be made for use in the shop or at a building. No elaborete attempt is made to explain the method of wiping a joint, which is said to be best learned only by continued practice, observing some general rules.

The last chapter is devoted to autogenous soldering or lead burning, opening with the following: "Although the art of lead burning has for many years been kept quite distinct from plumbing generally, it is, nevertheless, essentially a branch of the trade, and one in which a large number of plumbers are becoming quite proficient, not that there is required a large amount of skill or ingenuity in the execution of lead burning, because, as a matter of fact, when it is compared with first-class plumbing it is not nearly so difficult to acquire." This is followed by a description of the hydrogen machine generally used, and a method of using the ordinary illuminating gas, always readily secured, and with which good work can be done. Much in the book is interesting as showing the difference between English and American practice, and many of the "Hints" are instructive, particularly to the younger members of the craft.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

THE CANFIELD STOVE COMPANY of Rondout, N. Y., have recently installed Richmond heaters in the residences of H. Denny, J. B. Gallagher, Charles Bishop, M. Newcomb, W. J. Quick, Livingstone street church parsonage and the Rondout Club building, as well as the residences of W. C. Harris, at Acord, N. Y., and D. N. Matthews, at Shoken, N. Y.

LEIGHTON, DAVENPORT & Co., Bangor, Maine, who are agents for the Richmond boilers, have recently installed them in the residences of E. V. Merrill and N. R. Hopkins.

JAMES F. PEAVEY, Somersworth, N. H., is making arragements to have his shop heated by the Gurney hot water system.

FARRELL & CONSTON bid $499 and secured the contract for doing the plumbing work in the Chelmsford street schoolhouse, at Lowell, Mass.

HOWELL, SHANKLIN & DOWMAN, Charleston, W. Va., have been employed to remove all the water closets in the West Virginia Hospital for the Insane, at Weston, and replace them with modern closets and to improve the sanitary fixtures generally.

W. J. BURROUGHS, plumber, steam and gas fitter, Queen street west, Toronto, has been awarded the contract to place the steam, gas and plumbing fittings in the St. Lawrence branch of the Bank of Commerce, which is being built at the corner of King and Jarvis streets, Toronto.

P. J. MONTAGUE of the firm of Montague & Lewis, plumbers, of Knoxville, Tenn., is at Decatur, Ala., attending the contract which the firm has for the plumbing and steam fitting in the new court house nearing completion.

JAMES DONOVAN, Middletown, Conn., is heating the McDonough House and using Exeter ornamental steam radiators.

THE CONTRACT for putting in a water supply at the Benton School, at St. Louis, Mo., has been awarded to Ring & Reardon at $394, it being the lowest bid. The same firm bid lowest on the plumbing contract at the Washington School and were awarded the job.

THE CONTRACT for furnishing lavatories and plumbing fixtures at the Irving School, at St. Louis, Mo., has been awarded to M. Taaffe, the lowest bidder, at $953.

ALLEN & WARD, Athol, Mass., will put a steam heating apparatus into Emory Gage's new South Main street residence.

W. H. BUCKLEY & Co. have the contract for putting a steam heating apparatus into the new Hayward Block, at Burlington, Vt.

PAGE & SPEARING of Guilford, Maine, have received the contract to put a steam heating apparatus in the new schoolhouse at Milo.

AMONG THE CONTRACTS recently taken by the Samuel I. Pope Company, 360–364 Dearborn street, Chicago, can be mentioned the following: Steam heating plant for the Grand Trunk freight depot, Third avenue; for the Dental College of the Northwestern University, Dearborn street, near Twenty-fourth, steam heating apparatus; heating and ventilating plant for the Orington Lunt Library, Northwestern University; for the Quartermaster's Department, Fort Sheridan, Ill., change in ventilating system in cavalry and infantry barracks. Amount of contract, $4,469.

WILLIAM M. HALL, North Attleboro, Mass., is putting in a plant for the heating of A. S. Bishop's big furniture store and workshops by both steam and hot water systems.

TREHER & KNOTT, Gloversville, N. Y., have the contract to heat the German Catholic parsonage with a No. 6 Volunteer heater.

E. RUTZLER, 178 Centre street, New York, president of the National Association of Master Steam Fitters, is installing steam heating plants in the Cornell building, at Twenty-fifth street and Thirteenth avenue, and in Sire's Hotel, at Broadway and Forty-first street, New York. In the hotel he is using a Worthington horizontal tubular boiler. In Brooklyn he is installing the heating apparatus in the Bijou Theater, and has recently heated the armory buildings of both the Thirteenth and Twenty-third regiments of the National Guard.

THE ABINGDON HOUSE, at Providence, R. I., is being heated by H. T. Root & Son of that city, who also have heated the residence of the Rev. Father Creeden, Moosup, Conn., using Rich mond boilers.

J. V. MULVEY, Woonsocket, R. I., has recently placed a Victor steam heater in the Fairmount school house in that city.

GEORGE B. COBB & Co., 42 Duane street, New York, are engaged in erecting a steam heating plant in the Brock House at Enterprise, Fla., using a No. 125 Florida soft coal steam heater and 715 feet of Bundy Elite radiators.

E. P. YOUNG of 28 North Sixth street, Philadelphia, is doing the plumbing in the recent addition to the Rittenhouse hotel, Twenty-second and Chestnut streets, Philadelphia.

EDWARD S. HANKS has opened a plumbing shop at 58 Harrison avenue, Springfield, Mass.

JACOB DE KAM bid $575 and secured the contract for placing water closets in the Woodward avenue and Lovell street schools, at Kalamazoo, Mich.

THE WELLS & NEWTON COMPANY, 1108 and 1109 Monadnock Block, Chicago, have the contract for steam heating and plumbing in the Carter H. Harrison public bathrooms, 192 Madison street; also steam heating plant in the Tudor Apartment Building, Forty-third street and Ellis avenue. A tubular boiler and American radiators will be used in the latter.

THE SMITH & ANTHONY STOVE COMPANY, proprietors of the Sanitas plumbing specialties, 217 Lake street, Chicago, are to furnish Sanitas traps for the Champlain Building, Adams and Dearborn streets, and the great Stock Exchange Building, La Salle and Washington streets.

The Chicago Master Plumbers.

The Chicago Master Plumbers held their regular meeting at the rooms of the association, 197 Madison street, Monday evening, Decembor 11. L. A. Seeberger, Secretary of the Chicago Real Estate Board, was present by invitation of the association, and addressed the meeting on the important topic of the damage and loss to owners and plumbers by the thievery of the plumbing material in unfinished and unoccupied buildings. Mr. Seeberger stated that while the remuneration to the thieves mi ht be but a pittance, the damage and loss to owner or plumbing contractor might be a hundred fold greater. He suggested the advisablity of the Chicago Master plumbers appointing a committe to act with a similar committee from the Real Estate Board to devise ways and means of suppressing the evil. The address was well received, and in accordance with the suggestion a committee was duly appointed. A. W. Zimmerman of Washington Heights was admitted to membership in the association. In order to afford all members an opportunity to participate in the nomination of officers, and to review the year's work of the association, the next meeting will take place at 2 p.m., Tuesday, December 26. Another meeting, for the election of officers, will be held January 8, 1894, which will also commence at 2 p.m. This will give members ample time to participate in the election. The officers of the association desire a full attendance at each of the meetings.

The season's export trade of Montreal, Canada, ended on November 22, when navigation was closed. From all reports the season has been an exceptionally poor one. Freights have been remarkably low and prices bad on the other side. The amount of grain shipped from the St. Lawrence was 22,500,000 bushels.

STEAM AND HOT WATER.

American Comments on English Practice.—II.

By Percival H. Seward.

Of course I went to church while over there, but as I had heard sermons which did not seem to differ much from the one on this occasion my eyes and mind naturally wandered to things which seemed strange to me.

CHURCH HEATING.

Heating being, of course, uppermost in my mind, I looked to see in what manner this particular church was heated. There were no stoves, of course. There were fire places and ranges in abundance, but not a single solitary stove so familiar to all Americans. Fire places? I could see none in this case, so I came to the conclusion that as the church was in a cold and exposed location it must have some kind of a hot air or steam heating system. I was rather inclined to think it was the former, as, on looking over the door of the pew, I could see, far down the aisle, what appeared to be a large hot air register in the floor. When I came to inquire into the thing, and finally got permission to make an inspection, I found that they had a kind of indirect hot water system in use; but, in place of the regular indirect stacks, I simply saw four 4-inch cast iron pipes, in a trench, running the full length of each aisle. An opening was left in one end through which cold air was admitted, while the hot air was, of course, taken through the registers, or rather gratings, placed in the floor.

I found afterward that this was a system which is in general use for warming such buildings as churches and schoolhouses. I saw one of these jobs being overhauled in a schoolhouse.

The old boiler was being removed to make place for a more economical one, which would burn only 50 per cent. as much fuel as had formerly been required. I inquired as to the amount of fuel which they expected to burn and was surprised to find that we would heat such a building to 70° in zero weather with 60 per cent. less fuel than they still expected to use to only partially warm to 60° or 65° in chilly (20° to 30°) weather.

This subject of fuel is one reason why they do not strive to make their boilers as economical as ours. The first thing purchasers want to know here is "how much coal will the boiler burn in a season," while there, on account of the cheapness of the coal, they do not seem to think of that item at all.

STEAM HEATING.

Steam heating does not seem to be much in use in England except for large buildings where high pressure is employed. I saw several buildings in London and other cities heated in this way which presented an appearance somewhat similar to ours. Exhaust steam heating I did not see at all, although I understand that it is used in quite a number of cases. Live steam direct from the boiler at full pressure seems to be principally used for large buildings. Heating contractors generally told me that it would cost more to put in a low pressure steam heating apparatus for a residence than hot water. I only saw one job and this was evidently put in from plans drawn by an American engineer, as nearly everything used was imported from here and presented quite a different appearance from their general run of work. No steam pressure (above the atmosphere) was carried intentionally, as it was run on what they call the vapor system of heating.

GUARANTEEING TEMPERATURE.

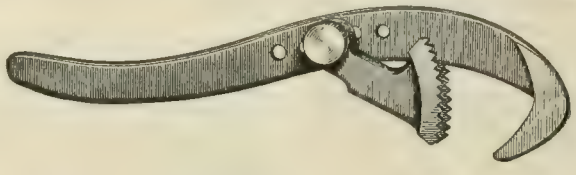
One firm I visited were just getting out plans for a system of hot water heating to be placed in a schoolhouse, and were very much troubled because they had to give a guarantee to maintain a temperature of 95° in any weather. "Why," I said, "we never close up a job without the usual guarantee that the apparatus when completed will warm the building to 70° in zero weather," which appeared to be very unreasonable, as they said they never guaranteed a job at all unless it was city or Government work, and then very seldom, if it could possibly be avoided.

The fact is they rarely figured out the pipe necessary to warm a residence, but simply put in whatever was handiest, as it did not matter what temperature the apparatus was capable of maintaining, the majority of their customers would use the open fire place in any case.

The prevailing idea in England is that we heat all our offices, sleeping rooms, schoolhouses, railroad cars, &c., to an entirely too high temperature, and those who had been over said that they felt the effects of our overheated, oppressive rooms very much. They preferred the hot water can and rug at any time to our overheated railroad cars. They have a mild climate, comparatively speaking, and do not care for living rooms at a temperature of more than 65°, and would actually refuse a heated sleeping room, while we want eating, sleeping and all other rooms at 70° at least in a climate where the thermometer sometimes runs down as low as 20° and 30° below zero. This, of course, is another reason why there is so much difference between us. We want well heated houses with everything connected with them as neat and attractive as possible, while they actually, in some cases, put in a heating apparatus simply to keep the chill off the rooms if the regular fires should for any reason be neglected and get low or go out entirely. When making any comparison it is well to remember that "circumstances alter cases."

GREENHOUSE HEATING.

In the matter of greenhouses they are not much behind us, as some people here still think 4-inch pipes are correct for this kind of work. This is rapidly being dispelled, however, as we can readily see from the manner in which small pipes are being more and more used. Small pipes are used here more than in England, as our very changeable climate demands an apparatus which will adapt itself very quickly to the sudden variations in temperature. A large body of water is too sluggish in its circulation, takes too long to heat when the house is cold and too long to cool when the house is hot. I explained to several people over there how this could be avoided by using small pipes, but they said at once that their temperature was generally stationary for days and weeks together in the winter months, and therefore they preferred a system which would hold its own in case of neglect to one which was more economical and effective when it was properly attended.



An English Pipe Wrench.

CONCLUSION.

I will say, in conclusion, that while my visit to England was necessarily short I saw many things which amused and also instructed me in this line of business. I noticed particularly that the subject of schoolhouse heating and ventilation is being agitated in a very effective manner. It seems to me to be a fight between systems of natural (cowls, &c.) ventilation and those which are mechanical (fans, &c.), although it is hard to see where there is any comparison between a fan system of ventilation and a few cowls and fresh air pipes. Mechanical ventilation seems to be making rapid strides, and although it is not likely that it will ever take the place of what we call natural ventilation (ventilation by means of columns of air at different temperatures), still it will hold its own and always be popular for some buildings.

[THE END.]

An English Pipe Wrench.

The annexed illustration shows the Tiger pipe wrench, patented by T. R. Paxton and manufactured by Timmons & Co., Birmingham, England. It is made entirely of wrought steel by special machinery and then tempered, giving it great strength and wearing qualities. Superior gripping power and the quickness with which it can be used are other features claimed. It is adjusted to different sizes of pipe by simply removing

the bolt from the movable jaw and replacing it in the proper hole in the lever jaw.

HEATING NOTES.

BUYERS of pipe cutting and threading tools and machinery will find the New York office of the Armstrong Mfg. Company at 139–143 Centre street after the first of the year.

THE FIRST CALENDAR to reach us this year is from the Gurney Hot Water Heater Company, with Boston office at 163 Franklin street and Chicago branch at 59 Wabash avenue. The calendar is a large card, the greater part of which is given up to a fine engraving of Nancy Hanks. We presume the suggestion is that the Gurney heater will circulate water with a speed equivalent to that in which the famous mare would cover a mile. The calendar proper is a pad of a dozen sheets attached to the lower part of the card.

THE RAYMOND & CAMPBELL MFG. COMPANY, Middletown, Pa., publish an estimate blank for the Sun steam or hot water heaters of their manufacture. The blank is arranged so that any one wishing an estimate will have little trouble in giving all the necessary information for the manufacturers to figure upon. The location, construction and particulars of the house are provided for, windows, hights of ceilings, size of cellar, flues, aspect of the house, &c., and in fact all that is called for in a preliminary estimate.

JOHN MANEELY, 219 Arch street, Philadelphia, Pa., who makes a specialty of steam and hot water fitters' goods and supplies, reports that the reception which has been given the Keystone radiators during their first year on the market has been in every way satisfactory.

IN A REVIEW of the trade of British India, published in the *Indian Engineer*, J. E. O'Conor mentions that the imports of galvanized iron have more than doubled in recent years. For roofing this description of material is in great demand in India, having taken the place of tiles or other material for sheds constructed by port trusts, municipalities, railways and mercantile firms all over the country. In the hills, private residences and stores, European and native, are universally being roofed with this material, the advantages of which are becoming generally recognized.

CASWELL & MOORE, Phœnixville, Pa., have the contract for roofing the furnaces of the Montgomery Iron Company, Port Kennedy, Pa. This firm of metal roofers are also figuring on a contract for the large pier shed to be erected in New York for the Jersey Central Railroad.

A curiosity in corporate literature is the following announcement in a recent list of applications for corporation licenses in Illinois: "Towaxystwo Porzyczkowe I Budowincize M. Kopernika, at Chicago; capital stock, $1.000,000; incorporators, John Bank, Frank J. Karch, Bernard Makiowicz, Adam Piasczynski, Frank Marcankowski, Frank Sowadzki and Kazinwinski Zychlinski." The population of Chicago is so cosmopolitan that foreign names appear very frequently in applications for licenses to incorporate, but this is, perhaps, the most striking specimen of an unfamiliar dialect to American readers that has thus far graced the official papers of the State of Illinois.

Inadequate Ventilation of Offices.

In an able article contributed to the Philadelphia *Record*, Dr. F. A. Adams touches on the question whether the large increase of steam heated office buildings, in which the great majority of rooms have no adequate means for renewal of the air to be warmed, does not, in large measure, account for the prevalence of pneumonia among those employed in such offices. Many of these buildings, Dr. Adams remarks, are admirably constructed to keep out air, whether cold or hot, this very perfection contributing to their insalubrity. In these hermetically sealed office rooms that abound in business buildings the steam heats the atmosphere to a delightfully comfortable degree, the occupant breathes and rebreathes the air during zero days when an open window cannot be endured, the effect being to silently undermine his powers of resistance, so that when he goes forth, exchanging such tropical air for the keen breeze of unrestricted nature, it happens that, through some subtle change in his system which has robbed his lungs of their power of resistance, their capacity to endure the onset or transition is gone, and the subtle poison of unrenewed air does its deadly work in the form of pneumonia.

The Golding Fire Proof Floor.

A series of experiments have been made lately at the Howard Iron Foundries, South Boston, with the Golding fire proof floor. At the suggestion of Capt. John S. Damrell, inspector of buildings, a section of the flooring in question was constructed in the foundry yard. It consisted of a section of single floor arch, with a span of 16 feet, making a surface of 62 square feet, resting upon iron girders, which were supported by four heavy timber blocks imbedded in the ground and rising above the surface about 4½ feet.

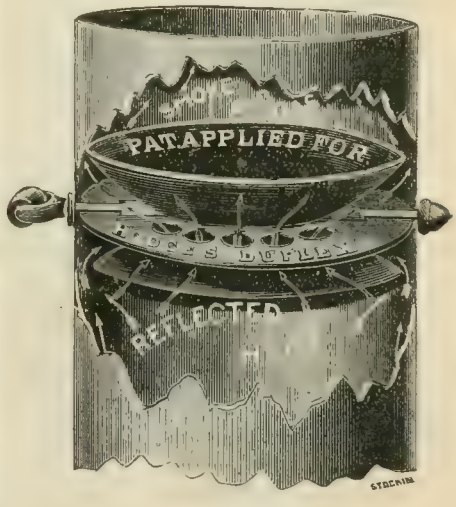
In making this arch, after the forming under boards were in place, the expanded metal, which is composed of meshes of steel, was stretched across and the cement concrete poured in and leveled up to the required hight, the metal being thus thoroughly imbedded in the concrete. On this was placed a single layer of boards. This was left to set and harden for about three weeks, though it is well known that it takes at least as many months for such concrete to even approach a maximum hardness and tenacity.

Tuesday evening pig iron was piled upon this floor arch to an amount equal to 750 pounds per square foot, or 46,500 pounds. Later an additional weight of pig iron was placed upon the arch of 9300 pounds, bringing up the total weight to 900 pounds per square foot. Up to 1 o'clock, even with this great load on, no perceptible deflection was noticed. When the time set for the exhibition arrived an additional weight of about 72½ pounds per square foot was put on, which brought the total load of the section of floor arch up to 60,310 pounds, or about 972½ pounds per square foot of surface.

Under this great weight the arch began to give, but the movement was at first slow, and even when it went down it was a gradual and easy descent—not a sudden disruption and a crash. When its central part reached the ground it still held together, and its ends did not leave the supporting iron cross beams.

Hodge's Duplex Damper.

The accompanying illustration shows a smoke pipe fitted with Hodge's Duplex damper, made by Hodge Brothers, 15 Chardon street, Boston, Mass. The special features of this new damper are readily understood. It consists of a round disk, on the top and bottom of which are concave reflectors. These reflectors are not quite so large as the pipe, giving passage for the smoke and products of combustion around the outer edges. Holes in the middle of the disk furthermore allow the gases to pass on up the chimney. In this way the smoke and gas are permitted to escape. A special feature claimed for this device is that the heat is retained and not wasted up the chimney. The claim made is that the concave reflector holds back the heat where it is wanted. The dampers are described as well finished, with an enameled wood handle, and are made in sizes from 3 to 10 inches, while larger sizes will be made at short notice.



Hodge's Duplex Damper.

Speaking of the comparative value of metals, Thomas A. Edison said recently: Gold is only valuable because it is rare. It is not nearly so useful as iron, which is the real precious metal. Aluminum is too soft, it is light but it lacks strength. The metal of the future is nickel steel, which combines strength with pliability. Gold is not worth as much as lead in commerce, and brass is more than worth its weight in gold.

An English scientist, Dr. Cohen of the Yorkshire College, has been making some interesting experiments as to dust particles in the atmosphere in different parts of the city of Leeds, on a clear day. It was found that at Woodhouse Moor, a large open space, there were 530,000 particles to the cubic inch; on the Yorkshire College tennis court, 850,000; at the Town Hall 1,200,000, and at the parish churchyard 3,500,000.

The North German Lloyd Steamship Company have established a new line of steamers to ply between Baltimore and Bremen.

TIN PLATES.

Exports of Tin Cans.

The vastness of the growing canning industry in the United States, and its bearing on the tin plate trade of the country, is commented on by a writer in a recent issue of the *American Exporter*, who gives figures to show how much of the tin plate imported and consumed by this country is re-exported annually in the shape of cans containing preserved products. Taking only a few lines of tinned goods, we find that in 1892 the following were exported:

Breadstuffs prepared and shipped in tins	$1,714,000
Canned salmon	1,738,000
Other canned fish	225,000
Canned fruits	2,498,000
Canned beef	7,876,000

These few canned articles alone reached a total value of $14,051,000. If were added the cans containing kerosene, lubricating and other oils, and the numerous other articles which are exported in tins, it would be better appreciated how large a portion of the $20,000,000 worth or so of tin plates we import annually is again sent out of the United States, much of it returning to the country from which we first received it. This is not, moreover, the only form in which tin plates are re-exported. The export trade in culinary and other household tinware is also attaining some importance, and is annually adding to the consumption of tin plates in this country.

SCRAP.

THE PLANT of the Locust Point Iron & Steel Company, at Locust Point, Md., has been sold to Mrs. Anna A. Coates for $25,000. The sale was made by virtue of decree of the Circuit Court of Baltimore. The property included the rolling mill and tin plate works, as well as considerable adjoining property.

THE JERSEY TIN PLATE WORKS and the Vernon Tin Plate Works, both at Britton Ferry, Wales, have lately been added to the list of idle plants.

F. R. PHILLIPS of 200 Walnut place, Philadelphia, is supplying to the Phillips Tin Plate Company of Philadelphia an improved Phillips automatic adjustable tinning machine, which, with three other machines already in operation, will give that company a capacity of 1000 boxes per week. Mr. Phillips is also building for N. Tratter & Co., Philadelphia, a new tinning plant to contain five Phillips improved tinning machines. Among other machines recently shipped have been three to the Newcastle Tin Plate Company, five to N. & G. Taylor Company, Philadelphia; three to the Chicago Stamping Company, two to the Canonsburg Iron & Steel Company, two to the Meurer Bros. Company, Brooklyn, N. Y.; one to the Lalance & Grosjean Mfg. Company, Harrisburg; two to Gummey, Spering & Co., Philadelphia, and one special machine for heavy work to the Iron Clad Mfg. Company, Brooklyn, N. Y.

THE ENGLISH TIN PLATE MANUFACTURERS and operatives are naturally much interested in the fate of the Wilson bill, or, at any rate, in that portion of it that relates to the proposed readjustment of the tariff on tin plates. In a recent issue, the *Western Mail* of Cardiff, Wales, prints an interesting interview with Lewis Richards, president of the Tin Plate Workers' Union, in which he states that over 200 British tin plate mills are idle, out of a total of 500. "Since the McKinley scare," Mr. Lewis is quoted as saying, "the state of trade has been very unsatisfactory. We are hoping that, with the almost certain reduction of the United States tariff and the fact that the large number of mills idle must have materially reduced stock, we shall enter upon a period of prosperity with the new year."

EXPORTS OF TIN PLATES from Great Britain for the month of November were 26,000 tons, as compared with 29,000 tons in the corresponding month of last year. Of this amount 15,000 tons were sent to the United States, being a slight increase over the shipments for October, but falling short by 5000 tons of those for November, 1892.

THE PHILLIPS TIN PLATE COMPANY of Philadelphia have built an extension to their works 50 x 60 feet to accommodate three additional sets of tinning machinery.

THE CIRCULAR and price-list published by the Apollo Iron & Steel Company, Pittsburgh, Pa., is a handsome example of a trade publication. At first sight it appears to be an ordinary price-list, 6 x 3½ inches, printed in colors, but closer inspection shows the care and expense that have been given to its preparation. The cover is of heavy paper, bearing the name of the concern and list of their manufactures, which include galvanized sheet iron, terne plates, iron and steel sheets, &c. The middle of the cover bears the trade-mark of their galvanized sheets, printed in red. The inner pages, 12 in number, are printed on one side of the sheet. A notable feature of the entire publication is that every page is printed from steel plate, three colors of ink being employed, black, red and blue, the larger letters looking as if they were put on in oil with a brush, while the text and figures in black have that clean, clear cut appearance of steel plate work. The first page gives a price-list of galvanized iron according to the list adopted July 1, 1893. The next page gives the extras. Then comes an announcement page relating to roofing sheets and terne plates, followed by reference to their Apollo special soft steel and next their Apollo refined. The back cover shows the standard gauges for black sheets as adopted by the United States Government and taking effect last July.

A RADICAL DEPARTURE from old established methods is made in the design of an annealing furnace recently invented for the purpose of annealing small sheets of steel used in making tin plates. The old practice of charging and drawing boxes through doors at the side of the furnace is abandoned, the furnace being built vertically and charged in that manner. By a simple arrangement annealing boxes, together with their bottom plates and contenst, are easily handled by two men, manual labor is largely dispensed with, and there is consequent saving in labor cost. It is claimed that the furnace is economical in construction and maintenance. The design is adaptable for using various kinds of fuel, such as coal, natural gas, crude oil or fuel gas. A. Beard, Cambridge, Ohio, is the inventor.

THE NEW CASTLE TIN PLATE COMPANY, New Castle, Pa., have just placed in position at their works what is regarded as the biggest tin whistle in the world. It is over 10 inches in diameter and is the design of Chas. Greer and Master Mechanic H. Hartsuff. Its voice will be heard at various times during the day and at nine o'clock every evening, when the night shift goes on duty.

Negro Skill at Tuskeegee.

As illustrations of the capacity and skill of the negro when efficiently trained, a Southern correspondent of the New York *Evening Post* recounts the following particulars of work and accomplishment lately carried out by teachers and pupils of the Tuskeegee Industrial School for negroes in Alabama, all of whom are colored: Professor Taylor drew the plans from which the large three story brick addition was made to Alabama Hall, Tuskeegee. He furnished the drawings for the industrial building, at Mount Meigs, Ala., also the designs for some pretty cottages of five and six rooms each, for teachers' homes. Professor Calloway is an authority on surveying in this country. He recently completed a clever bit of civil engineering in bringing water to the school from a mile away, and in laying off a system of mains to carry it to every building on the school grounds.

At the blacksmith's shop Professor Simon has made a very neat steam engine from his own drawings, which is now used to run the large Campbell cylinder printing press. A canning factory, with a capacity of 2500 quarts per day, was in successful operation during the season of fruits and vegetables. Our resident physician, Dr. Dillon, passed the summer in Philadelphia, taking special courses of study in the treatment of the eye, ear, nose and throat. Professor White of the Boston Conservatory of Music has taken the first steps toward the establishment of a similar institution here. After a close connection with the school, during 11 of its 12 years of work, I am pleased to say that no enterprise, started here, has failed for want of skill on the part of those having charge of it.

The town of Danbury, Conn., has appropriated $50,000 to provide employment and otherwise relieve the destitute of that community.

ROOFING AND CORNICE.

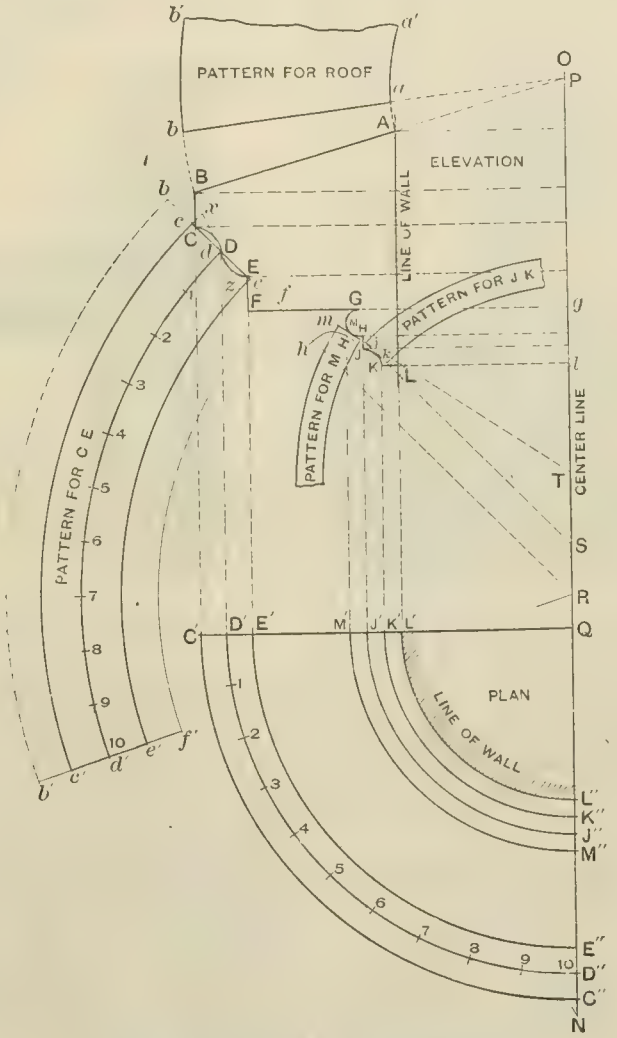
Blanks for Circular Cornice.

From C. U. B., *Louisville, Ky.*—I would like to be informed, through the columns of *The Metal Worker*, of a method for obtaining the patterns or blanks for the various moldings used in a cornice to go around a circular tower. The profile of the cornice is inclosed.

Answer.—In the accompanying engraving is shown the quarter plan and elevation of a circular cornice for which the pattern blanks are required. By an inspection of the cut it will be seen that a considerable portion of the patterns can be obtained from the elevation without referring to the plan, yet the plan will be found convenient for obtaining the stretchout of parts and obtaining some of the patterns. To obtain the pattern of roof, or such part as may be desired, extend B A to the center line N O, and, with P as center, and P A and P B as radii, strike the arcs indicated by *b b'* and *a a'*. Draw the line P *b*, and on *b b'* lay out a stretchout of C' C'' of plan, and from the point thus obtained draw a similar line to P. Such allowances for edges as may be desired are to be added. On account of space only part of roof pattern is shown.

For B C a strip having the width indicated by B C and the length shown by C' C'' of plan is required. The principle to be employed in obtaining the pattern for C E is simply that which would be used in obtaining the envelope of the frustum of a cone. To do this, the general average of the profile is to be taken in establishing the section of the cone; that is, a line is to be passed through its profile in such a manner that the frustum obtained can be formed to the shape with the least labor. In the present instance we will assume that *c e* is the proper line to draw. From D set off the stretchout of D C and D E, as shown by D *c* D *e*. Prolong *c e* until it intersects the center line N O in the point R. Then we can consider R to be the apex of a cone of which *c e* represents a section. If it is desired to measure the pattern from point D of profile, drop a line from D to D' of plan and strike the arc D' D'', which divide into any convenient number of parts. From R as center and R D as radius strike the arc D *d'*, and on this arc lay off a stretchout of D' D'' of plan, and through the last point obtained, as *d'*, draw R *d'* extended. From R as center strike the arcs *c c'* and *e e'*. If C B is required on the same piece it can be added to the pattern just obtained, as shown by *b' b c' c*. The pattern of E F can also be added, as shown by *e e' f f'*. If it is desired to have the blank with less flare, as indicated by the dotted line *x z*, it can be struck from point N as center.

The pattern for E F can be obtained as directed for B C, the stretchout being obtained from E' E'' of plan. The pattern of the planceer F G of the elevation can be obtained by taking E' J' J'' E'' of plan, or the distance from G M H would be to take a strip whose width would be equal to the stretchout of G M H, cut in a short distance along the edges, and then raise to shape. The width of H J is given in the elevation, and the length can be obtained from J' J'' of plan. If J K was to be formed by stretching, we would draw the average of the profile, making it equal to the stretchout of J K, as indicated



Blanks for Circular.—Plan and Elevation.

F to *g* and G to *g* in elevation can be used for radii in striking the pattern. If G M H is to be made in halves, the joint being at M, and the parts brought to the desired shape by raising, a line that would represent the average of the profile, as *m h*, could be drawn and extended to point T in the center line N O, and T *j* and T *m* used for striking the pattern, only part of which is shown. The same pattern would answer for G M.

Another method for constructing by *j k*, extend same to the center line, and use S *k* and S *j* for striking the pattern. If it was desired to form the part from H to L in one, the required amount of material could be added to the edges, as was done in the case of the pattern for C E. The radii for striking the pattern for K L can be obtained from the plan or elevation, as may be desired. While the net patterns only are shown, such allowances for edges as the method of construction requires are to be added.

FLASHINGS.

THE NEXT ANNUAL MEETING of the National Iron Roofing Association, which we understand is to be an important gathering of the organization, will be held the second Thursday in January, the 11th prox., at either the Southern or Linnell Hotels, St. Louis, Mo. The trade will take notice that the day of the meeting has been changed to Thursday instead of Tuesday, as formerly existed.

THE FIRM OF MARLIN & CO., Allegheny, Pa., manufacturers of water conductors, eave troughs, metallic skylights and galvanized iron cornices, have been succeeded by the firm of Marlin & Co., Incorporated, the change going into effect on Friday, December 1.

MANUFACTURERS of tin shingles say that if the proposed reduction of the duty on tin plates is carried out the consequent reduction in the price of the plates will enable them to compete very closely with wood shingles and slates.

THE PENN IRON ROOFING & CORRUGATING COMPANY., Ltd., of Philadelphia, have received a pleasing letter from the management of the Scattergood Building, in Birmingham, Conn., in regard to the five steel ceilings put up in that building by them. One of the ceilings is in the auditorium, a portion of the building to be used for church purposes, and capable of seating 2500 people. In speaking of the acoustic qualities of the ceilings, the writer states: "On Sunday we had a crowded house, and the singing and speaking were as clear as if the room was empty, which cannot be said of plaster or wood."

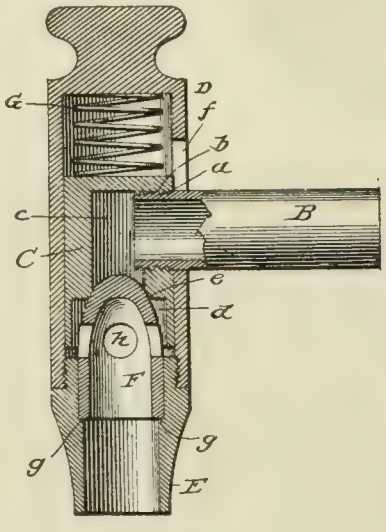
A FIRE recently burned out the shop of Guindon & Durant, coppersmiths and cornice makers, at Boston, Mass. The loss is said to be about $3500, on which there is an insurance of $2500.

A NOTICEABLE IMPROVEMENT in the demand for sheet metal working machinery, particularly such as is especially adapted to sheet metal roofing, is noted by Geo. C. Keene & Co. of Cincinnati, Ohio. Within the past week they have shipped the following: One large flanging machine to the McClary Mfg. Co., London, Ont.; one 8-foot geared brake to the New York Exhaust & Blow Pipe Company, Hartford, Conn.; and a carload of cornice and roofing machinery to the Allen Cornice Works, Chicago, Ill.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., advise us that notwithstanding the general depression in business their sales have steadily increased. They attribute this to judicious advertising and meeting the demand by making prices as low as is consistent with honest goods. They have unexcelled facilities for shipping, being able to secure low freight rates to all points in the West and South, and are in a position to handle carload lots or less of any of the various lines they carry. Their lines embrace corrugated iron in all its forms, for roofing, siding and ceiling, standing seam roofing, steel and one-third steel; both self capping and in rolls, V-crimp, beaded ceiling, steel imitation brick, &c. They also handle the well known Empire sheathing and all other kinds of building paper, felt roofing, mineral wool, iron cresting, woven wire fencing, wire railing, &c. They issue a series of catalogues, circulars, &c., which will be sent upon application.

Cock for Water Cooler.

Savill, Walls & Co. of Philadelphia, manufacturers of plumbers' supplies, are putting on the market the cooler cock shown in the accompanying cut. The cock is designed with the object of furnishing a simple, durable and compact self closing cock, constructed so that a minimum amount of frictional wear will result from its use. In construction the cock is simple. B is the draw off pipe connecting with a cooler or other vessel, screwed by means of the threads *a* and threaded aperture *b* into the head C. The head has a chamber, *c*, communicating with the draw off pipe. At the lower end of the head is a large recess, *d*, communicating with the chamber *c* in such a way as to form a shoulder, *e*, to serve the purpose of a valve seat. D is a sliding casing surrounding the head C, having a longitudinal slot, *f*, for the passage



Cock for Water Cooler.

of the draw off pipe, and provided with a spout or nozzle, E, which is detachable. The bore of the spout is reamed out at one end, as shown, so as to form the valve support *g*. F is a loose valve, hollow, and provided with apertures, *h*. The valve has a conoidal upper end, in order to allow of its normal closing, lightly, in the seat *e*, thus effectually preventing the passage of water from the chamber *c*. Owing to the peculiar form of the valve, it is claimed that in the case of the seat *e*, becoming worn and enlarged the valve will extend further into the chamber. G is a spring to hold the head C upon the valve F.

The makers claim that the valve is simple in operation, depression of the head being all that is necessary, and that frictional wear of the parts cannot affect its efficiency. The cock was invented and patented by Jas. H. Savill.

Stephen J. Meeker, president of the New Jersey World's Fair Commission, a large manufacturer of malleable and gray iron castings, at Newark, N. J., says that the Commission is waiting for bids for the New Jersey State Building in Jackson Park. If a good price is offered the building will be sold, otherwise the building will be taken down and brought to the State and probably erected at the Sea Girt Encampment as a military headquarters for the Governor. The building is an exact duplicate of the historic Washington's headquarters at Morristown, N. J.

The Electrical Co-operative Kitchen.

Of the possibilities of the co-operative kitchen with electrical cooking apparatus W. S. Keys argues forcibly that it is really as foolish for the housewife to undertake the cooking for her family as it would be to spin and weave their clothing, or to make, in her own bungling way, the family's shoes. Cooking is a fine art; and the individual kitchen, besides being necessarily costly and wasteful, contrasted with the cheap and saving co-operative system, seldom (relatively to members) produces really fine and excellent cooking. On well prepared and appetizing food depends, to no small degree, not merely the comfort, but the health of the family. Intelligence must preside over the kitchen as well as over the general affairs of the family; and upon it we must depend for the rescue from the extravagance of maintaining and running separate kitchens and the unnecessary waste and blundering. The relief from the cooking and the laundry work would enable the housewife to make almost a pleasure of the rest of the work—the sweeping, dusting, cleaning, table setting, dish washing—and enable the establishment of a more systematic and saving arrangement. All supplies would be purchased by wholesale; the "help" would be competent and would understand the work, and there would be no waste, every scrap would be saved. Each family would receive its daily bill of fare, nicely and intelligently cooked, to be served at home. It is the estimate of an experienced authority, Mr. Key says, that a person's meals, nicely cooked by an experienced *chef*, could be furnished for $1 a week, if a hundred were thus to be provided for at the same time.

An electrical kitchen is described by Mr. Key—and he attended a dinner, given to a dozen persons, that was cooked in such a kitchen, by the appliances of the Electric Heating Company of Boston—a first-class dinner, under the supervision of an Italian *chef*—and it was cooked without a spark of fire. The kitchen had no stove or range. A large elevated cupboard, to hold all the utensils, had, running along its bottom front, an electric switchboard, furnished with essentially the same appliances as a telegraph switchboard. Below and in front of it was a dresser or table, on which were the kettle, coffee pot, saucepan, plates, &c., each utensil connected electrically with the switchboard. The big oven was at one side, with the steak broiler on top, and a flue to carry off all fumes. Beyond it was a upright copper boiler, that furnished hot water to a sink and washbowl on the other side of the room. Everything was heated and cooked by electricity, and the roast joint in its gravy from the oven, the steak from the "grill," and the vegetables—all were as appetizing as any ever cooked by the best fire. This is all significant of what we may expect a dozen years hence.

Arnold H. Moses, one of the firm of architects of Moses & King of Philadelphia, Pa., resides at Merchantville, N. J., and represents that city in the New Jersey Sanitary Association.

For two days, recently, a monster eel stopped up a water pipe in Boston, until forcibly removed.

THE RETAIL STORE.

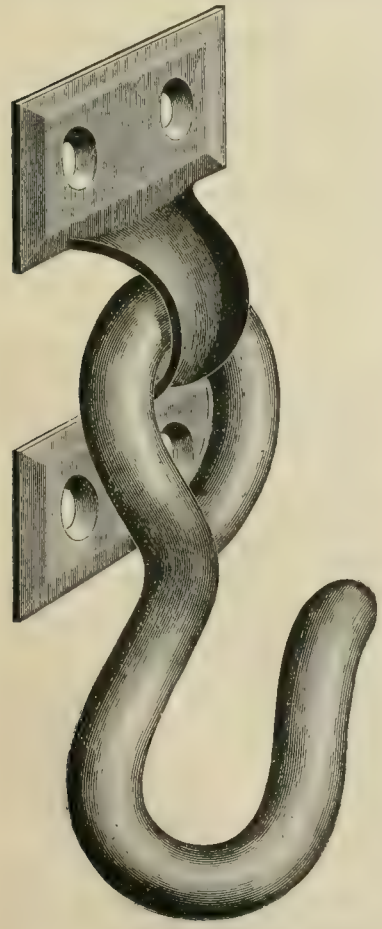
Steel Broiler.

The accompanying cut represents a steel broiler being introduced by the Cleveland Stamping & Tool Company, Cleveland, Ohio. The broiler is made of a single piece of heavy, cold rolled steel, all in one piece, which the manufacturers claim is peculiar only to this broiler. The point is made that it has no seams or rivets to catch grease, that it will not warp, that it cannot be broken and that it catches all of the juice of the meat.

Steel Broiler.

Stearns' No. 200 Hammock Hook.

E. C. Stearns & Co., Syracuse, N. Y., are putting the hammock hook herewith illustrated, on the market. The plate is made of a special quality annealed sheet steel, and the hook is formed up from ⅜-inch wrought iron. The company state that the article is the result of a great deal of experimenting on their part to produce a hook which would be lighter than those now on the market, and at the same time possess equal strength; that although the hook is very light it is at the same time capable of sustaining great weight, and that they have no hesitation in pronouncing it as strong as any of the regular size hammock hooks on the market. The hooks are tin finish, and are packed 1 dozen in a box.



Stearns' No. 200 Hammock Hook.

The Safety Cistern and Well Cover.

The Safety cistern and well cover shown in the accompanying cuts is offered by Menefee & De Vilbiss, Fort Wayne, Ind. The cover is made of cast iron, japanned to prevent rusting, having an outer rim (Fig. 1, Letter A), which is to be firmly cemented to the wall of the cistern or well, to obviate any possibility of bugs or worms getting into it. It is provided with an adjustable lid (Fig. 1, Letter B), to be used in connection with a pump, to fasten it in position, as in Fig. 2. For a pump placed in the house a solid lid is provided (Fig. 1, Letter C), instead of the split lid, this being fastened by a lock bolt, to obviate danger to children. The cover is provided with an air box, to allow foul air to escape, to keep the water in a pure and healthy condition. It is explained that the construction is such that no surface or waste water can possibly return into the cistern or well, and that either lid can be removed without disturbing the outer rim by the use of a common wrench. The manufacturers remark that the device, besides being as cheap as others, is free from dirt and insects, and that it is not open to the objections of wood covers, the underside of which become damp, causing decay, a growth of vegetation, and become inhabited with vermin, small snakes, &c.; also that, unlike wood covers, it will not become rotten and unsafe.

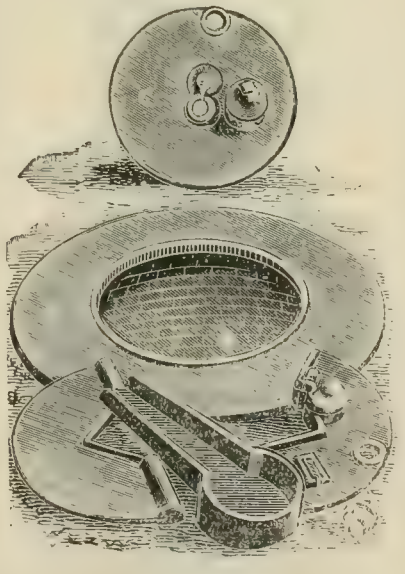


Fig. 1.—The Safety Cistern and Well Cover.

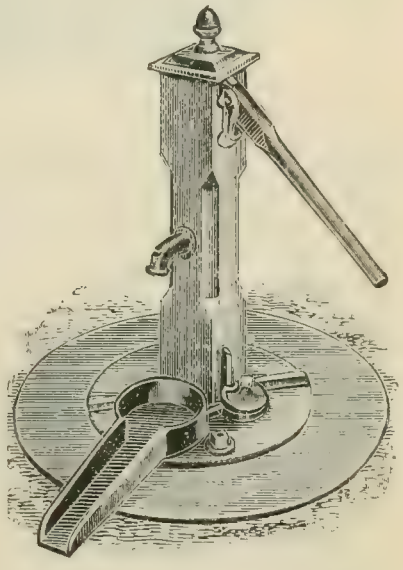

Fig. 2.—The Cover in Connection with Pump.

Holiday Show Windows

Additional attention may profitably be given to dressing show windows in anticipation of holiday trade. Activity in this direction need not be confined to merchants who make a special feature of Christmas goods, as those who carry Housefurnishing, Sporting and Athletic goods have many articles in stock, which, if presented to the public in holiday attire, will solve for them the vexing question of what to buy for presents. In fact, it is more needful for those to make a display who have not the reputation of handling holiday goods than for those stores to which purchasers would naturally go to have their wants in this direction supplied. At this time of the year customers hold their purse strings less tightly and expect to be more liberal in their purchases than at other seasons. These facts should be taken advantage f and high priced goods and those which have been hard to dispose of, which might be considered at all suitable for presents, can now be brought forward with good effect. Articles which are old to the merchant, and which he may be disgusted with, are probably new

to the majority of his customers, and will repay some labor in putting them in an attractive condition. It may be surprising, after the holidays are over, to see how many of these old stand-bys have taken to themselves wings.

While every one is supposed to know the use of most articles kept in a Hardware store, nicely lettered cards attached to the article, giving its name or use, will attract attention. In addition to the name some sentence, as, "Does your wife sweep?" "How's the old Tea Pot?" "A nice Christmas present!" "Does the boy skate?" "This is no hair splitter, but cuts clean!" &c., attached to corresponding articles, will produce the desired effect in many cases.

Prices marked in plain figures and placed on articles in the window will catch many customers, especially as many buyers have decided just the amount they will spend for each gift. If the article is made to appear to them suitable and the price comes within their means, an examination of the goods, with a few judicious words from the salesman results in a sale. The purchaser would probably not have come into the store to inquire the price, especially if not in the habit of trading there. The majority of people will buy presents, even if it involves going without some of the necessaries, and such prices should be made that will appeal to buyers as bargains. In such times as these merchants may be satisfied with the exchange of goods for the cash, at a slight advance on the cost, rather than expect large profits because it is holiday time.

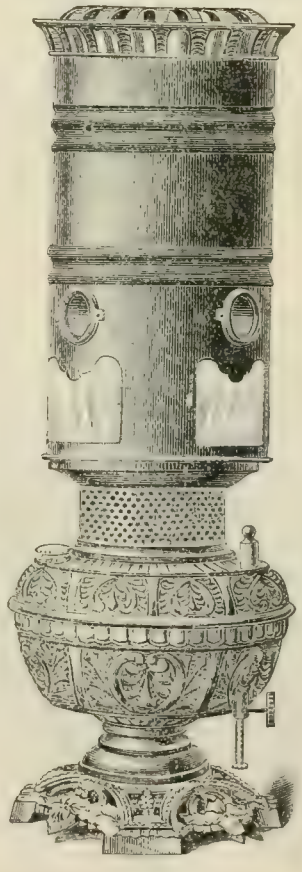
This principle applies to Christmas window dressing, as to any other—not to have the window crowded. An attractively arranged window, with goods shown as nearly as possible in the manner in which they are used, supplemented by a bright colored sign outside calling attention to Christmas goods, will cause people to stop in front of the store. In making signs, prices and cards for the display goods something better than wrapping paper and a marking brush is demanded. People will judge the quantity and quality of the goods before seeing them, by the quality of the signs. Let these be made by the best sign writer within reach and be done in his best style.

Something green in the window helps the display, as evergreens are so intimately associated with the popular idea of Christmas. Not too much green, but enough to give the window a decided holiday effect; not as if the evergreens got in there by mistake, but showing care and taste in arrangement and that a definite object was in view. An advertisement in the local paper can be used to advantage, in which special attention should be called to the window display. Articles in the window can be changed about each day for sake of variety, other goods substituted, and goods disposed of for future delivery can be marked "sold," showing business is being done.

All the foregoing suggestions are based upon any present stock, without special additions of holiday goods, and the work of getting things in shape for display cannot be commenced too soon.

Banner Oil Lamp Stove.

The Plume & Atwood Mfg. Company, 18 Murray street, New York, are introducing the oil lamp stove herewith illustrated. The fount and base of the lamp are nickel plated. The body of the drum is made of Russia iron, with round openings arranged to allow a continuous flow of cold air to be drawn into the flame, there to be heated and to be thrown off, largely increasing the heating capacity of the stove. The entire top lifts off from the fount for lighting, cleaning or trimming. The draft is regulated by an inside drum and side



Banner Oil Lamp Stove.

air chamber, so that no chimney is required. The flame is regulated by their Banner screw wick movement, which allows of nicety of adjustment. The manufacturers state that the fount has a capacity of about 1 gallon of oil, that it burns from 10 to 12 hours, without odor, heating comfortably at a nominal cost a room 15 feet square. The stove is referred to as especially valuable where only temporary heat is required, as in bedrooms, bathrooms, &c.

The Delmonico Meat Tenderer.

Pullman Sash Balance Company, Rochester, N. Y., are putting the meat tenderer shown herewith upon the market. The knives are described as made from tool steel, ground to a chisel point. The plunger, as shown in Fig. 2 is taken out by removing the pin when cleaning and washing the tenderer. The parts, it is stated, are all interchangeable and are easily kept clean. The tenderer is furnished both in tinned and japanned.

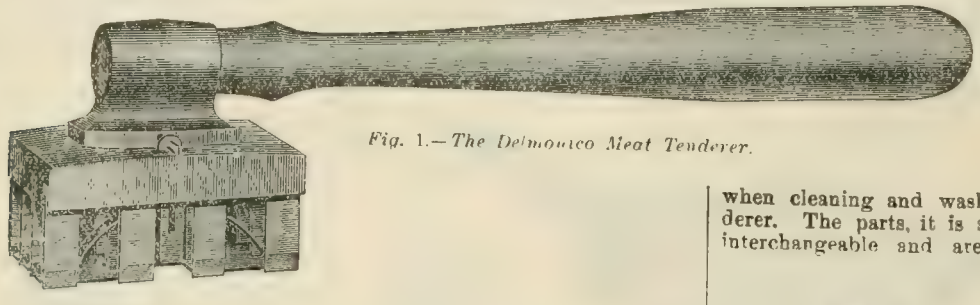


Fig. 1.—The Delmonico Meat Tenderer.

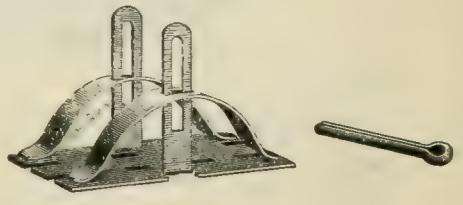

Fig. 2.—Plunger and Key.

MEMORANDA.

FRED. F. WHEELER of Albany, N. Y., who has been the South Pearl street dealer in Acorn stoves and ranges and house furnishing goods, has located in the handsome new building of the Albany Public Market Company, on Beaver street, and has an immense store there.

THE HARDWARE BUSINESS of A. M. Smith, at Silver Springs, N. Y., has been purchased by George E. Piper, who took possession December 1.

AN ENTERPRISING Brooklyn merchant recently hit on a novel mode of advertising. He purchased several thousands of high grade flat steel keys of a well known lock company, to each of which a tag with blank spaces for name and address was attached. These, with a four-page circular directing attention to many articles for sale, with prices, were inclosed in envelopes, and extensively distributed in territory adjacent to his premises. In the circular reference was made to the key, saying that 10 per cent. of the keys would fit a lock hanging just inside their door. Every one who succeeded in opening the lock would secure a neat sewing chair. In addition, all the keys entitled the holder to a chance at a handsome parlor suit then on exhibition in their window. After trying the lock the key was dropped in a box for a future drawing for the suit, the tag containing the person's name and address.

The Herreshoffs of Bristol, R. I., have received an order from a New York man for a Tobin bronze steam yacht, which, it is said, will be the finest yacht afloat. These famous builders are enthusiastic over the future and efficiency of Tobin bronze in yacht construction.

Ingenious Device for Catching Thieves.

The Hardware firm of Foster, Stevens & Co., Grand Rapids, Mich., recently employed electricity and photography to detect a burglar. It being found that their money drawer was systematically robbed at night, W. D. Stevens of the above firm applied to the Grand Rapids Electric Company to devise some scheme by means of which the thief might be detected, and suggested what may be termed the Electro-Photographic method.

The Electric Company's efforts resulted in the detection of the thief, the method adopted being shown in the accompanying illustrations. The device as first arranged is shown in Fig. 1, the camera being so placed as to get a front view exposure of a person standing before the money drawer. Electric connection was made with the Electric Company's plant to operate the device. A burglar alarm device was fitted on the money drawer, so that when the drawer was opened the shutter of the camera operated, exposing the lens, at the same instant setting off a flash light. The night after the apparatus was first put in place the thief opened the till and the apparatus worked just as had been designed, but the thief, in order not to be seen from the street, had placed himself under the desk and drew the drawer out over his head. Upon developing the plate the following day it was found that a good photograph had been taken, though the thief was not in it. The night man was, however, arrested the following day upon suspicion, and quickly confessed all when asked if he knew that his photograph was taken when the light flashed in his face. The flash light flared up the moment the drawer was pulled out, but the thief continued his work and rifled the till. He came to the conclusion that he had been discovered, and was easily brought to confession.

The second apparatus designed, as shown in Fig. 2, is referred to as working well, but no thief has yet appeared to be operated upon. The plan, no doubt, is capable of wide application. All parts of the apparatus can be so arranged as to be thoroughly concealed from the eye of the thief. An indisputable and convincing proof of guilt is a photograph of the offender, taken in the act; and the foregoing plan suggests a safe and efficient method of detecting burglars, which is capable a of wide adaption.

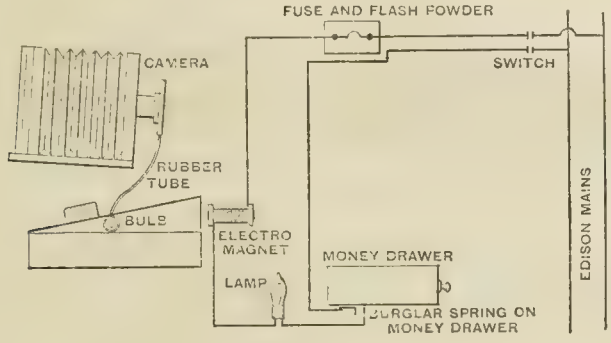

Fig. 1.—Photographic Detection of Burglars.

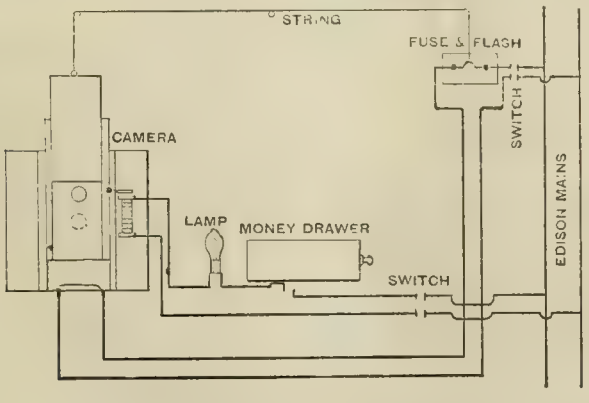

Fig. 2.—Another Arrangement of Apparatus.

Origin of Hardware Terms.

There is more or less uncertainty as to the origin of many trade terms in general use, and not a few of the designations of various kinds and sizes of Hardware articlesare involved in obscurity as to the reason for their adoption. As examples of this the way in which Nails are designated as 10 or 20 penny, the gauge of Shotguns, the numbers of Screws, Caps, &c., will readily occur to our readers. These and similar terms have been unquestionably in use for a long time and the origin of terms is largely tradition, as most of such markings originated with foreign makers before Hardware was manufactured in this country. When similar goods were first made here the designations familiar to the trade were naturally adhered to by the American producers so that confusion might be avoided, in very much the same way as American Tin Plate makers have adopted the foreign terms to designate the different grades of American Tin Plates. Among well informed persons explanations of most of these terms are, however, current, and in many cases there is little reason for doubt as to their correctness. In some instances, however, there are different and inconsistent explanations given and on these questions there is of course, more or less doubt. We give below the opinions of well informed parties as to the origin of some of these designations:

The Gauge of Guns.

The usage by which the bore of Guns is designated, as, for example, 12 gauge, is supposed to have originated in this way: The gauge of Guns was determined by the number of pure lead bullets, spherical in shape, any one of which would fill the bore of a Gun. Thus a gun whose bore would be filled by one of 12 such bullets weighing together a pound was termed 12 gauge.

Numbers of Caps.

The numbers given to Caps are supposed to have been arbitrarily given by foreign makers and were continued by American manufacturers when the goods were produced here.

Bastard Files.

The origin of the term "bastard" as applied to Files is generally explained in this way: The rough File was first made, then the second cut. A demand for a File between the two was afterward developed, which being out of the regular line was termed bastard.

Penny Applied to Nails.

Two explanations are current in regard to the use of the term "penny" as a designation of the size of Nails. The one which is very generally adopted is as follows: That the word penny is a corruption of pound. Thus, a 4d Nail was one of such a size that 1000 of them weighed 4 pounds. It may be remarked that originally the term "100" when applied to Nails was six score, or 120, consequently the 1000 was 1200. Another explanation is based on the fact that Cut Nails are comparatively of recent date, having been first made in this country, and were introduced in England as late as 1846. Formerly all Nails were forged, and the price for forging 1000 1½-inch Nails was 4 pence, or as the term is now used, 4d; the price for forging 1000 2-inch or 6d Nails was 6 pence and so on. As a reason why small Nails could be forged so cheaply it is stated that children often did the work.

Numbers of Horse Nails.

The numbers given Horse Nails are supposed by some to have originated in the same way as penny with Cut Nails, according to the first explanation given above. Thus, 1000 of any size weighed the number of pounds designating the number of the Nail. No. 6 Horse Nails would then weigh 6 pounds to the 1000; No. 8, 8 pounds, &c. It is obvious, if this explanation is correct, that the present weight of any number of Nail does not correspond to the original weight of the same number.

Numbers of Screws.

The numbers by which Screws are known designate the numbers of the Screw gauge to which the sizes of the Screws correspond. It would appear that Screws were first made in the various sizes and then a Screw gauge made as a standard, and Wire used in the manufacture of Screws drawn to conform to this standard gauge. The Screw gauge bears no relation to the Wire gauge, as in the case of Screws the largest number designates the largest wire, while in the Wire gauge the largest number represents the smallest size Wire.

STOVE TRADE NOTES.

The Stovemen's O. F. and L C. Club.

BY JEEMS.

This club, unimportant to the public, but the center of the universe to its members, is in quite a quandary regarding their future course. Like all other organizations, they have not escaped the prevailing pecuniary epidemic, and they have reduced their daily expenses down to such a fine point that death would probably ensue if any further retrenchment was made, at least that is the opinion of the German nobleman who keeps the Beanerie de Dispepsiary where this cantankerous and argumentative organization meet.

According to the baron proprietor, the club want a reduction on the price of meals. "Of 15 cend don't was cheap enough for roast meat mit dree kinds of dings mit it, and five cend for pie, den I shoot myself. Che, dem fellers wants roast tearkey for ten cent. Hauber I don'd care und I guess its bedder dot dey gone avay. Dey talk unt preach mit polidics unt religions und all kinds of stuff schust like crazies, holler und shout so strong dat der dishes dumble off der tables. Dey git so scared for fear dey get smashed dey smash themselves, yust like oder dam fools when dey get scared. Cost me more for crockeries den I git out of dem. Yes und I pet you yust as soon as der Demokrats members gits a machority around dot dable, dem saloon is full of 'publicans eating dinners, den dey git so mad at Democratic foolishness dat they talk, dey don'd talk low; oh no, der peoples look oud of der elevated road vinders cos dey hear dem, und dey say, 'Oh hear dot fide in Krause's ;' dot hurts me. Yes und it is just so when de Republican fellers gid de most in und dem Democratic customers, hear noting but Republican foolishness talk, den they git der ears on und by chiminey I gid crazy yust like lunatics, mit all der public gomplainds.

"Before der panixy day used to spend tirty cend, fordy cend, und vonce and vile fifty cend, che, day don't aferage twenty cend now, und by chimney dey kick all der time, dey wand palace cars mit velvet wheels for ten cend. You know what I tell 'em, yes, und I tell em to der faces, der inside is Krause's and der oudside is Pearl street. You run dot street in, but you can't run Krause's und dond you efir remember it."

It is reported in Water street that one of the members flipped a forty-cent check on the counter the other day and it startled the lady cashier so that she fainted and was sick for a week from the effects of the shock. Last year this time they had their eye on the Manhattan Club House, but Iselin got the best of them. But it was lucky for them, as the panic would have swamped them.

The refusal of Krause to cut down his hash dispepsiary prices has made a great commotion in the club; in fact, they have dropped tariff, religion, Hawaii and the balance of the earthly affairs which they used to regulate and have put all their brains to work to beat Krause and get a new hunking place.

It is reported generally that this club has secured the St. Andrew's coffee stand at the corner of Pearl and Frankfort streets, under the bridge.

In addition to its importance as an inexpensive institution the club will have a better chance to shout. To be sure the people on the bridge may be startled at times, but it cannot be helped.

They can pace up and down the walk and declaim to their hearts' content—in short, fling themselves to the winds and let it waft their eloquence from Cherry Hill to Kalamazoo. Objections were made by some of the members that it was not a good place for stormy weather, &c. But when that crowd gets excited they couldn't feel an earthquake, let alone such trivial affairs as blizzards and cyclones—objections overruled.

The only real generous man in the club is Henry Gleason. If a beggar dodges past the lynx-eyed cashier and gets to that table he is sure of a contribution and "God bless you" from Henry. As for the rest, it is not necessary to say much, but the beggar would drop dead before they would stake him. A few days ago one of these unhappy wanderers floated up to the table and Gleason, as usual, went for his First National Bank Trousers pocket, but found to his chagrin that the customary cent was missing. He explained to the miserable mendicant his unfortunate plight and in regretful tones bewailed his fate at the absence of his usual stipendiary coin that he bestows upon the worthy and unworthy beings who frequent the downtown slums. "I am sorry, my friend, for you, I can't give you any money to-day, but here are some microbes. God bles you."

ODD PLATES.

THE JACKES-EVANS MFG. COMPANY, 100 102 South Commercial street. St. Louis, Mo., have recently issued a four-page circular calling attention to the merits of the Acme wrought steel ranges which they manufacture in several styles. These goods, we are told, are constructed with a view to "economy, durability and general utility," and are "thoroughly tested and guaranteed." Among the special features to which attention is invited may be noted large oven, asbestos lined flues, swing feed door, high warming closet, water coil, drop oven door, scuttle ash pan, ventilated oven and nickel trimmings.

A SHORT TIME AGO we noted in these columns the fact that the Quick Meal Stove Company of St. Louis, Mo., had received an order for some of their goods to be shipped to South Africa. Since then the company have received another export order for Quick Meal stoves to go to Curacao, West Indies. The company have strong hopes that this order will be followed by still others of a larger nature, and that considerable business will be developed.

THE STANDARD LIGHTING COMPANY of Cleveland, Ohio, are offering the trade a new cabinet process stove, combining new features of interest and value. The stove is of attractive appearance, the ornamentation being of a neat and tasteful order. The oven is said to be the largest employed in connection with this style of stove, and is made on the company's "reflex" principle, which insures an even temperature and satisfactory operation. The ovens on the company's Nos. 3 and 4 semi-cabinets are of planished steel and asbestos lined. The oven burner is referred to as being powerful in operation and giving intense heat. The burner drums are made of brass, reinforced, and the reservoir so constructed that it can be easily taken apart for the purpose of cleaning, while the valves are readily detachable without being unsoldered. The company informs us that they are also bringing out a full line of "new process" gas stoves.

A VERY NEAT FOLDER, in imitation of a piece of birch bark, reaches us from the Boston Furnace Company of Boston, Mass. The second page of the folder is devoted to a picture of the building formerly occupied by the concern and showing workmen engaged in removing the stock to a dray and taking down the sign. Beneath the picture is the inscription "We are off with the old." The facing picture represents the new quarters of the company at 175 Hanover street and covered with signs indicating the varied assortment of goods carried in stock by the company. This picture has for a caption "We are on with the new." Between the two pictures is the statement that "The parting gave no pain."

A RECENT ISSUE of the Evansville *Courier* contains a short history of the Southern Stove Works, operated by Kiechle, Brentano & Oberdorfer, at Evansville, Ind. The changes which have taken place in the concern since its establishment in 1867 are noted, while a brief sketch of the heads of the concern forms an interesting feature of the article. It is illustrated with a general view of the building occupied by the company.

WE HAVE RECEIVED from the Quincy Steel Range Company of Quincy, Ill., a very neat four-page circular illustrating and describing the Noxall wrought steel range which they have brought out, adapted for the use of hotels, restaurants, boarding houses and private families. The oven is made extra large, the flues are asbestos lined and the high closet is made of planished steel. The arrangement of parts is such that the water front can be connected to a pressure boiler with satisfactory results. The water front is on the opposite side of the fire box from the oven, so that there is no interference with baking operations. The stove is finished in a superior style and ornamented with full nickel trimmings. It is intended for burning hard or soft coal, wood or coke and is made in several varieties.

The company state that they employ the best workmen and use the finest grade of materials in the construction of their goods.

THE NEW PLANT of the Kernan Furnace Company, at East Utica, N. Y., has been completed, and it is the present expectation of the company to have the works in full operation early in January. The business of the concern has gradually assumed such proportions as to render increased manufacturing facilities necessary, and the result is the new plant, which is fully equipped to meet the requirements of an extensive trade. A description of the new works of the company was published in these columns on March 18 of the present year.

ON THE EVENING OF DECEMBER 4 a blaze occurred in the core room of the Hart & Crouse Furnace Works, Utica, N. Y. The fire had gained considerable headway before it was discovered, and the building was nearly demolished. Fortunately, there were but few patterns and other articles of value in the structure, and the loss will not amount to over $1500, fully covered by insurance. The fire did not necessitate a shut down.

THE CHICAGO *Inter Ocean* for the 6th inst. publishes a very appreciative sketch of the industries of Mansfield, Ohio, from which the following extract is taken: "Second only in importance to the Aultman-Taylor Works comes the factory of the Baxter Stove Company, founded by Thomas Baxter, of whom, as one of the industrial pioneers, we give our readers a portrait. The works are now operated by his seven sons, who are leaders in every good word and work looking toward Mansfield's upbuilding, commercially, ethically or socially. The Baxter Stove Company manufacture 50 different styles of coal, wood and gas burning stoves, the Banner brand being known throughout the Northwest. Besides these, they make 13 different styles of gas and gasoline stoves and ranges, which, under the brand title of Monarch, have gained an enviable reputation."

AN ANNOUNCEMENT TO THE TRADE has been made by G. W. Landon, to the effect that on November 13 he was appointed by the Circuit Court permanent receiver of the William G. Fischer Mfg. Company of Kokomo, Ind., since which time he has made a careful inventory of the property. As the result of this inventory he has decided to operate the plant and use his best efforts to place the business in shape to supply customers promptly and satisfactorily with all the goods heretofore turned out by the concern named.

A CIRCULAR has been issued under recent date by George H. Barbour of Detroit, Mich., calling attention to the destitution existing in that city, and soliciting subscriptions, either in the way of money or merchandise, for the purpose of providing an adequate fund for caring for the poor and needy. The circular states that prompt attention is imperative with the conditions existing at the present time, and Mr. Barbour says that the main object in issuing the circular is to ascertain what amount can be raised and then call together the subscribers, or as many of them as can be present at a stated meeting, and appoint an executive committee, secretary and treasurer, together with such other officers as may be necessary to successfully carry on the work.

THE WROUGHT IRON RANGE COMPANY, St. Louis, Mo., are kept busy in their range department, and are averaging nearly a carload of their Home Comfort ranges every 24 hours, the shipments being made to all parts of the country. The company are also pushing their hotel ware department, and have recently sent outfits to the following hotels: R. C. Chambers & Co., *café* at Hot Springs, Ark.; Ingall's House, Bellefontaine, Ohio; Mexican Gulf Hotel, at Pass Christian, Miss. They have also shipped a large lot of copper ware to the Arlington Hotel Company, at Hot Springs, Ark.

EDWIN A. JACKSON & BRO, 50 Beekman street, New York, are one of the exhibitors at the World's Fair Prize Winners' Exposition in the Grand Central Palace, at Lexington avenue and Forty-third to Forty-fourth streets, New York. In the display is one of their well-known ventilating grates on which they received an award at Chicago. The metal work is of bronze, including fender, front, &c. This is surrounded by a tile facing, which is a combination of stone and brick work effect. The tiles are in two colors and two sizes, the whole harmonizing and showing to advantage.

EMMETT C. BAXTER, secretary and treasurer the Baxter Stove Company, Mansfield, Ohio, accompanied by Mrs. Baxter, are making an extended trip through the East, visiting New York, Philadelphia, Baltimore, Washington, D. C., and other cities. The trip combines business with pleasure, the principal object, however, being to arrange Eastern agencies for handling the new Monarch vapor and gas stoves made by the firm. While at Washington Mr. and Mrs. Baxter will pay their respects to the President and Mrs. Cleveland.

THE CARTON FURNACE COMPANY of Utica, N. Y., executed the contract for ventilating and heating the new school building in the Twelfth Ward of that place, and on December 4 the first test of the apparatus since the occupancy of the building was made. Superintendent Griffiths and Architect Gouge are reported by a local paper as being well pleased with the results of the test, and the figures presented showed that the air was changed in all the rooms in less than 15 minutes and in one room in a fraction over 7 minutes. These results are said to have been accomplished with heaters running very moderately.

THE 1893 CALENDAR issued by the Fuller & Warren Company, Troy, N. Y., met with such a gratifying reception at the hands of the trade that they have made the calendar for 1894 of the same general style. It measures nearly 11 x 14 inches in size, and is provided with a metal loop for hanging up. The heavy cardboard which forms the foundation of the calendar carries 13 sheets, measuring 8¼ x 10¾ inches, there being one for each month in the year, and one devoted to what is known as a counting house calendar. The latter gives the days of the week for 1894 and for six months of 1895. The sheets or leaves are of tinted paper, while the printing is in a deep chocolate color. We understand that the company will shortly issue advance sheets of a new warm air furnace catalogue, which will fully describe a cheap hot air heater, comprising 20 styles and sizes.

THE BELLAIRE STOVE COMPANY of Bellaire, Ohio, favor us with a copy of the supplement to their catalogue No. 2. It consists of 12 pages, and illustrates and describes the Brilliant Star range, an entirely new six-hole construction, embodying several features to which special attention on the part of the trade is invited. It has a large chute shaped feed in front, capacious fire box, thoroughly ventilated and supplied with duplex revolving grate, sectional fire walls, large ash box, cut top, heavy covers and centers, square ventilated oven, patent oven door opener and end shelf. The water in the extension tank is heated by circulating through a pipe extending lengthwise over the fire and into the tank. The Brilliant Star is made in three sizes and the usual modifications, the style of ornamentation of all being neat and effective.

THE BUCKWALTER STOVE WORKS, Royersford, Pa., will shut down on December 22, and remain closed until after the holidays.

SOUTHARD, ROBERTSON & CO., Water street and Peck slip, New York City, are offering the trade two sizes of their London furnace or double heater, which is made with or without galvanized iron casing. Its constructive features include, among others, shaking and dumping grate, dust damper, large cast iron ash pan and vapor pan. The manufacturers refer to it as being a very powerful heater and as suitable for use in stores, halls, &c.

THE CO-OPERATIVE FOUNDRY COMPANY of Rochester, N. Y., made a present of a Thanksgiving turkey to each one of their employees the day before that holiday.

SUPPLEMENTARY CATALOGUE No. 16 is being distributed by the J. D. Smith Foundry Supply Company, Cincinnati, Ohio. The supplement shows a full line of Monk's molders' solid steel tools, and includes a number of the latest shapes and sizes of handy tools suggested by practical molders. Trowels of all sorts are shown, stove tools, flanges, knives, mallets, spools, rammers and a large number of special tools for molders' use. Besides illustrations of various tools, the different sizes and the prices of each size are given in the circular.

FRANCHISES have been secured by the Schuylkill Valley Illuminating Company for the construction of an electric railway connecting Valley Forge with Spring City and Royersford, Pa, taking in Phœnixville, Harveyville, and other towns. The facilities afforded by this new road will be much appreciated by the inhabitants of that stove making district.

THE BOSTON FURNACE COMPANY of Boston, Mass., have just been settled in their new quarters in the building at the corner of Hanover and North Centre streets, with entrance at 175 Hanover street. A full line of samples of Novelty furnaces, hot water heaters, domestic ranges, Belding's New Perfection refrigerators and George M. Clark's Jewel gasoline stoves, for all of which the company are exclusive New England agents. Representatives of the Boston Furnace Company will soon visit the trade in the interests of the several lines named.

THE WAREHOUSE AND CONTENTS of the Auburn Stove Company, Auburn, Maine, were destroyed by fire on December 14, and the molding department was damaged. The total loss is estimated at $40,000, the greater part of which is covered by insurance.

THE MICHIGAN STOVE COMPANY have recently put out a most exasperating puzzle as an advertising device. It consists of a number of vertical, horizon-

tal and diagonal lines with dots at the intersections. The trick is to stick six pins in the dots so that no two of them will come on any one line. There is a solution, of course, but it is one of those things over which a man can tire his brain and fingers for hours and have the trick forever elude him. If he persists in softly saying to himself all the while "Garland stoves and ranges," he may not be assisted in solving the puzzle, but he will surely prevent himself from swearing.

THE CHATTANOOGA STOVE COMPANY, whose plant at Chattanooga, Tenn., has been idle for some time past, recently resumed operations with a force of 40 hands. We understand it is the intention of the management of the company to begin at an early date working full time with a full complement of men. A large number of orders are in hand and it is expected that business will continue to develop in sufficient volume to keep the works running the entire winter.

D. S. COOK, 171 and 173 Lake street, Chicago, heats his office and sample room with one of the Kelsey Furnace Company's corrugated warm air furnaces. The furnace is jacketed round the body, but the top is uninclosed, which enables the construction of the heat flues to be easily inspected and their operation tested. It is a novelty in the West, in which it was introduced the past summer during the World's Fair, at which the Kelsey Furnace Company had an exhibit. Mr. Cook is Chicago agent for the sale of the furnace. Preparations are also being made by him for the coming campaign in gasoline stoves. Samples of new stoves manufactured by the Baxter Stove Company, the Dangler Stove & Mfg. Company and the Standard Lighting Company have been received and are now ready for inspection on the sample room floor. Visitors to Mr. Cook's establishment will be interested in his method of illuminating. He uses gas, but manufactures it himself. A gas machine in the rear of the room furnishes a steady supply of gas from gasoline, 5 gallons of which will run 12 burners three days. Incandescent burners are used, which emit a brilliant white light, much more powerful than the ordinary illuminating gas and free from the usual annoying flicker. The gas made is not only better than the city gas, but is considerably cheaper.

WE ARE INDEBTED to the Co operative Foundry Company of Rochester, N. Y., for some advertising novelties which are intended to serve the double purpose of calling attention to Red Cross stoves and ranges and afford receptacles for matches, postage stamps, car tickets and small change. The articles are made of red leather, neatly lettered in gilt, and are of such a size as to enable them to be easily carried in the vest pocket. Upon the outside of each is a *fac-simile* of the company's trade-mark printed in old gold.

D. M. THOMAS of New York, secretary of the National Association of Stove Manufacturers, visited Chicago during the past week. The compliment of a call at our Chicago office is acknowledged.

THE DETROIT STOVE WORKS of Detroit, Mich., have just issued a circular illustrating their new stove known as the Solar Jewel soft coal base heater. The statement is made that this construction possesses a "new application of time tried and fire tested principles embodied in the first Jewel base heater for soft coal, of which more stoves have been sold since it was made a few years ago than any other stove of this class." The Solar Jewel is made in two sizes, having respectively 14-inch and 15-inch fire pots. Of the latter size the company are said to have been behind on orders, but are now caught up and can make shipments promptly. We are also in receipt from the same concern of a circular entitled "We offer only standard grades of best made stoves." It refers to the indisposition of their sales manager, said to be due to an extra amount of work in his department, and states that when he began to convalesce he confessed to his physician that one cause of his illness was a startling experience with a stove buyer during the first week in October. This experience was a conversation with a stove merchant from Illinois, who entered the sample room and after a few preliminary questions said: "Please show me the highest priced cook stove in your assortment." The sales manager did as requested and showed him the Kitchen Jewel, with the result that more than a baker's dozen were purchased. The sales manager says that in the years he has waited upon stove men he does not recall a similar inquiry, although thousands have asked him to show the "cheapest thing in the house."

Jewel Stoves.

George M Clark & Co., 153 to 161 Superior street, Chicago, are making a number of improvements in their line of gasoline stoves for the coming season. In process stoves they are bringing out a new three burner cabinet, which is exclusively a cabinet stove, having no step; also a new two-burner process stove, without the step. On all their process stoves the tank will be finished in brass, adding considerably to the beauty of the constructions. The oven burners are made considerably larger in diameter than heretofore. A removable shield protects the front tubes from the spattering of food and other causes of annoyance to tidy house keepers. This shield is decorated and makes an effective bit of decoration. It slides in and out of place. Above it has been placed a new ornament in the shape of a nickel name plate. A special feature of all the company's process stoves is the removable valve immediately under the tank. There is a separate valve for each burner, and each of these can be taken off even while baking is being done without disturbing the other valves. It can then be cleaned, which is an easy matter, and returned to its place. In generator stoves the company are bringing out a new line of 24 inch high Jewel juniors, with two and three burners; also a new line of Jewel Acmes, 24 inches high, with two and three burners. The juniors have a burner with a cut off for a low flame, and the Acmes have a quick thread direct acting burner, with a wheel for regulating the flame. All Jewel stoves and ranges, high or low, now have the Jewel lay down safety tank instead of the stationary tank. The old line of generator stoves will be continued. Improvements have been made in these by adding new ornamental doors to the No 95, and new doors, front and base to the No. 85 cabinet. The appearance of these ranges has been made much more attractive by the changes. Taken throughout, the gasoline line of this company will be far more complete for the season of 1894 than for any previous year.

Ventilation of Railroad Cars.

In speaking of the ventilation of railroad passenger cars the *Railroad Gazette* recently remarked that the greatest obstacle to improvement in this respect is the ignorance, or indifference, or both, of the passengers themselves. In any given train load of passengers there will always be some who are afraid of any suspicion of fresh air, and who will rise up against the opening of whatever apertures may be contrived for admitting fresh air or exhausting foul air; and the protests of one or two such persons in one car will generally be sufficient to overrule the wishes of those who want better ventilation, and the consequence is that all the apertures are closed at the first complaint. So, while it is not difficult to keep a car fresh by proper manipulation of the sashes in the clear stories and in the doors, general instructions for the management of these soon fall into dead letters. The irrepressible conflict between those who fear drafts and those who do not wish to die of asphyxiation is too much for the average trainman, and he soon concludes to let the whole thing go by default. The problem before the inventor is, actually, to insinuate fresh air in such a way that nobody will perceive that it is coming in, and to exhaust the foul air by equally concealed ducts. Very simple contrivances will answer, provided they are intelligently managed. What we want first is not more mechanical apparatus, but more education in the principles and benefits of ventilation.

In a case recently tried in the Supreme Court, in New York, a verdict affecting the disposal of nearly $125,000 hinged on the true definition of the little word "also." The action was brought to recover on an undertaking given by two sureties. By the defense it was contended that the complaint should be dismissed, on the ground that both sureties should have been made defendants, and that a clause of the bond on which it was sought to recover was void, because it did not contain the words "jointly and severally," as required by the code. It was admitted, however, that the first part of the undertaking did permit one of the sureties to be sued, because it contained those words. For the plaintiff it was contended that the word "also," connecting the two parts of the undertaking, carried with it the words, "jointly and severally" from the first to the second part of the bond. Dictionaries were brought into court, and after it was shown that "also" was defined as meaning "in like manner," the jury returned a verdict for the plaintiff.

Outfits for Venetian Iron Work.

A. J. Weed & Co., 106 and 108 Liberty street, New York, are placing on the market, in a popular form, materials for the construction of Venetian iron work. Suitable materials and the few necessary tools constitute the outfits obtainable from the company, by means of which, with designs and instructions, useful and artistic home decorations may be made. The construction of Venetian work is designed by the company for home work, as macramé lace making and scroll sawing have been, it being represented as an easy art to master, gratifying artistic taste, and one which may be made remunerative. It is also suggested that the construction of articles in the store or shop

during dull seasons, designed for sale over the counter, may be found profitable. For the construction of such Venetian iron work by amateurs the company furnishes materials, tools and working designs. The bracket and candlestick, as shown in Figs. 1 and 2, will convey an idea of what may be accomplished by workers in this line.

Fig. 1.—Bracket Frame.

The bracket frame or outline is furnished by the company, or may be made by a blacksmith. The company furnish iron strips of a suitable width, and these are bent and attached to the frame in any design which fancy may dictate.

Fig. 2.—Candlestick.

For candlesticks square pieces of iron are furnished for the center or backbone of the structure, and the strips are fastened to this in curves, angles or any other shapes desired. There is thus opportunity for much taste and skill. The cost of the materials for the candlestick shown, with the shade, shade holder and extinguisher—these three articles being furnished ready made—is 87 cents. It is estimated that about two hours' labor would be required for the construction of the article. These particular designs are only referred to by way of illustration and it is obvious that a large variety of articles can be made according to the taste, ingenuity and skill of each individual.

The materials necessary for this work, as furnished by the company, include strips of Russia iron, copper, brass and aluminum of different widths. These can be obtained in packages or made up into primary designs, as shown in Fig. 3, at a cost of from 10 to 15 cents per dozen.

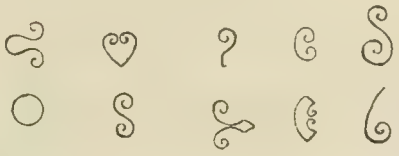

Fig. 3.—Machine Made Primary Designs

The copper, brass and aluminum strips may be combined in designs to advantage by advanced workers either from working patterns or from original designs. Strips of the various metals are also furnished twisted, fluted, in Grecian borders and in other designs.

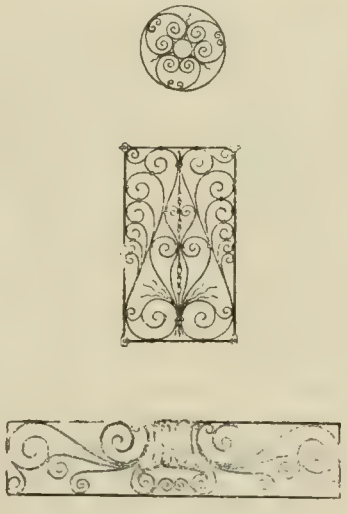

Fig. 4.—Wrought Iron Frames.

Those desiring wrought iron frames similar to those shown in Fig. 4 for windows, doorways, &c., for filling in with designs, or frames for brackets, fire screens, lanterns, &c., can obtain them in regular sizes, or frames will be forged to order from designs submitted. Working designs from which articles can be made are furnished separately, or at an annual subscription of $1 two full sized working drawings will be furnished each month. The tools required for this work are few and simple and will be furnished by the company if desired. In the construction of the different articles the strips of metal or machine made designs are fastened together with binders furnished by the company at from 5 to 15 cents per 100, according to the metal of which they are made. These are fastened by means of the binder tool shown in Fig. 5.

Fig. 5.—The Weed Binding Tool.

The standard of the binder tool is of machinery steel, case hardened, and the working parts are of tool steel. The binders, properly put in place with the tool, impart firmness to the article constructed. Black antique paint, furnished by the company, is used to paint the iron work after the article is completed, to give it a finished appearance.

For the convenience of customers the company put up the necessary tools and materials for making Venetian iron work in sets, varying in completeness according to the needs of the purchaser. There are three sets or outfits thus put up, known as A, B and C. Set A is the beginners' outfit and sells for $3.50, and contains all that is really necessary. In set B the tools are of a better grade, costing $6, and in addition there are several other appliances which will be found convenient, besides a greater amount of materials to work with. In set C the tools are of the best quality and everything as complete as the company's experience has made possible. This set costs $10. The following is the list, with prices, of tools and materials in set B, which is sold for $6, this being a representative outfit:

The Weed Binding Tool, for vise, with separate base	$1.25
The Weed Forming Tool	.25
Vise	.50
Iron Shears	.50
Cutting Plier	.60
Square Nose Plier	.30
Round " "	.40
Tape Measure	.10
Antique Paint	.50
Paint Brushes, per set, 3	.20
2 Hooks	.30
2 Backbones for Candlesticks	.30
Bracket Frame	.35
Package of Iron Strips, ¼ inch	.20
" " " " ⅛ inch	.05
" " Brass Strips, ¼ inch	.10
" " Iron Binders for ¼ inch.	.05
" " " " " ⅛ inch.	.05
Sample of Brass Binders for ¼ inch.	.05
Wire, per spool, Iron	.05
" " " Brass	.15
6 Spring Clasp Pins	.30
2 Candlestick Bobechés	.10
2 Extinguishers	.25
2 Candle Shades	.50
2 Extension Shade Holders	.35

The point is made that there is almost no limit to the kinds of articles and designs which may be constructed with the tools and materials obtainable; and that these outfits would form an attractive addition to the line of holiday goods for sale in Hardware stores. Samples of ready made articles may be obtained from the company for display.

With the object of acquiring an unobstructed outlet to the lakes, the Pennsylvania Railroad Company have secured a controlling influence in the Toledo, Peoria & Western Railroad. This will largely facilitate the business of the Pennsylvania Company in Northern Indiana and Illinois.

TRADE REPORT.

The Iron Market.

A heavy increase in the production of Pig Iron is shown in the monthly statistics; and this, together with the known fact that since the beginning of the month there have been further additions to capacity, simply emphasize the growing supremacy of the Central West. The increase in question is due almost entirely to the resumption of plants connected with rolling mills and Steel works, who are capturing nearly every order of consequence from the Atlantic Ocean to the Mississippi. In their fierce struggle for business they are making prices that even two months since would have been thought impossible. Even with the lowest basis for raw material the figures accepted for finished material, apparently without hesitation or keen regret, by the Pittsburgh and the surrounding districts leave rival producers unable to account for them. Low as they are, our quotations in the leading markets are nominal. All important business is done at material concessions.

If there were any evidence that the low sellers are filling up there might be some hope for the near future, but thus far there is no indication that any of the hungry giants are even temporarily gorged. One by one the weaker mills are withdrawing to await better times.

There has been some recent breaking in prices lately in the Cast Iron Pipe trade, the Jersey City contract for about 2500 tons going at $19.50 ℔ ton, delivered, while the Washington business was also taken at very low prices. One of the leading authorities in the trade does not take a cheerful view of the future, fearing even greater demoralization.

Pig Iron.—The New York market is quiet, some sellers reporting it particularly dull, while others note heavier shipments. It is probably true that more Pig Iron is being melted than for some time since. We quote: Northern brands, $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

The Philadelphia market is extremely dull, and while there are no evidences of large offerings, such demand as there is can be readily met at former quotations. The talk of an advance is certainly premature so far as this market is concerned, although if there was anything like an average demand it is not unlikely that an upward tendency would be developed. For the time being the supply is full and ample, and to secure better prices a larger consumption is indispensable. Prices for Philadelphia and near by points are about as follows:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

Chicago advices report that local Coke is moving rather steadily in small lots for quick delivery, but there is almost no inclination among buyers to place contracts for future delivery. Some figuring is being done, but it is simply owing to consumers keeping themselves posted. Stocks at local furnaces will last for a month or two more at the present rate of shipment, so that there is no immediate prospect of additional furnaces being blown in in that district. Some few sales have been made of Southern Coke, but trade generally has been extremely dull, and even the carload business has dropped to very small proportions. The leading companies are maintaining prices at the rates named last week, but some of their competitors are taking business at lower figures. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.50 @ $16.00
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25
Southern Coke, No. 2	12.15 @ 12.40
Southern Coke, No. 3	11.65 @ 11.90
Southern, No. 1, Soft	12.40 @ 12.65
Southern, No. 2, Soft	11.65 @ 11.90
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.25 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

With the approach of the close of the year, the demand for Pig Iron in the Pittsburgh district grows smaller, and in addition consumers are requesting postponement of shipments to an alarming degree. Buyers of Pig Iron say they can see no indications of the market toning up, and until they do they will continue to buy only as necessity requires. Makers are not able to offer any arguments to offset these statements, and it is the impression that an improvement in the Pig Iron market will not come for some time. Foundry Iron is falling off in demand and prices are lower. The market in general is thought to be in a very unsatisfactory condition, and the outlook very discouraging. Quotations are given as follows:

No. 1 Foundry	$12.00 @ $12.50	cash
No. 2 Foundry	11.00 @ 11.50	"

There has been a light volume of business in Pig Iron during the week in the Southern markets, and while price are not quotably lower, there was not enough done to really test the tone of the market. There is no urgency to sell, because the larger Southern Iron companies have recently sold so liberally that they are disposed to hold off for a time. There is much melting of Iron in progress by Iron Pipe works, and there are some contracts in sight for Pipe which may keep this up. The present situation of the trade appears to be no worse. But there are apprehensions of what may occur from the operations of the new tariff. There is some inquiry for Charcoal Iron, but it is not large. Quotations are as follows:

Southern Coke, No. 1	$12.25 @ $12.50
Southern Coke, No. 2	11.00 @ 11.25
Southern Coke, No. 3	10.50 @ 10.75
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—Prices have dropped off 15¢ @ 20¢ ℔ 100 lb. The decline is not easily explained except on the supposition that the load carried by leading holders is more than can conveniently be taken care of at the moment. In other words, the lack of any considerable "short" interest in the speculative branch of the market and very conservative buying on the part of jobbers and consumers leaves solid facts of a weighty nature to be wrestled with. Manipulation is extremely difficult in the face of the situation in London and the uncertainty connected with pending American tariff legislation. Some little business has been done on Metal Exchange contracts at 20.45¢, December delivery, and "outside" sales were said to have been made relatively as low, or say 20.50¢, cash, for 5-ton lots. Ordinary jobbing business is on strictly conservative lines, and prices for small lots are inclined to be weak.

Copper.—The market is quite as complicated now as it was a week ago, with the line of quotations somewhat lower. Contracts for Lake Superior Ingot have been sold on the Metal Exchange at 10.35¢ and at 10.30¢, January delivery. Some lots of actual Copper have been offered on the open market at 10⅜¢, and it would appear that purchases may yet be made at the latter price, in the face of the strong position assumed by leading producers and certain influential

operators. Similar irregularity exists as to market value of other varieties. The market is thus in somewhat uncertain form at the moment, and rather dull. The consumptive demand is on an exceedingly moderate scale, dealers reporting a very restricted business in both Ingot and Sheet Copper. Prices for small lots of the former are generally maintained at 11¢ ℔ lb for Lake Superior and 10¼¢ for Ansonia grade Arizona.

Pig Lead.—There has been hardly any business, and efforts in the direction of working up deals have been slimly rewarded. In fact, not only speculative sentiment, but good intentions of operators, seem to have been set aside by uncertainties connected with the new tariff bill. Such as it was, the business has been on a rather lower level of prices—say 3.20¢ @ 3.25¢ for ordinary Western brands for shipment during the balance of the year. Correspondingly low figures were said to have been quoted from leading Western centers. Consumers show little or no interest either in Pig or Manufactured Lead, the jobbing trade in these products being for the time practically dead. The price asked for retail quantities of American Pig is about ⅛¢ lower than former quotations, namely 4¢ @ 4⅛¢.

Spelter.—The local market is almost stationary. There are hardly any orders and the offering is exceedingly tame, with some suggestion that producers are slow to accept orders at current prices. For the present 3.80¢ @ 3.85¢ may fairly be quoted on ordinary Western brands, prompt or near future shipment, with an advance of from ⅛¢ to ¼¢ on small lots, according to circumstances. Choice brands bring about the usual premium.

Tin Plate.—Business has been extremely tame in the Tin Plate market, and is likely to continue so until after the turn of the year, as consumers are generally unwilling to purchase, unless for absolute necessities, at this season, when they are usually engaged in stock taking and adjusting their accounts for the new year. Moreover, uncertainties connected with the tariff have a restraining influence upon ventures in futures. Nothing beyond small orders for spot goods comes in; and the market, upon the whole, shows a weaker tone. Prices for jobbing quantities rule at about the quotations of the past few weeks, but concessions are, perhaps, more easy to obtain.

Sheet Iron.—The trade in both Black and Galvanized Sheets is of the narrowest and most perfunctory character. Prices are difficult to quote, as manufacturers and dealers alike are usually willing to meet purchasers with substantial cuts in the quoted rates in order to get business.

THE SHEET MILLS of the Joliet Sheet Steel Rolling Mill Company, Joliet, Ill., remain idle. It is understood that it is the intention of the directors to lease the mills if suitable terms can be arranged.

Chicago Report.

Scrap.—The demand for Old Material is fair, and Wrought Scrap is a little firmer, as the supply seems to be less plentiful. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3⅛¢
Pipe Lead	....	2⅛¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—The movement is not so large as it has been, and dealers are somewhat disappointed that the consumption does not increase with the continuous cold weather. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.85

THE NUBIAN IRON ENAMEL COMPANY of Cragin, Ill., report their sales of Nubian in small packages almost up to former years, notwithstanding the dullness in general trade. As an evidence of the manner in which tariff agitation disturbs trade in almost unexpected quarters, the company state that they have many customers among manufacturers whose products are affected by the provisions of the Wilson bill, and who will not buy until some definite decision is made by Congress. One customer, for example, is a manufacturer of cotton ties, who uses from eight to ten carloads of Nubian Enamel annually. As cotton ties are scheduled to go on the free list, it is not remarkable that this customer is not buying materials. Others are not hit quite so hard, but prefer to wait to see exactly where they will stand, and meantime the sales of Nubian as well as other materials must suffer.

CONDITION OF THE

Hardware Trade.

THE middle of December usually witnesses a falling off in the demand for goods and a gradually diminishing volume of business. The present year is no exception, and some special causes are operating to make the aggregate of sales even lighter than usual. In view of the condition of trade more than the usual number of travelers have returned home and are waiting until their efforts will be rewarded by a larger measure of success. The trade, however, on the whole is still being canvassed pretty thoroughly. The conservatism which has characterized business during the past few months is still the policy of merchants, who are limiting their purchases as much as possible until they have taken stock and ascertained the results of the year's or half year's business. At the present time the uncertainty with reference to the action of Congress in the matter of tariff legislation is also having a marked effect and buyers are waiting until this matter is definitely settled. There is, however, a good deal of business doing in a small way, as stocks in the hands of both retailers and jobbers are in most cases more or less broken. There is also a fair activity in seasonable goods and some late orders for articles for the holiday trade help to swell the aggregate of business. Some large buyers have deferred much longer than usual the placing of their orders for the spring trade, and a good many of them are still holding off. The unsatisfactory condition of the market in the matter of prices, especially in staple goods, has not a little influence in deterring merchants from purchasing at this time. While the volume of business is thus only moderate, it is gratifying to note the constant improvement in the financial condition, justifying the expectation that with an early resumption of activity in mercantile circles there will be a satisfactory spring trade. It is especially a matter for congratulation that Hardware merchants throughout the country have so well stood the financial strain of the past few months, and it is hoped that with the turn of the year there will not be many failures to report.

Advices from Chicago.—The steady winter weather of the past fortnight has enlivened business somewhat in the Shelf Hardware line. It has especially improved collections. The prevalence of snow throughout the Northwest has enabled farmers to market a great deal of their produce and in this way has undoubtedly made money much easier in purely agricultural districts. The movement, however, has not extended to all classes of the Hardware jobbing trade. Manufacturers of Tinware are exceptionally dull. The inventory season is always expected to be of this character, but much less is doing this year than in

previous similar periods, and a revival of demand is not expected now until considerably after the turn of the year. The heavy Hardware jobbers also report their business quiet, except in Sleigh stock, which is in particularly good demand and to some extent makes up for the dullness in other departments.

Notes on Prices.

Wire Nails.—With the advance of the season and the approach of the holidays there is a falling off in the volume of business, but the fact that stocks in dealers' hands are limited is evidently compelling a good many houses to purchase in larger or smaller quantities for a supply of their immediate requirements. Manufacturers also report more inquiry in regard to terms for shipment of fair assortments early in the year, but jobbers and other large purchasers are quite generally deferring placing their orders. Careful attention is, however, given to the market, and buyers are watching it closely and are preparing to place their orders at the first indication of a turn in the matter of prices. This point, however, has not as yet been reached. Notwithstanding the fact that quotations which have ruled for the past few weeks have been regarded as abnormally low the market has developed a further weakness and some sales have been made at slightly lower figures than were regarded as the extreme prices a week or ten days ago. The market is represented by the quotation of $1.15 for carload lots at mill, but attractive orders could without doubt be placed at a slight concession from this figure.

Advices from Chicago.—Some manufacturers of Wire Nails are booking orders for good quantities, although the volume of business is by no means so large as that of November. The current trade is, however, not generally distributed, and some concerns complain of a dearth of orders and expect to close down their factories at an early day, not to resume operations until some time in the new year. Prices are irregular, the nominal quotation continuing at $1.30, Chicago, but it is a comparatively easy matter to secure better terms from some of the manufacturers who are eager for business. The spot cash sellers are again making their appearance to some extent. Jobbers quote small lots from stock at $1.35 to $1.40.

Cut Nails.—The Cut Nail market is sluggish and rather weak, being affected by the same influences as Wire Nails. There is some irregularity in the quotations of the different mills, but in the East the market is represented by 90 cents for carload lots at mill, a figure from which concessions are made by some of the manufacturers. There are, however, others who are endeavoring to obtain a slightly better figure. Small lots from store in New York are quoted regularly at $1.20.

Advices from Chicago.—The Cut Steel Nail trade is quiet and is expected to become more so as the end of the year approaches. Prices are maintained at $1.15 to $1.20, Chicago, according to the character of the order. Small lots from stock are selling at $1.25.

Barb Wire.—The Barb Wire market continues in an unsatisfactory condition, both as regards the volume of business and prices. The demand is referred to as sluggish, and most of the mills report the aggregate of orders as small. Prices have receded slightly below the point at which they have been held for a few weeks, and the market is now represented by the quotation of $2.10 to $2.15 for carload lots of Four-Point Galvanized at mill.

Advices from Chicago.—A great deal of business has been placed recently by manufacturers of Barb Wire with jobbers in the West and Northwest for spring delivery. Prices appear to have been well maintained, owing to the noticeable conservatism of some manufacturers who have usually competed actively for business in this territory. Prices may, therefore, be quoted at $2.35 to $2.40 for factory lots of Galvanized, and $1.95 to $2 for Painted. Jobbers continue to quote small lots from stock at $2.55 for Galvanized, but report that manufacturers are more and more absorbing the retail trade

Cordage. — The manufacturers of Cordage report a light demand, buyers refusing to place orders in excess of their immediate requirements. We have to record a still further decline in the price, the following prices being obtainable on large lots, f.o.b. factory or New York : Manila, 7¼ cents; Sisal, 5 cents, and New Zealand, 5 cents. The competition between the different manufacturers continues active. The matter of the reorganization of the National Cordage Company is reported to be progressing satisfactorily, and steps are being taken to consummate the purchase of the plants and property of the National Cordage Company by the Reorganization Committee as trustees.

Cistern and Well Cover.—The Safety Cistern and Well Cover, manufactured by Menefee & De Vilbiss, Fort Wayne, Ind., is sold at a discount of 35 per cent. from the following list:

Size of cover.	Each.
36 inches	$3.85
38 "	4.15
40 "	4.65
43 "	5.50

Glass.—No new or interesting features have developed in connection with the Glass trade during the past week. No improvement in demand is noticed, and such orders as are received are for limited quantities for immediate use. There is a disposition on the part of some of the manufacturers who have not as yet started up their works to postpone immediate resumption. Prices at the present time are so uncertain that it is difficult to name quotations that will stand good under all circumstances. Local prices on American Window Glass are referred to as ranging from 80 and 20 to 85 per cent. discount, according to quantity. Pittsburgh prices are reported as being from 85 and 5 to 85 and 10 per cent. discount, while it is understood that Western factories are making still lower prices. Plate and imported Glass show no change in demand or prices.

Old Metals.—The demand for Old Metals is tame, and holders are not inclined to push their material on the market at the present low prices. The firmness is Copper has induced dealers to raise the price ⅛¢ ℔ lb, but the prices for other descriptions of Old Metals remain unchanged. The demand for Scrap Iron continues slow, and although offerings are not heavy, prices remain weak. Quotations are about as follows, delivered in New York:

Heavy Copper	℔ lb	7¢
Light and Tinned Copper	℔ lb	6½¢

Old Rubber.—The market for this material is narrow and weak. Prices in New York are about as follows:

Car Springs, ton lots, ℔ lb.	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.	@	.03
Rubber shoes, less than carloads, ℔ lb. 0.02¼	@	.03⅛
Large Hose, ℔ ton	@	9.00
White Wringer Rolls, ℔ lb.	@	.04¼
White Syringes, ℔ lb.	@	.05

THE SHEET AND PUDDLING MILLS of the Cleveland Rolling Mill Company, Newburg, Ohio, which have been shut

down since July 1, have started up. A reduction of 12 per cent. from the old scale went into effect.

Trade Notes.

WILLIAM J. H. GLUCK, Baltimore, Md., sends out a circular to the trade asking them to forward their orders direct by mail, as he will not have any salesmen out for 60 days, and a reduction of prices will be made on the saving in their traveling expenses. Accompanying the announcement is a sheet giving a list of Sheet Metal Goods on which special prices are made, the quantities of the articles and the prices being presented.

ATTENTION IS CALLED to an advertisement in this issue offering for sale an old established heating, plumbing and stove business, located in one of the best business cities in Vermont.

THE HEATH & MILLIGAN MFG. COMPANY of Chicago have just issued a very pretty *brochure* entitled "Hints on Exterior Decoration." It consists of 24 pages, bound in stiff paper covers, with an illuminated title, in which practical directions are given to builders or owners how to select colors and secure pleasing and tasteful combinations in painting the exteriors of houses. The following extracts from the introductory remarks show how the subject is treated: "It is important that one should know what colors will harmonize either in resemblance or by contrast." "A harmony in resemblance is obtained by a graduation of tints; a harmony by contrast is in the use of opposing colors." "If a dwelling has a brick or stone foundation it should be painted darker than the body of the house to give it the appearance of solidity and strength." "A dark color used on window sashes gives the window glass a much cleaner and brighter appearance than lighter colors." After a few pages of such hints there are 18 pages devoted to as many different combinations of colors, in which the actual tints are shown for trimming, body and sash. Each combination is accompanied by descriptive remarks, giving artistic reasons for the selection made. Attention is called to the excellence of the Paints prepared by the company for all classes of work.

THE LARGE PLANT of the Ætna-Standard Iron & Steel Company, at Bridgeport, Ohio, has not been in operation to full capacity at any time since last July. Last week at this plant there were ten sheet mills, two guide and one bar mill in operation, but how long these departments will continue running depends altogether on the receipt of orders. For some time this firm have made it a practice to operate such parts of their works as they have orders for, and on the completion of specifications in hand close down their mills for further accumulation.

NEW YORK WIRE CLOTH COMPANY, New York office 280 Broadway, have about completed additions to their York, Pa, works, made necessary by the total destruction of one of their factories at Hamilton, N. Y., June 2 last. The machinery is of the newest models and most improved kind, and in operation will double the capacity of that plant. They estimate that, based on ten hours each for 300 working days, they will be able to produce 25,000,000 square feet of Wire Cloth per year.

LAST WEEK the report of W. C. Hine, receiver of the Youngstown Stamping Company, Youngstown, Ohio, was filed in court. The report shows that from February, 1893, to May, 1893, $12,911 was received and $12,335.28 paid out; in May $20,263.78 was received and $19,966.09 paid out; in June $11,983.65 was received and $12.377.70 paid out; in July $7402.77 was received and $7588.14 paid out; in August $7943.65 was received and $7039.34 paid out; in September $7402.88 was received and $7721.32 paid out. This leaves balance on hand, October 31, $889.11.

AUGUST KREAMER, manufacturer of pieced and stamped House Furnishing Goods, South Third street and Kent avenue, Brooklyn, has bought the plant of Peter Michels of that city, for making Coffee and Tea Pots and a general assortment of Tinware. This will be incorporated with his own factory, and to provide the necessary room he recently added two new stories on the South Third street wing, giving an increased floor space of 6000 square feet. He is about to commence the manufacture of a line of heavy planished ware of four, five and six cross tin, supplementing a large assortment of goods already long made by him. This will include Chafing, Vegetable and Oyster Dishes, Urns, Tureens, Egg Coddlers, Rice Molds, Butter Kettles, Coffee and Tea Pots, &c. The goods made at this factory are mainly for fine trade, and, when so ordered, have the dealer's name struck in brass affixed to each piece. A full line of culinary and housekeeping ware of heavy tin, copper, sheet iron plain, galvanized, japanned and decorated is already well known to most of the largest dealers and department stores. A new catalogue, for a long time in preparation, will be issued in about two months.

CLEMENT & DUNBAR, 1129 Beach street, Philadelphia, Pa., are calling the attention of the trade to their Home and Rapid Ice Cream Freezers. The Home is a single action Freezer with an automatic adjustable scraper and white cedar tub. The Rapid is a double action Freezer with a tub large enough to allow of covering the can completely with ice without interfering with the working parts. The can, of heavy tin plate, has a solid iron cover and bottom, and is fitted with an automatic scraper which adapts itself to any difference in the surface of the can. At the bottom of the tub is a screw which raises the can, when required, sufficiently to compensate for any sag in the can, or wear in the bearings. It is claimed that the tubs are all full sized and allow of large lumps of ice being used, thus tending to hasten the process of freezing and minimize the labor incident to same. The firm are also makers of the Rapid Ice Breaker, designed for confectioners, hotel keepers, and all who use large quantites of broken ice.

ANNOUNCEMENT is made that Manley W. McClure has retired from the firm of Brown, McClure & Wales, Boston, Mass. The business of importing and dealing in Iron, Steel, Heavy Hardware and metals heretofore conducted under the above firm name will hereafter be continued by John G. Brown and William Q. Wales under the style of Brown & Wales.

HERMAN AICH, 43 Murray street, New York, is sole agent in this country of Arthur Krupp, Berndorf, Austria. At this place are extensive works, employing, it is stated, 3500 persons, manufacturing a large line of pure nickel Cooking Utensils. While well introduced abroad, they are said to be virtually new in this market. The utensils are all seamless and guaranteed absolutely pure nickel, also acid proof. Unlike copper goods of this character, they are always ready for use, while the former must at times be retinned. With ordinary care they are said to be practically indestructible. Probably they will first be used in hotels, restaurants, clubs, institutions, &c., as upon the recommendation of chemists, metallurgists and physicians they have been largely introduced abroad in such places. They are especially recommended for hospitals or wherever food is prepared for invalids. The ware is perfectly smooth inside and has a mirror polish outside, resembling in this respect silver ware. The variety of utensils include hotel deep, medium and shallow Sauce Pots, Stew, Frying and Dripping Pans, Egg Cookers, Fish Boilers, Trays, Cups, Tureens, Gravy Boats, &c., many of the leading articles being made in from 20 to 60 sizes each. A line of the principal goods and sizes will be carried here in stock, while importation orders can be taken for anything on the list. The manufacturer is the brother of the famous gun maker of Essen, Germany.

It Is Reported—

That G. W. Strong, Sherman, N. Y., has sold his stock of Hardware to W. H. Homewood and Henry W. Sperry. Mr. Strong will retain his interest in the sale of carriages and Agricultural Implements.

That J. C. Carter of Minneapolis, Minn., has bought the interest of his uncle, R. D. Boice, in the firm of Boice & Weidlein, Geneseo, Ill. The firm are the oldest Hardware concern in the county.

That Col. B. F. Sheets and Benjamin Knodle have purchased a Hardware store at Rochelle, Ill., of which Mr. Knodle will take charge.

That J. W. McDonald has recently opened a Hardware store at Norfolk, Neb.

That Charles Ellis, Brandon, Wis., has sold out his stock of Hardware.

That J. T. Shannon has sold his stock of Hardware at Madisonville, Texas, to Dr. W. C. Craw.

That a few Revolvers were stolen from the store of Evans Brothers, Roanoke. Va., on the night of the 20th ult.

That Fimrite & Hauge, Elmore, Minn., have purchased a stock of Hardware at Buffalo Center and are in charge.

That James M. New, Hardware merchant, Martinsburg, Iowa, has traded His Hardware store for a farm.

That the Hardware store of T. L. Burnett, Fort Worth, Texas, was entered by burglars on the 23d ult., and a large amount of Cutlery stolen, including Knives and Razors—in all about 20 dozen.

That A. Bahlke has disposed of his Hardware stock at North Star, Mich.

That a Hardware store is being erected at Wayne, Ill., for Ray Boynton.

That Mr. Bingham of Bay City has entered into the Hardware business with J. T. Harvie at Farwell, Mich.

That Burke Bros. of Ellsworth, Minn., have purchased the Hardware stock of M. E. Templer & Co., Trosky, Minn., and have removed it to Ellsworth. An opening is thus left for a Hardware store at Trosky.

That burglars entered the Hardware store of J. A. Boggs, Davenport, Neb., on the 29th ult., and stole about $30 worth of Razors, Pocket Knives, Revolvers, &c.

That Geo. H. Cutter of the Hardware firm of Cutter Bros., Meadville, Pa., shot and killed a burglar while in the act of ransacking the store on the night of the 21st ult.

That E. R. Morrill, senior manager of the Hardware firm of Morrill & Lackey, Woonsocket. S. D., has sold his interest to Fred. Dring.

That Ott & Boden's Hardware store, at West Bend, Wis., was burglarized on the 24th ult. and $150 worth of Knives and Revolvers was taken.

That in a fire at Fort Worth, Texas, on the 23d ult., the Hardware and Stove stock of Lathrop & Co. was damaged by water to the extent of $200.

That the Tompkins-Cary Hardware Company have filed articles of incorporation at Denvor, Col. The capital stock is $100,000. The directors are John Harvey, T. J. Cary, D. La Salle, H. H. Tompkins and S. H. Tompkins.

That S. H. Gay and Henry Gebhardt will soon open up a new Hardware store and Tin shop at Carbon, Wy.

That Foster & Burke, Hardware merchants, Petoskey, Mich., have bought out Williams & Carpenter, and now control most of the Farm Machinery business in that place.

That Christoper Wiemer has bought out his brother's share in the Hardware firm of Wm. Wiemer & Co., Radcliffe, Iowa.

That the new establishment of the Stratman Hardware & Builders' Supply Company, Huntingburg, Ind., is nearly completed.

That the Star & Bullock Hardware Company, Deadwood, S. D., have purchased the plumbing business formerly conducted by the Deadwood Plumbing Company.

That in a large fire at Milan, Mich., on the 4th ult., the Hardware stock and building of O. A. Kelley were destroyed. Loss, $10,000; insurance, $4000.

That Max Ludwig's Hardware store, at Pittston. Pa., was robbed on the 1st inst. Sixty dollars' worth of goods were carried off by the miscreants.

That Charles Bowen contemplates entering the Hardware business at Crooked Creek, Iowa.

That Eastwood & Chase are a new Hardware firm at Monticello, Iowa.

By a good steady PLUMBER, STEAM and HOT WATER FITTER; city or country; can furnish reference. E. J. McGinley, 3120 Almond street, Philadelphia. Dec. 16

By a BRASS MOLDER who thoroughly understands plumbing and steam fitting; capable of taking charge; 12 years' experience; city or country. "D. N.," 214 South street, Boston, Mass. Dec. 16

An American, good jobbing TINNER and country PLUMBER, also well up in steam and hot water heating, can estimate from plans and specifications and capable of taking charge of any general jobbing shop, wants work; strictly temperate. Purrish Bros., Great Barrington, Mass. Dec. 16

By a sober and industrious young man, as PLUMBER and GAS FITTER: wages moderate; country preferred. "J. P. B.," 131 Park avenue, Hoboken, N. J. Dec. 16

By a TIN and SHEET IRON WORKER. Henry Newberger, 300 Broome street, New York City. Dec. 16

By a PLUMBER of two years' experience; willing to go anywhere; reference furnished if required. Orlando C. Kent, 89 Elm street, Danbury, Conn. Dec. 16

By an ELECTRO-PLATER of 30 years' practical experience upon work of every description, with all solutions—oxide, polishing, buffing, lathe and hand burnishing; reference. "Electro-Plater," 35 Sheafer street, Cleveland, Ohio. Dec. 16

A METAL PATTERN MAKER; can file or fit or repair stove patterns; understands drop hammer work and carriage hardware; a steady job wanted; sober and industrious; has a good education; used to doing square work and a dollar's worth for a dollar. "J. M. D.," 11 Delevan street, Auburn, N. Y. Dec. 16

By a young married man, with five years' experience in PLUMBING, steam and water fitting; good reference; Massachusetts, Rhode Island or Connecticut preferred. Edward E. Silvery, 163 Locust street, Dover, N. H. Dec. 16

By an experienced city SALESMAN, a good line of hardware, tinware or cutlery; experience and references. "Box 49," office of *The Metal Worker*, 59 Dearborn street, Chicago, Ill. Dec. 16

A young man of experience desires to REPRESENT some manufacturing concern connected with the hardware trade; prefer tinware, cutlery, or some good specialty; address, with full particulars, "Tinware," No. 1216, office of *The Metal Worker*, 96-102 Reade street, New York City. Dec. 16

As SUPERINTENDENT or FOREMAN of FOUNDRY, by a practical foundryman and molder; 30 years in foundry work; speaks both German and English; well posted on all lines of work, stove, furnace and art metal casting; temperate and reliable; good references; has held positions of same character for the past two years; understands the management of cupola and the handling of men; open for engagement January 1, 1894. "Art Metal," office of *The Metal Worker*, 96-102 Reade street, New York City. Dec. 16

By a TINNER of 15 years' experience at the tin, sheet iron, pump and stove business, who also understands the hardware business; I am a married man and strictly temperate in all my habits and can furnish best of references both as to character and ability. "C. F. B.," Box 186, Malone, N. Y. Dec. 16

By a METAL SPINNER who thoroughly understands his business; if necessary, can take charge of small shop; can come highly recommended. "F. W. P.," 455 Ninth avenue, New York City. Dec. 16

PLUMBER, nine years' practical experience, would like a steady position in any part of the United States or Canada; can furnish the best of references. James Godsell, 1221 Third avenue, New York City. Dec. 16

As TINSMITH, ROOFER and GENERAL JOBBER. Isaac Wallestan, 101 Elm street, New York City. Dec. 16

A position as TRAVELING SALESMAN with a good tin and metal or iron roofing house for next season; will work cheap until trade will authorize fair pay. "A. S. C.," 193 West Sixth street, Cincinnati, Ohio. Dec. 16

As SPINNER and IRON WORKER, on tin and all kinds of stamped ware: 17 years' experience with an iron clad manufacturing company; can do anything in the line of spinning and wiring. Chas. Seider, 263 Floyd street, Brooklyn, N. Y. Dec. 16

By a good TIN and SHEET IRON WORKER, who is also a TIN and SLATE ROOFER; 16 years' experience; temperate; can furnish best of references. M. C. Wallace, 16 North Fifth street, Fort Smith, Ark. Dec. 16

By a young married man, speaks English and German, a steady job the year round with a good firm as TINNER; am considered a strictly first-class man and capable of taking charge of shop; have some knowledge of plumbing and can give the very best of reference as to honesty, sobriety and capability; the Pacific Coast preferred. "Tinner," 2529 South G street, Tacoma, Washington. Dec. 16

A1 BOOKKEEPER and CASHIER, with highest New York references, desires position in a wholesale hardware or importing house; speaks and writes German, French and English; excellent accountant. Francis L. Glessner, 313 Schermerhorn street, Brooklyn, N. Y. Dec. 16

By a TIN and SHEET IRON WORKER. N. Bloom, 40 Orchard street, New York City. Dec. 16

Before or by January 1, by a young TINSMITH, with eight years' experience at roofing, plumbing, stove, range and furnace work and general jobbing, also all kinds of pumps. Box 75, Manhasset, L. I. Dec. 16

TRAVELING SALESMAN, experienced and conservative, with extensive acquaintance among the hardware trade of Texas and the Indian Territory, is open for an engagement with reliable hardware firm after January 1, 1894; well posted on tin plate and other sheet metals; no objection to other territory. "Hardware," P. O. Box 1746, New Orleans, La. Dec. 16

By a good steady PLUMBER, city or country. J. Fitz, 222 East Eleventh street, New York City. Dec. 9

THE METAL WORKER.

NEW YORK AND CHICAGO.

Saturday, December 23, 1893.

Domestic Coal Consumption.

In large manufacturing establishments the amount of coal consumed is generally very accurately determined. The coal is usually weighed on the premises as delivered, and thus there is little room for error or fraud in the delivery. The same cannot be said of coal as purchased for domestic use from coal yards. The large majority of people have no way of determining whether or not the amount delivered is the amount purchased and paid for; and if such facilities for the commission of fraud do not sometimes lead to it, coal dealers must possess, on the average, a much higher standard of commercial morality than grocers, butchers and others from whom domestic supplies are obtained. That such frauds do occur is evidenced by the fact that a recent prosecution of a coal dealer by a customer who took special and unexpected pains to privately reweigh coal delivered resulted in a judgment in favor of the plaintiff. It might be advisable for other consumers to take similar pains. Some think that a close enough estimate can be made by a comparison between the bulk of any particular delivery with that of previous deliveries. But, aside from the fact that previous deliveries have generally been accepted as correct without reweighing, and so form no trustworthy standard of comparison, this method is unreliable in other respects. There is much variation in the density of coal, as may be proved by testing specimens from different mines, and even from the same mine at different periods. The specific gravity tables in engineering books give averages, not absolute, invariable figures. Specific gravity of various coals may differ as widely as 20 per cent. The only true way to determine weight is to weigh, except with substances whose weight for a given bulk is known to be constant.

Scales for Domestic Coal Weighing.

Very few domestic establishments are provided with suitable scales for conveniently weighing fuel. Even with platform scales large enough to weigh a considerable bulk, say 200 pounds, it would not always be convenient to weigh coal as delivered, though in most case with such scales this could be done; but spring scales, which will weigh 50 pounds, are not costly affairs, and with these coal may be weighed in the hod as consumed with little trouble, and a well kept tally would in the end show conclusively whether the amount purchased was fully delivered or otherwise. If people were known to adopt generally or even partially the system of weighing coal during its consumption dealers would soon become very careful to deliver full weight. Also some errors of judgment that more or less affect the furnace and steam heating trades would cease to be committed. For instance, a householder speaking of a new furnace he had used during a single winter said, "It is a handy furnace and heats well, but I judge it burns about three tons of coal more than the old one."

How a Furnace May Be Misjudged.

The person to whom the statement just quoted was made very patiently asked on what the estimate was based and was answered that the usual supply having been exhausted, 3 tons more, nearly all of which was burned, had to be purchased to get through the season, and as the average cold during the winter had not materially varied from that of the preceding winter, the required addition was attributed to the new furnace. In further conversation it came out that the coal had that year been purchased from a different yard than formerly. Of course there might have been more coal actually consumed; but, on the other hand, it is equally possible that injustice was done to the furnace and its manufacturer. This will appear more probable from a brief account of a different experience on the part of a resident of the same city. The person referred to had been in the habit of putting in coal purchased from a particular yard for some six or seven years in succession, the amount purchased and paid for for furnace use being 20 tons. Except in specially mild seasons the amount delivered was very nearly or quite consumed, the house being large and the furnace correspondingly large. One year, for some reason, he was led to buy his supply from another dealer, the same quantity being paid for and the same kind of coal being ordered. That year the winter was colder than the average, yet, at the end of the season, although the same person attended the furnace as in former seasons, he estimated that there remained in the coal bin at the end of the season not less than 2 tons. Now suppose this to have happened at the end of a season when a new furnace had been put in. In all probability the new furnace would have been credited with superior economy, and with no better foundation than that upon which the furnace previously cited was discredited. Very likely a heating apparatus is often misjudged through blind confidence placed in the integrity of coal dealers—a confidence paralleled in no other trade. People will weigh butter and meat suspected of light weight, but coal, not once in a hundred times.

The "Massachusetts Society for Promoting Good Citizenship" is a Boston association which is doing capital work in ventilating patriotic and social questions, and especially in educational matters. At a recent meeting of the society the topic for consideration was "Industrial Education and its Bearings on Citizenship and Social Progress." The subject was extensively debated by a number of educational authorities, officers of trade associations and persons engaged in philanthropic work, and strong opinions of the value of trade and technical training were expressed. The Superintendent of Public Schools of Boston spoke very favorably of the idea of trade schools, and favored the formation of an association in Boston to look after the needs of industrial education. Similar sentiments were conveyed in a speech by President Lathrop, of the Wood Carvers' Association, who favored the establishment of trade schools in order to benefit American boys, who, he said, are being forced out of the industries of the city by the competition of alien labor.

November's coinage by the United States mints was the greatest executed in any one month for many years past. The number of pieces coined aggregated 7,523,602, of the value of $11,031,440.35. Of this amount the gold coined aggregated 1,265,400 pieces, of the value of $10,784,800; the silver only 976,202 pieces, of the value of $142,340.35. Of the minor coin, 4,120,000 1-cent pieces were coined, to meet the demands of the Christmas trade.

The City Council of St. Paul has recently paid out $9000, in sums of $1.50 per half day, to the unemployed of the city, and has now voted $5000 more for the same purpose. Only $1 per half day will, however, be paid henceforth.

THE LETTER BOX.

Wants Rule for Furnace Capacity.

From E. P., *Philadelphia, Pa.*—Not having any great experience in furnace work, and being anxious to learn something even at the risk of showing my ignorance, I would like to be informed of a simple way of finding the area of furnace pipes ; also to find the number of cubic feet of space a furnace will heat having a given size fire pot and grate surface. As this subject may interest other readers of *The Metal Worker*, I would be pleased to have the information asked for supplied through its colums.

Note.—The area of a furnace pipe is found by squaring the diameter—that is, multiplying it by itself, and then multiplying by 0.7854. For instance, if a pipe is 10 inches in diameter, the diameter multiplied by itself is 100, and this multiplied by the decimal fraction will give an area of practically 78½ square inches. This rule is used for calculating the area of all circles. The second question has been previously asked in *The Metal Worker* without response. We know of no such rule, but can appreciate how valuable it would be to furnacemen. No doubt one rule would not apply to all constructions, and much difficulty would be met in formulating rules that would so apply, but this should not prevent the progressive furnacemen from making the attempt. The Letter Box is open for the discussion and we shall be glad to hear from our readers.

Another Inquiry for Boston Plumbers' Paste.

From W. F. S., *Bayfield, Wis.*—Some time ago a question was asked in *The Metal Worker* for the paste that Boston plumbers use instead of soil to prevent solder sticking when they make wiped joints. I would like very much to have the question inserted again, for it is better than soil and I think a great many more would like to have the recipe.

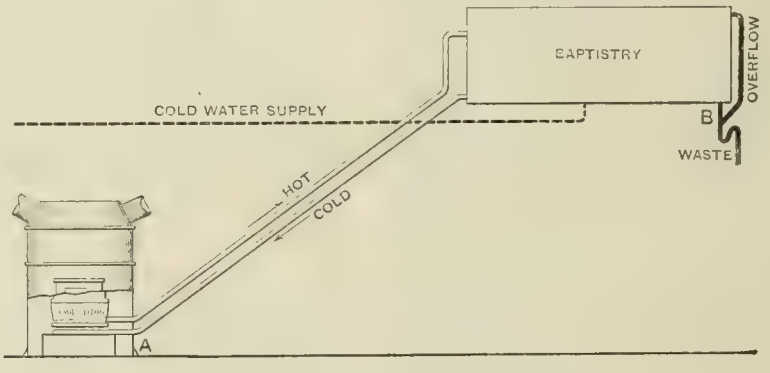
Note.—At the request of our correspondent we insert this again, and hope that some of our Boston readers will favor us with the information desired.

Pipe Fitting and Plumbing Queries.

From S. T., *Tamaqua, Pa.*—Referring to the inquiry of "E. V. S.," in *The Metal Worker* of November 25, I submit my opinion, gained from experience and intercourse with many practical fitters. The leaky joint does not result from the want of a good preparation to cover the thread, red lead being as good as any, and one universally used. The trouble lies either in the thread on the pipe or the thread in the fittings, or sometimes both threads. In cutting threads by hand, the thread is very often broken on account of a defective die or because of insufficient oil being used while the cutting is being done. Then, again, a poorly threaded fitting, either too tight or too loose for the pipe will cause a leak that can only be properly stopped by a new fitting. A nipple that is cut with adjustable dies will sometimes vary in size of thread. I think, in conclusion, that if the fitter uses care in selection of fittings—care in seeing that his threads are clean and true—that many leaky joints may be avoided.

Heating Coil Outside of Fire Pot.

From BAPTISTRY, *Suffolk, Va.*—Will you please answer the following inquiries in your valuable paper : Can water be heated sufficiently for use in a baptistry by placing a coil of pipe around the outside of the fire pot of a hot air furnace? My intention is to arrange the coil close to the fire pot, like the worm in a distillery, about 2 inches above the grate line. The water pressure in our city is from 35 to 70 pounds. What provisions for a perfect circulation are necessary beyond what are shown in the diagram, and how shall the danger of the water getting too hot be avoided, and when the cold water is shut off how shall the pipes be kept from bursting? Will the plan as shown in the diagram meet all requirements?



Heating Coil Outside of Fire Pot.

Note.—Much depends on the conditions as to the heating power of the coil located as shown. If the fire pot is thin and it gets well heated so low down, the cooling influence of a current of air passing over the coil may be overcome and the water heated sufficiently. If the coil was placed higher up it would receive more heat, and if the baptistry is very large it may be necessary to raise it up. Some experience with a heating coil outside of a fire pot is given in the Letter Box of October 7. The arrangement of the coil and the connection with the baptistry is correct. A stop cock should be placed near the furnace at A to empty the pipes when necessary and also on the waste pipe from the bottom of the baptistry at B, as shown. If the water supply is not shut off a continual waste would occur, while it is probable that the water would not be heated sufficiently, but by regulating the supply cock the temperature could be governed. If the water supply is shut off when the baptistry is full there will be a circulation that will prevent any likelihood of the pipes bursting, but this continual circulation would probably make the water too hot and steam or vapor would come up into the church. If the cocks are placed as suggested, the system can be emptied, and it is not probable that the coil placed as suggested will ever be heated sufficiently to be damaged.

Faulty Pipe Suction.

From J. W. C., *Greenfield, Ind.*—I see in *The Metal Worker* of December 16 a cut of the pump casing that I wrote you about. There is, however, a mistake in the drawing, for the casing is 8 inches instead of 3, as you have it. The 2-inch pipe extends 400 to 500 feet down and is filled with gas under a pressure of 150 pounds. The 8-inch casing extends down 200 feet to limestone. The 8-inch pipe is filled around the 2-inch pipe with packing, and then lead poured in and calked water tight. Water is plentiful. I had the pump set with suction ¾-inch pipe up and over the top of the 8-inch pipe and down to the water, but the friction was so great I had to use a 2½-inch cylinder, which did not throw enough water, and this was the reason for the new arrangement I adopted. With this explanation I hope some one will be able to offer me suggestions.

Buttermilk Strainer Wanted.

From JOHN SPOTES, *Eastport, Maine.*—Will some reader of *The Metal Worker* tell me how to make a buttermilk strainer or where I can buy them?

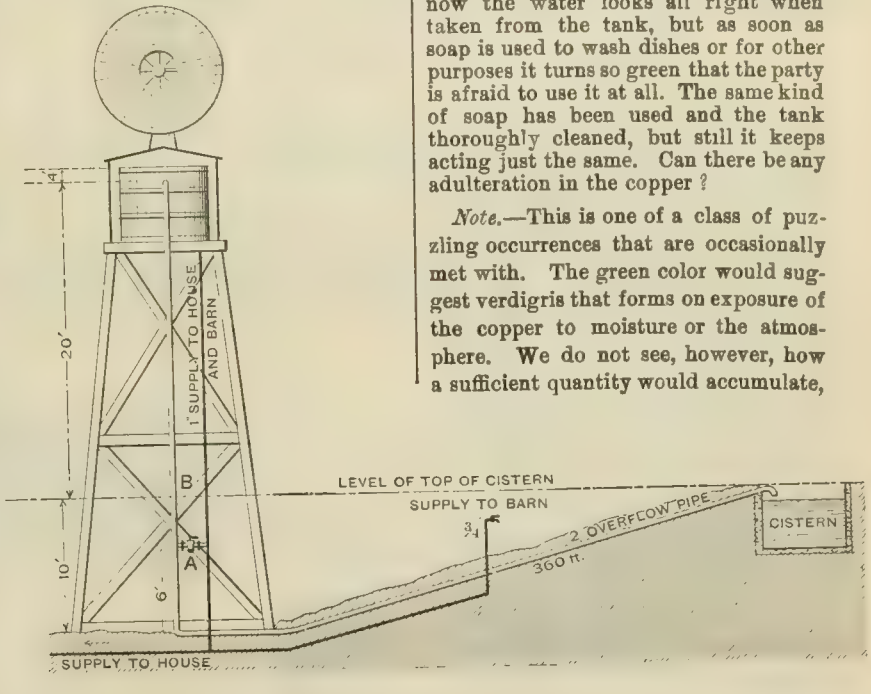
IX vs. IC Tin for Hot Air Pipes.

From CÆSAR, *Louisville, Ky.*—Referring to your remarks on my letter in *The Metal Worker* of November 25 and also to "Y. A. M.'s" comments in the issue of December 2 on the relative loss by radiation between IC and IX pipes, would say that I have never tried to ascertain what the difference is, but have practically demonstrated the question to my own satisfaction. When I have had pipes leave the furnace cellar and pass into an adjoining cellar which was cold I have had the IX pipe work and IC one not work. Again, in some cases, I wrapped the long or exposed pipe with asbestos paper from register to and within the furnace cellar. It is, or should be, a well known fact that thickness of covering prevents loss by radiation of heat. If this is not a fact, then why do we require an extra coat or heavier clothing when the weather gets colder? Again, why is it that an IC pipe will work all right when it is confined to the furnace cellar, and the same pipe, though of the same length, will fail when passed through a wall into an adjoining cold cellar? Heat is radiated in all cases at a right angle from the surface of the radiator, and it does seem to me that the greater thickness you can place between the inner warm current of air and the outer cold strata of air the less will be the loss by radiation. However, I am open for information on this subject, and if any good brother of the craft can enlighten me I shall be gratified.

Note.—Our correspondent has asked for opinions from the trade and we do not propose to push in our ideas to the exclusion of what our correspondents may have to furnish. The heavier clothes that one wears during the winter do not offer a parallel with the case of the thicker pipe, for a winter's overcoat is nothing but a collection of little air cells kept in by woolen walls. The greater number of layers of these air cells the better protection is there given against the radiation of heat from within. It is the constantly varying medium from wool to air that makes it so good a non conductor. If we could imagine wool packed down to the density of iron we do not think there would be much advantage in wearing a wool coat of IX gauge over one of IC gauge. The commonly accepted theory is that the difficulty in transmitting heat through metals is not due to the resistance of the metal itself so much as to the resistance of the absobing surface and the emitting surface. In other words—after the heat once gets into the metal it will travel through it with little reduction, but then there is a considerable loss when it gets to the other side and has to be radiated. There is a great difference, as we all know, between the loss of heat from a rough and black and bright and polished surface. Of course, this theory has its limits, and we would not pretend to say that a furnace pipe made from 6-inch armor plate would radiate as much heat as if it were made of taggers' iron. In covering pipes with asbestos and other non-conductors it is like putting on a winter coat. It is the air cells and fibrous materials inclosing them that prevent the transfer of heat. This is a subject of more than usual importance, and we believe that there must be many observers in the furnace trade who can furnish from their experience valuable conclusions and suggestions respecting the loss of heat from sheet metal pipes of different thicknesses. If it has been proven in practice that an IX pipe is very much superior, in going through cold rooms, to IC pipe, the trade wants to know it, so that they may make practical use of the information, all the arguments of the conductivity of metals to the contrary, notwithstanding. There is more good to be gained from practical experiment than from listening to a debating society.

Pipes from Tank.

From M. T. C., *Riverside, Cal.*—Will some of the readers of *The Metal Worker* inform me how to get water to run to a cistern through a 2-inch overflow pipe when the tank becomes full from the pumping of a windmill. A 3-inch pipe is attached to tank within four inches of the top. This pipe is reduced to 2 inches and extends to cistern, as shown. The cistern is located on high ground and the water from it is used for irrigating an orchard. A 1-inch supply pipe is taken from the bottom of the tank and is connected with house and barn. At A is placed a stop cock which can be opened to allow the tank to empty into overflow pipe. When the tank becomes full the water does not run out through the top of overflow pipe, but over the top of the tank. When the tank is full, by opening the stop cock at A for a short time the water will run out of tank through overflow pipe until it reaches the lower part of opening, but will not start itself when the tank again becomes full. While the pump is in operation the water continues to run over top of tank and will do so until the stop cock at A is opened or the pump is stopped.



Pipes from Tank.

Note.—The behavior of the water under the conditions reported seems extraordinary, but we hope that submitting the problem to our readers for solution will call forth some explanations. It is quite possible that in a pipe that runs a distance of 360 feet up a grade of 10 feet there are dips and raises that would become air traps. The action of an air bound pipe is often puzzling and the best way to overcome the trouble is to remove the air pockets.

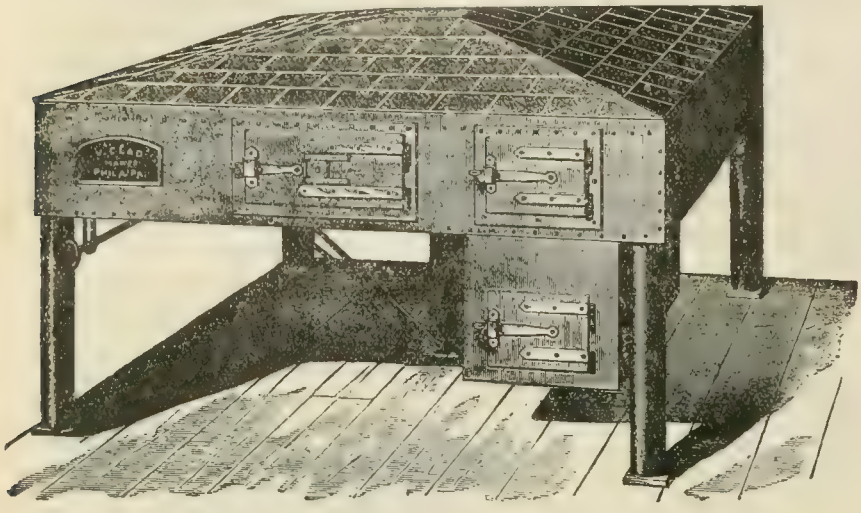
Green Water from Copper Tank.

From J. H. S., *Richmond, Maine.*—Will you please let me know through the columns of *The Metal Worker* if anything like the following has come under your observation? A little more than a year ago I made a new copper tank for a range, the old one having burned out. The new one has been satisfactory until within a few days, now the water looks all right when taken from the tank, but as soon as soap is used to wash dishes or for other purposes it turns so green that the party is afraid to use it at all. The same kind of soap has been used and the tank thoroughly cleaned, but still it keeps acting just the same. Can there be any adulteration in the copper?

Note.—This is one of a class of puzzling occurrences that are occasionally met with. The green color would suggest verdigris that forms on exposure of the copper to moisture or the atmosphere. We do not see, however, how a sufficient quantity would accumulate, particularly as the tank has been cleaned and the water, presumably, frequently withdrawn. As it appears only when the soap is added to the water, it indicates that there is something in the solution that is precipitated by the addition of the soap, thus making it evident to the eye. We can offer no suggestions to our correspondent, for we have never heard of a similar instance before, and we have never known of sheet copper being adulterated in any way. In fact, it is necessary to have the copper very pure for rolling, and the only admixture is occasionally a trace of lead, but that is only a fraction of a per cent., and does not in any way explain the green water mentioned.

Portable Brick Bake Oven.

The erection of a bake oven on premises which are not owned by the baker calls for an expense that few desire to make unless a long lease can be secured. In some instances the lack of capital interferes with the baker supplying his own oven, and in other cases the owner of the property is not willing to make such an addition for the benefit of the baker. The illustrations presented herewith show a portable brick bake oven manufactured by V. Clad & Sons, 117–119 South Eleventh street, Philadelphia, which is designed to such requirements. Fig. 1 shows the bake oven complete, and in Fig. 2 is a sectional view showing the location of the fire box, the smoke outlet and the general construction. The outside body of the oven is a heavy steel casing, with oven mouth, fire door and fire box securely fastened to it, the whole being mounted on five large pipe legs, and the structure being bolted and braced with buck stays and tie rods. The oven is furnished complete with the necessary fire brick for the hearth and other parts required for setting. The makers say that the lines for the arch are marked off and after the casing is set up an ordinary brick mason can fill in with common red brick, gravel and sand, completing the oven ready for use. The steel body is of such a weight as to hold the oven securely together, and prevent the cracks that occur in brick ovens as ordinarily built. In case of a desire to move from one location to another, by simply removing the sand and the bricks, the whole oven can be taken apart and transported. The oven is said to accomplish everything that the old fashioned bake oven is capable of doing and possesses many substantial advantages. The oven is made in six sizes, the smallest being 6 x 6 feet, outside measurement, and the largest 8 x 8 feet.



Portable Brick Oven.—Fig. 1.—General View of Oven.

President Gompers of the American Federation of Labor places the present number of unemployed workmen in the United States at 3,000,000. Mr. Gompers, in his annual address in Chicago on Monday last, attributes the dearth of employment to the extraordinary industrial depression of the past few months, superinduced by overproduction and the general adoption of labor saving machinery. The only method, he believes, by which a practical, just and safe equilibrium can be preserved in the industrial world for the fast and ever-increasing introduction of machinery is a commensurate reduction of the hours of labor. He expressed himself as very sure that if employers were to substitute a division of the work required among all their workers instead of the discharge of a number, the country would much sooner emerge from its present industrial and commercial stagnation. This is a part of the truth, doubtless, if not the whole of it.

A Curious Occupation.

In the cost accounts of South Staffordshire, England, rolling mills there is an item which finds no place in similar accounts in this country. It appears on the credit side, and represents the amount paid by an individual known as the "breezeman" for the privilege of hauling away, without cost to the company, the cinders falling from the grates of furnaces. The consideration is usually about half a crown for two weeks for each furnace burning lump coal, and it is further agreed that the boiler ashes be removed free of cost, although they have no value. The cinders from the furnaces are taken by the breezeman to an open space, where they are spread on the ground about a foot thick. Women who are employed for the purpose then rake out all the clinkers and bats, leaving nothing but dust and partly burned cinders, which are still combustible matter. This is wheeled to a large tub with water running through it, and dumped therein. The water is agitated by means of a long rake, and as soon as the dust is washed off and the black cinders float on the surface of the water they are removed with a large sieve of about 1-inch mesh, and at once become a marketable fuel known as "breeze," used extensively in the shops where hand made nails are wrought into shape by women, and in shops making light axles, &c., also in all blacksmith shops. It meets with a ready sale, and carts having huge sideboards, containing breeze, are a common sight on the roads between Birmingham and Dudley. The "breezeman" derives his income from the sale of breeze, less the amount paid to the company for the privilege and the cost of labor. Usually he makes a good living. He rents the furnaces for a year and takes chances on having a large stock on hand on account of nailers' or axle makers' labor troubles.

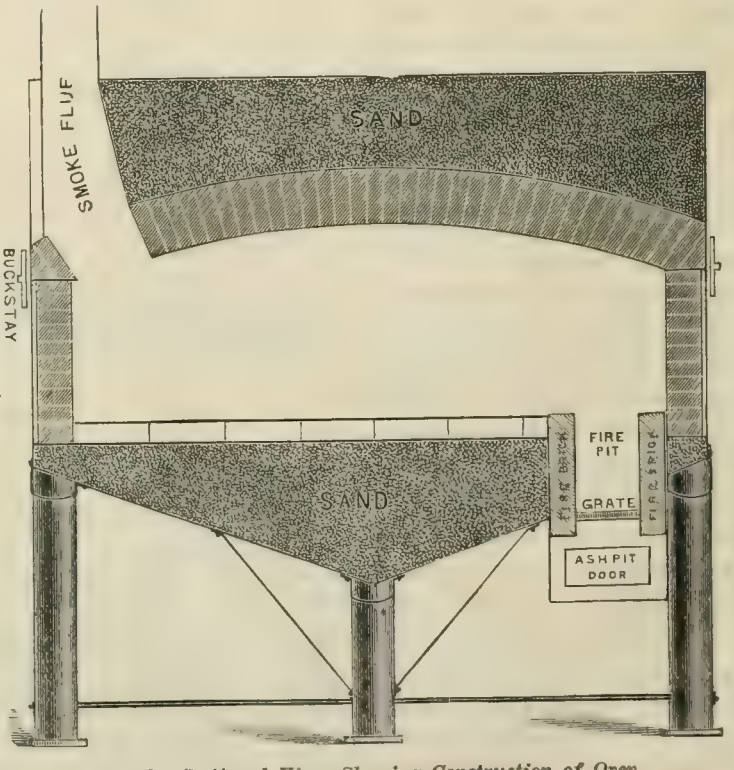


Fig. 2.—Sectional View, Showing Construction of Oven.

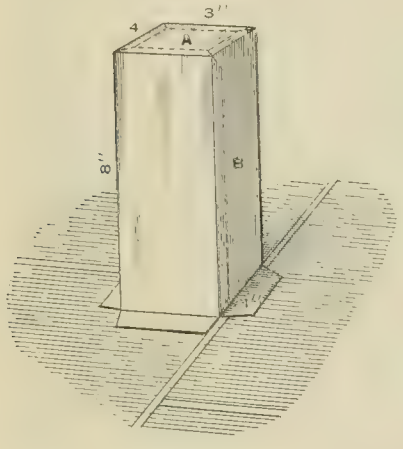
Richard Raddatz of Oshkosh, Wis., is reported to have succeeded, after ten years' study and experiment, in producing a submarine boat which can operate at great depth and be run by one man. The boat has been engaged by a Detroi wrecking firm to make a survey of western Lake Huron next spring.

Philadelphia is to dispose of her garbage by cremation. A proposed ordinance provides for the construction of a number of furnaces at $40,000 each.

ROOFING AND CORNICE.

Trouble with a Roof.

From W. N., *New York.*—The following account of a method I employ in protecting metal roofs may be interesting to some of your readers. In Fig. 1 is shown a piece of joist called blocks, covered with tin or other metal, the joist being cut to any desired hight. In this case it is 3 x 4, and 8 inches in



Trouble with a Roof.—Fig. 1.—Showing Block Covered with Tin.

hight. A flange 1 inch in width projects all around the bottom of block, as shown in Fig. 1, and is used to solder water tight to the roof. The dotted line shown at the side at B, and top at A, indicates how the laps are placed, and over the top of the laps, as shown at A, a piece of metal is soldered water tight. These blocks are now set in their proper positions on the metal roof,

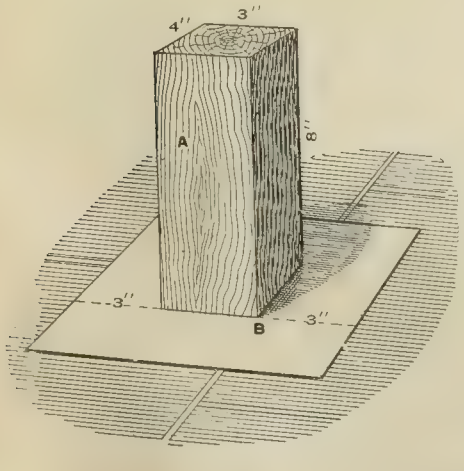


Fig. 2.—Showing Block Resting on Sheet Copper.

say about 6 feet apart, and soldered water tight to the tin or galvanized iron roof. This keeps the water from soaking under the block and rusting out the metal roof. After all of the blocks have been properly placed, cross joists are set on top of same. Then spruce strips of 1¼ x 3 inches in thickness are nailed at right angles to the cross joists not over 2 inches apart. In making the platform it should be made in such sections that it can be easily removed in case the roof needs repairing or painting. If the roof was very large quite a number of blocks would be required, and as there may be some objection to the expense of covering the blocks, Fig. 2 shows how the covering could be avoided. A in Fig. 2 represents the wooden block of the same size as shown in Fig. 1. If the wooden blocks were set direct upon the tin or galvanized iron roofs it would be found after each rain, even after the roof was dry, that it would be quite wet between the wooden block and metal roof, because the air could not circulate, and in time the tin or galvanized iron would be rusted through. Therefore, to avoid the rusting of the tin or galvanized iron, and still not cover the blocks, we would proceed as follows: In Fig. 2 B represents a piece of 18-ounce sheet copper tinned on both sides, projecting 2 to 3 inches all around the entire block, as shown in Fig. 2, and is then soldered water tight to the roof. On top of this sheet copper the wooden block is set. The water soaking between the wooden block and sheet copper would have no effect in destroying the copper, as would be the case if placed direct upon the tin or galvanized iron, as before explained. The sheet copper is tinned on both sides, so as to avoid any electrical action between the two metals that would eventually destroy the tin or galvanized iron.

FLASHINGS.

An illustrated catalogue issued by Gara, McGinley & Co., Philadelphia, Pa., is a pamphlet 11 x 9 inches in size containing over 100 pages. The first section is devoted to metal fronts, many illustrations of different styles being shown. Cornices and other sheet metal work in connection with the roofs of houses occupies the middle of the publication. These include window and door heads, finials, bay windows, vanes, crosses, &c., also iron crestings and ridging, skylights. Various forms of zinc ornaments are illustrated, also metal ceilings. The firm are also sending out some timely reminders to householders, calling attention to the need of repairing and painting roofs before the winter season, that injury by leaks may be avoided.

Joseph James, post office box 887, Montreal, Canada, issues a circular letter addressed to the trade calling attention to Actinolite asphalt for roofing, which is claimed to be a composition that will not crack in severe Canadian winters, nor run in the hot summer that they have in Montreal.

The Eclipse Machine Company, Troy, N. Y., have during the past year brought out the Eclipse gutter beading machines, intended for making galvanized gutters and eave troughs 12 feet long. It is operated by hand power and fitted with three mandrels, so that there may be turned out three sizes of beads and any size of gutter.

We are indebted to the Clay Shingle Company of Indianapolis, Ind., for a copy of an interesting pamphlet entitled "Burned Clay as a Roofing Material," prepared by John R. Elder of the city named. The matter consists of a paper read before the seventh annual convention of the National Brick Manufacturers' Association, at Louisville, in January last.

At the close of the year with such a record for dull trade as 1893 it is somewhat cheering to learn that there are a few concerns whose books show an increase in business. Among the number is the New York Iron Roofing & Corrugating Company, controlling two factories at Jersey City and Philadelphia respectively. They state that during this year their business has reached 3500 tons of black sheets, corrugated and painted and for other forms of roofing and siding, also 400 tons of galvanized roofing. This is a marked increase over 1892.

The collapse of the great bridge now under construction between East Louisville and Jeffersonville, Ind., which occurred last Friday, was one of the greatest disasters of the kind experienced of late years. The accident was caused by the strong current and heavy wind carrying away the iron and timber false work of the 500-foot span in the middle of the river, the fall of which brought down the other spans with it. Many workmen were drowned or buried under the falling mass of *débris*. The structure was the work of the Phœnix Bridge Company of Phœnixville, Pa., and was being erected by them. Every precaution had been taken to prevent disaster, and it is stated that the company have received a dispatch from the engineer in charge of the railroad for which the bridge was being built, exonerating them from all blame.

The World's Fair Prize Winners' Exposition.

Under the management of the Manhattan Industrial Exposition Company, this exposition is being held at the Grand Central Palace, Forty-third street and Lexington avenue, New York. In addition to some of the prize winners a great many features of the Midway Plaisance are on exhibition. The following are some of the exhibits that are of interest to our readers:

W. M. CRANE & CO.,

838 Broadway, New York, make an extensive display of gas stoves. At the left of their exhibit, which extends for 20 feet, is a French range, adapted entirely for the use of gas in cooking. At the right end is, to all appearances, a brass gas grate, set attractively in a hardwood mantel. In the center of the exhibit is another hardwood mantel, which has a gas fire log resting on fire dogs. The exhibit consists of Perfect and Success gas ranges, and the Vulcan gas radiator, which combines the feat-

ures of a popular Leader stove, the Leader stove which is prominently distributed through the exhibit, the Gibbons gas broiler, and a varied line of cooking utensils adapted for use with gas.

THE WOLFF GAS RADIATOR MFG. COMPANY

of 164 Franklin street, New York, show their various forms of gas radiators, the fireplace heater which can be used the same as a Baltimore heater to warm the room above, being an attractive feature of the exibit.

THE HATCH CUTLERY COMPANY

of South Milwaukee, Wis., make a fine display of the Hatch patent bolt and washer, shears and scissors and automatic pocket knives, tinners' snips, Christie knives and Capewell's patent tack pullers. The exhibit is in charge of David Eastman, of 97 Chambers street, New York.

EDWIN A. JACKSON & CO.

50 Beekman street, New York, show three handsome mantels, one being of tile with one of their ventilating grates, finished in gilt and with a gilt fender and tile hearth. Another mantel is of wood and tile, with a terra cotta gas log resting on brass andirons. Another is of tile and wood, with a gas log and wrought iron dragon fire dogs. These are arranged in a half circle and present a very attractive appearance.

L. H. MACE & CO.,

117 East Houston street, New York, make a fine display of refrigerators and kitchen furniture. They have their Diamond, Leader, Royal and Excelsior refrigerators on exhibition, in which the circulation of cold air is the strong feature. They are giving out a souvenir in the shape of a refrigerator which is a money bank made of wood and painted to show all the trimmings of a full sized refrigerator. The suggestion is to save your pennies and buy a Mace refrigerator.

THE HEAT & ODOR EXTINGUISHING COMPANY

of 1293 Broadway, New York, made an exhibit of an adjustable heat and fireproof curtain, which forms a flue to carry off the heat and fumes of cooking. It is shown in connection with a Cort gas range made by J. H. Cort & Son, 320 Water street, and a Faultless double oven coal range, made by Graff & Co., 208 Water street, New York.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

DISTRICT INSPECTOR DYSON, Worcester, Mass., recently tested the heating apparatus in a Laurel street school building, Fitchburg, Mass., which was warmed by the Fuller & Warren Company's system, put in by the Jennison Plumbing Company. The result of the test was very satisfactory in every way.

JAMES DONOVAN has secured the contract for placing a steam heater in the McDonough House, at Middletown, Conn., and will use a Richmond sectional steam boiler.

THE CONTRACT for heating the new Presbyterian church at Clinton, Mass., has been awarded to the Hub Plumbing, Heating & Stove Company.

E. D. HORNBROOK & Co., Kansas City, Mo., have secured the contract, amounting to over $25,000, for the plumbing, heating and gas fitting in the new Union Depot being built at Portland, Ore., by the Northern, Union and Southern Pacific railroad companies. The gas and electric lighting fixtures are to be very handsome.

MUNDLOCH & YAGLE, Hancock, Mich., have just finished putting hot water heaters in James R. Dee's building, L. Hennes & Co.'s store and the St. Patrick's parsonage, at Houghton. They also have the contract for heating apparatus in the new convent and school. The latter will be connected with a 4-inch pipe from the plant in St. Patrick's Church.

E. H. BAGLEY of White River Junction, N. H., has a force of men at work on George H. Moore's new house, Newburg, putting in heating and lighting plants.

PHILLIPS & Co. of Niagara Falls, N. Y., are putting in the steam heating apparatus for the new business block of the Lewiston Avenue Improvement Association of that city. The building will have two No. 4 double Florida heaters. The same firm are replacing the hot water apparatus in the Erie passenger depot with a No. 45 Florida steam heater.

THE PHILADELPHIA BOARD OF EDUCATION'S Property Committee and Council's Committee on Schools recently opened bids for heating apparatus for the various new school houses and additions to old ones. The contracts were awarded as follows: The Davis & Gorman Company, for heating the new addition to the Lynd School, Twentieth section, $200; addition to Manayunk School, Twenty-first section, Philadelphia Steam Heating Company, $1547; heating and ventilating Whitehall School, Twenty-third section, Philadelphia Steam Heating Company, $3192; addition to Bellvue School, Twenty-eighth section, J. A. Welt, $460; heating and ventilating Robert Morris School, Twenty-ninth section, Philadelphia Steam Heating Company, $5383; heating and ventilating Bayard Taylor School, Thirty-third section, Thompson Brothers, $2272; Fox Chase School, Thirty-fifth section, T. T. Rockett, $400.

SCHOLL & SEMPLE bid $290 and secured the contract for remodeling the plumbing and closets in the court house at Youngstown, Ohio.

AT A SPECIAL TOWN MEETING recently held at Guilford, Conn., the sum of $1000 was appropriated for heating the new town hall with steam.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until January 5 for low pressure return circulating steam heating and ventilating apparatus for the United States Post Office building at Ashland, Wis. Drawings and specifications may be obtained from the Supervising Architect at Washington, or at the office of the superintendent at Ashland.

S. F. LITTLEFIELD & Co., Wakefield, Mass., recently installed steam heating plants, using Exeter radiators, in the post office, G. A. R. Building and Jordan's drug store at the place named.

THE KEWANEE BOILER COMPANY, 96 Lake street, Chicago, have recently shipped the improved Haxtun boilers, as follows: Four No. 9½ for T. B. Leiter's flat building, Sixty-fifth street; one No. 4 for residence of D. Curtis, Loomis street; one No. 9½ for Theo. Jacobs Company; one No. 10½ for the Griefuhagen Building; one No. 9½ for new warehouse of the Wabash Railroad Company; one No. 12½ for Kenyon flat building.

THE AMERICAN RADIATOR COMPANY, 111 and 113 Lake street, Chicago, are to furnish the radiators used in the Union Depot, St. Louis, Mo.

AMONG THE CONTRACTS lately taken by John W. Mills, 100 Lake street Chicago, can be mentioned the following: Bolton heater for the residence of E. E. Kilmer, 5735 Indiana avenue; Capitol heaters for residences of Dr. N. S. Thomas, 2930 Lake Park avenue; Geo. L. Peterson, Pine Grove avenue; Adolph Dohl, 1241 Wolfrahm street; J. J. Lovett, Mont Clare, Ill., and A. B. Tallman, Brainard, Ill.

WILLIAM H. GRIFFIN has completed his contract for plumbing at the new Bancroft place, Second Beach, R. I., and has returned to Narragansett Pier.

THE CONTRACT between the city of Allentown, Pa., and Francis S. Mertz for the heating of the American hose house and Allen engine house and First Ward station house was signed recently, and Mr. Mertz began on the improvements at once. The Backus steam heating system will be put in the American house and station house and hot air in the Allen engine house.

TIMOTHY LYNCH of South Newmarket, N. H., is putting in a hot water heating apparatus in Arthur Caron's residence at Salmon Falls.

P. J. SWEENEY & Co. are putting a hot water heating apparatus in Selectman Daw's residence at North Andover, Mass.

HIGGINS & Co., Mount Vernon, N. Y., recently installed a Victor steam heating plant in the New Rochelle Bank and a No. 66 Victor and 1000 feet of radiation in the large residence of J. Henneberger.

ONE OF NEW YORK'S BUSIEST PLUMBERS is John Tucker of 45 East Twentieth street. He is doing the plumbing work in the Corn Exchange Bank Building, at William and Beaver streets, in the new Astor mansion at Sixty-fifth street and Fifth avenue, the residence of Mrs. Bruce Brown, Seventy-second street and Madison avenue; residence of P. T. Baiter, 149th street and St. Nicholas place; residence of Uriah Lott, 29 West Eighty-first street, and is also overhauling the plumbing work in the residence of Pliny Fisk, at Plainfield, N. J. Mr. Tucker is also making alterations at his Newport, R. I., shop, which will shortly be opened as a first-class plumbing emporium.

DURING the recent cold snap the trustees of the Children's Home, at Georgetown, Ohio, investigated the heating plant installed by G. N. Becker of that city. It is a W. H. Page Boiler Company's hot water plant with one of their special self-regulating devices so arranged that with a temperature of the water at the boiler of 164° all parts of the institution are kept at 70°. Commendation of the system, its operation and the workmanship is freely expressed.

THE ENGINEER of the Metropolitan West Side Elevated Railway Company of Chicago, selected the Mott Sunray heaters, manufactured by the J. L. Mott Iron Works, New York and Chicago, for heating the stations of the above road. The order was secured by C. M. Converse, who has charge of the heating department of the Chicago branch.

TIN PLATES.

A Tin Plate Interview.

From an interview with C. R. Britton of the Britton Rolling Mill Company, Cleveland, Ohio, published in a recent number of the Cleveland *Press*, we reprint the following:

"We began making tin plate in August, 1891, and know that we can and do produce a very superior article; in fact, almost too good to be profitable. The customers we secured when we first went into the business we have ever since held, and they include the large manufacturers and dealers here at home, and there is no better location in the country for tin plate works, as the local consumption of that product is enormous.

"The most unfortunate thing that can happen to a new and experimental industry like ours is to have it dragged into politics and covered with partisan mud. As a consequence of this, there has undeniably been a lot of prevarication on both sides of the tin plate question. For one, I aim to consider it from a purely business standpoint, and state only what I personally know to be facts. Here are some worth a second thought.

"In our tinning house to-day we have no machinery that was in use 18 months ago. It is all new, and not only that, but purely American, both in make and invention. We have not used a pound of foreign plate in a year and a half. We are getting our plate from Niles, Pittsburgh and other points. We have altogether discarded Welsh methods, and employ American labor only.

"For some time previous to last August we were closed down, or working but two or three days at a time, but receiving satisfactory assurances from the Ways and Means Committee of Congress that a specific instead of an ad valorem duty would be imposed on tin plate and that the Wilson tariff bill would not go into operation before October 1, 1894, we started up and are turning out $500 worth of tin and terne plate per day. . . .

"In the Wilson bill we are favored about 5 per cent. over sheet iron and relatively cannot, therefore, complain of unfair treatment. The changing of the duty on tin plate from an ad valorem to a specific one is so great an advantage to us that we would have had to shut up shop if subjected to the ruinous uncertainty inseparable from the former. There is not one tin expert in 100 who can determine the quality and value of tin plate from its appearance; consequently, it is impossible to lay an ad valorem duty upon it equally or equitably. Besides the amount of such duty would largely depend upon fluctuations in the foreign market price, and no man would dare to give a time order under such circumstances. With a specific duty of 1½ cents per pound, or any other amount, we always know just what we have to pay, as that goes by weight alone, and the state of the market cannot affect it. Consequently, in competing with foreign production all we have to do is to add to the known market value at any time the specific duty, and we then know precisely where we stand, and can gauge output and prices accordingly."

Tin Plate Litigation in England.

An interesting side light on the situation in the British tin plate trade is shown by the report given in the London *Iron and Steel Trades Journal* of a recent motion in the Court of Appeal of Great Britain. The firm of David & Howell, owning works at Taibach, South Wales, was recently dissolved, as the result of Chancery proceedings between the partners. The court ordered the partnership property to be realized, but Mr. Howell applied to Justice Stirling to defer the sale of the works until March next. This application was refused, and a week or two ago Mr. Howell applied to the Appeal Court, when his counsel stated that the point raised really turned on the probability that the Democrats in the United States of America would be able to obtain the repeal of the McKinley tariff. Since Justice Stirling's order the state of things had improved from the view taken by the appellant, inasmuch as the Democratic body had now brought before the Ways and Means Committee in the United States a bill which would modify the McKinley tariff to the extent that so far as regarded tin plates the proposed duty, if the bill were carried, would be about half the present amount. At present the trade was very much depressed. In 1890 alone the exports of tin plates from England were 420,000 tons, of which 320,000 went to the United States, but the McKinley tariff practically stopped all that trade. The profits of the partnership business of the plaintiff and defendant were, in 1891, upward of $43,200, whereas in 1892 they were only $12,960, and it was common ground of belief that if the McKinley tariff were repealed there would be an immediate improvement. If the new bill were carried, the date for it to come into operation would be March 1, and all he asked was that the sale might be postponed till after that date. The Lords Justices gave it as their opinion that they ought not to be asked to speculate as to what politicians in America might do, and declined to delay the sale.

SCRAP.

GUMMEY, SPERING & COMPANY, Philadelphia, Pa., have received an order for 250 boxes, 20 x 28, Pennsyl Old Method American terne plate, to cover the large buildings now being erected by the Harrison estate in Philadelphia. We understand that the demand for this plate, which is claimed to carry 40 pounds of metal per box of 112 sheets, has so largely increased that the firm are putting in additional pots at their works for its manufacture. The firm also make at their own works the Leominster brand.

A PATENT has been granted to Thomas H. Griffiths, a resident of Philadelphia, Pa., for an improvement in apparatus for coating tin and terne plates. The special feature consists in the means for subjecting the plates to a bath of oil. A tank of oil is provided above the pot, with a discharge spout emptying between the rollers and a valve controlling the flow of oil.

WE ARE ADVISED that the report that the plant of the United States Iron & Tin Plate Mfg. Company, Demmler, Pa., was entirely closed down is without foundation. While it is true that the plant is not being operated to full capacity, it is also a fact that at no time within the past three or four months have operations been entirely suspended. While the demand for sheets is very light at present this firm are doing a large business in tin and terne plate. As their tinning capacity is not large enough to consume their entire output of sheets it is necessary occasionally to run the sheet mills only half time.

THERE is but little improvement in the British tin plate trade mentioned in late advices. An upward movement in tin had added to the difficulties surrounding the struggling manufacturers in South Wales, as no corresponding advance had developed in the value of tin plates. The prospect of a reduction in the American tariff was a source of encouragement, but this was not taken as a certainty, and the possibility of a postponement of the lesser duty was entertained, serving to repress any undue haste on the part of the Welsh makers in starting up the mills. There is considerable distress still existing throughout the tin plate districts, it being computed by L. Richards, president of the Tin Plate Workers' Union, that of the 519 mills in the trade more than 200 were idle at the beginning of December. To remedy this state of things many suggestions were made, the most favored one being a month's stoppage and the strict limitation of 36 boxes to a shift. Stocks in sight are about half the quantity available at this time last year.

THE SHEET MILL of the Lalance & Grosjean Mfg. Company, Harrisburgh, Pa., is running steadily. Their product of black sheets, over and above those required for home consumption in the company's factory at Woodhaven, L. I., are disposed of to tin plate works for tinning purposes. An active demand for this material is reported.

The Columbian Desk Calendar, which is issued annually by the Pope Mfg. Company, of Columbia bicycle fame, is out for 1894, much improved in appearance. It is a pad calendar of the same size and shape as those of previous years, having a leaf for each day, but its attractiveness has been hightened by the work of a clever artist, who has scattered a series of bright pen drawings through its pages. It also contains, as usual, many appropriate and interesting contributions.

Representative Chickering has introduced a bill in Congress directing the Secretary of War to have surveys made for a ship canal from the great lakes to the Hudson River.

PLUMBING and GAS FITTING.

New York Trade School Day Classes.

The day classes for instruction in plumbing, carpentry, bricklaying and painting at the New York Trade School will open January 2, 1894. The number of applicants to the plumbing class is far in excess of previous years at this time, being now 84. The number that can be accommodated is 120. In the other classes the number is on an average with former years.

Washington Master Plumbers.

The Master Plumbers' Association of Washington, D. C., held their annual meeting recently at the Builders' Exchange, electing the following officers for the ensuing year. Joseph R. Quinter was chosen president, James Nolan, vice-president; Edward Mallett, Jr., secretary; James Cunningham, treasurer, and Charles Barrick, sergeant-at-arms. The induction into office of these men formed a conspicuous feature of the occasion.

After the meeting a banquet was held at Osborn and Hoban's *café* on Seventh street. Speeches were made by President Quinter, ex-President John Mitchell, Chief-Inspector Robinson and Edward J. Hannan. George McDerby continued with a discourse on the "Water Service of the District," Veteran Daniel Hannan told about "Plumbing in ye Olden Time" and E. S. Hutchinson treated "Social Intercourse in Trade." The remaining speakers were T. V. Noonan, J. C. McCubbin, E. G. Schafer, Robert Leich, Sr., and Thomas Somerville.

The invited guests were Capt. George McDerby, S. A. Robinson, Robert Leich, H. M. Woodward, R. G. Campbell, John Hyle, Edward Caverly, Frank Reed, C. J. McCubbin, Henry Walter, E. G. Schafer, E. S. Hutchinson, A. Ward, Jr., John Mitchell, Jr., M. Sullivan, John Curry and E. Ridgway.

Sanitary Precaution.

The San Francisco Sanitary League offers to the public the following practical suggestions:

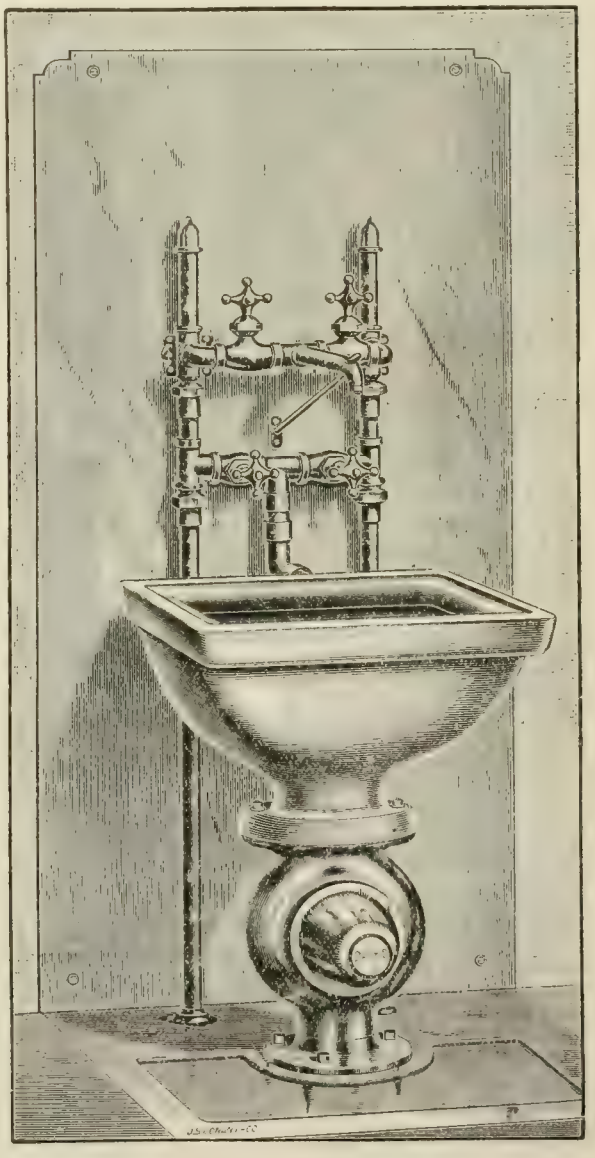
As partial security against bad sewerage and defective plumbing, the keeping closed, as a rule, the stopples in bowls and bathtubs; the keeping in a handy place a demijohn of lime water (6 ounces of chloride of lime to the gallon), and pouring a small quantity of the mixture into bowls and drains several times a day; the necessity of an adequate supply of outside air into the house night and day through open windows, placing a screen between the bed and window as protection from drafts.

The free use of sunshine, air and water as disinfectants; the burning by housewives of all garbage possible in stoves and ranges, thus obviating the necessity of its remaining any length of time about the premises.

Also the fumigation of rooms for the destruction of possible disease germs by burning sulphur on hot shovels; removing plants and birds, leaving the room closed for a time and then thoroughly airing it before occupancy.

Sanitas Slop Sink.

One of the handsome plumbing fixtures made by the Smith & Anthony Company, Boston, Mass., is the Sanitas slop sink shown in the illustration. The sink is furnished either in porcelain or enameled iron, provided with a flushing rim and arranged to use a 3-inch Sanitas brass trap, so that there is little danger of it becoming foul or clogged. It is arranged with hot and cold water fixtures, so that it can be flushed with hot water when desired. The upper portion of the fixture provides a strong extending spigot that will hold a pail while it is being filled. The cocks are of the compression character, and all of the fixtures are nickel plated.



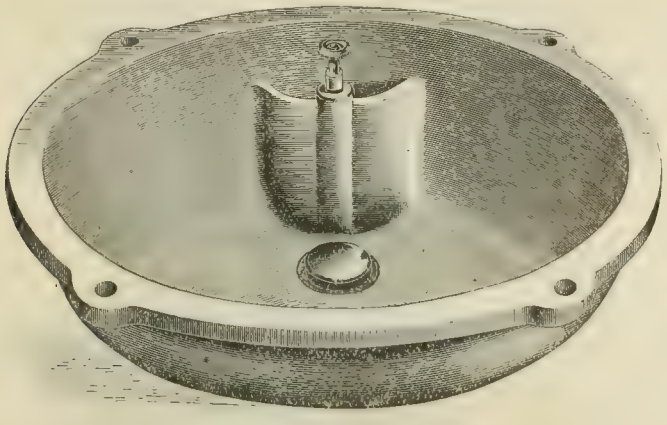
Sanitas Slop Sink.

A UTICA, N. Y., paper gives an account of the effect on unlicensed plumbers of the application of Chapter 602 of the New York State Statutes. Patrick E. Teefey, dealer in tinware, 130 Court street, was recently arraigned in the City Court before Judge Harvey for violation of the plumbing rules. Plumbing Inspector David McKeough made the complaint, as he found defendant had put in four traps in kitchen sinks This he had no right to do, as he had not been examined and had no license, and his work had not been done to comply with the plumbing rules adopted. Josiah Perry appeared for the city. Teefey pleaded guilty and paid a fine of

$5. The fine could have been more severe, but it being the first case of its nature in Utica, the Judge felt in a lenient mood.

The Complete Wash Basin.

Fred. Adee & Co., 90 Beekman street, New York, who manufacture plumbers' goods, are just introducing the Complete wash basin, which is a combination of basin and waste valve. The stopper and metal parts are brass, heavily nickeled. The basin is emptied by raising the stopper by means of the thumb piece seen in the cut. A slight lateral turn keeps it in that position, if desired, until released. If necessary to remove the stopper on account of obstructions, it may be turned to a given point, when it can be lifted out. The overflow is larger than the supply, and every part of the basin is in full view for cleansing, &c. The top is ground level so as to properly fit the slab, while nickeled brass fittings hold the basin securely in position.



The Complete Wash Basin.

TRAPS AND VENTS.

A COMMITTEE OF ARRANGEMENTS, with Col. George D. Scott for chairman and Edward Murphy for secretary, has issued invitations for a supper at Jaeger's on Saturday evening, December 23. This will be the occasion for tendering a testimonial from the Master Plumbers' Association of New York City to its esteemed president, Henry Gabay.

AS A RESULT of the recent controversy between W. E. D. Stokes of New York and the local Board of Supervisors at Yonkers, N. Y., Commissioner of Public Works Cooper, who is *ex officio* a member of the board, has given notice that at the next meeting he will offer a resolution amending the local regulations so that any plumber having a place of business in New York City, and having a certificate from the plumbing authorities of that city, shall have a certificate for Yonkers on passing an examination before the local board and paying the usual fee.

C. CARSON has opened a plumbing shop in the Harford Building, on East Main street, Middletown, N. Y.

ARTICLES OF INCORPORATION of the Iowa Construction & Mfg. Company were recently filed for record with the county recorder at Sioux City, Iowa. The incorporators are Albert Paige, John Flannigan and Harry Nobles, who also constitute the Board of Directors, from which the officers are to be elected. The company will engage in plumbing and steam fitting, and in the construction of water works and gas plants.

P. A. MCGUIRE & CO. is the style of a new plumbing firm who have recently embarked in business at 811 Broad street, Chattanooga, Tenn. M. J. Murphy is associated with the new concern.

ROSSMAN & BRACKEN, plumbers, 387 Lexington avenue, New York, are engaged in completing their contracts which have made the past year satisfactory in the amount of business transacted.

THE HAYSEED GAS BURNER, says a local paper, is the name of an invention by Clarence M. Kemp of Baltimore. He says the harder you blow at this burner the more stubbornly does the light refuse to go out, and if by chance it is puffed out by very strong lungs, the gas is immediately relighted automatically. It is designed particularly for use in hotels where gentlemen of rural training retire for one night's rest and arise in eternity while the coroner holds an inquest on the remains. We learn from Mr. Kemp that the burner, though perfected, is not yet on the market, but will probably be regularly manufactured within a few months.

THE STORE of W. H. Matlack, manufacturing plumber and gas fitter, at 423 West Jefferson street, Louisville, Ky., was recently badly damaged by fire and water. His loss, as reported, will amount to $6000, insured. He hoped to be able to begin work in the factory part at the usual time the next morning. The firm employ 29 men. The fire is thought to have been of incendiary origin.

JOHN WARDELL, Dunmore, Pa., late partner in the firm of Wardell & Palmer, has leased and is about to open a plumbing and gas fitting establishment in the empty store of Thomas Dansapaugh.

JAMESS MUIR, SONS & CO., 27 East Twentieth street, New York, are completing the work in the residence of Cornelius Vanderbilt, at Fifty-seventh street and Fifth avenue. This is said to be one of the handsomest pieces of plumbing work in the United States, a feature of which is two bathtubs carved from a solid block of Italian marble. Other fixtures in the house are in keeping with these elegant tubs, and were largely selected from the line of the J. L Mott Iron Works.

AT THE ANNUAL MEETING of the stockholders of the Hubbard Foundry & Machine Company, Warren, Ohio, the following trustees were elected for the ensuing year: J. W. Russell and Fred Russell, W. A. Loveless, J. Q. Veach and H. H. Hiscock. Only the foundry department of the plant is at present running, being engaged on a large order for sinks.

GEORGE P. KING & CO. are the latest plumbing, steam and gas fitting concern in Janesville, Wis. The partners are George P. King, who has a reputation for fine work, and Herbert E. Kent formerly in the employ of McVicar Brothers. Both young men are well known in Janesville.

THE BOARD OF HEALTH of Springfield, Mass., met in the Mayor's office recently and voted to have the new plumbing ordinance published in full. Plumbers' licenses were granted Edward S. Hanks, Edward D. Linnehan and William A. Henry.

AT A MEETING of the Master Plumbers' Association of Philadelphia, held on the 14th inst., a committee was appointed to meet the Highways Committee of Councils in regard to regulating permits for opening streets. The committee is composed of Wm. Harkness, W. S. Clark and A. M. Hicks. Among the routine business transacted at the meeting was the nomination of officers for election at the next meeting of the association.

THE HEAT CONTROL & PLUMBING COMPANY, LIMITED, is the name of a new concern established at 1721 Chestnut street, Philadelphia. J. C. Worthington is president, Levenus S. Kern secretary and treasurer, John Worthington manager of the plumbing department and O. L. Billings manager of the heating department. The company will undertake the heating of houses, public buildings, general plumbing work and the installation of electric lighting systems. They will also undertake the inspection and testing of plumbing and heating systems of all kinds. They propose to have a staff of men on hand at all hours, day or night, for repair work requiring immediate attention. They have been appointed the agents for Philadelphia for the sale of the Ridgway heater. As specialties they will manufacture and handle Billings' thermostat, thermorheostat and rheostatic governor. The company are at present employing 18 hands.

J. J. WADE & SON have moved their plumbing establishment from 298 to 276 Dearborn street, Monadnock Block, Chicago.

THE CRESCENT MFG. COMPANY, 281 Center street, Meadville, Pa., send out a batch of advertising circulars relating to some of the specialties that they are putting on the market. Those of particular interest to our readers are the Flexible Light Holder, a gas tube that can be bent in any direction and hold its position. There is also the Crescent Fire Mat and the Matchless Self-Lighting Gas Burners, all of which are illustrated and briefly described in the circulars.

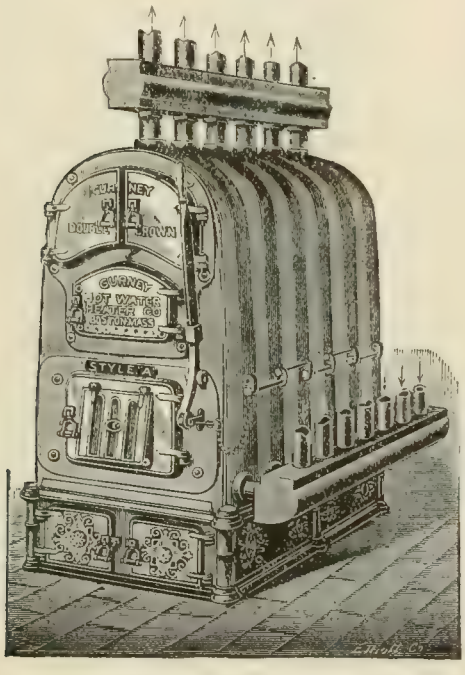
THE OHIO STATE MASTER PLUMBERS' ASSOCIATION will hold their annual convention in Toledo, February 13, 14 and 15.

THE PLUMBING ESTABLISHMENT of Wells & Hughes, Oskaloosa, Iowa, has been purchased by the Oskaloosa Plumbing Company. The new firm, under the management of I. W. Davis, have a new and complete stock of plumbing, gas, steam and hot water goods.

STEAM AND HOT WATER.

Gurney Style "A" Double Crown Heater.

The cuts introduced in this article illustrate the Gurney style "A" Double Crown hot water heater, which the Gurney Hot Water Heater Company of Boston, Mass., have recently added to their already well known line of hot water heaters and radiators. Previously they had only made two styles of this particular type of hot water heater—viz., style "B" and style "C"—their capacities ranging from 1200 to 600 feet of radiation. Fig. 1 is a general view of the heater and Fig. 2 is a broken view, showing internal construction.



Gurney, Style A, Double Crown Heater.—Fig. 1.—General View.

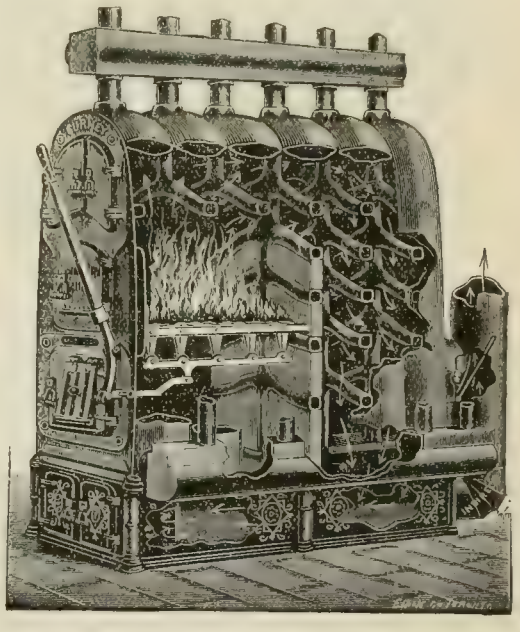


Fig. 2.—Broken View of Heater.

The style "A" differs from the style "B" and "C" in some few particulars. There is one return drum, as shown. The heater is made with a shell base and diving flue, having both direct and indirect draft. The position of the fire is at the top of the heater, similar to the two former styles, and it comes in contact with large heating surfaces directly over the fire. The general idea is carried out in this heater, as applied to their style "B" and style "C," with which the trade are familiar. This heater is made in three sizes and has capacities of 600, 800 and 1000 square feet of direct radiating surface, respectively.

HEATING NOTES.

The Wm. H. Page Boiler Company, Norwich, Conn., are just completing an addition to their plant, comprising a large foundry for making boiler castings, which will be ready for occupancy by February next.

We are indebted to B. H. Hillier & Co., New London, Conn., for a photograph of the Connecticut Odd Fellows House, at Fairview, which the above firm heated by a Richmond steam heater and Exeter radiators.

From the Globe Steam Heater Company, North Wales, Pa., we have received a 12 page catalogue of the Globe portable steam and hot water heaters and the Globe horizonal stationary steam heater. The various dimensions of the apparatus are given, as well as a rating of the radiation the different boilers will carry. The Globe adjustable pipe hanger, which is shown, can be taken off or put on after the pipe is in position and adjusted with ease. It is made for pipe from ¾ to 14 inches in diameter.

Jenkins Brothers, manufacturers of Jenkins valves and standard packing, will remove their Philadelphia branch from its present quarters at 21 North Fifth street to 117 North Fourth street.

Under date of December 11 Edward P. Bates, Syracuse, N. Y., issues a notice to the trade that the business of his Chicago office having proved unremunerative he has decided to close the same on January 1. Mr. Bates will continue in the steam and hot water heating business, with principal office at Syracuse, N. Y., where he will be pleased to correspond with former customers and to reply to new inquiries.

The trade are receiving an envelope bearing the stamp of official business of the United States Department of Agriculture, addressed to the Herendeen M'g. Company, Geneva, N. Y., inclosing a letter from William Saunders, horticulturist, &c., which is highly complimentary of No. 6½ Furman steam boiler, used in heating a greenhouse 26 x 130 feet.

The William H. Page Boiler Company, Norwich, Conn., have opened an office at 45 Dey street, New York, where a line of samples of Volunteer and All Right steam and hot water apparatus will be carried.

The Smith & Anthony Stove Company, 217 Lake street, Chicago, report a favorable trade in Hub water heaters for the past season. It is stated that their customers are well satisfied with the operation of the heaters regarding economy of fuel, circulation and ease of management.

The Farquhar Heating Company, 58 Dearborn street, Chicago, are furnishing Farquhar heaters for hot water heating in the residences of W. T. Block, 1628 Indiana avenue; E. D. Oliver, Harvey, Ill., and Cornelius Trompen, Roseland, Ill.

McMann & Taylor, 42 Cliff street, New York, dealers in steam fittings, plumbers' supplies, &c., have been made agents for this territory of the Eddy Valve Company. They will carry their goods in stock.

At the monthly meeting of the Board of Trade and Transportation in New York last week a report was adopted recommending a system of revenue marine as an adjunct to the United States navy.

Experiments with Gas Stoves.

Something over two years ago the management of the London *Lancet* appointed a special analytical sanitary commission to investigate and report upon the subject of smoke prevention and perfect combustion. The results of the work of this body were published in different issues of the paper named and attracted widespread attention. One of the reports—the third of the series—relates to gaseous fuel, including gas heating and cooking appliances, and covers a series of experiments with gas heating stoves which cannot fail to prove interesting to American readers. In connection with the report on this subject, the first instalment of which is given below, are two tables, showing the maximum and minimum consumption of fuel. These tables our readers will do well to preserve for use in connection with the conclusion of the article, which will be given in a later issue:

REPORT OF THE LANCET.

In previous articles we have explained the conditions necessary for the complete combustion of solid fuel or coal, and the conclusions to which our experimental investigations have led us may be briefly and opportunely recapitulated. We have shown that when bituminous coal is burned in the ordinary manner incomplete products are formed because heat is absorbed in effecting distillatory changes, and the volatile and gaseous products of these changes are cooled down considerably below the point at which they combine with oxygen. In addition to this, the products are mixed with a large proportion of inert nitrogen derived from the absorption of oxygen from the air which served to maintain the combustion of the lower strata of fuel. Thus it is that smoke consisting of visible gases (tarry compounds) and invisible gases (carbon monoxide, sulphureted hydrogen, hydrocarbons, &c) is formed and escapes unburnt into the air, representing a considerable waste of fuel and loss of heat. While, therefore, coal distills, and in doing so gives rise to complex products, coke or carbon is incapable of undergoing a similar change; for carbon, in burning, glows brightly and gives off the complete product of oxidation, carbonic acid, or if the oxygen is not in excess, then the incomplete product, carbon monoxide. This explains the steps in the combustion process taking place in the ordinary coal fire, where the coal on ignition gives off first inflammatory gases, part of which is burnt and part unburnt, and then when they cease to be evolved the residual coke or cinder glows without flame and burns without smoke. In other words, the red cheery appearance of a fire is due to the combustion of carbon (coke or cinders), and the luminous flames are due to the combustion of hydro-carbon gases. It is, therefore, the bituminous nature of coal or its property of yielding gases on heating which gives rise to considerable difficulties in effecting the perfect combustion of this form of fuel. These difficulties, however, great as they are, may be surmounted, as we have shown, when proper consideration is given to the conditions under which the perfect combustion of coal may be insured, and by modifying the structure of the fireplace according to these requirements.

GAS FOR HEATING.

Of late years very considerable attention has been directed to the application of gas for heating purposes, the main argument in favor of gas fuel being that in burning it produces nothing but complete products of oxidation, as, unlike solid fuel, it must in the nature of things be constantly surrounded with a plentiful supply of oxygen, which supply can never be barricaded or interfered with by preliminary changes. The hope has been again and again expressed, therefore, that the universal adoption of gaseous fuel would prevent the formation of unhealthy and smoke-laden fogs. It is obvious that whatever remedy is at hand it must of necessity be drastic. Whether it be gas, coal, or even electricity—and considerable efforts are being made to render electricity available for both heating and cooking purposes—the outlay, expense and trouble involved in the introduction of any new system must prove a temporary burden on the consumer. An important question to decide, therefore, is which of the systems of heat production at present available is most effectual, economic or hygienic in its working, and which would be the most convenient to adopt for general employment. The latter is manifestly a question which can only be dealt with satisfactorily by Imperial legislative inquiry, while it is certainly beyond the province of an article of the present character. All we can undertake is to point out the advantages and disadvantages of the systems at hand, founding our conclusions on the results of careful experimental inquiry. Having proceeded so far in demonstrating how practicable a system is, and more particularly how effectual it is likely to prove in minimizing the discomforts and alleviating the evils to health arising from the smoky outpourings of London's vast forest of chimneys, we may stop and leave the rest to those of our legislators whose duty and concern it is to watch over the health and well being of the people. In the present article, therefore, we propose to record our experience with gas as fuel both for heating and cooking purposes, and to publish the result of what really amounts to a scientific investigation in which the health question has been steadily kept in view, and which has absorbed much of our time and attention during the last twelve months.

COAL GAS INDUSTRY.

So long as the supply of coal is maintained it is certain that coal gas will be available as fuel. There is, therefore, no argument more in favor of the one or the other system that can be based on the question of supply; but, in view of the increased demand for gas for purposes other than illuminating, it is important to ascertain how far our producing centers are in a position to meet and cope with the enormously increased consumption of gas which its employment as fuel would entail. On the other hand, new methods of lighting may lessen the demand for lighting purposes, and to some extent, although we venture to think to a very slight extent, may balance the increasing needs of a supply for heating purposes. Judging from the steadily increasing employment of gas for both cooking and heating purposes which has taken place during the last decade, and bearing in mind, also, the fact of the great improvements that have been effected in the construction of gas fires and cookers, further improvements being almost a matter of daily occurrence, we are inclined to the opinion that, while there will be little diminution in the quantity of gas at present supplied for lighting, there will be a considerable quantity required over and above the present output for heating and cooking. It is important, therefore, to determine whether the gas works of London would be equal to such an increased production of gas were this increase demanded. Information of this kind can only be satisfactorily obtained from an inspection of one of the large gas manufacturing centers itself. By the courtesy of the Gaslight & Coke Company we were supplied with some interesting information on this point, and our Commissioners were permitted to visit their well known works, situated some 8 miles from the metropolis, yet, nevertheless, the largest station supplying gas to London. There are no finer works in regard to site and construction than the Beckton Gas Works on the banks of the Thames, where there is accommodation for large steamers to come alongside the wharves to discharge coal and other materials and to receive coke and other products.

At Beckton the gas is not stored in large bulk, but it is pumped through two 48-inch mains supplying gas holders in various parts of the metropolis. It is interesting to add that part of the gas manufactured in Beckton is conveyed to a district 14 miles distant. The Gaslight & Coke Company "carbonize" no less than 2,000,000 tons of coal a year, of which 1,000,000 tons are carbonized at Beckton. This represents an average of about 6000 tons a day, equal to the production of 60,000,000 cubic feet of gas per diem, or 20,000,000,000 cubic feet per annum; and to distribute this enormous volume of gas there are laid down in London streets nearly 2000 miles of main, exclusive of services and of other companies' supply. Concerning statistics, the following particulars, kindly placed at our disposal by the Gaslight & Coke Company's distributing engineer, furnish a striking and complete answer to the question as to whether the gas companies would be equal to the task of supplying an increased volume of gas, were it demanded by the application of gas for heating and cooking purposes. On Tuesday, December 1, 1891, with the thermometer at 46° F., the consumption of gas was 82,000,000 cubic feet; on Thursday, the 17th, with the thermometer at 37° the consumption was 92,000,000 cubic feet. Then suddenly a fog set in, and on Friday, the 18th, with the thermometer at 26°, no less than 118,000,000 cubic feet were required, and on the following Tuesday as much as 128,000,000 cubic feet (a record output)—that is to say, some 50,000,000 cubic feet of gas above the normal daily winter demand — an addition nearly equal to the daily average supply. If this enormous increase can be successfully grappled with at a single day's notice and maintained for several days (it is often only a few hours' notice, for there are no means of ascertaining the precise moment when fog appears, or when the temperature will suddenly fall), it is evident that even the existing plant, both manufacturing and distributing, is equal to the increasing requirements necessitated by the application of gas for purposes other than those of lighting. Moreover, by a system of high pressure services extending over the company's area, the ordinary pressure supplied to the consumer being

regulated from the high pressure mains by means of governors, the supply is constantly maintained even when a largely increased volume is demanded, to the introduction of novel systems, and none the less is it so when the proposal is made to interfere with the time honored system of burning coal. The English mind as to render the substitution of invisible sources of heat quite out of the question. Hence the failure to introduce into this country the coke

GAS FIRING.

Present Types.—Mere sentiment frequently constitutes a powerful obstacle hearth, with its cheery, bright, incandescing fuel, will ever be associated with the comforts of the English home—an association so deeply rooted in the stove, the closed combustion stove used on the Continent and other places, and other appliances, which are effective enough as regards heat and fuel econ-

omy, as well as combustion, but whose dead, dull, cheerless blackness has operated decisively in preventing their adoption in English homes. With gas fently see, he has more or less successfully attained. In the present inquiry we have confined our attention to the gas fires, in the structure of which the is thus directly utilized. But in by far the majority of stoves a form of indestructible fuel, as clay, asbestos or iron, is maintained at a cheerful glow

Note.—HC indicates unsaturated hydrocarbons.

as fuel, however, any objection to this character cannot obtain, as, while perfect combustion is secured, the fire may be made to approach the glowing coal fire so closely in appearance as to deceive even the keen observer. This has been the aim, indeed, of the gas stove manufacturer, which, as we shall pres- atmospheric or Bunsen burner is an essential feature. Gas fires of this description afford either radiating heat, convective heat, or both. In some forms there is no fuel; the gas is simply burned and the heat of combustion carried away by the products and partly by heat currents of ascending air, and by the heat of the almost invisible Bunsen flame. It is well known, of course, that ordinary luminous flames could not be used for heating fuel, as the introduction of a cold body into a luminous flame results in a considerable deposition of soot. In the stoves tested there were three varieties of fuel used

—clay ball fuel (with certain modifications), asbestos fiber and iron trellis. In stoves provided with a chamber at the back a current of air passes over the heated surfaces, becomes warmed, and then mixes with the air of the room. In other forms the heat is simply radiated from the glowing fuel. The installation of gas firing into a house, however, does not necessarily involve either a new stove or the removal of existing arrangements, as an ordinary fire place can readily be filled with fuel and fitted with atmospheric burners. In the accompanying tables, embodying the experimental work carried out, a short description of each stove under test is given.

EXPLANATION OF TABULATED RESULTS.

The quantity of gas consumed in a stove, unless it is fitted with governors or regulators, depends, of course, upon the pressure of gas from the main acting upon the burners. We have, therefore, tested the stoves both under maximum and minimum conditions, the former representing the full pressure of gas leaving the meter in a $\frac{5}{8}$ inch pipe, the pressure varying from 1.4 to 2.1 inches, while in the latter case it was found that a safe working minimum was 0.4 inch. By a safe minimum is meant the smallest quantity of gas that could be burned in a stove without fear of "lighting back" or blowing out (*vide* Bunsen Burner). The gas was measured through a Parkinson meter, which had been previously tested, sealed and stamped at the City of London Meter Testing Station. The numbers attached to the columns in the table make reference easy. We may describe them *seriatim*.

Column 1 gives a brief description of the kind of stove under test.

Column 2 records the consumption of gas in cubic feet in one hour, excepting in the case of the coal fire, where the number of pounds consumed in one hour is given.

Column 3 indicates the pressure of the supply and the pressure acting on the burner.

Column 4 gives in degrees Fahrenheit the mean heating effect on the air of the room in one hour. (It should be mentioned in this connection that in order to make really comparative determinations the starting temperature was in all cases approximately the same, from 55° to 57° ; and, moreover, the room being situated at the top of the building, so that the roof and two walls were exposed to the outside, there was no appreciable difference between the external and internal temperature. The experiments made with a view of ascertaining the heating effect of the stoves were not made in hot or extremely cold weather, but when the temperature in the morning was found to be within a degree of the starting point of preceding trials.) The space of the experimental room was 1080 cubic feet.

Column 5 gives the temperature registered by a thermometer placed 12 inches in front of the fire and immediately opposite the centre of the fuel. In one case, however (stove P), it is the heat of the ascending current of air.

Column 6 gives the cost of gas per hour, taking as an average price 3 shillings per 1000 cubic feet. In other calculations coal is taken to be worth 25 shillings a ton.

Column 7 shows the composition of the gases in the center of the fuel. The results are of special interest as indicating the changes that go on during combustion.

Column 8 conveys the information at once whether combustion is complete, for the gases occurring in this column should consist of nothing but carbonic acid, nitrogen, and the external air induced to flow up the flue by convection.

Column 9 shows the proportion of air mixed with the gas before burning, a mixture effected by the injecting action of the gas issuing from a small jet into the Bunsen tube, which is open to the air at the bottom.

Column 10 is interesting in marking at once any defective action of the stove as exhibited by an undue increase of carbonic acid in the room. Considering that carbonic acid is the chief complete product of combustion, we may take the presence of this body to indicate the extent of contamination from other products (carbon monoxide, &c.). The results are expressed in parts per 10,000, the normal amount existing in air approximating to 4. It is essential to state that the doors and windows of the room were closed in the ordinary sense during the whole time of the experiment, but no precautions were taken to prevent the ingress of air through window and door crevices, so that the conditions were rather unfavorable to the stove and such that would not exactly obtain in the dwelling room. Contamination arising from experimenters breathing the air of the room was, as far as possible, avoided.

Column 11 is reserved for observations where they are justified.

RESULTS OF TESTS.

The results yielded by the various gas fires under test may now be dealt with, and in so doing comparisons may be drawn, defects pointed out, and improvements, where desirable, indicated.

Stove A.—A good average example of an efficient stove fitted with clay ball fuel, warming the room satisfactorily by radiant heat only. No smell could be detected in the room, nor was there any indication of vitiation of the air on chemical examination. There were no incomplete products of combustion in the flue.

Stove B.—A similar stove to *A*, but consuming some six feet more gas per hour, the cost showing a slightly corresponding increase, which, however, is compensated for by greater heating effect in the room. The increase of carbonic acid was inappreciable, while the composition of the gases in the flue was satisfactory. It is to be noted, also, that the burner of this stove produces a gaseous mixture in which the proportion of gas to air is greater.

Stove C.—A good, economical, radiating stove; combustion products satisfactory. There was, however, distinct but not important increase of carbonic acid in the air, arising probably from the fuel obstructing the flames.

Stove D.—This stove heats the room both by convection and radiation and is therefore very economical as regards heating effect, 40 feet of gas raising the temperature 9° while at minimum working—that is, for 16½ feet consumed the air was warmed 4°. The carbonic acid in the air after one hour's working was practically nil, and the proportion of gas to air effected by the burner was satisfactory.

Stove E.—Similar to *D*; a radiating and heat current producing stove. Heating effect, therefore, high, consumption being 44 feet (4 feet more per hour than *D*), while air and gas were in suitable proportion, but the carbonic acid in the air, though insignificant, was higher. The products of combustion in the flue were complete.

Stove F.—This stove under full pressure of gas performs a somewhat extravagant consumption, which is not balanced by a corresponding heating effect. The flames were very long and occasionally protruded in front of the dome at the top of the stove, an occurrence which accounts for the distinct though small increase of carbonic acid in the air. The stove gives better results accordingly when worked at minimum pressure.

Stove G.—A stove fitted with iron trellis, giving feeble radiant heat, but the heating effect arising from warmed air was satisfactory. There was little increase of carbonic acid in the air after one hour's working of the stove. The flames were but slightly impeded, owing to the nature of the fuel. There was absolutely no increase of carbonic acid at minimum working. It works economically also as regards heating effect when the supply of gas is properly regulated.

Stove H.—Another type of stove with iron trellis, heated by atmospheric burners. As regards the amount of gas consumed the stove is very economical in relation to the degree of heat produced in the room, although a slight increase in carbonic acid points to some small defect, such as interference to the passage of the flame, which, however, is remedied when the pressure is reduced. The radiated heat is feeble, the heat being derived chiefly by means of a warm current of air passing through a chamber at the back.

Stove I.—Heat from this stove mainly radiated from glowing clay-ball fuel. Moderately economical ; combustion products perfect; small effect on air; proportion of gas to air satisfactory.

Stove K.—This stove is provided with four separate burners, an arrangement which offers a very distinct advantage of regulating the heat almost to a degree. It produces a very satisfactory degree of temperature in the room, derived exclusively from heat radiated from glowing clay-ball fuel, while its effect upon the air leaves little to be desired. A glance at the table will show that it is economical and that the products of combustion are complete. The rate of consumption in this stove can be reduced to 12 cubic feet per hour, the amount consumed by one burner, the heating effect of which is 3°.

Stove L.—This is a similar stove to *K*, but larger and fitted with six burners and provided with a heating chamber. For the amount of gas it consumes an excellent heating effect is obtained. The carbonic acid is slightly increased, arising from the fuel offering an undue obstruction to the flame. The stove may be reduced to one burner, burning 7½ cubic feet per hour, costing one farthing and producing 2½° increase in temperature.

Stove M.—This is a metal fuel stove similar to *G* or *H*, but having no chamber ; the heat produced in the room is, therefore, entirely radiant. Its heating effect is very great, considering the quantity of the gas consumed ; but through some cause, as with the stove *H*, there is a distinct increase of carbonic acid in the air after an hour's working. It is satisfactory, however, in all respects when attention is paid to the regulation of the supply (*vide* Minimum Working).

Stove N.—In this stove the Bunsen flame plays upon the asbestos fiber. There is, therefore, but small impediment to the flame, and the carbonic acid in the air shows little increase. From the nature of the fuel considerable heat is lost by traveling up the chimney, the

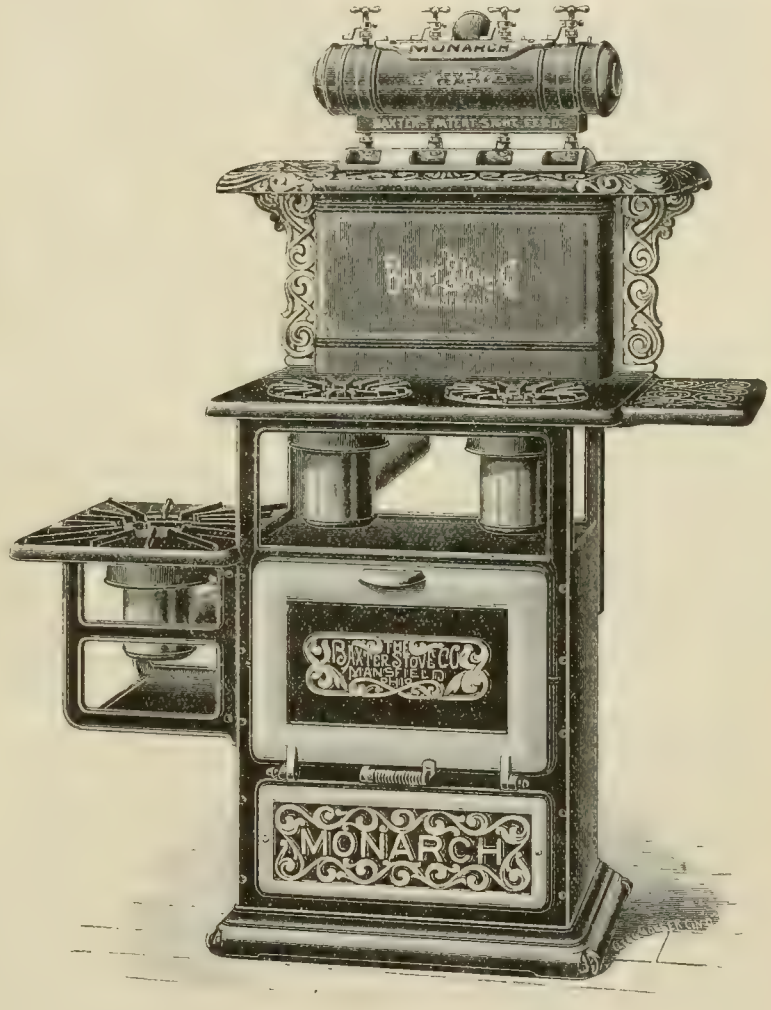
radiating effect comparing very unfavorably with clay ball fuel. Thus, for 39 feet consumed 5° is the effect. The products of combustion were complete.

Stove O.—Stove fitted with asbestos fiber of the same type as *M*, producing similar results, but showing a distinct improvement as regards leakage of carbonic acid in the air. It gives very satisfactory results at minimum working.

Stove P.—This stove produces the best results as regards heating effect, but the chief product of combustion, carbonic acid, is wholly discharged into the air. Thus the carbonic acid is raised from 5 2 to 8 parts per 10,000 in one hour, while for the small consumption of 16 cubic feet the room is heated through no less than 10°. The stove, in fact, is of the condenser type, in which the products of combustion pass through a length of tubes in which the moisture formed condenses, carrying with it the products of the oxidation of sulphur. A tray is provided at the foot of the stove to catch this water, which on analysis is found to contain the sulphur in the form of sulphuric acid, with some ammonia present as sulphate. The stove is especially applicable in cases where a flue is inconvenient or impossible. While, of course, the carbonic acid resulting from the combustion of the hydro-carbons of coal gas tends to vitiate the air, we cannot fail to approve of the ingenious device by which practically the deleterious sulphur products are removed. Although efficient for heating rooms, it cannot claim to present a cheerful appearance, a drawback to which we have already alluded, but some attempt has been made to remove this objection by the adoption of a luminous burner and placing in front of the flame a red glass window. The stove we tested, however, was fitted with an atmospheric burner.

Stove R (coal fire).—In this experiment coals were burned in a grate, immediately in front of which the stoves just described were tested. It may be urged that the comparison of its heating effect is hardly a fair one, because the coals were burning immediately under the chimney, while in the gas stove the fire was situated some eight inches toward the front; but on reflection it will appear that these conditions were, after all, such as would obtain in actual practice. Coals must be burned immediately under a flue, but a gas stove may project a short distance into the room. There is thus a gain derived from the fact that in the combustion of coal a large proportion of the heat is lost up the chimney. Where, however, a gas fire is fitted to an ordinary fire grate the same loss, it will be urged, will take place. As a matter of fact this need not be so, because the log fuel that is frequently used may be so built up that a maximum yield of radiant heat is effected and a comparatively small proportion escapes up the flue. Moreover, with gas there is no loss of heat through incomplete combustion, and consequently no production of smoke. In the experiment recorded in the table 2½ pounds of coal were consumed in an hour, and the effect on the air of the room was the raising of the temperature equal to 5°—a very satisfactory result, considering the cost of the fuel, which, at the rate of 25 shillings per ton, would be only 3 pence. Now a glance at the heating effect of a few of the gas fires will show that the same result was produced for 1 shilling 4 pence (equals 40 cubic feet of gas), which is approximately five times the amount for coal, or, oddly enough, in exact ratio of the thermal value as compared with gas. But the stoves mentioned do not give a maximum heating result, for reasons already put forward, the bulk giving twice the degree of temperature (from 10° to 12°) for the same outlay 1 shilling 4 pence. On this basis, therefore, we may regard the practical heating value of gas, calculated on the prices quoted, as equal to two-fifths that of coal. It is interesting to notice that in dealing with the products of combustion of the coal fire carbon monoxide does not occur in the fuel but in the gases in the chimney. That is the exact reverse of the case where gas as fuel is concerned. Probably, therefore, the carbonic acid found in the fuel gases is reduced as it comes into contact with the upper layers of red-hot fuel, forming carbon monoxide in accordance with the equation $CO_2 + C = 2\ CO$. In addition to carbon monoxide in the gases proceeding up the chimney there were also tarry matters and a considerable proportion of hydrogen.

(To be continued.)



Monarch Gasoline Range.

The Monarch Gasoline Range.

The Baxter Stove Company of Mansfield, Ohio, successors to the Adams & Westlake Company, have just brought out for the season of 1894 a gasoline range known as the Monarch. It is shown in general view in the accompanying illustration. The range is made in two sizes: one with two burners on top and one under oven, and one with two burners on top, one under the step and one under the oven. The oven and step burners are extra large and of great strength. The range is claimed to be constructed with a compactness that makes it ideal for family use. The ornamentation is elaborate in rich design and embellished with nickel, which, together with a highly japanned background, produces a neat effect. The body of the range is constructed entirely of cast iron, producing greater rigidity and substantiality than where sheet iron is used. Under all the burners are removable pans, for the purpose of catching any drippings from the cooking utensils.

The manufacturers also lay great stress upon the two features embodied in this construction, Baxter's patent sight feed and Baxter's patent evaporizing chambers. By means of the former the operator is enabled to see plainly the dropping of the fluid upon the evaporating cones and to regulate the flame exactly as desired, and by means of the latter the evaporating cones are completely surrounded with hot air conducted from the burners, greatly accelerating and assisting evaporation, and also giving the stove a more substantial construction. The manufacturers lay claim to possessing in the Monarch originality and perfectly satisfactory operation. The Danville Stove Works will look after the interests of the Monarch line in the East, and the same will be exhibited in New York at their place of business, 284-286 Pearl street.

New York and Cincinnati are now in telephonic communication.

STOVE TRADE NOTES.

A. Weiskittel & Son,

of Baltimore, Md., favor us with a copy of an attractive descriptive catalogue and price-list of Baltimore fire place heaters, Golden Rule and Petapsco ranges, and the varied line of Fire King gas stoves and heaters which the firm manufacture. The 150 pages of letter press of which the volume is composed carry well executed engravings of the leading lines mentioned, together with numerous testimonials showing the favor which the goods have received at the hands of the trade. An interesting feature of the work is found among the opening pages in the nature of directions for setting the fire place heaters manufactured by the firm. These heaters are illustrated and their principal features described. The greater portion of the volume is taken up with cast iron stoves and ranges, made both portable form and for brick work, following which are the company's gas burning appliances, offered under the name of Fire King. The assortment is a varied as well as an interesting one, and there is shown about everything that a dealer is likely to require in the way of goods in this class. A price list of stove hollow ware, a telegraphic code with carefully prepared index, together with a general index, are features of the work. The corners of the pages are rounded, the edges finished in a yellowish tint, and the binding is in paper covers, with embossed side title in white enameled letters upon a black ground.

The Ohio Stove Company

of Portsmouth, Ohio, send us a copy of a neatly arranged catalogue and price list of stoves, ranges, grates, hollow ware, &c. The early portion of the work is occupied with illustrations of the Buckeye range, a stove which the company introduced to the trade this year. Its constructive features cover oval shaped fire box, extra large flues, swing hearth, extra heavy sectional cast fire back, anti-clinker grate, cut top, patent oven door opener, and full size square oven. The ornamentation is of a pleasing character, and the stove has proven popular with the trade. The company's leading cook stove is also known as the Buckeye, and is decorated in a style similar to that used in connection with the range just mentioned. The Eclipse cook, Our Home, Valley Gem, Home Pride, Scioto, Dixey and National are some of the other goods illustrated and described. The leading parlor stove is the Sweet Home, arranged for burning hard coal and embodying the modern features of construction. This is followed by the Iolanthe parlor heater and the Columbian, made for burning hard or soft coal or coke. The latter is a neat heater, brought out this season from patterns made by the same concern who designed the company's Buckeye range. The ornamentation is of a pleasing character and the stove is rich in finish and design. Other goods to which attention is invited include the Oak Home, the Round Franklin, Ruby Home Model, Comet, Bloom, Vernon, Fire King, Boaz, Home Box, Amazon and Diana. A long list of hollow ware and stove repairs, kept constantly on hand, are other features of the catalogue.

ODD PLATES.

THE CATALOGUE of the Central Electric Heating Company, 26 Cortlandt street, New York, bound in a red cover, has 40 pages devoted to portable heating stoves and radiators, tailors', laundry and hatters' irons, soldering coppers, dentists' muffles and jewelers' crucibles. The last half of the catalogue shows an electric kitchen, and is devoted to ovens, boilers, hot plates, tea kettles, boilers, steam cookers and tea and coffee pots.

THE ACORN CALENDAR for the year 1894 has been issued by Rathbone, Sard & Co. of Albany, N. Y., and is of the popular shape followed by the company for several years. The front and the reverse are acorn shaped, and are decorated handsomely in a bluish gold, combined with the acorn lettering in carmine. The interior sheets containing the months are of many pleasing colors. The attractive and useful little article will be distributed among the trade.

RECENTLY a test of the heating and ventilating apparatus in the new school building, No. 20, at Utica, N. Y., was made under the supervision of George W. Griffith, superintendent of schools. The outside temperature was about 20° above zero. An anemometer was used. The apparatus was put in by the Carton Furnace Company of that city. Following shows the result:

Rooms. No.	Cubic feet in rooms.	Air exhaust per minute. Cubic feet.	Time to change air in each room. Minutes.
1.....	10,075	933	11
2	10,400	852	12
3.....	9,425	1,250	7½
4 .	9,435	1,022	9 1/6
5.....	9,672	675	14⅓
6.....	9,984	750	13⅓
7.....	9,048	1,008	9
9.....	9,048	825	11

The first four rooms are on the first floor; the second four on the second floor.

IN A LATE ISSUE of the Bucyrus *Telegraph* is an interesting article concerning some box stoves which are said to have been in use for over 40 years. According to the account, one of the principal manufacturing concerns in Bucyrus at the period named was the foundry of Wingert Brothers, which occupied the lot at the corner of Charles and Poplar streets. Among the more important products of this foundry was a box stove of moderate size, and adapted for burning wood. The stove was plain and heavy, the pattern being furnished, it is said, by a Dr. Augustine. It was about the time when stoves began to be substituted for the old-fashioned fire place, and a large number were put in use in that section of Ohio in which Bucyrus is located. To day, the *Telegraph* states, at least seven of these stoves are still in use, where they have done constant duty in public and private rooms for over 40 years, and, so far as appearances go, are practically as good as new. The only repairs which have been made have consisted of an occasional set of new rods or bolts. The article states that there may be, and probably are, others of these stoves still in use.

AMONG THE CALENDARS for the new year which have come to hand is that issued by the Standard Lighting Company of Cleveland, Ohio. It consists of a piece of heavy white cardboard measuring 11 x 14 inches, carrying upon the upper half a steel engraving representing a scene on the Western frontier. A conspicuous feature of the foreground is a herd of cattle in motion, while in the distance is seen the smoke from an approaching train of cars. Across the top of the card is the inscription in black letters: "Bull beef always tender cooked on the wonderful new process vapor stove." The 12 leaves forming the calendar proper are fastened below the picture described. In addition to the days of the week and month are given the phases of the moon. There is also presented in this connection a yearly calendar, printed upon tinted paper.

M. A. MURRAY, the Cold Springs, N. Y., agent of Rathbone, Sard & Co., recently shipped a Live Acorn stove to Pierre Conjard, Moras, Drome, France. The purchaser has lived in this country 10 or 11 years and a few weeks ago started for his native place. He had, however, remained in the United States long enough to appreciate the usefulness of an American stove, and consequently took one home with him. American made stoves are becoming more and more known in European countries and the sales are larger every year.

THE SOMERSET STOVE FOUNDRY COMPANY, Somerset, Mass., are now running three days in the week.

THE EXCELSIOR MFG. COMPANY, St. Louis, Mo., advise us of an inquiry from Amsterdam, North Holland, asking for catalogue and discounts on their line of Charter Oak and other stoves. The party making the inquiry states that he is familiar with the reputation of the product of the Excelsior Mfg. Company, and wishes to make arrangements to handle their goods.

W. H. SCOTT, who has for several years been connected with the Sill Stove Works, has been appointed manager of the Chicago branch at 52 and 54 West Van Buren street. W. H. Peckham, the late manager, has retired from the stove business and will engage in another branch of trade.

J. R. BARSE of Minneapolis, salesman in Minnesota for Rathbone, Sard & Co., celebrates his china wedding on Christmas Day. His fellow employees in the Chicago office of the company, with high appreciation of Mr. Barse's many good qualities, combined and purchased a costly and very artistic china pitcher to commemorate the event. The gift reflects much credit on the taste and generosity of the donors, and is worthy of preservation as an heirloom in the Barse family.

J. M. WARREN & Co. of Troy, N. Y., have issued a postal card notice relative to the fire that occurred in their warehouse on Thursday, December 14. They state they will necessarily be inconvenienced a few days by the conflagration, but as their principal building on River street escaped damage they hope to be able to fill orders within a very short time.

"COOKING MADE EASY" is the title of an eight page folder which reaches us from the Standard Lighting Company of Cleveland, Ohio. How this is accomplished is intimated in the reference to the New Process vapor stove, which is illustrated in several styles adapted to meet varying requirements.

THE BAXTER STOVE COMPANY of Mansfield, Ohio, have just completed arrangements with the Danville Stove & Mfg. Company of Danville, Pa., and 284–286 Pearl street, New York, whereby the latter concern will look after the interests of the Monarch line of goods in New York State, Pennsylvania, New Jersey and the New England States. We understand that a full line of Monarch stoves will be carried in stock by the Danville Company at their different warerooms, so that shipments can be promptly made.

H H. WATERMAN, a well known and popular salesman with the trade, who represents the Central Oil Gas Stove Company, 406 Pearl street, New York, will spend his holidays among his friends in Pennsylvania.

THE CONSUMPTION of Sam and Game oil and coal stoves is said by Sam S. Utter, 113 Beekman street, New York, to have been up to the average this year because they suit the people.

NORTH DIGHTON CO-OPERATIVE STOVE COMPANY, North Dighton, Mass., are sending out a neat calendar attached to a handsome embossed lithograph on which the faces of two pretty children are most prominent. The advertising matter refers to their Oak Grand, Live Oak and Prize Oak ranges.

A HANDY LITTLE POCKET DIARY comes to us from the Buckwalter Stove Company of Royersford, Pa. It is of convenient shape for the vest pocket, and each day of the year is apportioned ample space for the entering of business engagements and reminders. There are several blank pages for addresses and entries of a permanent character, as well as other pages with rulings for cash entries. Postage rates, a list of the largest cities in the United States, a list of the States with their populations, and a list of the largest cities in the world is the only printed matter contained in the diary, unless we except four inside fly leaves, which are devoted to remarks concerning the company's stoves, ranges and furnaces, in which appears a poetical quotation conveying to the chilly public a strong hint to get an Eclipse Duplex furnace:

"Get some warmth in this present life,
Not all in that to come."

JOSEPH H. BRODEUR, for eight years past employed as a wood pattern maker by the Co-operative Foundry Company of Rochester, N. Y., died on Sunday morning, December 17. He was born in Albany, March 17, 1844, served with distinction during the War of the Rebellion, and was mustered out of service with his regiment June 30, 1863. Three years later he became a member of the Tenth Regiment, N. G., S. N. Y., remaining until March 5, 1881, when he resigned his commission and removed to Rochester. He leaves a widow and five children. He was buried with military honors from his late residence, 94 South Clinton street, on the afternoon of Tuesday, December 19.

A. WEISKITTEL & SON of Baltimore, Md., are distributing among their friends in the trade a neat card wishing the recipients "A Merry Christmas and a Prosperous New Year." The sentiment is expressed in script letters, and in the upper left hand corner of the card is a *fac-simile* of the trade-mark of the firm, briefly setting forth the reputation of Fire King gas stoves and ranges.

THE QUICK MEAL STOVE COMPANY of St. Louis, Mo., are distributing an interesting little pamphlet of pocket size relating to Quick Meal gas and gasoline stoves. The 24 pages contain a great deal that the dealer handling goods of this kind can read to advantage, while numerous testimonial letters show the estimation in which the Quick Meal goods are held by those who have used them. The last page of the pamphlet is devoted to some interesting facts about the Quick Meal stove, which, it is said, was born in 1882. In that year 876 stoves were made on the third floor of a building 20 x 40 feet in size. Now, the home of the Quick Meal stove consists of three and four story buildings, having a frontage of 160 feet and a depth of over 300 feet. The works are equipped with machinery especially adapted to the production of Quick Meal stoves, and over 500 men are given employment. In the year 1893, it is stated, there were 71,316 Quick Meal stoves made and sold, each burner being carefully tested before being placed in position, and the stove carefully inspected before going to the warehouse.

THE MATTHEWS-NORTHRUP COMPANY, art printers, of Buffalo, N. Y., have brought out their Daily Reminder for 1894. This is a diary for the vest pocket, put up in such convenient form and so well adapted to the requirements of business men generally that those who have once used them are anxious to keep up the habit in succeeding years. Stove manufacturers will find them greatly appreciated by their customers. The Matthews-Northrup Company offer them in eight different styles of finish at extremely reasonable prices, with special stamping on the covers for advertising purposes. As the company truly say, they are good enough for a millionaire to carry and cheap enough to scatter broadcast.

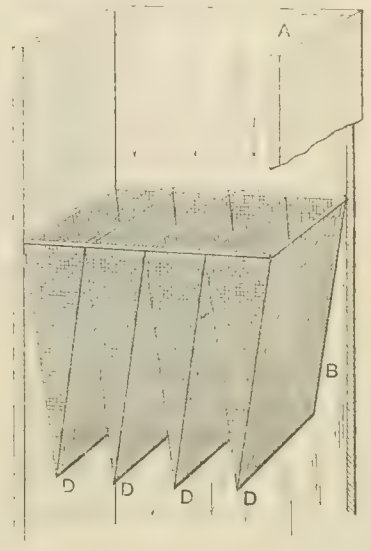
THE MICHIGAN STOVE COMPANY have prepared for advertising purposes copies of their trade-mark printed on paper in bright colors. The paper is cut to the exact outline of the trade-mark and is gummed on the back. Several sizes are furnished to dealers in Garland stoves and ranges in the expectation that they will be posted in conspicuous places. They are so brilliant in appearance that they cannot fail to attract attention.

Detroit, Pittsburgh, Buffalo, Philadelphia and other large labor centers are rising nobly to the situation in making provision for the relief of their unemployed poor by means of public works and organized private charity.

One of the few remaining refuges is about to be closed to forgers and embezzlers. Argentina, it is announced, has entered into an extradition treaty with Great Britain, which covers these offenses.

Dodge's Air Purifier.

The illustration herewith shows an air purifier for which patents have recently been granted to John S. Dodge, who is manufacturing it at 720 East Sixteenth street, Minneapolis, Minn. Mr. Dodge, who is connected with large flour mills of that city, says that his device originated from experience in handling flour dust in the mills, and that his experiments date back to the



Dodge's Air Purifier.—Fig. 1.—Broken View.

mill disaster of 1878. The purifier, however, is designed to be used in connection with any system of heating, steam, hot water furnaces or hot blast. The object of the invention is to arrest the dust and other floating particles in the air and provide means for automatically regulating the strength of air currents used in heating and ventilation. The purifier consists of a series of V-shaped cloth pockets arranged in

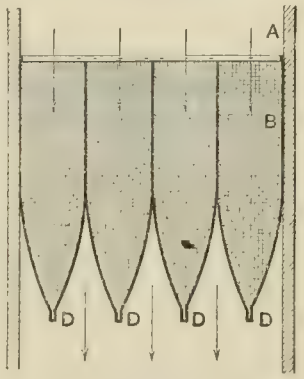


Fig. 2.—Pockets Distended, Reducing Air Supply.

an air duct and completely filling it, so that the air must pass through the cloth. Fig. 1 shows a broken perspective view of the purifier ready for use, the large end of the pockets being presented to the entering air and the small end being weighted to make them hang evenly. Fig. 2 shows the pockets distended under an excess of air pressure. The device is said to reduce and purify the air supply as required, regardless of the force or condition of the air that enters. The weights bring the pockets back to their natural shape when the pressure is modified. The filter cloth is of special weave, with a long nap, which keeps the mesh of the cloth free and collects all the dust and impurities on the outer surface. Provision is made for the removal and renewal of the cloth.

TRADE REPORT.

The Iron Market.

Deeper gloom is settling down on the Iron trade, and there are few crumbs of comfort for those engaged in this great industry. Pittsburgh and its adjacent districts are enjoying the melancholy distinction of crowding competing sections to the wall and threaten, with a further lowering of wages at some of the mills, to drag the level of prices even lower. In Eastern Pennsylvania the Iron manufacturers have been appealing quite successfully to their local financial institutions to withdraw accommodations from the Western rivals, and consumers throughout the Eastern territory are being plied with arguments to show them the danger of delivering themselves into the hands of distant producers.

In Pig Iron the general markets are very dull so far as Foundry grades are concerned. The attitude of the Southern producers will not be thoroughly tested until some of the larger Cast Iron Pipe contracts come into the market which are now under negotiation. Among them it may be interesting to mention is one for 8000 tons for Mexico. From Philadelphia comes the significant news that capitalists close to the iron trade have bought considerable quantities of Pig Iron for investment. It is not believed that the holdings of the Crane Company, which are to be sold, are large enough to create a lasting impression.

Steel Billets are squarely down to $16.50 at Pittsburgh, and are correspondingly weak in the East. Wire Rods, for which the off season has come, are offered at $24 at Western mills. In connection with the Wire trade it may be mentioned that the 25,000 keg order for Wire Nails for the Standard Oil Company was captured by a local mill. Every important concern in the country fought for the contract. The demoralization in prices for all rolling mill products continues.

Pig Iron.—Transactions in Pig Iron in the New York market are very light. The failure of the Crane Iron Company restricts the quantity of standard Lehigh Iron available for the markets, although it is understood that the furnaces may be started to work up raw material on hand. Some of the pledged stock of Iron may be sold peremptorily to satisfy advances. We quote: Northern brands, $14 @ $15 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

Philadelphia advices intimate intense dullness in Pig Iron. Consumers have no desire to load up under present conditions, neither are producers inclined to enter many orders at such prices as the market would at this time afford. It is believed that things will drift along for some time without any material change in prices, although considering the increase in production and the almost total suspension of consumption during the next two or three weeks, prices may go a little lower before there is anything like liberal buying. It is significant, however, that some heavy speculative purchases are being made by capitalists who are closely identified with the trade. Money has been quietly invested wherever it was most needed and whenever prices were made attractive. Doubtless the figures were very low, but the Iron was bought as a speculation, and would not have been bought unless special inducements were offered. These, with purchases made some two or three weeks ago by legitimate consumers, have relieved the market temporarily, so that while there is more Iron being made, pressure to sell is as yet no greater than it has been all along. General quotations for Philadelphia deliveries are about as follows:

No. 1 Foundry	$13.75 @ $14.25
No. 2 Foundry	13.00 @ 13.25

In Chicago, trade in all kinds of Coke Iron is quiet, but there are indications that after the new year opens a number of concerns will be in the market for a considerable quantity of Iron. Consumers are now exceedingly careful not to take any more stock than is absolutely necessary to meet their requirements. Orders for single carloads in almost every case name definite quantities, which are not to be exceeded. Quotations at present are purely nominal and indicate the prices asked for small lots only, and they can be shaded materially on round lots. Offers are being made of Iron from second hands or from the stock of bankrupt foundries at very low rates. Transactions in Lake Superior Charcoal have been a little more frequent. Several lots were sold the past week to malleable companies for immediate shipment at a slight concession for spot cash. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.50 @ $16.00
Local Coke Foundry, No. 1	13.50 @ 14.00
Local Coke Foundry, No. 2	12.75 @ 13.00
Local Coke Foundry, No. 3	12.25 @ 12.75
Local Scotch	14.00 @ 14.50
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25

Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

The week has been uneventful in the Pittsburgh Pig Iron market. Pittsburgh is now making nearly as much Iron as ever before in her history, and this fact, more than anything else could do, proves the superiority of that district over all other places for the cheap production of Pig Iron. Quotations are as follows:

No. 1 Foundry	$11.75 @ $12.00 cash.
No. 2 Foundry	11.25 @ 11.50 "

Business in Pig Iron during the week in the Southern markets has been in the main confined to filling small orders from the jobbing foundries, which only in a few instances reached as high as 500 tons. There was no large demand either for spot or forward delivery, but there were moderate sales of No. 2 Foundry Coke Iron at $7.90 @ $8 ℔ ton, f.o.b. Birmingham, which is a decline of 25¢ @ 35¢ ℔ ton from the prices obtained two or three weeks ago. There were moderate orders from the East for various kinds of Iron, yet none of them were large, and the aggregate sales of all kinds were not important, although larger than in any week in the recent dull times. Quotations are as follows:

Southern Coke, No. 1	$12.25 @ $12.50
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.50 @ 10.75
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—The movement in prices has been very narrow, and the line of value is practically the same at this writing as it was a week ago. Speculation remains dormant, pending developments in the tariff matter or other incentive. Dealers have purchased cautiously, and consumers have bought even more sparingly than usual at this season of the year. The bulk of business was at prices on the basis of 20.50¢ net cash for Straits, in 10-ton lots, near future delivery. Consumption shows the usual falling off for this season, and the jobbing trade is, accordingly, extremely dull. Prices for small lots remain at the same figures as have ruled for the past three or four weeks.

Semi-official data show that 1450 tons of Pig Tin were shipped from the Straits to Great Britain and America during the first half of December, besides 375 tons to Continental Europe, against a total of 655 tons during the corresponding period last year. Since July 1 about 770 tons have arrived here, the greater portion of which is in bond, and there are now about 650 tons afloat for this point.

Copper.—Business has been quiet throughout the week. Prices have undergone no radical change, but quotations made in various sources are considerably apart and leave a ripple on the surface that seems to have a rather annoying effect in more quarters than one. Copper was supposed to be well under control and sellers who represent the producers profess to maintain something like uniform prices. In some quarters it is denied that there is any understanding or agreement and that prices have not been cut below a level that is supposed to represent sellers' ideas of value. There is what may be termed strong circumstantial evidence that, whatever the surface appearances may be, the market is slightly free from restraint and not particularly strong as viewed from the statistical position. Producers of most brands of Lake Superior Ingots quote 10½¢ and claim to be sold ahead. Lots from second hands could have been secured at ⅛¢ less, however, and on the Metal Exchange there were offers to sell at 10.30¢ @ 10.35¢ for January delivery. The demand from consumers is on a very moderate scale for both Ingot and Sheet Copper. Prices for small quantities are firm at former quotations.

Pig Lead.—Dealings have been on a very moderate scale and there is no sign of livelier demand, except perhaps in a speculative circle, where it not frequently happens that "demand" is nicely timed for effect upon prices. In other words, the best bidding has been from sources in which manipulation is common. Consumers have been influenced very little up to the present time. In any event they have purchased moderately and seem to have given little more than passing attention to the speculative manouvering. The sales effected were chiefly at 3.20¢ @ 3.22½¢ for carload and larger lots, near future delivery. Bullion price has been down to 3.10¢ during the week and moved up to 3.20¢ subsequently, while 3.27½¢ for January and 3.30¢ for February were bid on the Exchange. For ton lots and less, 4¢ @ 4½¢ is asked, but concessions on these prices are not uncommon.

Lead Pipe and Sheets.—Business is stagnant in these products, owing in a measure to the restricted demand—which always marks the stock-taking period, but largely to the absence of life in the building trade. No material revival of trade is looked for, even under the most favorable circumstances, until the spring trade begins. Prices are soft, although nominally unchanged.

Spelter.—Western brands are very irregular in price at the present time. Some may be had at 3.70¢, while 3.80¢ is generally quoted for what is classed as prime and 3.90¢ reported paid for choice. The demand is slow and hesitant. The offering is uneven. Upon the whole the market shows rather poor form, and a turn for the better is dependent in a good measure upon the policy of producers in the matter of restricting their output. Jobbers' asking prices for ordinary Western in small lots are 4½¢ @ 4¾¢.

Tin Plate.—The market for Tin Plate is of the dullest, even when due allowance is given for the season of the year. Early in the week some fair contracts were reported for ordinary Coke Plates for spring and summer delivery. These transactions were, however, limited in number and confined to but a few dealers. The general run of jobbers report that business has been slow in both prompt and future deliveries, and no brisker movement is looked for until after the holidays. Such orders as are received are merely for the smallest possible quantities that will satisfy absolute needs. The outlook is not generally regarded as promising, particularly if the anticipated reduction of tariff is postponed until October 1, according to the latest proposal of the Ways and Means Committee. Even some of the domestic Tin Plate manufacturers, who would presumably benefit by the delay, express themselves as being in favor of an earlier date. Prices show little change, but the buyer of spot stock would not find it a hard task to obtain concessions on quoted rates for cash or other desirable inducements.

A London cable, of December 20, to *The Iron Age* reports that Tin Plate has been in somewhat more active demand on the other side, but except for moderate quantities of Bessemer Cokes few orders have been placed. Sales have been chiefly from stock on hand, and for early delivery. Prices continue low. Liverpool quotations were as follows:

IC Charcoal, Alloway grade	12/3 @ 12/9
IC Bessemer Steel, Coke finish.	11/3 @ 11/6
IC Siemens " " "	11/6 @ 11/9
IC Coke, B. V. grade, 14 x 20	11/3 @ 11/6
Charcoal Terne, Dean grade	10/9 @ 11/

Sheet Iron.—Very little business is doing in Black Sheets, but some inquiries are reported for delivery during the early months of the coming year. An improved tone is noted in mill business in Galvanized Iron. Prices, however, were unchanged, at 70 % @ 70 and 2½ % for small lots from store.

ONE OF THE EVENTS of the season will be a grand assembly of Christmas turkeys and Royal Roasters. Silver & Co., 18 Warren street, New York, report a mass of invitations for their Royal Roasters, and say that in no case have regrets been sent.

Chicago Report.

Scrap.—The inquiry is light now, as consumers will not buy until after the expiration of the year. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton	Per lb
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....

Heavy Brass	....	5½¢
Light Brass	....	3½¢
Pipe Lead	....	2½¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—The great coal companies have evidently overestimated the demands of this locality. The heavy trade in November and trouble in getting shipments through by rail caused them to hasten shipments by boat from Buffalo before navigation closed on the lakes. Now, a local paper says: Although the receipts of anthracite at Chicago were nearly 80,000 tons less this year than last, the docks are filled to overflowing and many steamers are held in the river because there is no place to put their cargoes. It may be a month before there will be a chance for some of the boats to unload. Instead of lying in the coal cellars of private residences and business houses, as has been the case to a large extent in former years, this city's supply of fuel is still unbought and is on the docks. People generally cannot afford to buy their season's supply ahead, but purchase a few tons at a time and economize in the consumption as much as possible. Prices are weak, but rates have not been openly cut. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40

CONDITION OF THE

Hardware Trade.

THE year draws to a close with the falling off in business which isexpected at this season. The approach of the holidays, the withdrawal of travelers from the road, the attention being given to plans for the new year's business, the effect of the financial disturbance and business depression of the past six months, the uncertainties of Tariff legislation, the weakness in the prices of some staple goods and the probability of lower prices in other lines—are influences which at this time are conspiring to make the trade defer all unnecessary purchases. The volume of business is therefore, to a good degree, limited to a few seasonable supplies and such goods as are needed for immediate sale. The improvement in the financial condition is a matter for congratulation, with the prospect of a better state of things in the near future than has characterized the last part of the present year.

Advices from Chicago.—The Shelf Hardware jobbers have enjoyed a comparatively fair trade the past week, but believe that business is now about over for this year. Salesmen are very generally on their way home to pass the holidays, and there will be few orders transmitted by mail direct from country buyers. Manufacturers' agents report a quiet condition of affairs in almost every line. A good demand has been experienced for Heavy Hardware. The trade in Iron and Steel is fair from small consumers, but there has been an unusually large movement in Sleigh stock, on which prices have risen owing to the scarcity of material. A stiff advance is asked on made-up Cutters.

Notes on Prices.

Wire Nails.—The market still continues to show a declining tendency and carload lots of Wire Nails at mill are much more readily obtainable at $1.10 than they were a week or two ago, and it is understood that sales have been made at $1.05. The regular demand for early delivery is very moderate, but the low prices which are ruling have had the effect of inducing the placing of some fair orders. The trade are, however, to a large extent deferring purchases until after the first of the year, but at the same time buyers are watching the market carefully, so as to be ready to place their orders when there are indications of a strengthening in price.

Advices from Chicago.—Matters are quiet in Wire Nails. There is more or less inquiry for spring delivery, but few Nails are wanted for December or early January. Factory lots are quoted at $1.25 to $1.30, Chicago, and small lots from stock are selling at $1.35 to $1.40.

Cut Nails.—With the unsatisfactory condition of the market the mills are to a considerable extent reducing their production and avoiding as far as possible undue accumulation of stocks. The price in the East is represented by the quotation of 90 cents for carload lots, f.o.b. mill, and is regarded by many as being as low a figure as is obtainable on regular specifications. There is, however, reason for believing that this price has been slightly shaded. Small lots from store in New York are quoted at $1.20 to $1.25.

Advices from Chicago.—Business in Cut Steel Nails is very quiet and will probably continue so until after the turn of the year. The reported fire at Lake Side did no damage to the works proper, but only affected the keg factory, which is operated by outside parties. The works are in active operation and will not shut down for the holidays. Prices are unchanged at $1.15 to $1.20, according to the character of the order, while small lots from stock are selling at $1.25.

Barb Wire.—Barb Wire as well as other leading staples feels the effect of low prices made by manufacturers who are especially desirous of realizing on their product, and as a result still lower prices have been developed. It is understood that some sales have been made by Western makers in large lots at $2 for Four-Point Galvanized at mill. The market is fairly represented by the quotations of leading manufacturers of $2.10 for Galvanized and $1.70 for Painted, with 5 cents off in carload lots. One or two of the manufacturers, however, refuse to meet current prices, and for the time being have practically withdrawn from the market. The legitimate demand is light, but some business is induced by the extremely low prices which are offering. Small lots from store in New York are quoted at $2.35 to $2.40 for Galvanized.

Advices from Chicago.—Manufacturers who deal largely with the retail trade report as much Barb Wire sold now as last year up to the same date. The tonnage being made up of small orders, a better price is realized than if the orders were as large as are usually placed by jobbers. Manufacturers who cultivate relations with jobbers report a very quiet trade. Prices continue to be quoted at $2.35 to $2.40, Chicago, for Galvanized Barb Wire in factory lots; $2 50 to $2.55 in small lots.

Plain Wire.—The market for Plain Wire is weak and irregular, and somewhat lower prices have been developed within the past two weeks. The condition of the market is reflected in the following quotations of a well known concern, which are subject to an abatement of 5 cents on carload lots:

	Annealed.	Galvanized.
Nos. 6 to 9	$1.35	$1.75
" 10 and 11	1.45	1.85
" 12 and 12½	1.55	1.95
" 13 and 14	1.70	2.10

Some of the manufacturers, however, refuse to meet these prices and are naming slightly higher figures.

Lanterns.—Buhl Stamping Company, Detroit, Mich., quote these goods at the following net prices:

Mascot assortment, three square lift Lanterns, assorted colors, two dash Lanterns and one head light, per case	$5.00
Brilliant assortment, 12 square lift Lanterns, assorted colors, per case.	6.00
Dash Board Reflector Lanterns, japanned blue, per dozen	5.50
1894 Tubular head light, per dozen..	21.00

Venetian Ironwork Outfits.—The materials for Venetian Ironwork described in our last issue as put on the market by A. J. Weed & Co., 106-108 Liberty street, New York, are subject to a trade discount of 20 per cent. A manual relating to this work gives complete list prices on the goods.

Hammock Hooks.—Stearns' Hammock Hooks, manufactured by E. C. Stearns & Co., Syracuse, N. Y., No. 200 of which was illustrated in *The Metal Worker* December 16, 1893, are sold at net prices as follows:

No.		Per doz.
200.	Steel Plate Hammock Hook	$0.60
20.	Hammock Hook	.60
24.	Hammock Hook	.60

Hair Curlers.—The Unique Self Heating Hair Curler, is manufactured by the Unique Novelty Company, Detroit, Mich., and sold on 30 days time, or 3 per cent. discount for cash in ten days from the following net prices:

	Per dozen.
Nickel	$16
Silver	24
Gold	36

Steel Broiler.—The Steel Broiler illustrated in our issue of December 16, 1893, and manufactured by the Cleveland Stamping & Tool Company, Cleveland, Ohio, is sold at $1 each, from which a discount of 70 and 10 per cent. is allowed.

Adjustable Paint Burner.—The Quick Meal Adjustable Paint Burner, manufactured by Quick Meal Stove Company, St. Louis, Mo., and illustrated in our issue December 9, 1893, is sold at $5 each, less a discount of 30 per cent.

Glass.—The week has developed few or no changes in the condition of the Glass market, although some additional factories in the West were put in operation. It is reported that some of the factories making Glass have orders which will keep them employed for some time. Local trade is limited to small orders, which is not unusual at this season of the year. Prices are reported from Pittsburgh as being 85 and 5 and 5 per cent. discount for single and 85 and 10 and 5 per cent. discount for double strength Glass. Western prices from factory are given as 85 and 7½ per cent. discount for single and from 85 and 10 and 10 to 85 and 15 per cent. discount for double strength Glass. It is reported that the price at which Plate Glass is being sold allows of its use as a substitute for Window Glass of the larger sizes.

Cast Iron Soil Pipe.—At a meeting of Soil Pipe manufacturers, held in New York on the 5th inst., the follow-

ing changes in the list prices of Soil Pipe and Fittings were adopted: 4-inch Standard Soil Pipe, 40¢ ℔ foot; 4-inch Double Hub Standard Soil Pipe, 46¢; 4-inch Standard ¼ Bends, 75¢ each. The list prices on ⅛, ⅙, ⅓ and 1/16 Bends, Standard and Extra Heavy, from 2 inch to 15-inch inclusive, to read the same as ¼ Bends. The list prices on ⅛, ⅓ and 1/16 Double Hub Standard and Extra Heavy Bends to be the same as on Double Hub ¼ Bends, 2 inch to 15-inch inclusive. The list price on Tees, Standard and Extra Heavy, to be the same as the list price on Standard and Extra Heavy Y's, 2-inch to 15-inch inclusive. The list price on Standard and Extra Heavy Cross Heads to be the same as on Standard and Extra Heavy Double Y's, 2 inch to 15-inch inclusive. The list price on long Tees to be the same as on Standard Extra Heavy long Y's, 2 inch to 15-inch inclusive. All fittings, Standard or Extra Heavy, with outlet or hub vent, add to the list price as follows: 2-inch, 50¢; 3 inch, 60¢; 4-inch, 75¢.

Old Metals.—The market for Old Metals is dull and lifeless. Some recent forced sales of Scrap Iron have resulted in very low prices on this material, particularly for the Wrought Scrap. The demand continues very slow and prices weak, quotations for New York delivery being about as follows:

Heavy Copper	℔	lb	7¢
Light and Tinned Copper	℔	lb	6½¢
Heavy Brass	℔	lb	5¢
Light Brass	℔	lb	4½¢
Lead	℔	lb	3¢
Tea Lead	℔	lb	2¾¢
Zinc	℔	lb	2½¢
No. 1 Pewter	℔	lb	14¢
No. 2 Pewter	℔	lb	6¢
Wrought Scrap Iron, ℔ gross ton	$7.00	@	$8.00
Heavy Cast Scrap, ℔ gross ton	8.00	@	9.00
Stove Plate Scrap, ℔ gross ton	4.00	@	5.00
Burnt Iron, ℔ gross ton	2.50	@	3.00

Old Rags, Paper, &c.—Business in these materials continues slack and is likely to be so for the next two or three weeks. Prices are somewhat irregular, the following being about the present rates paid for Old Rags, Paper, &c., by New York dealers:

No. 1 White Rags	℔	lb	3¼	@	3⅓¢
No. 2 White Rags	℔	lb	2¼	@	2½¢
Mixed Rags	℔	lb			2¼¢
Blues and 3ds	℔	lb	1	@	1¼¢
Hard Sized White Shavings	℔	lb	2¼	@	2½¢
No. 1 White Book Shavings	℔	lb	2	@	2⅛¢
No. 2 White Book Shavings	℔	lb	1	@	1⅛¢

No. 1 Manila Paper	℔	lb	1	@	1¼¢
No. 2 Manila Paper	℔	lb	⅝	@	¾¢
Bogus Paper	℔	lb			½¢
Common Paper	℔	lb	⅜	@	½¢
Straw Chips	℔	lb	½	@	⅝¢
Binders' Clippings	℔	lb	½	@	⅝¢
Jute Butts	℔	lb	1½	@	2 ¢
No. 1 Jute Bagging	℔	lb	1	@	1¼¢
Mixed Bagging	℔	lb	¾	@	1 ¢
No. 2 Bagging	℔	lb	½	@	¾¢
Hemp Twine	℔	lb			2½¢
Manila Rope	℔	lb			2½¢
Jute Rope	℔	lb	1½	@	1¾¢
Mixed Rope	℔	lb	¾	@	⅞¢

Old Rubber.—The market for Old Rubber is unchanged in its dullness. Quotations are approximately as follows:

Car Springs, ton lots, ℔ lb.		@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔ lb.		@	.03
Rubber shoes, less than carloads, ℔ lb.	0.02¼	@	.03⅛
Large Hose, ℔ ton		@	9.00
White Wringer Rolls, ℔ lb.		@	.04¼
White Syringes, ℔ lb.		@	.05

Trade Notes.

THE DIXON CRUCIBLE COMPANY, Jersey City, N. J., show a most sympathetic appreciation of the editorial needs. In view of their kindness, it is our pleasant duty to acknowledge having received from them a box of assorted pencils. They are hard and soft, with and without rubbers, adapted to every mood of the writer. Nor was there omitted that most important of all things, the blue pencil, of which there are a half dozen samples included in the selection.

THE PITTSBURGH REDUCTION COMPANY, Pittsburgh, Pa., are putting up a plant at Niagara Falls for the manufacture of aluminum, using the electrical power generated by the Niagara Falls Power Company. The plant will probably be in operation by the middle of next year.

THE TARBOX MFG. COMPANY, New London, Conn., distribute an illustrated price-list relating to the Tarbox Stove Gloss of their manufacture. The special advantages of this Stove Gloss, which is put up in pails, cans and bottles, are alluded to.

WE ARE INDEBTED to the New Bedford Copper Company, New Bedford, Mass., for a little pamphlet giving interesting information and statistics about the old Massachusetts town of New Bedford, which is a handbook of the place, giving its history, a map, statistics of its manufactures and trades and other local information.

THE GURNEY REFRIGERATOR COMPANY, Fond du Lac, Wis., have just completed an important addition to their plant in the shape of a two-story brick building, 36 x 115 feet, in which they have installed considerable new machinery. The company have also made some improvements recently in the style and finish of the cabinet work on their Refrigerators. Business has been very promising with them during the year, and orders of goods for the coming year indicate a promising trade in their specialties.

MATTHAI, INGRAM & Co., Baltimore, Md., have added materially to their manufacturing plant. The new features include a fire proof retinning building, and a four-story addition, 80 x 120 feet. The firm have also enlarged their Galvanizing and Black Iron departments.

THE FACTORY of Cordley & Hayes, manufacturers of Indurated Fiber Ware, Lockport, N. Y., which was destroyed by fire last July, has been rebuilt and is now in full operation, with an added producing capacity of from 50 to 100 per cent. The demand for the special line of goods made by the firm is reported to be increasing rapidly.

STRANSKY & Co., 27 Murray street, New York, say that notwithstanding the widespread depression in business, the demand for their Cameo Ware has increased so that they have been unable to fill orders as completely as usual. With a view, however, to filling their back orders, they have closed out the greater portion of the stock of another importer, and with increased manufacturing facilities in Europe they hope to meet future demands satisfactorily.

GEORGE W. JOHNSON'S SONS, wholesale Tinware manufacturers and dealers, Wheeling, W. Va., have enlarged their building from a three-story brick to a five-story brick, with stone front. Each floor is 130 x 25 feet, and the new facilities afforded and space gained enable the firm to extend their business materially.

A NUMBER OF SHEET MILLS in the plant of the Moorhead-McCleane Company, at Pittsburgh, which have been idle for some time, have again been put in operation.

THE PLANT of the W. Dewees Wood Company, at McKeesport, Pa., manufacturers of patent planished Sheet Iron, is in operation to nearly full capacity.

THE PLANT of Summers Brothers & Co., Struthers, Ohio, manufacturers of box annealed Sheet Iron and Sheet Steel, is in partial operation, the product being light steel sheets. Prospects for the continued operation of this plant for the winter months are reported as very bright. The continued excellent demand which this firm are receiving for their iron and steel sheets is due to the fact that they endeavor at all times to turn out a product of the very best quality.

THE CHICAGO STAMPING COMPANY, 227 to 231 South Green street, Chicago, announce the appointment of W. L. Goodrich to the entire charge of their city and country sales. Mr. Goodrich has been connected with the Metal and Tinware trade for the past 25 years, and has a very wide acquaintance throughout the Hardware interests of the Northwest.

JOHN H. BAIRD, who represented the Jos. Dixon Crucible Company of Jersey City, at the World's Fair, has published a charming little *brochure* giving his reminiscences of the exposition. Mr. Baird is of a poetic temperament, and has been deeply impressed by the greatness of the fair, so that the vigorous prose in which he has clothed his thoughts glows with enthusiasm. The many friends of Mr. Baird will value this work as a memento of his personality as well as a souvenir of the exposition itself.

THE RAZORINE MFG. COMPANY, 2 West Fourteenth street, New York, have prepared card stands upon which are fastened a dozen cakes of Razorine for advertising purposes. Above the packages is printed matter calling attention to the merits of the preparation and announcing that by its use the dullest razor can be sharpened. The company are prepared to offer liberal inducements to merchants to insure the more rapid introduction of this specialty.

MUDGE & BENJAMIN is the style of a firm which has recently entered the Hardware and House Furnishing Goods business at Olean, N. Y. They will give particular attention to retailing, but will also, they advise us, conduct a wholesale business. The new firm will be glad to receive catalogues, circulars, &c., from manufacturers and importers.

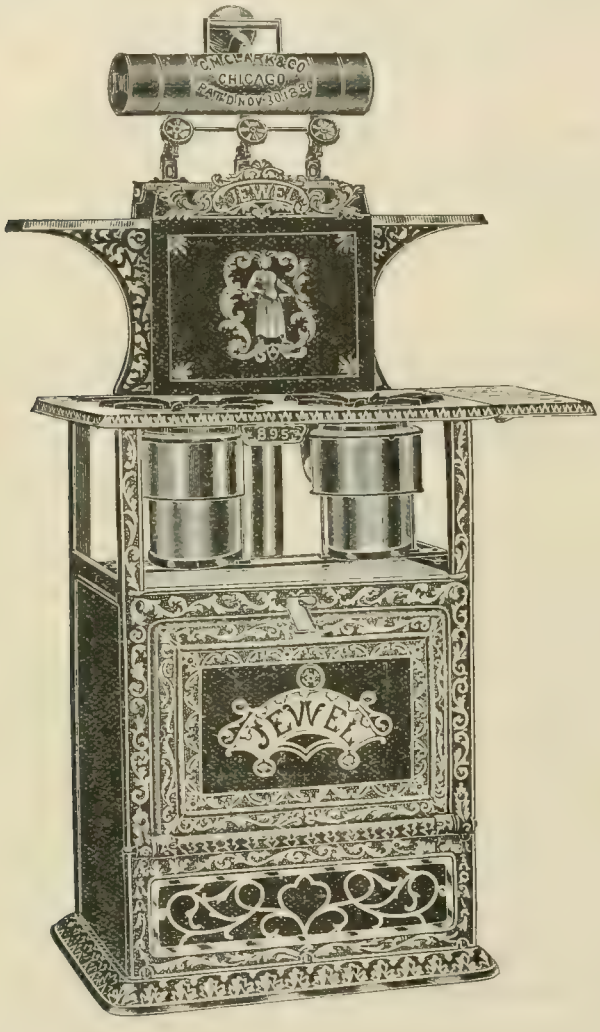
BRONSON SUPPLY COMPANY, 72 Beekman street, New York, have been offering special inducements, which hold good until December 31, to merchants on season goods suitable for holiday and regular trade. They selected five leading sellers from the production of their several companies and have made the price extremely low. Two are of their Seamless Steel Never Break

Ware, a brass Umbrella Holder of the Ideal specialties, one from the Puritan line of cooking utensils and a baking and roasting Pan of the Excelsior kind. They direct the attention of the trade to the plan and refer to it as producing satisfactory results.

LALANCE & GROSJEAN MFG. COMPANY, 19 Cliff street, New York, have been engaged in perfecting an entirely new line of Enameled Ware, which they purpose placing on the market with the new year.

New Jewel Process Range.

George M. Clark & Co., 153 to 161 Superior street, Chicago, have brought out the New Jewel process range, which is illustrated in Fig. 1 of the cuts. It



New Jewel Process Range.—Fig. 1.—General View.

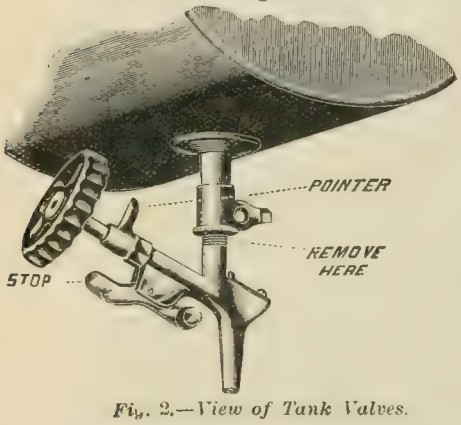


Fig. 2.—View of Tank Valves.

is a compact cabinet range, having no end shelf or step, and is, therefore, adapted to conditions for which the range with a step is found undesirable. It has three burners, two of them being on top and a large one in the oven. The oven has a drop door with a spring balance, so that it closes at a touch. The oven is further constructed on the principle of Jewel portable ovens, with direct heat, and a rear connection is arranged for a small stove pipe to the chimney to carry away the fumes of baking or roasting. The oven burner is entirely inclosed within the oven to insure the utilization of all the heat. The frame of the range is of cast iron, the body of cold rolled sheet steel, drip pans are under all burners, the grates are raised and the range is mounted on casters. It presents a very neat appearance, and is confidently expected to prove a good seller as well as a reliable piece of kitchen furniture.

An illustration is also given in Fig. 2 of the tank valves used on the process stoves of George M. Clark & Co. and made exclusively by them. These valves are thus described in the company's catalogue: "The casting is made of brass, the needle of German silver, and the entire work is machine shop work. This part never goes into the tin shop, but is screwed into the tank fitting after the tank has been received in clean shape from the tin shop. Therefore there has been no heat at the valve, consequently no corrosion from acid or other cause. The needle valve is fitted with a pointer, which is adjusted to stop at the adjustable stop that is attached to the valve casting. In case it is necessary to remove the needle the adjustable stop may be tilted to allow the pointer to pass. The feature of our valve is that each one is separate, and should it be necessary to remove a valve it may easily be done by any one, cleaned and replaced in a very few minutes."

It Is Reported—

That the Hardware store of Brindley, Drennan & Co., Swanton, Ohio, was burglarized on the 4th inst. About $25 worth of goods were taken.

That the Hardware dealers of New Albany, Ind., have donated to that city a supply of Picks to be used in the street repairs.

That William Jenkins' Hardware store, at Oxford, Mass., was robbed on the 31st inst. Razors and Pocket Knives comprised the booty.

That John Holker has retired from the firm of William Holker & Co., dealers in Stoves, House Furnishing Goods, &c., Newburyport, Mass., and William Holker will hereafter conduct the business alone.

That J. M. Schram's Hardware store at Ridgway, Pa., was destroyed by fire on the 12th inst. Loss, $7000; fully insured.

That the Hardware store of A. M. Churchill, Morrisville, Vt., was slightly damaged by a fire in that place on the 13th inst.

That a newsboy, while attempting to sell a paper in S. L. Boyce & Son's Hardware store at Port Huron, Mich., on the 9th inst., entered the office during the bookkeeper's absence, and unlocking the money drawer of the safe, abstracted a pocketbook containing $40. The boy was subsequently arrested.

That F. A. Beltz, Boyd, Minn., has sold a half interest in his Hardware store to P. Golden.

That on the 12th inst. fire destroyed the Hardware store of Bartlett & Mallett, Groton, S. D. Loss on stock, $7000; insurance, $4500; loss on building, $2000; insurance, $1400.

That in the tornado which visited Harrisburg, Ill., on the 15th inst., the Hardware store of J. S. Ferguson was unroofed.

That A. F. Anderson has bought the Hardware store of H. S. Rich & Co., Red Wing, Minn.

That M. M. Davidson has sold his Hardware stock at Tipton, Iowa, to William Muhs of Milwaukee. Mr. Muhs will take possession the first of the year.

That D. Thompson has bought A. H. Nichols' Hardware store, at Marlette, Mich.

That U. P. Solberg has purchased a new Hardware store at Sioux Center, Iowa.

That A. L. Johnson's Hardware store, at Blaine, Wash., was burglarized on the 5th inst. The thieves broke in the side window and carried away about $100 worth of Pistols and Cutlery.

That V. P. Moore, Adairville, Ky., has sold a half interest in his Hardware store to Morris Barker of Keysburg.

That J. W. James has sold his Hardware store at Point Pleasant, Ohio, to Hoopman Bros. of Byesville. Possession will be taken January 1.

That Steer & Church, Coleman, Mich., have purchased S. S. Tower's stock of Hardware and removed it to their store.

That Mr. Yost has recently entered the Hardware business at St. Louis, Mich.

That F. C. Dickson has leased the Weyh Building, Armour, S. D., and will put in a complete stock of Hardware. Mr. Taylor, a nephew of Mr. Dickson, will have charge of the store.

That Grate Bros., Hardware merchants, Carondelet, Mo., hope to have their new brick store completed by the first of the year.

That Huddle & Shoemaker, Ashley, Ohio, have sold out their entire stock of Hardware, Farming Implements, &c., to Wesley McCurdy and John Olds. The firm name will be Olds & McCurdy.

That the Hardware firm of Godley & Watson, Oberlin, Ohio, was dissolved on the 4th inst, and a new partnership formed. Mr. Godley purchased the half interest of Mr. Watson and subsequently sold it to David E. Morris, the firm name becoming Godley & Morris.

That R. W. Maben of Garner, Iowa, has traded his stock of furniture for a stock of Hardware in the southern part of the State.

That the Hardware firms of C. S. Bucktel and S. G. Empey, Tobias, Neb., have consolidated, and will hereafter be managed by C. S. Bucktel. A part of both stocks will be moved to Swanton, and a branch store opened there.

That Baily & Storch, Hardware merchants, Fullerton, Neb., have purchased the Hardware stock of Sprague Bros., Belgrade, Neb., and will conduct it as a branch store.

The Heating and Ventilating Engineer.

The art of heating as it exists to-day is based rather on accumulated experience than abstract reasoning. To the steam fitter and the furnaceman belong the greater part of the credit of our present successful methods, as on account of the conditions under which they have worked their financial interest has literally compelled them to accomplish the best results with the least expenditure of money. As a consequence, we are in possession of empirical rules for proportioning radiating surfaces, flues, registers and the like with relation to given cubic contents, window and wall exposure. But the rules thus established have led the true scientist to investigations looking to the establishment of experimental constants, factors and formulæ as inimitable as the laws upon which they are based. The science of ventilation has followed far in the wake of that of heating, for human comfort is measured by immunity from cold rather than by freedom from a polluted atmosphere. The action of the one is immediate and serious, of the other extended and insidious. From the expert in heating and the student of ventilation has been evolved the heating and ventilating engineer, a man conversant with things practical and things theoretical, capable of designing, building, installing and operating under any given conditions a system of heating and ventilation that shall be best suited, most satisfactory and most economical. His experience in heating must enable him and his relation to his client must compel him to recommend only that which is best. Improved ventilation has been the work and study of the scientist rather than of the artisan and theory has preceded practice. Ventilation has been considered and improved only after scientific investigation has shown the injurious effects of a polluted atmosphere, has pointed out this cause and suggested the remedy. The creation of public sentiment in favor of better ventilation lies largely in the hands of the expert, and his success in convincing his clients and fulfilling the requirements will be, in great degree, a measure of his ability as a heating and ventilating engineer.

Hard Times and Inventors.

It is asserted by patent solicitors of experience (and it is thought the patent records will justify the assertion) that soon after a recovery from business depression begins to be felt, there is, as a rule, a notable increase in the number of applications for patents. Part of this increase may be attributed to delays caused by financial embarrassments; but the total increase seems greater than can be so accounted for. It appears probable that the additional time afforded for study and invention through temporary stoppage of works or other curtailment of general industry yields a harvest of material improvement. The great pushing-on of the frontiers of progress seems to be urged at such times more vigorously than when shops are crowded with orders and the energies of all are taxed to meet pressing demands. The workers in the field of invention are mostly in the ranks of the employed. The heavy load of financial management is not borne by them, but by those who pay their salaries, and any reduction of their ordinary duties more or less sets free their active minds to originate something new or to perfect what has perhaps long awaited completion.

From the Columbus (Ohio) *Dispatch* we learn that the trade school that is conducted in that city under the auspices of the local Gas and Steam Fitters' Union is meeting with much appreciation. Practical questions connected with plumbing and sanitation are discussed at the meetings of the school, and the exchange of experience proves highly beneficial to the apprentices and tradesmen who avail themselves of the advantage offered. At a recent session of the school the City's Building Inspector and his assistant were present and addressed the students.

The Employment of Idle Money.

The enormous accumulations of loanable funds in our financial centers, says *The Iron Age*, opens a wide field for activity for that clever and useful negotiator, the promoter. He is usually quick to discern the direction into which popular favor can be diverted when the time comes to withdraw funds from deposit in banks and trust companies and employ them in active work promising greater remuneration. It may be acknowledged at once that the time has not yet come when moneyed men have sufficiently recovered from their scare to allow them to take hold of new ventures. But a good deal of preparatory work must be done, and it is probable that where it has not been undertaken it will soon be required. The experience of the past year has been hardly such as to encourage much outside capital to jump into the manufacturing branches which *The Iron Age* represents. Nor is the uncertainty concerning what Congress will do with the tariff calculated to encourage investment. Probably the best chance for fresh capital lies in the rehabilitation of some of the manufacturing plants whose owners have failed. We do not, of course, refer to those undertakings which have been forced into receivers' hands simply through internal quarrels and intrigue. As is well known in the iron trade, there are a number of conspicuous cases of this character. But there are a number of works of recognized vitality and capacity for future money making which can be acquired for much less than the actual hard cash invested in them. Their competitors will hardly regard the infusion of fresh blood into them as a blessing.

To the iron, metal and allied trades the first source of orders has already come through the ability of municipalities to market obligations at fair rates. The manufacturers of pumping machinery, the pipe foundries and others have received quite a number of orders lately. The fact that prices obtained are unprecedentedly low has tempered their enthusiasm.

Another line in which an investing movement has started and is likely to develop very rapidly is the construction of suburban electric railroads. It is well known that many of these have proved very remunerative during their short life, so that the promoter of such schemes can make a very good showing by inference. We expect to witness a very rapid and considerable development in this branch, which will give a good deal of work to our industries.

There seems to be little chance for the promoter of standard steam railroads, because the market for this class of securities is overstocked now and because the majority of the great banking institutions who issue them have still their strong boxes filled with bonds underwritten but not placed by them.

There is quite a good deal of preparatory work going on in building circles, but it will take some time before money freely flows into the old channels of real estate improvement.

There is one point which American manufacturers should consider, when contemplating the contingency of the passage of the Wilson bill, and that is, that the present plethora of money would make it relatively easy to raise capital to back up importing partnerships, even if foreign funds did not eagerly seek such opportunities.

Management of Men and Manufacturing Industries.

FOURTH PAPER.

A Good Boss.

BY THOMAS D WEST.

He is "a good boss" is a term often heard expressed by employees and employers, and any one unacquainted with industrial parlance and significance often attached to expressions would be at a total loss to understand why a man called a good boss by the former should not always be considered the same by the latter.

It must be admitted there is a cause not obvious to many for the varying conception of such qualifications.

"A good boss," to be such in the strictest literal understanding of the term, is a man who will faithfully and justly perform the duties or labor for which he receives pay.

I am aware that the good book tells us "a man cannot serve two masters," but that version was not intended to refer to employers and employees, for they are not two masters for a boss to serve.

There is only one, and he is the man who purchases the product that the combined duties and labor of the boss and workmen produce, and in this light only can "a good boss" be justly considered or admitted.

Will one workman admit another to be a good man if he has not the physical power and brains to ably perform the work for which he receives compensation from his employer? Certainly not. Then why should a boss be called good who does not ably perform the work for which he receives compensation from his employer?

It takes but little thought upon this point to see there is something higher in "a good boss" than is generally conceived of.

I well know the term as applied by some means a boss that is easy, careless and indifferent to the duties for which he receives pay, and I shall endeavor to show in this paper that such men are not good bosses for workmen to even encourage, and if they are not good men for their employers as well, then they should not be permitted to occupy offices of trust and confidence.

Necessity for Proficient and Minor Labor.

In seriously considering the question of manufacture, we cannot but be impressed with the idea that in producing the product of a firm every person from the most minor to the most proficient in their employ has some influence in perfecting the quantity and perfection of the output.

This admitted, we can but in a sense consider the efforts of all essential to effecting the ends sought for, and that the services of the minor, as well as the proficient, must be employed.

Acknowledging we must have the minor and that his labors are necessary to the completion of the product, where can we justly draw the line for the master to commence and the man to leave off?

Man and Master.

Surely not at the boss, for he can only be justly numbered with the proficients and may often be placed as the first of them. His duties may be in having control and directing, but could the effort or labor of those under him be dispensed with any more than his own in producing the firm's finished product? Of course not. Rightly considered, the boss is but the proficient whose duty it is to advise, instruct and push forward the work to the end that the product can be made profitable and sufficiently perfect to be acceptable to the buyer, and who is, when we look squarely at the problem, the true master, for it is the customer that all efforts of any manufacturing enterprise must labor to please.

Blunders and Poor Workmanship.

If work is condemned or found fault with by the purchaser, every one engaged in its manufacture can generally expect to get a dressing or reprimand, the lash being first applied to the highest proficient (the manager), who in turn gives it to the superintendent, he then to the foreman, the latter to the next most responsible. They in turn send it down the line to the most minor. They all get it, the only difference being that the first lashes of the whip are most severe and cutting, and ofttimes go so deep as to cut many out of their positions.

We must now admit, and I think truly so, that employer and employee are not man and master and the efforts of the first two are so in common that no such line should be drawn, and that each is only laboring to the interest of the other in trying to please the buyer.

Mutual Interest and Responsibility.

The main difference, if any, between employer and employee is that the former is now held financially responsible for damages in every form and if the master says he will not accept work, the latter is fairly sure he will at least get his pay, though the lack of same coming to the former may result in ruining him.

The interests of the employer and employee are mutual. They should not be separated, and to clearly illustrate the justice of such an alliance we will suppose all the industries of this country to be under one management and the product only salable to one foreign nation, and not until it would accept the goods would money be forthcoming to pay the employer and expense of manufacture. Such a condition would surely cause employees to think there was something more than figuring "to get in time" necessary to insure them their wages, and seriously impress all with the true conception of who was the real master. Some may say this is an exaggeration. Even so—they cannot dispute but that the present methods of doing business embrace the same principle, the only difference being there are now thousands of managers to oversee production and thousands of masters to purchase the product, and this large division of control and territory gives more of a leeway to dispose of unprofitable and imperfect manufactured products and the employee an opportunity of being disregardful of just duties to his employer who hires him to aid in producing profitable goods that will please the buyer.

If the employee found that by careless and poor management on the part of a boss he were to suffer in not receiving his pay his conception and desire for qualification would be very rigid and much changed from that now generally found.

"A Snap."

A good boss in looking out for the interest of his employer is also looking out for that of the employee, and his goodness cannot be defined by permitting those under him to have "a snap."

He is paid for fulfilling a trust placed in him, and there are many ways in which he can exhibit goodness that will be a hundred times more beneficial to those under his charge than by permitting "snaps" or favors to a few, for as a general thing where such are found existing some are made to suffer for it.

A True Boss.

"A good boss" will not show partiality, but ever stands independent and in a position to say no or yes, or discharge any person upon the "spur of the moment" for a just reason.

He will have higher principles than tolerating clannishness, "snaps" or favors, but will endeavor to do justice to all. There are many ways in which he can dispense goodness and command respect and confidence, though apparently "ruling with an iron hand," and the writer's experience as a journeyman proved that men who were rigid, exacting, and distant with all their men were men of principle, kind to a fault and reasonable in their dealings.

Kindness to Employees.

There are always opportunities arising to give a boss chances to exhibit kindness and consideration for the welfare of those under his charge other than by permitting "snaps" and being indifferent to his duty. If a man gets injured let him see you have feeling and desire to do all in your power to relieve his sufferings. Have his home visited, and if his family require necessaries of life use all your influence to see they are provided for. If slackness compels you to lay him off with no immediate prospects for resuming work, advise and do all you can to get work elsewhere for him. In short, if you learn of his being in any trouble do what you can to help him out. Make friends of your men and get them so attached to your works that they would not wish to leave them.

These are the characteristic points, combined with using effort to seeing that work is turned out profitably and perfect, that go to making a man a "good boss" and for one I would much prefer working for a man of principle, though he might be most exacting in obtaining a big day's work than some, of the insipid, let things take care of themselves bosses that are to be found.

I well know there are bosses who are drivers and have no principle, but the march of progress is making them less every day and time will take care of them.

What is more required is to understand one another and conceive who are the real "men and masters" and what should to both sides justly constitute "a good boss," and when such elements come to be rightly recognized, then, and not till then, will we be on the right road to solve the problem of capital and labor.

Two representatives of the Chinese Government are now in the United States studying the naval and military methods of this country.

The Standard Oil Company are about to begin a vast oil and gas operation in Northern Pennsylvania, where they have leased all the territory where surface indications of oil or gas exist.

THE LETTER BOX.

Noise in Boiler.

From B. & S., *Napanee, Ont*.—We have recently set up a 50 gallon copper boiler and connected it with a range in the ordinary way with ¾-inch pipe, the tubing outside of range boiler being about ½ inch. The connections to boiler are of lead pipe with nipples or connections for ¾ inch pipe. Our customer, who is great on having large pipe, thinks that the lead pipe, being a trifle smaller than the connections, causes the boiler to creak. We thought at one time it was on account of his not using enough water from the boiler. The minute the hot water tap was opened the noise ceased. We have tried cooling the water but it does not make any difference, and some days it is quiet. It seems when it does make the noise that it has the motion of the water works pump. If *The Metal Worker* can furnish us with any information that will lead to a remedy it will be appreciated.

Answer.—Too little description is given of the trouble to locate its cause and suggest a remedy. But from the fact that the noise ceases when the hot water tap is opened, it may be due to a loose part in some of the connections which vibrates under pressure and makes the noise, which stops at times when the part is temporarily secured or when the pressure is removed by opening the faucet. A projecting washer or some irregularity of form in some part would impede the circulation or cause an eddy that would produce noise. A dip or partial obstruction in pipe from a bad joint, causing an air trap, has been known to give rise to rumbling. It is bad practice to use a pipe with smaller bore than the connections in connecting the boiler and water back. Benefit is derived from using a larger pipe for the return to the boiler. If the heated water cannot flow to the boiler as soon as it is heated, steam is likely to form in the water back, making noise when it condenses. Some minor detail of the work will, on careful examination, probably be found to be different from what it should be.

Varying Water Line in Boiler.

From M. E. R., *Tennessee*.—I have just finished a steam boiler with cast iron head and base, made of 1¼ inch extra heavy pipe. The head is 12 inches high. When we have steam on the water line in the water gauge is very irregular, rising and falling continually. Can you through the columns of *The Metal Worker* tell me the cause and suggest a remedy?

Note.—The fact that the water line in a boiler rises and falls irregularly indicates that the circulation within the boiler is bad, and that the current not going continuously in one direction produces eddies and waves that alter the water line. Without knowing the exact construction of the boiler it would be worse than useless to attempt to analyze the particular difficulty in our correspondent's case. We would suggest, however, that careful thought be given to the direction of the heated water as it rises in the boiler, and provision be made for returning it from the top to take the place of the newly heated water without cross currents.

Capacity of Steam Mains.

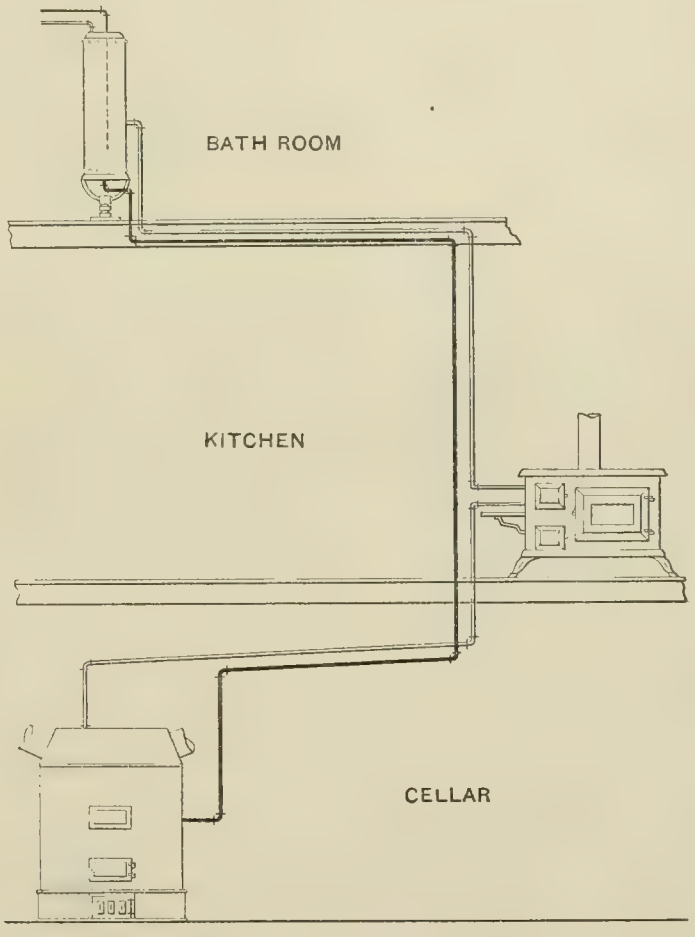
From G. W. A. & Co., *Philadelphia*.—Please give in *The Metal Worker* the amount of radiation the following sizes of steam pipes will carry, ¾, 1, 1¼, 1½, 2, 2½ and 3 inch for low pressure heating.

Note.—A common rule is to use the area of 1-inch pipe for a basis and to allow 100 feet of radiation to a 1-inch pipe. From this basis as many times 100 feet of radiation are used on a main as the area of the main will contain the area of a 1-inch pipe. The amount of radiation given below is calculated from this rule.

Size of pipe	¾	1	1¼	1½ inch.
Amount of radiation	55	100	150	225 sq. ft.
Size of pipe	2	2½	3	inch.
Amount of radiation	400	600	900	sq ft.

Reversed Circulation.

From W. H. C., *Rahway, N. J.*—In answer to the query of "H. R." in *The Metal Worker*, December 2, I would say the connections are made improperly. If the piping is changed so that the circulation will be continuous there will be no reversed circulation. I send a diagram showing how the water can be made to circulate without any possibility of its backing up.



Reversed Circulation.

From G. W. M., *Waynesboro, Pa.*—In reference to the difficulty of "H. R.," in *The Metal Worker* of December 2, the circulation takes the near cut instead of the course offering the greatest resistance. After drawing the fire in the range the circulation continues through the range coil, which completes the short circuit, the temperature gradually falling in the boiler, as only a portion of the flow goes to the fire below. A valve in either pipe to the range will remedy the difficulty. A

system arranged as shown by "H. R." will always work slow and finally reverse and go the wrong way, when it can never heat satisfactorily. I hope I have thrown some light on the subject that will be a benefit to the readers of your interesting, valuable and reliable paper.

From S. H. D., *Watkins, N. Y.*—I notice the article of "H. R." on "Reversed Circulation" in *The Metal Worker* of December 2. Instead of attempting to give a reason for what is said to occur, I beg leave to doubt the statement. If the circulation is reversed between boiler and range it must stop between the heater and boiler or run both ways in the same pipe, which is an absurdity. More likely the circulation occurs between the heater through water front as well as through the boiler. In that case the lower pipe from water front would be about as warm as the upper pipe to front. I suppose there are no other pipes than those shown in diagram of the piping. If "H. R." will place a swinging check valve in the lower pipe from water front of range, so the water can not enter that way, but can come out freely, he can settle the question.

Location of Air Supply.

From W., *Warsaw, N. Y.*—In reply to the letter of "Snips," in *The Metal Worker*, December 2, I would ask him how he would connect a 10 inch hot air pipe with a 9-inch register box. If he will figure the capacity of a 10 x 14 register, less the grating, he will find that it has no more capacity than a 10-inch pipe. If the mouth of a cold air box is located on the opposite side of the house from the prevailing winds, hot air will be drawn from the furnace instead of cold air being supplied.

A Partition Flue Suggestion.

From SUGGESTION, *Boston, Mass.*—Through reading the letters of "P. F." and "Cæsar" in *The Metal Worker* of November 11 and 25, the following idea was suggested to me. Why not let the partition flue extend out into the room to give it size. Surely the fact that the family health and comfort for six months in the year depend on artificial warmth is sufficient to warrant ample provision to be made for a supply, even to the extension of the partition flue into the room. It is a foregone conclusion that neither the architect nor carpenter will listen to this or aid in it if old plans are followed. If an ornamented column of cast iron, terra cotta or sheet metal appeared against one of the walls of a room would it be considered a detraction from the general appearance? It could be partly in the partition, as now, and then would not need to extend into the room half so far as the old flues, and yet could be of twice the capacity. In shape the front could be agreeably varied and the design arranged to suit the room in which the flue was used. Arrangements to receive the register and the finish up to the wall at each side would be simply matters of detail. In price probably the sheet metal flue would be the cheapest and could readily be supplied in lengths that would reach from floor to ceiling. In cast iron and terra cotta the flue would probably have to be made in sections and the joints hidden by the decoration. The flue could be finished in colors to suit the individual taste of the customer. The use of flues of the capacity possible with this flue would enable many furnaces to give better satisfaction and reduce many coal bills. The quantity of air it would carry would aid in ventilation. In fact, the semi-partition flue could be used for a ventilating flue, being placed on the opposite side of the room from the heating flue. The semi partition flue is not patented, so far as I know, giving opportunity for the makers of ornamental sheet metal work and the manufacturers of terra cotta goods to consider the suggestion.

Defective Circulating Plan Proposed.

From S. H. D., *Watkins, N. Y.*—I notice plan of "Defective Circulating" plan contributed by your Fresno, Cal., correspondent. It is a fixed fact that the circulating pipe must be entirely below the lowest water line of the supply tank. Water will not rise in any part of the system any higher than this water line at any time, a fact supposed to be known to every one. "C. W. B.'s" ideas are perfectly correct in regard to the way the connections are to be made to work properly. There is no objection to dropping the return circulating pipe down below the floor if care is taken to have it on a grade either way, but not level or with sags in it. The circulating pipes must be seen the same as if the boiler or tank to be heated was a water radiator, and it will work the same as if it was really a radiator, as the water don't know the difference.

From G. W. M., *Waynesboro, Pa.*—In answer to the inquiry of "C.W.B.," in *The Metal Worker* of December 2, I am positive, from a considerable experience with the kind of work described, that the flow pipe must be brought down or the tank raised so that the flow pipe will enter the tank below the water line. No amount of firing would raise the water in the flow pipe above the natural water level. The return pipe dropping down below the floor and running to the heater is all right and will avoid circulation going the wrong way. "C. W. B." is right in his views, gravity being the whole principle of hot water circulation.

Fails to Heat.

From F. N. P., *Washington, N. J.*—In answer to the inquiry of "R. J. M.," which appeared in *The Metal Worker*, December 9, I would say: Put a stop cock on the pipe from the bottom of the boiler above where the return from the radiator branches into it and he will get circulation through the radiator. When he overcomes his trouble he should send "The Letter Box" an explanation of how it was done.

Angles in Cold Air Box.

From E. A. J. & Bro., *New York.*—There is one inquiry in *The Metal Worker* of December 16 that prompts our answer. The letter was from "J. W. B.," Lexington, Ky., who asked why a cold air connection made with a right angled bend in box, running down the cellar wall and along the floor, should be more satisfactory than when the box was taken on an incline from the opening to the furnace. In the latter case, your correspondent complained that an outward current was felt. This is due to the long rising leg surrounded by the warm air of the cellar. In the former case one side is against the cold wall of the cellar, so that it cannot become heated. Moreover, the inclined box, while rising no higher, is longer and exposes more surface to the heat of the cellar, and therefore becomes more highly heated.

Stereotype Paste.

From D. H. F., *Saginaw, Mich.*—Your answer to my previous inquiry about stereotype metal, published in *The Metal Worker* of December 2, was of great assistance, and now I want to trouble you again for information about stereotype paste and how to keep it from souring.

Note.—We are not sure what our correspondent refers to by stereotype paste, but we think that the paste used in building up the matrix in paper is simply a flour paste. Paste specially prepared for this purpose may be bought in the market. The following receipt for a paste that will not sour may prove of interest to our correspondent: Dissolve 4 teaspoonfuls of alum in 1 gallon of water. When cold stir in as much flour as will give it the consistency of thick cream. Beat smooth. Add 1 teaspoonful of pulverized rosin and 20 drops oil of cloves. Pour the whole into 2 quarts of boiling water and stir thoroughly until cooked. Pour into a glazed earthen vessel, and when cold cover the top with oiled silk and put in a cool place. Take out small quantities as needed for use.

Pattern for Flaring Article.

From A. B., *Richmond, Ind.*—I am a young tinner and would like to have *The Metal Worker* publish a method for obtaining the pattern for a flaring article.

Answer.—If our correspondent wil refer to *The Metal Worker* of November 4, page 44, he will find a method published describing the desired pattern.

Green Water From Copper Tank.

From S. S., *Marcellus, N. Y.*—I notice a letter in *The Metal Worker* of December 23 from "J. H. S.," Richmond, Maine, also your reply. I have had just such occurrences as he speaks of. It took some time and study of the difficulty and a number of experiments to determine what the trouble was. It is simply gas. "J. H. C." will find upon examining the tank in question that it does not fit closely on the sides or ends. It has possibly been bent in moving to clean it or in some other way, so that when the fire is under check the gas can permeate the tank, or, in other words, go through the spaces and under the tank covers. He will also find his tank covers very rusty on the under side. If he will see that the tank is fitted closely to the collar or rim he will have no more trouble. If the tank is a misfit and will not fill the opening properly, he can fill the remaining spaces with stove putty. I have only one request to make; it is this: As I have given him my prescription, I should like to hear from him how it worked.

Pipes from Tank.

From E. H. M., *Jersey City, N J.*—In answer to the inquiry of "M. T. C.," Riverside, Cal., which appeared in *The Metal Worker* of December 23, I would say that after carefully looking over the diagram I find that the trouble is due to an air pocket between the water trap and the top of the tank, which holds up the overflow water by its natural elasticity, and when the cock from the supply pipe is opened into the overflow the air is displaced, and the water in the trap below is moved by the sheer weight of water. The cure for it is to connect to the overflow pipe, at a point where the stop cock now connects, a ¼-inch pipe, and carry it up and over the top of the tank. This will remove the air automatically.

From S. & S., *Sunapee, N. H.*—In the December 23 issue of *The Metal Worker* we notice our brother wind engine man of Riverside, Cal., is having trouble, as he describes it, with the overflow pipe running from tank in the wind mill tower to a cistern 10 feet above the base of tower and 360 feet away. We fully agree with *The Metal Worker* in thinking that it is air bound and that such cases are blind matters to deal with, but from our past experience we feel confident that the trouble may be removed. Offset the pipe just below the tank and carry the same through the bottom of tank to desired hight the tank is to be filled, and bevel top of pipe to at least 45°. This will allow the water to flow in at the lowest point and the air to escape on the opposite side. If it were to be left square on top, it would give the air confined in the pipe an equal pressure on the surface of the opening, and it is not uncommon in such cases for it to cap over with water and overflow the tank, as described by "M. T. C." There is still another way to remove the trouble, and which can be more easily done in this case. Disconnect and remove the elbow where the pipe makes the bend to go into the tank, and replace it with a tee. Reconnect it the same as with the elbow. Then use a short nipple in the upper end of tee, of sufficient length to insure the water not running out at the opening. This will allow an escape for the air as the water passes down the pipe. Our suggestions may not prove equal to this case, but it will be little trouble to make the experiment in the way last mentioned. We would be pleased to learn whether it proved successful or not.

From J. W. C., *Greenfield, Ind.*—In answer to "M. T. C.," Riverside, Cal., in regard to trouble with pipes from tank, I would advise him to attach his waste pipe to the bottom of the tank. Put on a float valve to stop the flow when the water gets as low as he wants in the tank. In this way he will not have any trouble. Furthermore, if there are any air traps, take them out of the pipe to the cistern.

From "J. B.," *Hudson, Mass.*—In reply to "M. T. C.," Riverside, Cal., in regard to trouble with his overflow in wind mill tank, I would advise him to put in a tee at the lowest point in the overflow pipe at the base of the tower, and carry a small pipe, say 1 inch, up vertically about 2 feet above the level of the cistern. This will act as a vent to the pipe, as it is evident that the overflow is air bound. When the quantity of air contained in the overflow is considered, it is a large amount, being over 1225 cubic inches. This quantity of air, or the greater part of it, being underground, is heavier than the surrounding air and needs quite a pressure to move it. As the overflow pipe extends to within 4 inches of the top of tank, there is only the pressure of a column of water 4 inches high, which is equal to less than $\frac{3}{16}$ pound, and which has to force 1225 cubic inches of what might be called dead air out through the overflow, and up grade most of the way. Now, the theory of the 1 inch pipe at the lowest point is that it will give a vent to the air at that point, thus allowing the water to fall down the overflow and the air to escape through the vent. When the water comes to the vent and rises in it, it will have weight enough of itself to force the remaining air out through the pipe to the cistern. I claim that he has proved my theory in the way it works by opening a stop cock between the overflow and service pipe. In the first place, on opening the stop cock A there is pressure enough to drive the air out, as the supply is near the bottom and he has all the pressure in the tank to force the air through, or a pressure of one half as many pounds as the distance to the level of the water in the tank.

From J. W., *Wappinger's Falls, N. Y.*—If your correspondent, "M. T. C.," Riverside, Cal., will turn the overflow pipe down into the tank, more or less, and put on a float or ball valve to prevent the opening of the pipe being uncovered, I think the overflow will be all right, provided the pipe is tight. Or, if practicable, the overflow might be made small enough not to let the water come out as fast as it goes in. At any rate, keep the outlet covered.

Note.—We do not see how the last suggestion will prove a remedy, for if the overflow was of less capacity than the inflow the tank would necessarily fill up and spill over the edge. Perhaps, however, our correspondent had another idea in his mind.

From A. S. B., *Lawrence, Mass.*—In *The Metal Worker* of December 23 is a question from "M. T. C.", Riverside, Cal., who complains that he cannot get the water to run from a tank to a cistern. I think if he will put the pipe intended to fill the cistern through the bottom of the tank to within 4 inches of the top, the water will run to the cistern without any trouble, and I think a 1-inch pipe will be better than a larger one. I think that the trouble with the pipe as arranged is that more air than water enters it, but by passing it through the bottom and using a smaller pipe more water than air will enter. I do not think that air in the pipes will prevent the water from flowing to the cistern if you can get the water into the pipe at the upper end, which cannot very well be done as it is now arranged, for the water will not rise enough to cover the outlet. It seems that the water flows now to the house and barn, and if a cistern pipe is arranged in a similar manner it will work. Perhaps a 1-inch pipe may be too small, but I should use a size that would keep the water from flowing over the tank, and yet keep the upper end covered with water as much as possible without overflowing.

Note.—We fear this suggestion about a smaller pipe will be pretty difficult to follow, for it would be a very nice piece of work to adjust it so that the water would cover the mouth of the pipe and yet not rise to the top of the tank.

A Sensible Movement

The members of the Woman's Protective Health Association, a Philadelphia organization, are evidently not content to merely theorize on sanitary questions. At a recent meeting of the association some exceedingly practical resolutions were adopted and signed by each member, showing that they have a very clear idea of the superiority of prevention over cure. The resolutions were as follows:

"I will have the sidewalk in front of my residence and place of business swept early every morning, and no rubbish shall be swept therefrom into the street.

"2. My ash barrel shall be put out every day at the proper hour and taken in as soon as it has been emptied. It shall be kept within the stoop line, and not on the outer edge of the sidewalk. It shall never be filled so full that it cannot be lifted and emptied into a cart without spilling. To prevent dust I will have water sprinkled lightly over the ashes in the barrel.

"3. I will not mix papers with the ashes and garbage nor throw them into the street. (Paper should be burned, sold or given to a junkman.) I will not throw orange or banana peelings or fruit of any kind upon the sidewalks or into the gutters.

"4. I will be watchful of the general condition of the streets, and if I notice negligence or carelessness on the part of the householders or city employees, I will promptly report the same by mail or in person to the proper officer."

The last resolution shows that the association contemplates an aggressive movement in the matter of street cleaning, which, if intelligently carried out, should lead to valuable results in keeping the householders and municipal employees of the Quaker City up to the mark of their duty in contributing toward the preservation of the public health. A good many other cities might welcome the efforts of a similar sanitary vigilance committee.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until January 16, for the cut stone work, brick work, floor, ceiling and roof construction and roof covering on the superstructure of the United States Post Office building at Chester, Pa., in accordance with the plans and specifications, copies of which may be had from the Supervising Architect at Washington, or of the Superintendent at Chester, Pa.

The wise man's axiom that "there is nothing new under the sun" applies, it seems, to the electric light, which has done so much of late years to brighten our streets and dwellings. A London journal points out, as a fact not generally known, that the voltaic arc light was known to and exhibited by Sir Humphrey Day in 1805; while, for years later, Albermarle street, Piccadilly, was electrically lighted at the expense of the British Royal Society.

The mule is to be superseded by electric propulsion on the Chesapeake and Ohio Canal as a consequence of the recent successful experiments with the trolley on the Erie Canal.

PLUMBING and GAS FITTING.

Examinations in Plumbing.

At the last examination in plumbers' work in connection with the City and Guilds of London Institute, says the *Architect and Contract Reporter* of London, the following papers were set:

ORDINARY GRADE.

1. (*a*) How would you make a reliable joint between a lead branch and an iron soil pipe? (*b*) How would you make reliable joints in a stack of iron pipe receiving wastes from baths, sinks and lavatories, with hot water supply? (*c*) Describe the cements used for ordinary jointing purposes and their composition.

2. (*a*) Give the composition of ordinary and fine solder, and the melting points of each. (*b*) If a pot of solder is "poisoned," *i.e.*, rendered porous or unworkable by the introduction of some foreign substance, how would you remedy it? (*c*) What fluxes are used for jointing copper, brass, lead and iron to lead?

3. Describe the process of autogenous soldering: when should it be used, and what are its advantages?

4. How should sheet lead be set out and cut in order to line a sink 2 feet long by 1 foot 6 inches wide inside, 12 inches deep at back and sides, and 6 inches deep in front, with 7 pound lead, turned over on top edges 1½ inches all round? Describe or show by sketch. What would be the total weight of the lead? What would be the total weight of the solder you would use?

5. Show what you consider the best possible arrangement of waste pipe from a sink, bath or lavatory, with its discharge to drain.

6. Sketch various forms of defective traps with which you are acquainted, and also improved kinds you would recommend in place of same.

7. The well supply to cistern in an old house having permanently failed, it has become necessary to lay on the supply from the town main; what alterations would have to be made in order to efficiently accomplish this?

8. The drain receiving large quantities of waste water from scullery sinks is frequently choked. What remedies would you suggest?

9. Enumerate the common defects found in water closets which are bad in principle and construction, and show by sketch what kind of fittings you would suggest in place of same.

10. Show or describe what you consider the most complete arrangement of waste pipes and services for a range of three urinal basins with automatic flushing tank over, and proper surface drainage from floors, with the sizes of the various pipes.

11. What precautions would you take in fixing the waste pipe (*a*) from a refrigerator where food is stored, (*b*) from a sink or lavatory?

12. Sketch a lead bend, elbow and set off, and enumerate the various tools required in the formation of same.

HONORS GRADE.

1. What cisterns and pipes would you recommend for the storage and distribution of (*a*) rain water, (*b*) hard water, (*c*) sea water? State your reasons for such selection.

2. Describe the process of manufacture of milled sheet lead and pipe.

3. Show in the accompanying sketch of sectional house, having a water closet on each floor, bath on first floor, lavatory on ground floor and sink in basement, the plumbers' work required and the positions you would suggest for the above mentioned fittings. Describe the form of each fitting you would use, and the size and arrangement of the various service, soil and waste pipes.

4. Show on the accompanying plan what arrangement you would adopt for a complete system of drainage for the house described above, and give the various sizes of pipes, &c.

5. A water pipe running alongside a leaking drain receives an injury: describe the circumstance under which sewage can be sucked into the pipe at the point of injury while the pipe is charged with water. A cistern kept charged with water is situated in the roof of a house having three stories. A service pipe from this cistern supplies a bath on the first floor and a bath on the ground floor. Under what circumstances can water in the bath on the first floor be made to discharge through this pipe into the bath on the ground floor?

6. Describe the principles of a common syphon, and state what is the greatest hight a syphon will draw water when once set in action.

7. It is impossible to obtain a good fall to a system of house drains: what precautions would you recommend to prevent stoppage? What do you consider the best and also the least falls to be allowed for a 6-inch main drain?

8. Describe or show by sketch what methods you would adopt for ventilating a water closet apartment which is not placed next to an external wall, and give your reasons.

9. (*a*) Give some of the causes of "humming" noise in rising mains to cisterns. (*b*) What defects in a system of hot water circulation will cause noises in the pipes, &c.? (*c*) Give causes of concussion in pipes and their remedies.

10. Describe or show by sketch the "cylinder" system of hot water circulation and the "tank" system, and give the advantages and disadvantages of each; explain the reason of hot water circulating in the pipes.

11. Show by plan and sections how you would arrange a lead flat, 22 x 20 feet, giving size of bays and gutters and formation of rolls. What weight lead would you use and what would be the approximate weight of the whole?

12. What precautions would you take for the protection of fittings and service pipes from frost in a country house situated in a very exposed position?

THE FORMER FIRM of Frost, Ware & Taylor, doing business in Holyoke, Mass., have petitioned in insolvency, in order to wind up the partnership accounts.

Domestic Electrical Work.—V.*

BY W. A. W.

ANNUNCIATORS AND ALARMS.

In the electrical annunciator we have an instrument which has nearly if not quite as wide a range of application as has the electric bell. In large houses it can be used in connection with the door bells to indicate the door from which the call comes; it is used on elevators to indicate the floor at which the elevator is wanted; it is indispensable in the modern hotel; it is used in the office, the kitchen, in connection with automatic fire alarms and burglar alarms—in fact, to use an old threadbare expression, its uses are "too numerous to mention."

In hotel work No. 16 and 18 double covered annunciator wire should be used (all circuits which have been and are to be described are assumed to be on new work where all parts are accessible). The first thing to do is to lay out the shortest route for the battery wire which should be No. 16. It should start from the battery and run through the building in much the same manner as the main pipe for water or gas is run, so that splices can readily be run from it to each separate room. The furthest end of this wire may either terminate in one of the push buttons, or it may be left in some accessible place for future additions. Having run the main battery wire the push buttons should be located next. These are usually placed close to the casing of the door leading into the hall and about 4 feet from the floor. Should there be no solid backing to fasten the push to, it is best to nail a 3 inch strip of wood between the studding. Through this bore a ½ inch hole where the push is to go; drive a nail alongside of it to wrap the ends of the wire on. In high buildings it is more convenient to run a main wire along the hall of each floor, and connect all together at any suitable point.

All the preliminaries being arranged the next thing in order is to start from the location of the push with a No. 16 wire (bringing the end out through the ½-inch hole in the wood strip nailed between studding and wrapping the end around the nail) and running up or down between the studding as the case may require, splicing on to the main wire at the nearest point. Right here it may be well to say that too much care cannot be exercised in making these splices. It being assumed that when the building is finished all wires will be either behind lath and plaster or between floors, the work should be put in with a view of making it as permanent as the building itself. To make a good job all splices should be soldered (using resin as a flux; never use acid). Then cover the bare splice with a layer of thin paper, followed by a good tight wrapping of rubber tape. This is the nearest practical approach to a perfect job we have as yet seen. Of course the

* Copyrighted, 1893, by David Williams.

ideal job would be one continuous wire of the same metal, but this comes near enough for all purposes.

The next thing in order is to run a No. 18 wire from each post direct to the annunciator. None of the wires should be bunched or twisted together if it can possibly be avoided, especially in damp places or where rats or mice have access to them, with the possibility of these pests gnawing off the insulation and causing a great amount of trouble and confusion, which is often very difficult to locate and remedy. If bunching is necessary it should be done very loosely. It sometimes happens, however, that the electrician is confronted by the absolute necessity of bunching his wires tightly in order to pass some obstruction in his path. When such is the case the wires should be wrapped with rubber tape where they squeeze together, or what is better still, a piece of soft rubber tubing may be slipped over each wire. This tubing can be purchased from $\frac{1}{32}$ inch in diameter up, and all things considered it is perhaps the safest and cheapest thing to use in dangerous places. Staples for fastening the wires in concealed work should be used very sparingly, as it is much better to leave the wires rather loose. The practice of drawing wires tight and fastening in that position should be avoided as the settling of a building is liable to break a wire and cause a great deal of annoyance. Close attention to detail is very essential in electrical work, and it should be the study of the electrician to prevent rather than cure defects, and no stronger argument can be made in favor of anything than that it can be depended on to do its intended work at all times without fail. Nothing will cause an article of real merit to gain in public favor so quickly as the fact that it is never out of order.

Sometimes a great deal of time can be saved by running a number of wires from a certain part of the building at the same time, which makes it often difficult to keep track of the wires and the rooms to which they run. It is therefore desirable to get as many different colors and combinations of colors of wire as possible, and dividing the building off into sections use a different colored wire for each room in a section; or each section may be wired with one color and the connections made on the annunciator in the following manner: Suppose section No. 1 contains rooms numbered from 1 up to 25. When all is ready and a wire has been run from battery to battery connection on the instrument, connect these 25 wires at the bottom or highest numbers on the instrument. Suppose the annunciator is made for 100 rooms, connect these 25 wires from No. 75 up. Next the buttons in the rooms they are connected with should be pressed, beginning with No. 1 and continuing up to No. 25 in rotation, a helper at the instrument noting down the numbers in rotation as they fall. After all the buttons in the section have been pressed, open the base of the instrument and transfer the wires to their proper places. Knowing that the first call came from No. 1, by referring to the numbers as they fell in rotation when the buttons were being pressed, it will be an easy matter to do this. Suppose the first number that fell on the annunciator was 81, it is evident that this wire should be transferred to No. 1 on the annunciator, and so on.

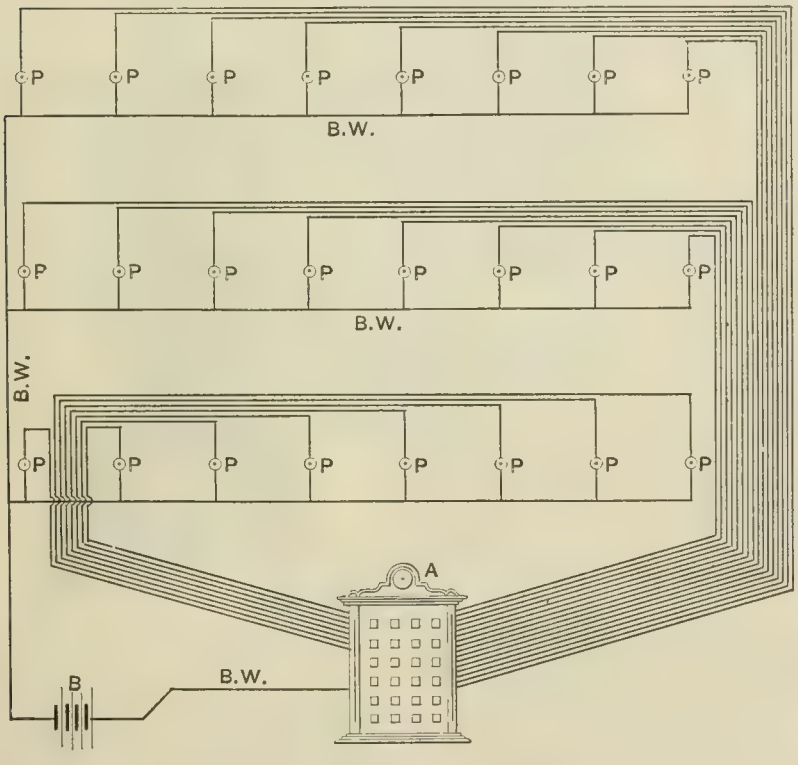


Fig. 12.—Annunciator Circuit.

The diagram, Fig. 12, shows a simple annunciator circuit with 24 room connections. A is the annunciator, B the battery, and P P P are the pushes in the rooms. The wires marked B W are the battery wires, while all the wires starting upward from the pushes are return wires. For a hotel building of say about 100 rooms, where not more than four or five bells are likely to ring at the same time, a battery of five cells connected in series will be sufficient.

Benjamin C. Smith, 275 Pearl street, New York, issues under date of December 20 his Catalogue No. 10, a catalogue and price-list of porcelain enameled iron bathtubs. A variety of different patterns of tubs are shown; also sitz baths, foot baths, showers, &c. Together with the illustrations are given tables of sizes and prices.

Chicago Master Plumbers.

There was a large attendance at the meeting of the Chicago master plumbers held at their rooms 197 Madison street, Tuesday afternoon, December 26. The report of the Executive Committee on the revision of the constitution and by-laws was adopted. The Executive Committee will hereafter consist of the president, vice president, secretary, treasurer, sergeant-at-arms, retiring president and three members to be annually elected to serve with them.

The following nominations were made for the officers to be elected at the meeting to be held January 8, at 2 o'clock p.m.: President, Paul Redieske; vice-president, Chas. J. Herbert, Thos. Conway; secretary, A. W. Murray; treasurer, P. Sanders, D. J. Rock, J. G. Webber, C. C. Breyer, Robert Griffith; sergeant-at-arms, W. H. Commings, G. A. Larson, P. T. Morrisey, C. J. Boyd, Charles T. Byrne, J. J. Doyle; executive committee, Robert Griffith, P. M. Murphy, M. L. Mandable, C. C. Breyer, D. J. Rock.

Missouri Master Plumbers.

In response to a call issued some weeks ago by J. M. Life of St. Louis, State vice-president of the National Association of Master Plumbers, a number of master plumbers met December 18, at the Builders and Traders' Exchange, Kansas City, for the purpose of organizing a Missouri State Association of Master Plumbers. The meeting was called to order by E. D. Hornbrook, president of the local association, who made the delegates an address of welcome. L. B. Cross of E. D. Hornbrook & Co. was elected temporary chairman. The Committee on Credentials appointed by him reported the following delegates: Captain H. Goss, L. B. Cross, George Kirtley, Dent Yates and L. Farley, Kansas City; J. A. Benson and George C. Wilcox, Nevada; T. T. Gray, Sedalia; T. Bristol, William Downs, M. W. Jackson, J. T. Hopper, J. Flin, J. W. Powers, St. Joseph; J. Sheehan, M. J. Ward, J. B. Kelleher, William Schwehn, Jr., J. M. Life, W. H. Kuhns, St. Louis; William Shidy, Chillicothe; W. H. Brown, Lexington, and T. H. Branhan, Hannibal. The constitution and by-laws of the New York Master Plumbers' Association were placed before the delegates and after a few changes adopted. The following officers were then elected for the ensuing year: L. B. Cross, Kansas City, president; J. W. Powers of St. Joseph, vice-president; J. P. Kelleher of St. Louis, secretary; Henry Goss, Kansas City, treasurer. The Executive Committee is to consist of these officers and and the three following delegates at large: T. T. Gray, Sedalia; Harry Cooper, Springfield; J. M. Life, St. Louis.

Wm. Allen will begin visiting the plumbers in the interest of the McCambridge Company, Limited, 522-527 Cherry street, Philadelphia, with the new year. The Sycho closet and plumbers' fine brass goods will be his leaders, with a full line of plumbers' supplies to meet the regular demand.

TRAPS AND VENTS.

J. L. McShane of J. L. McShane & Co., Pittsburgh, last week took a number of master plumbers in a special car to the city poor farm to inspect the $50,000 plumbing job recently completed there. In the party were: James G. Weldon, James Hay, J. P. Reinecke, O. H. Stinson, J. M Tate, John Cowley, James Anderson, Joseph Rice, Frank McKnight, James O. McGinness, I. K. Becker, Wm. Chandley, Charles H. Humbert, George Sands, Joseph Weldon, Louis Heilig, S. W. Hare, John Kelly, and John Farrell.

Mrs. Fitton, Bellaire, Ohio, has purchased the plumbing establishment of her late husband and will continue the business at the old stand.

Fred Baldner and James Fletcher have purchased the Richard McBride plumbing establishment on East Main street, Xenia, Ohio. They will add to the stock of pumps, &c., and will be prepared to do any kind of plumbing work.

E. P. Young, 28 North Sixteenth street, Philadelphia, in plumbing the Rittenhouse apartment house, used 70 of the Standard Mfg. Company's enameled baths and 75 Bourse siphon jet water closets, made by the J. D. Johnson Company, 139 North Seventh street, Philadelphia, who supplied the materials.

Louis Wanner, 106 North Sixth street, Philadelphia, whose sample room shows that he makes a specialty of fine plumbing, has recently completed the plumbing in the residence of J. Stahl. He fitted two bathrooms with tile floors and walls, Standard Mfg. Company's enameled baths and closets and lavatories. A Cummings filter is used on the water service to purify all of the water used in the house.

Froelich Bros., 142 North Seventh street, Philadelphia, are receiving carloads of soil pipe and fittings and 1000 Philadelphia plain hopper closets as an addition to the large line of plumbers' supplies which they carry.

Stambach & Love, 52 North Seventh street, Philadelphia, report a satisfactory year as a result of their endeavor to supply the plumber with whatever he requires for his work.

After long agitation for cheaper gas the inhabitants of the Quaker City have at last succeeded in securing a reduction of the price to $1 per 1000 cubic feet. The gas supply of Philadelphia is mainly in the hands of the city government, and hitherto $1.50 has been the municipal charge. The Common Council, yielding to the popular demand, have, however, passed an ordinance this week making a cut of 50 cents per 1000 in the price of the illuminant. This means, at the present ratio of consumption, a decrease of some $500,000 in the city's revenue: but it is claimed by the advocates of cheaper gas that the increase in consumption will easily counterbalance the problematical loss and leave a handsome profit to the city. About 66 per cent. of the dwelling houses of Philadelphia are at present unfurnished with gas, mainly owing to its high price, and the majority of them will, it is believed, now make use of this illuminant.

The Mason Regulator Company of Boston have made three additions to their engineering series. No. 4, "Electricity for Engineers," contains such facts about electrical machinery as every engineer who has it under his charge needs to know; also all the rules of the Underwriters' Union for the installation of electric plants; 50 cents, post paid. No. 7, the "Engineers' Log Book," for keeping an accurate and systematic record of the engine room; 50 cents. No. 8, the "Chief Engineers' Record Book," for keeping the record of the mechanical plants of large factories; 75 cents.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

A contract for heating the new Presbyterian Church at Clinton, Mass., has been awarded to the Hub Plumbing, Heating & Stove Company.

George Schissler is putting the finishing touches to his contract for placing the steam heating apparatus in the city buildings at Mansfield, Ohio.

M. D. Lawrence, Westfield, Pa., has secured the contract for putting in the furnace and heating apparatus of the new M. E Church at Galeton, Pa.

The contract for the steam heating and plumbing for the new Deaf and Dumb School now in course of erection at Morganton, N. C , has been awarded to the Brewster Hardware Company, Raleigh, N. C.

Clarkson, Scott & Co., 118 Custom House Place, Philadelphia, recently used 2500 feet of radiation and O. K. boilers in the large residence of M. Kohler at Jenkinstown, Pa.

Thompson Bros., 112 Broad street, Philadelphia, have received the contract at $4500 for heating the Temple College, at Broad and Berks streets, Philadelphia. They will use the Sturtevant blower system of indirect steam.

The Baker & Smith Company, 193 to 197 Van Buren street, Chicago, have placed a hot water heating plant in the offices of the Mechanical Rubber Company, 230 Randolph street.

The Smith & Anthony Stove Company, 217 Lake street, Chicago, have installed two Hub hot water heaters in the residence of F. Heinig, Winnetka, Ill., and one in the residence of C. M. Day, Glencoe, Ill.

The Lovell street and Woodward avenue schools, Kalamazoo, Mich., are to be provided with eduction closet ranges, furnished by the Walcott-Hurlbut Company, 175 and 177 Lake street, Chicago.

The Parkersburg Supply & Plumbing Company, Parkersburg, W. Va., were recently organized for the purpose of carrying on a plumbing, steam and gas fitting business and dealing in supplies. The capital is $25,000 and the incorporators are J. W. Roberts, J. H. Cole, W. M. Cox, Lysander Dudley and G. H. Cole.

The steam heating plant erected at the Sutton town poorhouse, Sutton, Mass., by L. White & Son of Oxford, Mass., in which a Richmond Victor boiler was used, was recently inspected by District Inspector Dyson and found to be in every way satisfactory. Messrs. White & Son have also just completed the piping of a house and barn at the same place for water furnished by a wind mill erected by Smith & Winchester of Boston, Mass.

Among recent steam heating apparatus installed by H. E. Heath of Lynn, Mass., were the following business blocks: Dearborn Bros. & Co., Central Investment Company, J. L Libbey & Son and the Tapley Estate, besides 24 residences in Lynn in which Exeter radiators were used.

The Imperial Oil Heater and Cooker.

This new candidate for favor, of which an illustration is herewith presented, is manufactured by the R. J. White Mfg. Company, 40 and 42 State street, Chicago. It is extremely simple in its construction, and is spoken of as a remarkably powerful heater for its size. It is constructed with a cast iron base and a sheet iron drum. The drum is perforated at the bottom for the admission of air, which is discharged after being highly heated through other perforations at the side near the top. A nickel-plated dome covers the top. It is removable, and the stove can then be used for cooking, heating flat irons, &c. The drum can also be removed easily, and the full use of a lamp of 400 candle power is then available for illuminating purposes. The lamp has a circular wick, receiving air through the base. When running at its greatest capacity the fount of the lamp does not become heated. One size is made, but founts are furnished in either nickel or brass, as preferred. The manufacturers make a special point of the low price at which this stove is supplied to the trade.

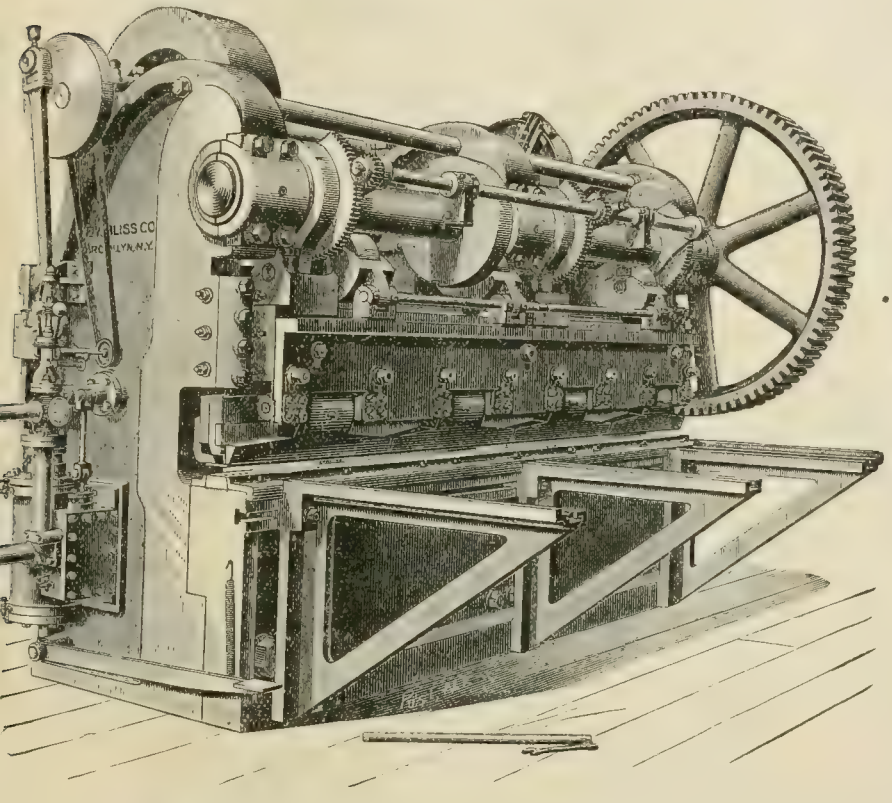
The Imperial Oil Heater and Cooker.

According to a press dispatch from Bennington, Vt., the Vermont Slate Trust will not organize for 1894. Some of the workers desire, it is said, to sell their stock on hand, and will refuse to sign the contracts, trusting that with a reduction of prices they can dispose of their surplus. The quarries that are uncontrolled by the trust are now working full time.

The Salvation Army in San Francisco recently undertook to sift the truth of the rumors about the large numbers of unemployed workingmen alleged to be in that city. It offered work at $1.40 a week and found no takers. The *Coast Seamen's Journal* does not think the test was a fair one.

Engine Driven Gang Punching Machine.

The accompanying illustrations show a punching machine intended especially for punching a large number of holes at one stroke, Fig. 1 showing it as arranged for punching 150 holes ¼ inch diameter through iron ¼ inch thick. The vertical engine at the loft gives motion to the crank shaft at the top of the machine, there being on this shaft a friction clutch which is thrown in and out by a foot treadle and gives the operator complete control of the machine. When the crank shaft has made one revolution a cam throws out the friction clutch and applies the brake, thus stopping the machine at the highest point. The adjustment of the slide is actuated by two cams on the crank shaft, which cause it to descend before the punches, holding the sheet and straightening it during the punching action. Fig. 2, which is a section of the slide and die, shows the construction of this stripper. The main advantage of this stripper is that it permits of using shorter and consequently stiffer punches. By making the front portion of this stripper in sections, as shown, it is possible to easily renew punches which have been bent or broken. As will be seen from Fig. 2, these portions of the stripper are hinged and can be swung forward easily. The



Engine Driven Gang Punching Machine.—Fig. 1.—General View.

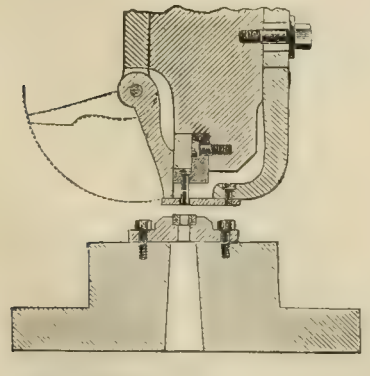


Fig. 2.—Section of Slide and Die.

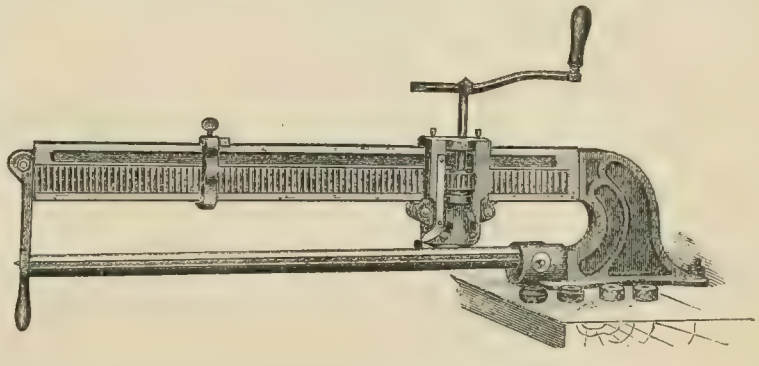
is effected by means of an eccentric disk interposed between the crank pin and the pitman, which eccentric disk is actuated by means of the pinion shaft shown in front of the main shaft in Fig. 1, this shaft being turned by hand by means of a ratchet which is permanently attached to it. Another special feature in this machine is the cam actuated stripper. This stripper



Queen City Grooving Machine with Round Horn.

principal dimensions of the press are as follows: Length of table, 154 inches; width of table, 12 inches; length of slide, 154 inches; stroke, 2 inches; diameter of shaft, 8 inches; diameter of eccentric, 10 inches; back gearing, 1 inch to 28 inches; total weight, about 60,000 pounds. It is made by the E. W. Bliss Company, 16 Adams street, Brooklyn, N. Y.

Sealed proposals will be received at the office of the Supervising Architect at Washington, D. C., until January 12, for the stone work and terra cotta work, iron and wood floor, ceiling and roof construction, roof covering, &c., for the superstructure of the United States Post Office building, Columbus, Ga. Copies of the drawings and specifications may be obtained from the Supervising Architect at Washington or at the office of the Superintendent, Columbus.

Queen City Grooving Machine with Round Horn.

The accompanying illustration shows the Queen City grooving machine with removable round horn made by the Niagara Stamping & Tool Company Buffalo, N. Y. The round horn is 1¾ inches diameter to accommodate 2-inch conductor pipe. The carriage with the flattening and grooving rolls moves over the work, thus making it convenient for the operator. The machine grooves and flattens the seam at the same operation, thereby doing away with the necessity of hammering down with a mallet, and the seam is said to be perfect in tightness and appearance. The grooving roll can easily be removed and replaced by another with groove of different width. Rapid adjustment is provided for regulating the pressure of the rolls upon the seam, also a clamp to hold the sheet at the starting end. The round horn is fastened in a socket by means of set screw and can be turned to either side or removed altogether. At the will of the operator the groove can be put on the inside as well as on the outside of the work. For inside grooving a flat roll is used and the metal is pressed into a groove on the round horn. On the horn there are four grooves of different widths to accommodate different sizes of seams. A hinged latch connecting the upper bar with the horn adds to the stiffness of the machine. This groover will take in work up to 32 inches in length.

According to the annual report on the Director of the Mint, just published, there has been an increase of $318,295,000 in the aggregate circulation of gold and a decrease of $111,600,000 in the aggregate of silver if the principal countries of the world during the 12 months covered by his report. He puts the gold circulation of the world at $3,901,900,000, and that of silver at $3,931,100,000.

The Bishop of Urgel, in the European republic of Andorra, recently prohibited and anathematized the installation of telephonic apparatus and other supernatural and diabolical electrical necromancy.

THE TIN SHOP.

Patterns for Double Elbow to Connect Two Boilers.

From J. J. H., *Anaconda, Mont.*—Inclosed find the half elevation of a double elbow to connect two boilers, for which patterns are required. The various dimensions of parts are given in the half elevation.

Answer.—An inspection of the half elevation, Fig. 1, shows that sections 1 to 4 are similar to an ordinary pieced elbow, excepting the miter line E Q E1. The profile for this part of the article is indicated by A O A1. Sections 10 and 11 also conform to this profile. As only the half elevation of article is shown, patterns will be obtained for certain sections to the left of center line L N. The large end of article, as indicated by K L, is round, and one-half of this is shown from K to K1. As sections 1 to 5 and 10 to 11 conform to profile A O A1, and section 9 represents the straight pipe, sections 6 to 8 will be given the necessary taper. In Fig. 2 is presented a duplicate of the first four sections of the article, and the half patterns of sections 1 and 4 are shown.

To obtain the patterns proceed as follows: For the pattern of section 1 divide the profile A O A1 into any convenient number of equal parts, and, with the blade of the T-square placed parallel with A B, drop lines from the points thus obtained, cutting the miter line B B1. On A A1 extended lay off the stretchout line A3 A4, as shown, through the divisions in which draw the usual measuring lines. Place the T-square so that the blade shall come parallel to the stretchout line, and, bringing it against the several points in the miter line B B1, cut corresponding measuring lines. Then the line B3 B4 traced through the points thus obtained forms with A3 A4 the half pattern of section 1. For the pattern of section 4 proceed as follows: From the points in B B1 carry lines parallel with B C, C D and D E,

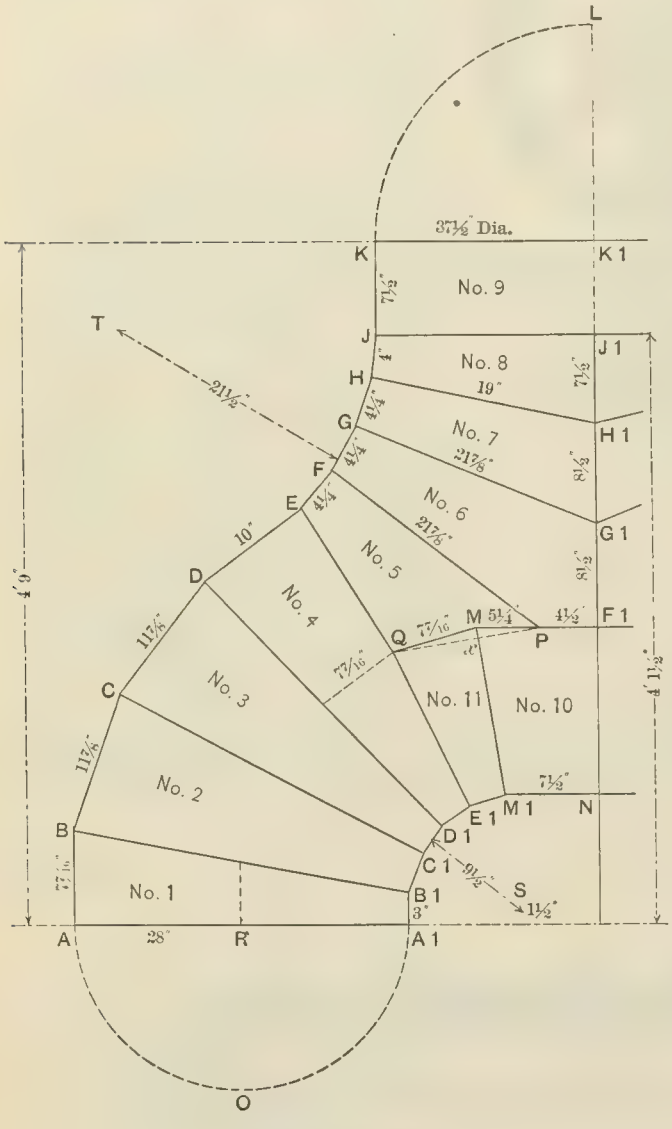


Fig. 1.—Half of Elevation.

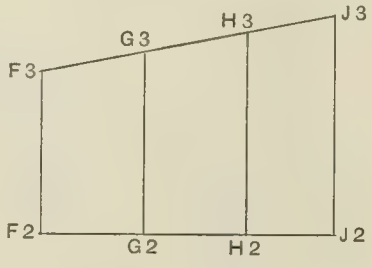

Fig. 3.—Hights on F1 J1 of Elevation.

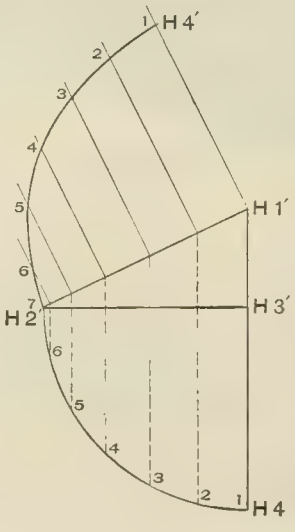

Fig. 4.—Method of Obtaining Shape on Miter Line H H1.

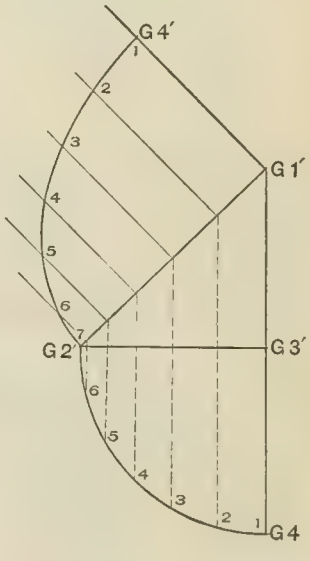

Fig. 5.—Method of Obtaining Shape on Miter Line G G1.

PATTERNS FOR DOUBLE ELBOW TO CONNECT TWO BOILERS.

cutting E *e* E1, as shown. At right angles to D E lay off a stretchout of A O A1, as shown by *e d*, through the points in which draw measuring lines in the usual manner. Place the T-square so the blade will be parallel to the stretchout line *e d*, bring it successively against the several points in the miter lines D D1 and E *e* E1, and cut the corresponding measuring lines. file of large end, and connect F3 J3. If it is not desired to have the line F3 J3 straight, as shown, G2 G3 and H2 H3 can be extended so that F3 J3 will represent a curve. An inspection of Fig. 1 will show that the shape of miter line J J1 is represented by K L. To obtain the shape on miter line H H1 proceed as follows: Draw the right angle H2′ H3′ H1′ in Fig. 4, and with length of lines in H2′ H3′ H4 and transfer the distance to lines of similar number drawn through H2′ H1′. A line drawn through the points thus obtained, as shown by H2′ H4′, will complete the quarter ellipse, or shape on line H H1 of elevation.

The shape on miter line G G1 of elevation is shown by G2′ G4′ in Fig 5, and is obtained in a similar manner.

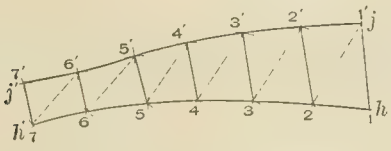

Fig. 10.—*Pattern for Section* 8.

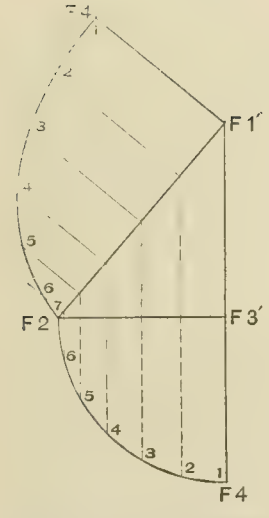

Fig. 6.—*Method of Obtaining Shape on Miter Line F P.*

Fig. 7.—*Method of Obtaining Pattern for Section* 8.

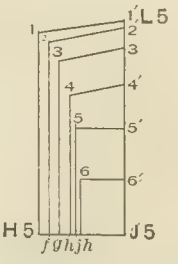

Fig. 8.—*Divisions Represented by Solid Lines in Fig.* 7.

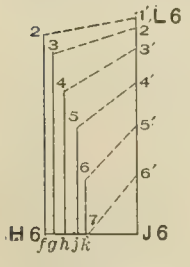

Fig. 9.—*Divisions Represented by Dotted Lines in Fig.* 7.

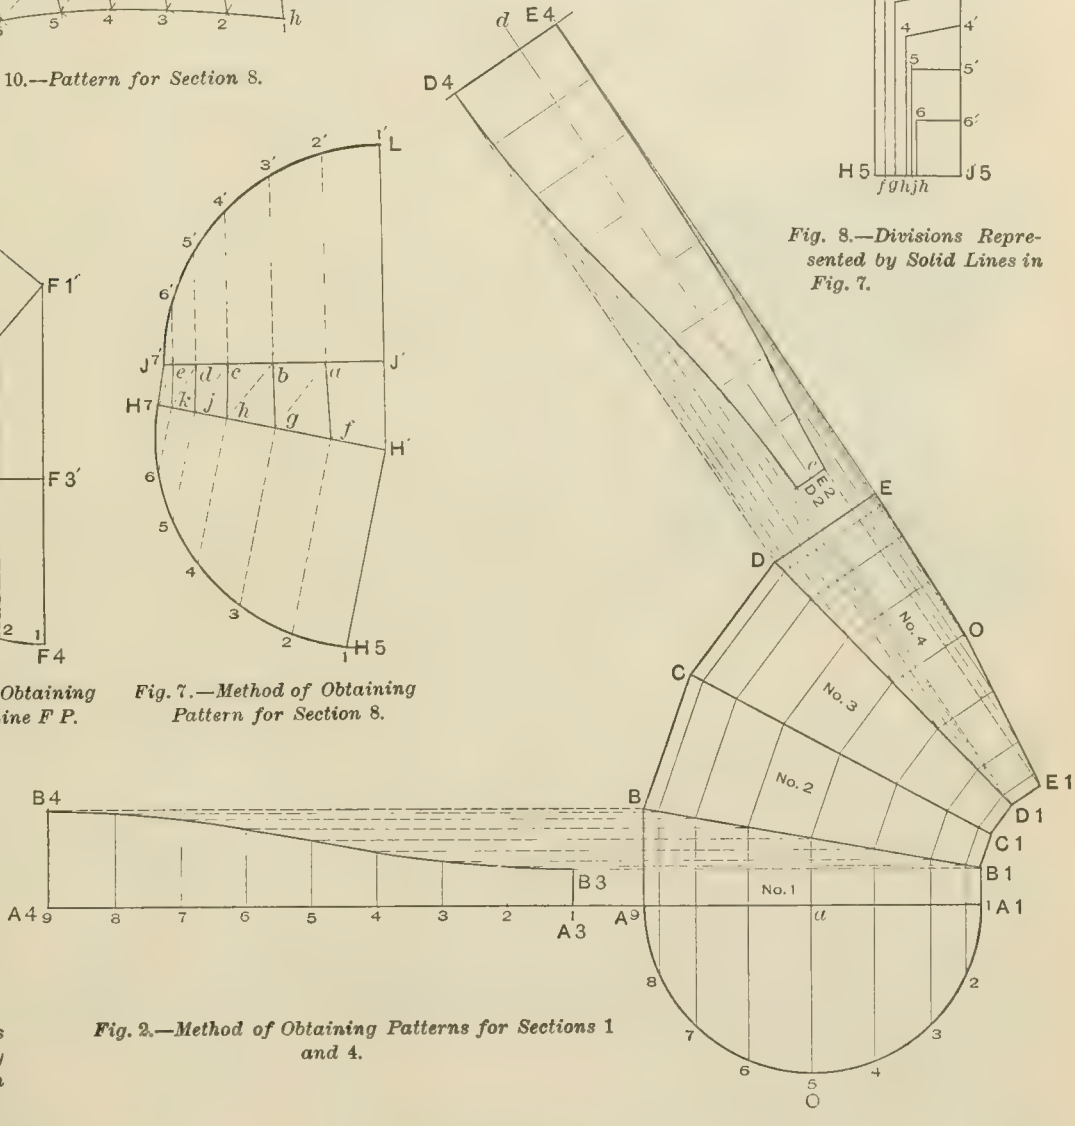

Fig. 2.—*Method of Obtaining Patterns for Sections* 1 *and* 4.

PATTERNS FOR DOUBLE ELBOW TO CONNECT TWO BOILERS.

Then lines traced through these points, as shown by E2 E4 and D2 D4, will be the pattern of section 4. The patterns for sections 2 and 3 can be obtained in a similar manner or by duplication.

To obtain the hight of sections on line F1 J1 of elevation, Fig. 1, proceed as follows: On any line, as F2 J2 in Fig. 3, starting from F2, set off the distances F1, G1, H1 and J1 of elevation, and from the points thus obtained erect perpendiculars, as shown. On F2 F3 set off the distance A R of profile of small end. In a similar manner set off on J2 J3 the distance K K1 of pro- H3′ as center, and H2 H3 of Fig 3 as radius, strike the quadrant H2′ H4. Divide H2′ H4 into any convenient number of equal parts, and, with the T-square placed parallel with H3′ H4, carry lines through H2′ H3′, extending them indefinitely. With H H1 of Fig. 1 as radius, and H2′ of Fig. 4 as center, strike a small arc, cutting H4 H3′ at H1′, and draw H2′ H1′. With the T square at right angles to H2′ H1′, and brought against the several points in same, draw lines through said points, as indicated by the figures 1, 2, 3, &c. By means of the dividers take the In this figure the distance G2′ G3′ is derived from G2 G3 of Fig. 3, and the distance G2′ G1′ is derived from G G1 of elevation. In Fig. 6, the shape on miter line F P of elevation is shown by F2′ F4′. In this figure the distance F2′ F3′ is derived from F2 F3 of Fig. 3, and the distance F1′ F2′ from F P of elevation. To avoid a confusion of lines, a duplicate of section 8 of elevation is shown in Fig. 7, and K L K1 of Fig. 1 has been transferred to J J′ of Fig. 7, as has H2′ H4′ H1′ of Fig. 4 to H H′. Then J L J′ of Fig. 7 represents the shape on J J1 of elevation, as H H′ H5

does on H H1 of elevation. To obtain the base lines of divisions for obtaining the pattern of section 8, as shown in Fig. 7 by J J′ H′ H, draw lines from the points in J J′ to similar points in H H′. Thus connect *a f*, *b g*, *c h*, &c., as shown. In a similar manner connect the points in J J′ with those in H H′, as shown by the dotted lines J′ *f*, *a g*, *b h*, &c.

In Fig. 8 is shown a diagram of divisions giving the distances from points in J J′ to corresponding points in H H′ as if measured on the finished article. To construct the diagram of divisions, draw the right angle H5 J5 L5, and on J5 L5, measuring from J5, set off the length of lines in J L J′. In a similar manner, measuring from J5, set off on J5 H5 the length of the solid lines in J J′ H′ H. From the points in J5 H5 erect perpendiculars equal to the length of corresponding lines on H H′ H5. Connect the points thus obtained with points of similar number in J5 L5, thus connecting 1 1′, 2 2′, 3 3′ &c. In Fig. 9 is shown a similar diagram of the cross sections, as indicated by the dotted lines in Fig. 7. To construct this diagram, draw the right angle H6 J6 L6, and on

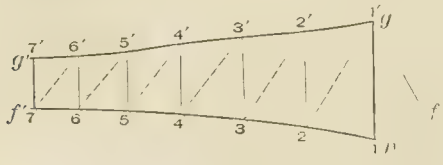

Fig. 18.—Pattern for Section 6.

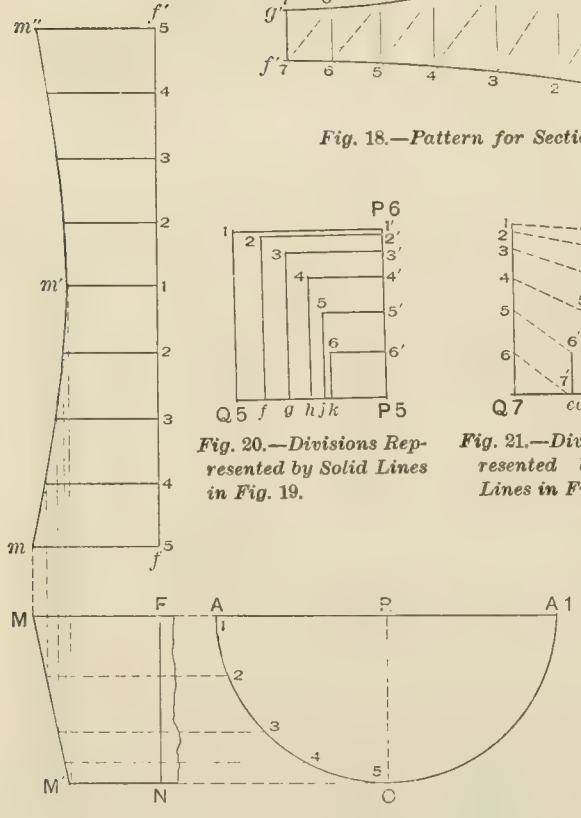

Fig. 20.—Divisions Represented by Solid Lines in Fig. 19.

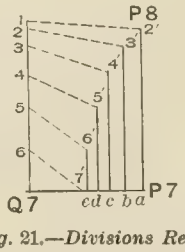

Fig. 21.—Divisions Represented by Dotted Lines in Fig. 19.

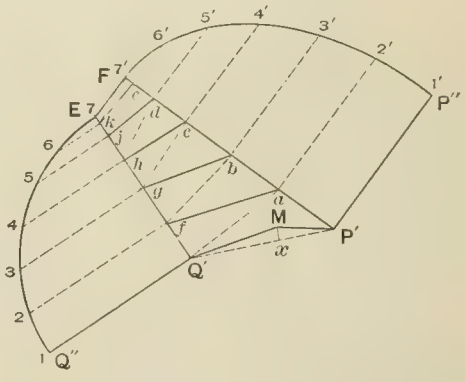

Fig. 19.—Method of Obtaining Pattern for Section 5.

Fig. 23.—Method of Obtaining Pattern for Section 10.

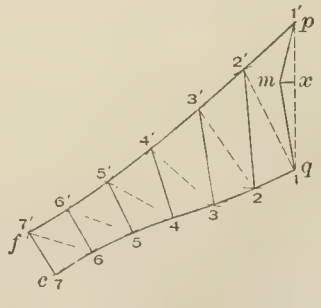

Fig. 22.—Pattern for Section 5.

PATTERNS FOR DOUBLE ELBOW TO CONNECT TWO BOILERS.

J6 L6 set off the length of lines in J J′ L, and on J5 H5 the length of dotted lines in J J′ H′ H, and from these points erect perpendiculars having the length of corresponding lines in H H′ H5, and connect the points as shown by the dotted lines in diagram.

The pattern for section 8 is shown in Fig. 10, and to describe the same, proceed as follows: On the line *h j* set off the distance 1 1′ of Fig. 8. With point 1 of pattern as center, and 1 2 of Fig. 7 as radius, strike a small arc, which intersect with one struck from point 1′ of pattern as center, and 1′ 2 of Fig. 9 as radius, thus establishing point 2 of pattern. With point 2 of pattern as center, and 2′ 2 of Fig. 8 as radius, strike a small arc, which cut with one struck from point 1′ of pattern as center, and 1′ 2′ of Fig. 7 as radius, thus establishing point 2′ of pattern. With point 2 of pattern as center, and 2 3 of Fig. 7 as radius, describe a small arc, which intersect with one struck from point 2′ of pattern as center, and 3 2′ of Fig. 9 as radius, thus establishing point 3 of pattern. With point 3 of pattern as center, and 3 3′ of Fig. 8 as radius, strike a small arc, which intersect with one struck from point 2′ of pattern as center and 2′ 3′ of Fig. 7 as radius, thus establishing point 3′ of pattern. Proceed in this manner until the various points in *j j′ h h′* of pattern are established, when lines drawn through the various points, as shown, will be the required pattern.

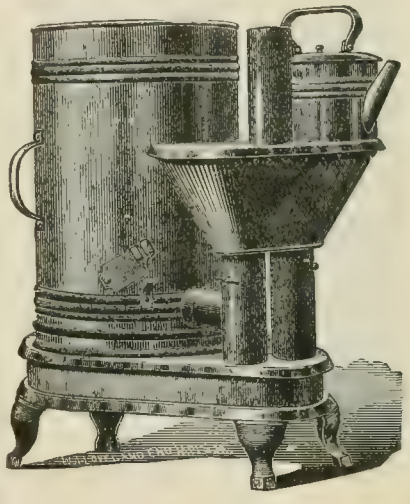
A similar method is followed in obtaining the pattern for section 7, as shown in Figs. 11, 12, 13 and 14. On H H′ of Fig 11 is drawn the shape H2′ H4′ H1′ of Fig. 4, which gives the shape on miter line H H1 of elevation. Also on G G′ of Fig. 11 is drawn the shape of G2′ G4′ G1′ of Fig. 5, which gives the shape on miter line G G1 of elevation. In Fig. 12 are shown the divisions represented by solid lines, and in Fig. 13 the divisions represented by dotted lines, derived from corresponding lines in Fig. 11. The method used for obtaining the pattern is the same as previously described. A similar method is followed in obtaining the pattern for section 6, as shown in Figs. 15, 16, 17 and 18. On G G′ of Fig. 15 is drawn the shape G2′ G4′ G1′ of Fig. 5, which gives the shape on miter line G G1 of elevation. Also on F P′ of Fig. 15 is drawn the shape of F2′ F4′ F1′ of Fig. 6, which gives the shape on miter line F F1 of elevation. In Fig. 16 are shown the divisions represented by solid lines and in Fig. 17 the divisions represented by dotted lines, derived from corresponding lines in Fig. 15. The method used for describing the pattern is the same as for section 8. To obtain the shape of *g f p* of pattern, corresponding to G1 F1 P of elevation, proceed as follows: From G5 in Fig. 16, distance G1 F1 of elevation, and from the point *p* thus obtained erect a perpendicular in length equal to P5 1 of Fig. 15, as shown by *p p*,′ and connect *p*′ G6. With point *g* of pattern as center, and G6 *p* of Fig. 16 as radius, strike a small arc, which intersect with one struck from point *p* of pattern as center, and P F1 of elevation as radius, thus establishing the point *f* of pattern; then connect *p f g*. A similar method is followed in obtaining the pattern for section 5, as shown in Figs. 19, 20, 21 and 22. On F P′ of Fig. 19 is drawn the shape of F2′ F4′ F1′ of Fig. 6, which gives the shape on miter line F P of elevation. On E Q′ of Fig. 19 is drawn the shape of F2′ F4 F3′, which gives the shape on miter line E Q of elevation. In Fig. 20 are shown the divisions represented by solid lines, and in Fig. 21 the divisions represented by dotted lines, derived from corresponding lines in Fig. 19. The method used for obtaining the pattern, Fig. 22, is the same as previously described. In Fig. 20 Q5 P5 is made equal to Q P of elevation, and *q p* of pattern is the same as Q5 P5 or 1 P6 of Fig. 20. To obtain the point *m* of pattern, from *q* on *q p* set off the distance Q *x* of elevation, and from the point *x* erect a perpendicular in length equal to M *x* of elevation. Then connect *q m*, *m p*, as shown.

In Fig. 23 is shown the method of obtaining the pattern of section 10. The profile A O A1 is similar to the profile of the small end in the elevation, being designated by similar letters. Divide the profile A O A1 in the usual manner into any convenient number of equal parts, and from the points thus obtained carry lines parallel with A A1, cutting M M′. Prolong the line N F″ and upon it place a stretchout from the profile A O A1, perpendicular to which draw measuring lines in the usual manner. With the T-square placed parallel to F″ N, and brought successively against points in M M′, cut the measuring lines of corresponding numbers. Then a line traced through the points of intersection thus obtained will be the half pattern sought, all as shown by *m m′ m″ f′ f*. The pattern for section 11 is obtained in a similar manner, or as shown in Fig. 2 for section 4.

A Straw Consuming Stove.

The De Smet Stove Company of De Smet, S. D., are manufacturing a stove peculiarly adapted to localities without timber or coal. It is designed to burn straw, hay, cobs or any other light material, and is meeting with a ready sale. An illustration of this novel stove is given herewith. It is constructed partly of cast iron and partly of sheet steel. The drum and the connecting pipes and the band between the two base castings are made of sheet steel, and the other portions of cast iron. As shown in the cut, the "cooker," which has two holes, is in front, but the stove is now made so that the two short pipes below are dispensed with and the cooker rests on and connects with the base. A partition runs from the back of the base of the stove to within a few inches of the front, and there are two dampers in the cooker, so that all the heat can be thrown to one of the pot holes or it can be compelled to go into the base, pass around the partition and come up the other hole, making a complete base heater.

The fuel is fed to the stove by a peculiar method. The large drum, shown in the rear of the stove, contains the fuel. The drum is lifted off for the purpose of refilling. On the lower part of the drum is a cover, which is removed when the drum is taken off for refilling, or to empty the ashes. Handles are conveniently arranged for lifting the drum on and off. Different thicknesses of sheet steel are used in the drum, the heavier parts being used where the heat of the fire is the most intense. The manufacturers state that two drums are desirable for regular service, as thus one drum can always be kept filled ready to replace the other when it burns out. They also state that



Straw Consuming Stove.

a drum well filled will last from five to seven hours, depending on the draft given to the fire. There are three draft holes in the lower part of the drum, one of which is shown in the cut.

The oven designed for this stove is of such a form that it can be placed over the cooking holes and attached to the stove pipe. An inner drum in the oven causes the blaze and heat to pass round it, imparting an even heat on all sides. Four different styles of this stove are made, including a single base which has no base heater, the legs being attached to the upper casting without cooker or oven. They are referred to as "the poor man's friend," because with the aid of his straw pile he can secure the comforts of a good fire as well as if he were able to obtain coal or wood.

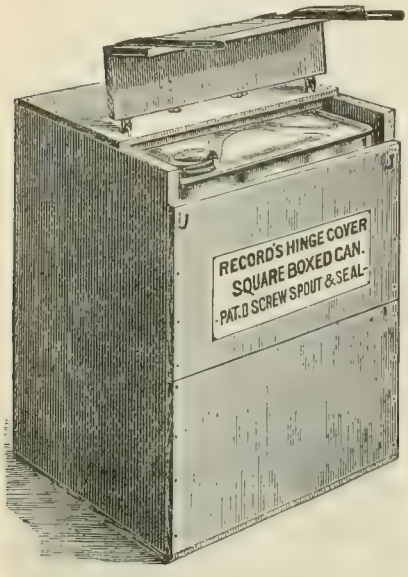
The company purchase their castings, but do all the other work of making the stoves in their own shop. The design originated in De Smet. The De Smet Stove Company are a corporation with a capital stock of $25,000. The president is I. J. Miller; vice-president, J. D. Peirson; secretary and treasurer, J. T. Cooley.

The British Board of Trade returns for November show a reduction in foreign trade from that of October. The imports for November amounted to $171,844,109, and the exports to $84,736,043. A considerable decrease in the receipts of American wheat was one of the unfavorable features of the month. American cotton showed, however, a slight increase over October.

THE RETAIL STORE.

Record Hinge Cover Square Boxed Can.

We show in the accompanying illustration a new 5-gallon hinge cover can with Record's screw spout and seal, which is being put on the market by the Record Mfg. Company, Conneaut, Ohio. The screw on the can is 1¾



Record Hinge Cover Square Boxed Can.

inches, with a vented spout on the cap, which is lined with a gasket. The firm also furnish with this their patent seal. When the can is filled for shipment the seal with the rubber gasket, it is said, completely locks the screw, so that the contents are secure. When it arrives at its destination the seal is taken out, and the can being provided with a vented spout screw, the contents may be easily poured out.

A Cut Nail Pencil.

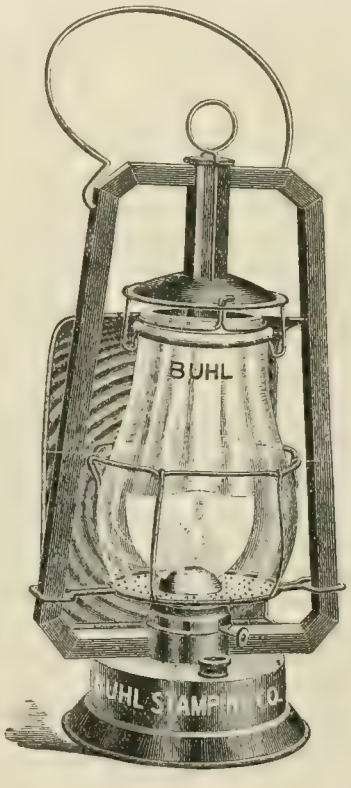
Cross Pen Company, 168 Devonshire street, Boston, have just brought out a regular propelling lead pencil, as shown in the accompanying cut. This is made in exact imitation of a 10d cut nail, and is designed for pocket use. The company are known to the trade as manufacturers of nickel pencils made in imitation of wire nails, stove and carriage bolts, screws, &c. The point is made that the cut nail pencil is especially adapted for advertising purposes, as

A Cut Nail Pencil.

the sides, being flat, admit of stamping in good sized plain letters any name, business or address. The manufacturers are prepared to make quotations on this novelty for advertising purposes for the new year.

Buhl Dash Lantern.

The accompanying cut of a dash lantern represents one of the six pieces contained in the Mascot assortment of the Buhl Stamping Company, Detroit, Mich. These goods are furnished in colored hard enamel finish. It is remarked that the lanterns contain the latest improvements, never leak, give a steady bright light and never go out in the wind. The Brilliant assortment put up by the company contains one dozen square lift tubular lanterns, assorted red, blue, russet and maroon colors. The assortments are referred to as being especially adapted to the wants of small customers and hardware jobbers during such a year of business depression as the present.



Buhl Dash Lantern.

Hayes' Safety Kettle Bottom.

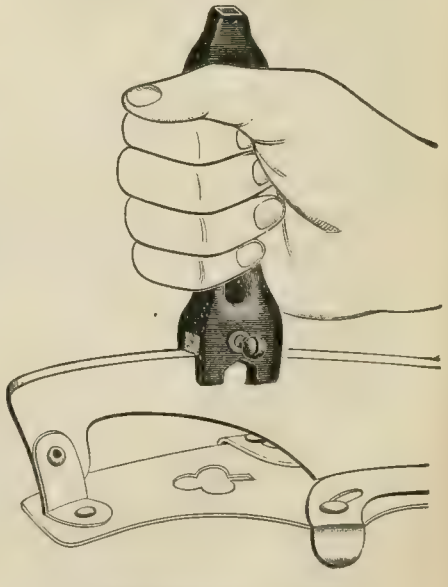
The safety kettle bottom shown herewith is offered by the Diamond Hardware Company, 620 Atlantic avenue, Boston, Mass. It is made of steel, so as to give it requisite strength, and is principally designed to be placed inside a kettle, to prevent meat, vegetables and other articles of food sticking or burning on the kettle bottom while being boiled. It is explained that the bottom may be put to many other uses, as follows: Turning it bottom side up in the kettle, it makes a good and convenient steamer; it may be used bottom side up on the top of the stove to keep hot tea, coffee or anything that it is not desirable to place on the bare stove; it

Hayes' Safety Kettle Bottom.

may be placed in the same position on the table for a sad iron holder; if pies are not sufficiently baked on the bottom the baking may be completed by putting them in the kettle bottom on the top of the stove; it may be used for broiling meat or toasting bread by removing a stove lid and setting the bottom in the kettle hole, and in the same position a tea or coffee pot may be set in it to boil quickly.

Boys' Lightning Skate Sharpener.

The cut herewith given represents the Boys' Lightning skate sharpener, put on the market by the Sandwich Novelty Company, Sandwich, Ill. The sharpener has in combination a skate key and wrench, all made of malleable iron, and



Boys' Lightning Skate Sharpener.

referred to as light, strong and durable. It is remarked that the files are of the best hardened steel, that they are square, with four sides available for use, thus lasting a long time, and that when worn out they can be replaced at slight expense. The manufacturers claim that with the sharpener a boy can put the dullest pair of skates in fine shape in from 3 to 5 minutes.

The Breck Sap Spout and Cover.

Joseph Breck & Sons, Boston, Mass., are placing on the market the sap spout and cover herewith shown. The spout, Fig. 1, is of galvanized malleable iron, to make it indestructible, and is inserted in the ¼-inch hole V, as in Fig. 2, bored 1 inch into the tree. The point of the blade D is driven slightly into the body of the tree at the back of the hole V. The reduced portion M, of the spout body enters that portion of the hole V surrounded by the bark Z of the tree and forms a bearing for the spout. It is explained that by this means the grain of the wood is in no manner compressed by the spout when inserted in the spout hole, as the only bearing of the spout in the tree is the point at the back of the hole and the reduced body portion in the bark. The manufacturers remark that the sap lies within an inch of the bark, and that upon this principle the spout is made. In Fig. 3 the cover is represented by H, and consists of a thin metallic sheet, provided with holes for receiving the spout eyes *h*. The edge of the cover is inserted under the undercut shoulder T on the spout, the eyes *h* projecting through the opening in the cover. The cover is designed to prevent rain, snow, sun and falling particles from entering the bucket and discoloring the sap collected. As the cover is attached directly to the spout, it interferes in no way with removing the bucket. It is stated that all sap spouts will freeze during a cold snap, but that the reflection of the sun on the tin cover will produce heat enough to thaw the spout from one to two hours earlier than others. In connection with the cover, in Fig. 3, is the pin No. 15 for attaching the cover to the spout, and carrying an indicator, X; this is designed to show, as far as it can be seen, that the bucket has been emptied, or *vice versa*. As each bucket is emptied and replaced on the hook, the indicator is to be turned up to show that the tree has been visited. At the next gathering the indicators are turned down. The point is made that often the same tree is visited two or three times unnecessarily after the sap has been gathered, and that the indicators prevent this loss of time; also that all the trees must be attended to, as any omission will be shown by the position of the indicator. The spouts and covers can be obtained separately if desired, also special bits by which all holes will be bored the exact depth. The manufacturers call attention to the fact that their spouts will not break in driving, and that the buckets will not twist the hooks off under the strain of high winds.

Value of Sanitary Work.

As illustrating the value of sanitary work, the following extract from a report recently made by Colonel C. P. Goodyear to Governor Northen, of Georgia, on the results of the Florida Sanitary Inspection law of the State, are highly interesting. The colonel writes: "I think it is demonstrable that in the short period of five years of the operation of this Florida law it has saved portions of that State three times from epidemics which, but for its provisions and prohibitions, would have been widespread and disastrous. The epidemics of yellow fever at Brunswick and Savannah in 1876 were conservatively estimated to have cost those cities not less than $3,000,000, and to have cost the entire State, including those cities, not less than $10,000,000. The epidemic at Fernandina in 1877 was estimated to have cost that city directly nearly $1,000,000, and the State of Florida over $2,000,000. Various estimates of loss to the State of Florida by the widespread epidemic of 1888 range from $7,000,000 to $15,000,000. The epidemic which commenced at New Orleans and took in nearly the entire Mississippi region, with its tributaries, in 1878, was estimated by the most conservative estimates to have cost the territory involved not less than $200,000,000, an amount equal to the losses by the great Chicago fire, and none of the losses referred to above, except the loss of life, can be insured against by any known system of insurance. We pass laws for the education of our children and make liberal appropriations to enforce their provisions, and decline to legislate against the evils which are preventable in their nature and which result in epidemic, killing the children by hundreds and thousands, after we have educated them."

The attention of ingenious men and women is directed to the fact that the Franklin Institute, Philadelphia, Pa., are interested in the grant of certain medals for discoveries and inventions. The Elliot Cresson Gold Medal, founded in 1848, may be granted for some discovery in the arts and sciences, or for the invention or improvement of some useful machine, or for some new process or combination of materials in manufactures, or for ingenuity, skill or perfection in workmanship. The John Scott Legacy Premium and Medal, which is $20 and a bronze medal, is awarded by the city of Philadelphia on the recommendation of the Franklin Institute for useful invention. The Edward Longstreth Silver Medal is awarded for useful invention, important discovery and meritorious work in or contributions to the sciences or the industrial arts. Full directions as to the manner and form in which applications for an investigation of inventions and discoveries will be sent by addressing William H. Wahl, secretary of the Franklin Institute, Philadelphia, Pa.

The death of Sidney Shepard of Sidney Shepard & Co., Buffalo, N. Y., is reported. We defer ntil a later issue reference to his business career, and the prominent position he has long occupied in the lines with which he has been actively identified.

While boring a well on the property of a Cold Storage Company in the city of Montreal, a few days ago, natural gas was struck at a depth of 1020 feet. This discovery, it is believed, may lead to important results.

STOVE TRADE NOTES.

Experiments with Gas Stoves.

(*Continued from page* 45, *December* 23, 1893.)

RELATIVE HEAT VALUE OF COAL AND GAS.

We may now discuss the character and composition of coal gas, and it would be instructive to compare it with the composition of the coal from which it is obtained. We shall thus gain considerable information bearing on the comparative calorific value of these fuels. Coal gas drawn from the supply pipes in the *Lancet* laboratory (Gas Light & Coke Company's supply) has the following percentage composition according to our analysis:

	By volume.	By weight.
Benzine (C_6H_6)	0.55	3 98
Olefines (C_2H_4)	4.45	11.76
Carbon monoxide (CO)	7.80	20.00
Hydrogen (H)	52.90	9 84
Methane (CH_4)	31 80	48.00
Nitrogen (N)	2.50	6.42

An average sample of coal gives the following figures:

	Per cent.
Carbon (C)	82.12
Hydrogen (H)	5.31
Nitrogen (N)	1.35
Sulphur (S)	1.24
Oxygen (O)	5.69
Ash	4.29

It will at once be seen that, whereas in coal the carbon is the chief constituent, in coal gas it is replaced largely by hydrogen, the carbon being left behind in the retort as coke Hydrogen, methane and carbon monoxide are the chief constituents of calorific value in coal gas. Methane is closely related to hydrogen and is characterized by similar properties. While the calorific value of carbon is 8080 units, that of hydrogen is 34,500 units, or more than four times as great. There is, therefore, a distinct calorific gain in this respect; but to make a fair contrast between the calorific value of gas and coal we must compare the thermal value of a given quantity of coal with the gas yielded by that quantity. For that purpose we cannot do better than place side by side the heat value of a ton of coal and the heat value of 10,000 cubic feet of gas, which is the average amount a ton yields. It is as well to explain first that the heat unit is taken to be the amount in grams of water raised 1° C. by 1 gram of the substance. On this basis the thermal values of 1 ton of coal and the gas it is capable of producing, both of the composition indicated above, are as follows:

	Heat units.
Coal, 1 ton	= 8,353,846,640
Gas, 10,000 cubic feet	= 1,635,000,000

The gas produced, therefore, represents approximately one-fifth of the calculated heat value of the ton of coal from which it is derived, so that if the ton of coal be worth 25 shillings, the gas, as regards the heat value, will be worth 5 shillings. or 6 pence per 1000 feet. The difference represents the energy of the residual coke, the tar and the heat spent in converting part of the coal into gas. The calculation is valuable in indicating one thing—namely, that the calorific value of coal gas is a fifth of coal, or equal to 400 hundredweight of the coal from which it is obtained, supposing that the total energy of the coal is made available; but this is too strong a supposition. Coal is far from completely burnt in probably 999 out of 1000 fires; a large proportion of its heat value is lost in the shape of incomplete products, inflammable gases, soot, and so on; on the other hand, gas admits of complete combustion under easy circumstances, and its total calorific value is therefore utilized. In other words, while gas does its duty fully, coal, as commonly consumed, fails largely in this respect. Here is an important point, and one on which the whole question in relation to its bearing on the fog difficulty rests. In burning coal in the ordinary way we not only lose a notable proportion of fuel, and thereby heat, in the shape of tarry products, soot and unoxidized gases, but in so doing the air is charged with just those bodies which give to the particles of moisture in ordinary mist the detestable and injurious character of the notoriously pea soup colored London fog. With gas as fuel, which in some measure represents these products, there is very small possibility of such undesirable products ever being formed, while an important economy as regards heating effect is at the same time secured.

It must be remembered that gas at the present time is ostensibly supplied for lighting purposes, and the maintenance of a definite illuminating power and a certain degree of purity contributes largely toward its expense. Gas suitable for heating purposes could be supplied doubtless at a very much cheaper rate, and then its cost as fuel compared with coal would sink into insignificance. It has been suggested, indeed, that if London were supplied with a non-illuminating gas, say at half the rate at present charged for illuminating gas, then there would be a clear and open way out of the difficulty as regards heat efficiency, combustion and fuel economy. In that case either a device for rendering the gas luminous at the point of burning when an ordinary burner is used by means of naphthalene or some known carbureting compound or else the universal employment of the incandescent burner would meet the requirements of such a novel installation. Gas engineers, however, express doubt as to the practicability of such a system. It would certainly have many drawbacks. In the present incandescent system, for example, the use of glass lamp chimneys constitutes a source of inconvenience and trouble, while with carbureting contrivances periodical changing and constant inspection would be inevitable. Nevertheless, the incandescent burner, with recent improvements, is rapidly growing in favor, and we feel confident that this form of burner promises to play a very important part in the future. In any case, it is certain that there is still plenty of room for improvement in the method of using gas as an illuminating agent. It is well to bear in mind, however, that if a cheaper gas were produced it would be certain to consist largely of water or producer gas, 50 per cent. of which practically consists of carbon monoxide, a deadly and an odorless gas. On the other hand, such a gas would be equally suitable for heating purposes. Again, any modification of the present system of gas producing would seriously affect, if it did not stop altogether, the yield of valuable by-products, and, as we shall show, this is a matter of considerable importance.

CONSIDERATION OF THE RESULTS.

From a knowledge of the composition of the fuel burnt we can easily ascertain what should be the composition of the products of its complete combustion. Thus, according to the analysis of coal gas given above, it contains hydrocarbons, hydrogen, and a trifling amount of sulphur and nitrogen. The products of complete oxidation of coal gas should be, therefore, chiefly steam and carbonic acid, with traces of sulphurous and sulphuric acids and nitrogen; but in the flue these products are necessarily largely diluted with atmospheric air, a current of which is induced to flow up the chimney by the heat of the fire. We should expect to find, therefore, on analysis of the gases in the chimney, carbonic acid, a large excess of nitrogen, partly derived from the air, that has yielded up its oxygen to the fuel, partly from air, introduced by convection, and partly, but to a very small extent, from the nitrogen originally present in the gas. The hydrogen, of course, turns to water, which condenses to liquid. If, on the other hand, combustion were incomplete, other products, such as carbon monoxide and hydrogen, would be found. As a matter of fact, in no single instance of a gas fire could incomplete or imperfect products of combustion be found in the gases going up the chimney. In other words, the permanent gases from the flue consisted wholly of carbonic acid, nitrogen and oxygen (*vide* Column 8).* This cannot be said of the products of combustion of coal when it is burned in an ordinary fire place. In this case we see at once from the analyses of the gases that valuable heat producing materials, in the shape of hydrocarbons, carbon monoxide and a large proportion of hydrogen and tarry compounds, escape into the chimney, eventually contaminating the air. It should be remembered also that in the fuel thus lost occur the tarry by-products already referred to, which are recovered at the gas works, yielding, when suitably treated, an abundance of valuable bodies. Hence has arisen the proposal to leave the distillation of coal (for that, after all, is really what takes place in the ordinary grate) to the gas maker, so that he may not only recover the valuable and volatile by-products and obviate waste, but also supply a fuel which, without trouble or difficulty, burns without smoke and evolves no products prejudicial to health. However perfect the combustion of coal gas may be, there is one element in it which gives rise to a product on burn-

* The table to which this and later references are made was printed in *The Metal Worker* December 23.

ing which demands serious attention. We refer to the sulphur in coal gas. Sulphur itself in burning gives sulphurous acid, but in the form in which it occurs in coal gas it burns nearly completely into sulphuric acid and not into sulphurous acid, as generally supposed, or, at any rate, the quantity of the latter compound compared with the former is very slight. This is proved in the above experiments, but the following simple test may be quoted as conclusive. When water is boiled in a glass flask over a Bunsen burner a strongly acid liquid may be washed off the bottom of the flask after some time, which will be found to char paper and to give all the reaction of sulphuric acid. Doubtless this in some measure accounts for the destructive action of gas in burning on the various articles (brass work, ceiling, plants) of the dwelling room. In the products of combustion of coal gas, then, there occur sulphuric acid and probably sulphurous acid.

PURITY OF GAS.

As mentioned later, the Legislature requires the gas to be purified down to within 20 grains per 100 cubic feet, and the gas supplied by the Gas Light & Coke Company is reduced to 12 grains below this limit—that is to say, to 8 grains. Satisfactory as this is, it would be better if the sulphur could be completely removed in view of the effect of its combustion products on vegetation, and probably, therefore, on animal life; but no known purifying process can reduce the sulphur to less than 8 grains per 100 cubic feet, which is the degree of purification effected in actual practice. We dwell, and lay some emphasis, on this subject because the experiments of Prof. Thistleton Dyer, at Kew, have shown conclusively that the deleterious effects of fog on plants are due to the toxic influence of small proportions of sulphurous acid. Professor Oliver of the Horticultural Society also attributes the action to sulphurous acid, and in experiments he has made in which an atmosphere containing a surprisingly minute quantity of sulphurous acid was employed, the changes in the tissue of the plant were observed with the microscope to be the same as those produced by fog.* We are, therefore, led to repeat that it would be a distinct advantage if gas could be completely freed from sulphur compounds ; not that sulphurous acid or sulphuric acid conduces to fog formation—for there is no evidence that they do—but because there is reason for objection on other grounds to even small traces of sulphurous acid in the atmosphere. Let it be observed, however, that by far the greater proportion of the sulphur of coal is left behind in coke in the retorts ; nearly all the remainder, in the shape of volatile sulphur compounds, is eliminated in the processes of purification. The use of gas fuel would therefore minimize the evolution of sulphur compounds in the air. Moreover, when the combustion of coal is imperfect, the poisonous gas sulphureted hydrogen (H_2S) is produced. On the other hand, if, as is rarely the case, it is complete, then practically the whole of the sulphur would be given off in the form of sulphuorous and sulphuric acids (SO_2 and SO_3). In the next place, the results furnished on an analysis of the gases drawn from the glowing fuel (Column 7) are of special importance, since not only is a knowledge gained of the steps in the combustion process, but the revealed composition of these gases accounts in a very interesting manner for certain deleterious effects which are known to be produced by some gas stoves under certain conditions of working, in which case, be it remarked, it generally happens that the defect is due to a want of application of common intelligence as to the requirements of a fire, be it coal or gas.

* London Hygienic Congress, August, 1891.

COAL GAS.

Referring once more to the composition of coal gas, we find that the fuel constituents consist practically of hydrogen, methane and carbon monoxide and that when the coal gas is admitted, into the atmospheric burner it is mixed with air in the majority of cases in the proportion of 1 volume of gas to 2.3 volumes of air. Now, 1 volume of gas for complete combustion requires 8½ volumes of air, so that the air admitted with the gas into the burner is quite inadequate to effect complete combustion. The chief combustion constituents of the gases from the center of the glowing fuel prove to be hydrogen and carbon monoxide, the latter often in greater proportion (10 per cent.) than it is ever found in the gas itself before burning. This may be due to one of two things: either that the saturated hydrocarbons and the greater part of the hydrogen burning first naturally raise the proportion of carbon monoxide, or that carbon monoxide is formed from incomplete combustion of the hydrocarbons. Whichever is the explanation the fact remains that the gas which is present in the fuel contains traces of unsaturated hydrocarbons and a large proportion of carbon monoxide. From a hygienic point of view this is of the utmost concern, since if the working conditions of the stove are disturbed—as, for example, by a down draft—it is extremely probable that among other products the deadly gas carbon monoxide would find its way into the room. Unfortunately, the presence of this poisonous gas in the air is not evident to the nose or eyes, as the objectionable gas acetylene or the smoke of a faulty fire would be; but as it is usually accompanied by other products which possess a characteristic smell its presence may usually be detected without difficulty. That carbon monoxide is the last gas to burn is also evident from the lambent blue appearance of the flames above the clay fuel; but we imagine that no one would ever be likely to say that a gas stove would burn satisfactorily in the same setting where a coal fire has produced unpleasant results. In view of the large amount of ignorance exhibited on this point we must strongly insist, and it may be taken as an axiom, that if a gas fire is expected to give satisfactory and especially salutary results it should have precisely the same provisions made for its favorable working as are required for the satisfactory working of a coal fire. It is, further, a popular and a serious mistake to suppose that a gas fire will remedy a faulty chimney, but a drafty chimney may in most cases be remedied by reducing its capacity by means of an iron pipe, which affords ample outlet for the products of a gas stove. For the purpose of the present experiment the flue of the gas fires conveyed the products of combustion directly into an ordinary chimney. The fires were thus working under conditions which it is absolutely essential should be observed, and accordingly most minute tests failed to find any deleterious products in the air of the room, in spite of the fact that no special precautions were taken to insure ventilation. As an example of the kind of testing performed in this direction blood itself was taken for the purpose, through which the air of the room was aspirated during the whole time the experiment lasted. In no instance was carboxyhæmoglobin (COHb) detected, while it was rarely detected even in the flue gases, but invariably in the gases drawn from the fuel. The risk of contaminating the atmosphere with carbon monoxide is minimized when the stove is worked at low pressure; the flames being shorter, they are not impeded or spread out by the fuel, and complete products are therefore formed before the gases leave the fuel area. It will be noticed, again, that the proportion of carbon monoxide is considerably reduced in those stoves where asbestos fiber or iron trellis is used as the heating agent. The interference or choking of the flame by the fuel being closely packed upon the burner would appear, therefore, to have some share in preventing the burning of carbon monoxide. As has already been stated, however, complete products of combustion were invariably found in the chimney.

BURNERS.

The stoves examined were all fitted with the Bunsen or atmospheric burner. These were selected for investigation because the Bunsen burner gives greater heat and the products of combustion are more satisfactory. Moreover, Bunsen burners can only be used for heating fuel, since luminous flames deposit carbon. Luminous flames, therefore, are only applicable to stoves without fuel, and consequently to those patterns which, when working, present the appearance of an ordinary coal fire. In the Bunsen or atmospheric burner the gas merges from a central nozzle, and passing unburnt up the burner tube, draws air with it by injection action through an opening provided near the inlet. The mixture of air and gas, which, according to our experiments, varies from 63 per cent. of air with 37 per cent. of gas to 71 per cent. of air with 29 per cent. of gas, can be lighted at the top of the tube, where it burns with a faint blue perfectly smokeless flame. It may be assumed that the air so introduced enables the carbon which is concerned in rendering the flame luminous to burn at once. Comparatively recent observations have shown, however, that this explanation is incomplete, if not incorrect, for if instead of mixing the air with the gas inert gases, such as nitrogen or carbonic acid, be employed the flame similarly becomes non-luminous. Prof. Vivian Lewis, who has devoted a great deal of attention to the subject of flame, maintains that luminosity is due to the formation at from 1000° C. to 1200° C. of acetylene from the original hydrocarbons, but that the moment the temperature is reached by the combustion of the hydrogen and carbon monoxide the acetylene formed decomposes, with a further rise of the temperature, and the carbon heated to incandescence radiates heat and light. On this theory the following is the probable explanation of the chemistry of the non luminous or Bunsen flame: The nitrogen of the air acts in the normal Bunsen flame by so diluting and protecting the hydrocarbons that a far higher temperature is needed for their decomposition, and this action gives time for the oxygen of the air with formation of acetylene or the liberation of carbon, and hence without luminosity. The cooling of the air introduced, which is able to add to the

general result, leads to loss of luminosity, although the cooling is less than the increase in temperature brought about by the oxidation due to the oxygen in the air. There are two drawbacks to atmospheric burners: 1, the non-luminous flame may exhibit a tendency to "light back"—that is, to run down the burner tube to the supply nozzle; and, 2, the phenomenon of injection in the Bunsen burner, by which the air is mixed with the gas, gives rise to a roaring noise resembling the escape of gas from a pipe. "Lighting back," or the ignition of the gas in the burner tube till it reaches the small gas nozzle inside the air mixing chamber, may be caused by a down draft acting against the upward pressure of the mixed gas, or more commonly it results from too small a nozzle or choking of the nozzle, or else insufficient gas pressure to effect the complete injecting action. The defect of lighting back is a serious one and has created considerable prejudice against this system of gas firing from the fact that when a burner lights back incomplete combustion is the result, offensive acetylene is produced, and the fuel is blackened with soot. It can only be obviated by strict attention on the part of the maker to the proper adjustment of the burner and on the part of the consumer to the regulation of the gas supply by allowing sufficient pressure to act upon the burner and by occasional cleaning of the burner. Lighting back frequently happens when the burners are first lighted, arising from the admixture of the gas with an excess of air present in the supply pipe or in the burner. Before lighting, therefore, it is best to allow a small quantity of gas to escape. Governors or regulators fitted to each burner if there are separate taps obviate the necessity of regulating the main pressure, and give perhaps the most satisfactory results, although we have noticed a tendency in the flames of burners provided with governors to become in part and gradually luminous. The second drawback, which is occasioned by the roaring noise of the injector, is a difficulty which has not been satisfactorily met. Certain attempts have been made to produce a noiseless burner, but there is still room for considerable improvement in this direction.

REGULATION OF THE HEAT.

Stoves fitted with one atmospheric burner, in which the flame is distributed through several holes, offer some inconveniences which we have not failed to notice. When the gas is full on they burn satisfactorily enough, but if it is desired to moderate the temperature of the room, and if the flames are accordingly turned down, they become very unstable and are likely to light back unless the supply of gas is kept above a certain limit; this limit in the type of stove referred to is a supply equal to 0.4 inch pressure, averaging a consumption of 20 feet of gas per hour. It therefore follows that when the room is sufficiently heated, and especially a small room, it is difficult to keep the temperature at, say, from 60° to 65° F.; but with separate burners, each being provided with a tap, it may be regulated with exactness by reducing the number of burners to three, or even to one.

FUEL.

The best fuel for gas firing is undoubtedly that known as clay ball fuel or some modification of it. It gives the best heating result, has the nearest appearance to a cheery coal fire, and affords the maximum of heat in the best form—namely, radiant heat—and saves loss of heat up the chimney. In grates to which gas firing is adapted log fuel is an excellent material. It is important, however, that the fuel should be packed well, as too great an interference with the normal flow of the flame (choking of the flame) tends to the production of unburnt gases as well as the emission of combustion products into the air. Cases of this kind occurred in a few of the stoves examined. Both asbestos fiber and iron trellis are inferior to clay ball fuel, although the objection just urged does not apply unless the flames are unusually long. As shown in the table, neither form of fuel, metal or fiber, is economical in producing a degree of heat proportional to the amount of gas consumed.

STRUCTURE OF STOVES.

In view of the fact that most of the authorities on the subject of the efficient and sanitary warming of a dwelling agree that radiant heat conduces most to healthy conditions, we are bound to entertain a preference for gas stoves in which the heating effect is due to radiated heat only. Of course, in a stove constructed to maintain a constant stream of air warmed by passage over heated surfaces, generally metal, the fullest calorific effect is gained, but it is well known that air so heated loses some of its essential properties. Apart from this consideration, air scorched in this manner is apt to impart a disagreeable smell to the room, arising from the burning of dust particles. The consideration of these important points leads us to the conclusion that gas fires evolving solely radiant heat are to be held in preference to those fitted with a chamber for warming the air or in which provision is made for the warming of air by convection. An objection which may be justly raised, and one which we noticed in the course of the experiments, is that the enamel or varnish used to protect the metal of the stove gives rise to disagreeable smell and smoke when the stove is first used. This could be easily obviated, one simple course, which we believe the Gas Light & Coke Company adopt, being to put the stove through a preliminary test before sending it out. Otherwise an enamel free from this property should be used. Again, although water is by far the chief product of the combustion of gas, yet gas fires produce a drier atmosphere than coal fires, because the strong heat near the stove rapidly appropriates the moisture in the air immediately in front of the stove and carries it away up the chimney. The air is thus dried, and the presence of moisture is essential for healthy and comfortable inspiration. The temperature of the room also being more rapidly raised with gas than with coal, the capacity for moisture is greatly increased. In many cases, however, the drying effect experienced is due to an unreasonable overheating of the room, an occurrence which is more likely to take place with gas than when a coal fire is used, and the result invariably of neglect. A tray filled with water placed near the fire is stated to be a simple remedy. Summing up the evidence gained from the entire results of the investigation, we are induced to express the opinion that gas can be used for warming purposes efficiently without prejudice to health and without the formation of fog forming constituents or air contaminating products, provided that certain conditions are strictly adhered to.

SUGGESTIONS.

The following suggestions, based on an experimental review of the methods of gas firing at present in vogue, may be taken as meeting the requirements which we deem to be essential.

1. It is desirable that the stove should afford radiant heat only.
2. For this purpose some form of clay fuel is best.
3. Attention should be given to the packing of the fuel, so as to avoid undue clogging or impeding the flow of the flames.
4. The stove should be supplied with separate burners with taps.
5. Some means of controlling the supply should be adopted. Governors or regulators are indicated.
6. A simple arrangement appears to be necessary by which undue drying of the warmed air may be avoided.
7. Indestructible enamel, or enamel little affected by heat, should be used for coating the stove; common paint, varnish or ordinary enamel should be avoided.
8. An efficient flue should in all cases be provided. With gas fires, however, the flue pipe may be much smaller than the chimney required by coal fires.
9. The burner should be as far as possible noiseless.

In dismissing this important section of the subject it only remains to point out the manifold advantages of gas over coal fires—advantages, however, which are only too obvious to need description. None will deny the convenience of the system. With gas a bright, hot fire can be obtained at any moment, night or day; the heat can be regulated to a degree, the fire can be stopped at will, conveyance of coal is dispensed with, and the oftentimes troublesome and clumsy process of lighting with wood and paper is avoided, while cleanliness is an inevitable result of gas installation. At first sight it would appear that gas as fuel compares unfavorably with coal in regard to cost; but when all the factors—cleanliness, convenience, manipulative advantages—are taken into account—when the pros and cons are considered in minute detail—it is probable that, used rationally, gas runs coal very closely even on the score of expense. But one thing is certain—namely, that the universal adoption of gas as a source of heat would eventually lead to the complete abatement of the smoke laden and unhealthy fogs which are a bane and a reproach to the most important city in the world.

COOKING BY GAS.

An inquiry of the present character would be incomplete without a few observations on the use of gas for cooking purposes. In this section we have made no experiments, the main object we have had in view being to determine the practicability of using gas as a general fuel, and in showing how its substitution for solid fuel or coal would prove a means of overcoming the fog difficulty. We are, however, far from saying that the indifferent use of coal in the private kitchen or the restaurant for culinary purposes is not a serious factor in contributing toward the aggravation of fog and smoke; on the contrary, there is abundant reason for thinking that the kitchens of the restaurants and hotels of London are great offenders in this respect. We have confined our attention in this part of the inquiry simply to the inspection of some of the large kitchens of London as represented in some of our great institutions—as, for example, workhouses, hospitals, hotels, warehouses and other large establish-

ments. As in all branches of industry, so in the manufacture of gas cooking appliances, there are to be found all grades of workmanship, but we have noticed with satisfaction that the leading and well-known firms pay close attention to those *minutiæ* upon which the working success of a gas cooker largely depends. Indeed, high class work is a *sine qua non* when the construction of gas cookers is concerned. Improvements occur almost every day, but we have seen cookers by leading makers that have been in use for over ten years and still give satisfactory results.

ADVANTAGES OF GAS FOR COOKING.

The advantages accruing from the use of gas for cooking purposes are especially manifest where it is employed on a large scale; in fact, where cooking has to be done, perhaps, several times a day for 1000 persons and upward coal fires would prove to be unequal to the task. It is perfectly surprising to see in what small space a complete meal may be cooked, comprising joints, vegetables and pastry, in a few hours, for upward of 1000 employees, in, say, a retail establishment; and the cleanliness attendant on the use of gas in the kitchen settles all question both as to economy and as to efficiency. We have seen hundreds of pounds of meat roasted, large piles of potatoes baked and all kinds of pies and pastry cooked, and yet in spite of the large quantity cooked the kitchen presented the aspect of a model dairy rather than a busy culinary department, in which, when coal fires are used, dirt and grime are commonly present. Cooking by gas is economical, simply because the gas is only used when it is required and its full effect is utilized to cook the food, whereas in ordinary coal fires much of the heat is lost up the chimneys. On a large scale it may be reckoned that for every pound of meat cooked 1 cubic foot of gas is consumed; that is to say, 100 pounds, or nearly a hundredweight, of beef would require 100 feet of gas for complete cooking, which means, at the rate of 3 shillings per 1000 cubic feet, a total cost of 3½ pence. The cost would be somewhat greater in proportion for small quantities of meat. In some gas cooking stoves luminous flames are used, while others are fitted with non-luminous or atmospheric burners. It is maintained, on the one hand, that luminous burners are better adapted for roasting, while, on the other, some regard the atmospheric burner as cleaner and equally if not more efficient. In both cases the joint is exposed to the products of combustion, but as the oven is well ventilated these are immediately carried away through a flue—a provision of some importance seldom if ever made, or at least effected, in the ordinary coal fire oven. The advantages derived from the use of luminous flames are that radiant heat is largely furnished—the form of heat used when a joint is roasted in front of the fire, and that the flame is constant. On the other hand, delicate analyses have shown that every luminous flame burning freely in air gives off distinct traces of carbon monoxide, acetylene, and even inflammable gases such as hydrogen and methane. The products of the atmospheric burners, on the contrary, are more complete, but there is the drawback already alluded to of the tendency of atmospheric burners to light back or of the air holes to become choked, and very objectionable and disagreeable products then result. Periodical cleaning of the burners, however, is all the attention needed to successfully avoid this difficulty, and we have seen atmospheric burners that have been in use for several years and yet show little sign of deterioration. Stoves fitted with the atmospheric burner seem to be most in favor and in greater demand. One point in this connection is interesting to observe, and that is that meat or other food cooked by gas seldom if ever exhibits any objectionable flavor which could fairly be attributed to the gas. This arises from the fact that the cooking operation is so certain and sure that vapors are constantly being emitted from the food, which effectually ward off any odors that may happen to be in the oven, which are then rapidly carried away into the flue by the constant draft of air passing through the cooking chamber. The flavor and character of the meat or food cooked by gas leave, as experience has shown, little to be desired. Consequent on the sharp heat and a plentiful supply of air around the joint cooked, the juices of the meat are kept in while the excess of fat is eliminated. This is the reason why in cooking with gas the joint is invariably richer in gravy constituents. Moreover, the fat which collects in a pan provided underneath the cooker is cleaner—in fact, nearly white—the degree of perfection in this respect depending upon the distance the catchpan is situated from the source of heat. If it is too close the dripping is browned; but in some stoves an arrangement is made for drawing the fat away from the burners; dripping so obtained is beautifully white. Space forbids us entering into a description of the various and manifold appliances for cooking by gas and their several modifications, and we need only add that, in addition to the case of roasting, gas is equally applicable to grilling, cooking pastry, bread making, boiling, and most other culinary operations; moreover, our inspection has satisfied us that in gas cooking stoves, as in gas heating stoves, the products of combustion are complete, and that smoke or soot is never produced.

[THE END.]

ODD PLATES.

FRED G. BRAND, secretary and treasurer of the Brand Stove Company, died at his residence, 531 Galena street, Milwaukee, Wis., on the morning of Sunday, December 17. He was the only son of Sebastian Brand, president of the company, and possessed excellent executive ability, standing high in the business community. He was born in Milwaukee, on April 1, 1859. Mr. Brand had been unwell for a long time, and for the last six or eight years had been compelled to seek a warmer climate during the cold winter months. The present winter his illness took a serious turn, ending in his death.

WE HAVE RECEIVED with the compliments of Buck's Stove and Range Company, St. Louis, Mo., a very neat pocket memorandum book, giving more or less information of a general character likely to prove of interest and value to the owner. The book is in the nature of a calendar, diary and memorandum combined, being copyrighted by the Mathews-Northrup Company, of Buffalo, N. Y. The second and third pages of the covers carry yearly calendars for 1894 and 1895, while several pages are devoted to statistics showing the population in 1890 of the larger cities of the United States, and also showing the cities of the world having over 125,000 inhabitants. Each page is divided into seven spaces, there being four lines to a day, for the purposes of memoranda. In the upper outer corner of the early and closing pages is a *fac-simile* of the company's trade mark. Another feature of the little pamphlet is found in a number of pages intended for names and addresses, while others are ruled for cash account.

THE LEXINGTON FOUNDRY COMPANY of Lexington, Ky., are meeting with a very gratifying demand for their stoves fitted with Secretary J. M. Kelly's patent wrought steel oven. The demand emanates from an extensive territory, extending from the New England States to Louisiana and as far West as Utah. Samples of the stoves with the patent oven have been shipped during the past year to nearly all parts of the country, and in fact to such an extent as to necessitate the constant running of the company's foundry. We understand that the manufacturers now have more orders on hand than they can fill during the next 60 days, and that in every instance the patent oven has given entire satisfaction. The oven, it may be stated, is made out of a solid piece of steel, bolted at the grate rests and braced horizontally with beveled cast strips which, it is claimed, makes it impossible for the oven to warp or buckle. The patent covering this device was issued December 12 of the present year.

ONE of the most dainty souvenirs that has ever reached *The Metal Worker* is a beautiful wall calendar, for which our acknowledgments are due to Henry Gleason, 106 Beekman street, New York. It is entitled "A Calendar of Cronies," and is composed of 12 cards, 11 x 9 inches, with scalloped edges, bearing exquisite *fac-similes* of water color paintings of child and animal life, by Maud Humphrey. The leaves are suspended by a bow of white silk ribbon, each being devoted to one month of the year 1894. That for January alone exhibits at the bottom a neat little card in artistic lettering bearing the compliments and name of the donor, with a modest advertisement of the wares he is prepared to offer to the stove trade. If Mr. Gleason's urns and figures, tiles, stove knobs and hinge pins compare in artistic excellence with the gift that heralds them, they should prove unusually attractive ornaments for the fire stove. Each leaf of the calendar presents a charming design of a winsome little maiden at play with some dumb pet, beasts, birds and even fishes—the last of the gold and silver sort—being included in the domestic menagerie. The coloring is exceedingly delicate, and the general get up of the calendar makes it a real work of art, which would find a more fitting resting place on the walls of a lady's parlor than on those of a prosaic office room. The souvenir is one that will be highly prized by the fortunate recipients of Mr. Gleason's courtesy.

THE LEHIGH STOVE & MFG. COMPANY of Lehighton, Pa., favor us with a neat little calendar for the new year. The card is embellished with a floral design, lithographed in colors and worked in semicircular form about a *fac-simile* of the trade-mark of the company, and their name and address. The leaves constituting the calendar for the months are attached to the lower part of the card and are printed in bold faced type.

SINCE STARTING their works in January of the present year the Stamford

Foundry Company of Stamford, Conn., ran continuously, with the exception of four days in July, up to Friday, December 22, when they closed for taking account of stock. All things considered, the company have enjoyed a gratifying volume of trade, and state that they have made and sold more goods than in 1892.

We have received from Egley Brothers, Onarga, Ill., a holiday greeting in the shape of a neat folder showing what the firm designate as their "Pyramid for 1893." It consists of blocks, each representing a State or Territory, and indicating, we assume, the section of country in which the Owen wood stove is sold. At the bottom of the pile is the inscription, "Watch for our 1894 pyramid."

"A Trip Through the World's Fair with a Camera" is the title of a very handsome publication which has been distributed to their agents by George M. Clark & Co. of Chicago. It is a souvenir of the World's Columbian Exposition, and consists of numerous views of buildings, exhibits, &c., which must prove of value and interest to all who visited Chicago during the past summer as well as to those who were deprived of that pleasure. Two pages at the beginning of the little volume are devoted to general views of the Jewel gas and the Jewel process stoves manufactured by the company named. As time passes, and the fair loses its interest for publishers, these souvenirs will increase in value and will be more highly prized by their possessors. We understand that the company's gasoline stove catalogue will be ready for mailing to the trade within a few days.

The Ringen Stove Company of St. Louis, Mo., are distributing with their compliments a calendar for 1894, which conforms in general size, shape and arrangement to that which it has been their custom to send out for several years past. The device consists of a metal easel supporting a pad giving the days of the week and month, as well as affording space for memoranda purposes. Above the calendar proper are the name and address of the company, a *fac-simile* of their trade-mark and an indication of the line of goods manufactured. At the bottom of each leaf is also a reference to the Quick Meal goods. The device is so arranged that it may be set upon the desk or hung on the wall, as may be most convenient.

At a recent meeting of the Mississippi Valley Stove Company of Fulton, Ill., J. M. Meyers was elected president; Frank W. Dana, vice-president; E. B. Meyers, secretary and treasurer; J. M. Meyers, F. W. Dana, E. B. Meyers, Thomas J. Kintz and Jacob Martin, directors. Stock as follows was subscribed: E. B. Meyers, 140 shares; John M. Meyers, 140 shares; Thomas J. Kintz, 140 shares; Jacob Martin, 140 shares; C. C. McMahon, trustee for Fulton Development Company, 200 shares. This is a new enterprise in which Ohio capitalists are interested. The works are now in course of erection.

The plants of the Perry Stove Company and Rathbone, Sard & Co., at Albany, N. Y., have been shut down for the purpose of taking the annual inventory of stock and making necessary yearly repairs. President Nathan B. Perry of the Perry Stove Company, says: "Our object in ceasing operations at our Van Rensselaer Island plant was for inventory and repairs. There is nothing unusual about this, as we always close at this season of the year. There is, in addition to taking an inventory, a need of certain repairs, which could not be made if the works were in operation. Furthermore, at this season of the year, the days are so short and the weather is such that we cannot carry on our work satisfactorily. We have worked as many days this year as in 1892 and have kept our men pretty busily employed. We have run constantly since last January, except during one week in the intense heat of the summer and the employees have earned a rest. We cannot say when we will start the plant again, perhaps not before the first of February. There is no absolute necessity of operating at this season, for the reason that dealers have their stock for winter trade, and it is true that business is dull just at this time. The closing is not due to the business depression, as the trade of the Perry Stove Company has been good. But business might have been better, and I am of the opinion that it would have been better if affairs had been conducted differently by the Administration. However, we will be ready to go on with stove working as soon as the necessary work has been completed. Last year the men did not return to their places in the foundry until some time in January, so you see there is nothing unusual about the shut down at this time." Vice-President Grange Sard of Rathbone, Sard & Co., said: "The foundry of our company has been closed to allow our inventory to be taken. It is our custom to take an inventory at this time of year, and when that is completed the works will be ready to resume operations."

Hart & Crouse of Utica, N. Y., have leased the foundry of one of the shops of the Eureka Mower Works for a year. Until the completion of their new plant in East Utica they will use the same in which to manufacture their Royal heaters. The Eureka plant is one of the largest and best equipped in the city. Hart & Crouse will take possession January 1, and shortly afterward will have from 60 to 70 men at work making hot air, hot water and steam heaters.

The Weir Stove Company, Taunton Mass., resumed operations at their works at Weir Village on Thursday, December 21, after a shut down of a week.

The Midway is a double oven range which has just passed through its first season with results that have been highly satisfactory to the Leibrandt & McDowell Stove Company, Philadelphia. In appearance it is substantial and pleasing, and, having a large fire box, large water back and two large ovens, with a large elevated hot closet, it has a large cooking capacity and is of the popular style, requiring no brick work.

The culinary department of the Hotel Powelton, at Philadelphia, was fitted out complete with ranges, broilers and utensils by W. H. Ingram, 106 North Third street, Philadelphia.

A. King has assumed the management of the Philadelphia office of the Keeley Stove Company of Columbia, Pa., and brings with him the experience of several years on the road through Pennsylvania.

C. B. Smythe, representing F. M. Borden & Bro., 118 North Second street, Philadelphia, is already out on the road talking New Process and Splendid Novelty gasoline stoves and Challenge Iceberg refrigerators.

The stove foundries at Royersford Spring City, Pa., all observed the holidays by shutting down.

J. Ellwood Yeager will begin the year at 56 North Second street as the sales agent for the Yeager-Hunter Spring City Stove Works, and will carry a full line of New Era goods. He will have a New Era gasoline stove and a variety of refrigerators to show his many friends in the trade.

The Leibrandt & McDowell Stove Company of Philadelphia have a new catalogue in course of completion which will contain several new stoves.

The Thomas, Roberts, Stevenson Company of Philadelphia will make an exhibit of their Active Fortune and gauze door ranges at the Pure Food Exposition in Washington, which begins January 15 in Albaugh's Opera House.

F. Sabin, 146 North Second street, Philadelphia, makes a fine display of the Colonial Fortune range, one of the latest productions of the Thomas, Roberts, Stevenson Company, for use in fine residences.

The Tycoon is a new square open fire double heater that has just made its appearance on the sample floors of the Leibrandt & McDowell Stove Company, Philadelphia. It is of attractive design and decorated with nickeled trimmings. The outer ornamental casting surrounds a sheet iron body lined with fire brick, with an air passage between, which, they claim, will supply an abundance of warm air for an upper room or effect a thorough circulation in the room in which it is placed. A feature is a new patented telescoping draft slide, by which double the usual draft opening is secured, and which is indispensable with open stoves. A handsome blower stand is furnished with each stove. This stove is also made as a fire place heater, retaining all of its beauty and excellence.

Bergstrom Bros. & Co. of Neenah, Wis., manufacturers of Royal stoves and ranges, are distributing a fine wall calendar for 1894. It is of good size with a full leaf for each month, on which the figures are printed in large clear type. The leaves are fastened to a heavy card, on which the name of the firm appears in shaded gilt letters on a pink background. Their trade-mark forms a feature of the ornamentation in the margin. A full calendar for 1894 occupies the space on the back under the monthly leaves.

The Michigan Stove Company have presented their friends and patrons with a very pretty Christmas souvenir this year. It is a lead pencil, made of aluminum, and contains a sufficient supply of lead with which to note almost any number of pleasant events. The handsomely printed circular accompanying the gift expresses the hope that it may prove useful in recording a successful year, and we heartily echo the sentiment. The company have also distributed a picture card in colors, on the reverse side of which is a puzzle that will doubtless prove a source of much entertainment in endeavoring to arrive at its successful solution.

A press dispatch from Ironton, Ohio, of December 27, reports that the Hanging Rock Stove Foundry was destroyed by fire on that day. One thousand stoves and 500 patterns are said to have been lost, together with all the buildings connected with the foundry. The total loss is estimated at $60,000.

TRADE REPORT.

The Iron Market.

There have only been surface indications concerning the probable course of events in the near future, and they have fortunately not been of an altogether discouraging character. It is true that work is wanted everywhere, and in the majority of branches it is wanted desperately. But it is a fact also that in some lines business is coming up quite well. Thus it is estimated that contracts for 50,000 to 60,000 tons of Cast Iron Pipe will be closed during the next 30 days, which is a good indication that municipalities are able to raise money. Besides this American shops are figuring on two orders for 23,000 tons in the aggregate for export. All this work will be taken at unprecedentedly low prices, since the leading shops throughout the country are cutting down to the bone.

The tonnage, however, is sure to be welcomed by Pig Iron producers, and is likely to impart tone to at least the Gray Forge end of the market. In Foundry grades a weaker feeling is developing, some of the Southern furnaces being again among the leaders of the anxious.

Pig Iron.—Current business in the New York market is very light, nor is any movement expected in the near future. Considerable work is coming up for the Pipe foundries in New England and locally. Contracts at Providence recently taken were at very low prices. We quote: Northern brands, $13.75 @ $14.50 for No. 1; $13 @ $14.25 for No. 2, at tidewater. Southern Iron, same delivery, $13 @ $14 for No. 1; $12 @ $13 for No. 2; $11.50 @ $12.25 for No. 3; $11.75 @ $12.25 for No. 2 Soft, and $12.25 @ $12.50 for No. 1 Soft.

Philadelphia advices report that so far as new business is concerned there is practically none in that market, everything being closed for the year. Prices are at the lowest on record, while the demand is relatively smaller than ever before. On general principles it is supposed that there must be a change soon, but how or when it is to come no one appears to know, and in the sense that there is no inclination to break away from the monotony, it may be said that no one seems to care. Some consumers have bought to cover the first three months' requirements, but the majority are taking hand to mouth lots, which, in fact, corresponds with their orders; that is to say, they have no orders of any account except such as are sent in from day to day. On the other hand, sellers are not particularly anxious to fill their order books at such prices as the market would afford, so that there is a tacit understanding on both sides to let the market take its course. Prices show no change from last week, but the market is so narrow that it is impossible to form any very definite opinion, although the chances are that on the right kind of offers good buyers could obtain concessions.

Local Coke is in comparatively good demand in Chicago. The usual carload trade is moving and a few contracts have been made for delivery the early months of next year, while the prospects are favorable for much more business of the same character. Southern Iron is quiet and Lake Superior Charcoal seems neglected. Quotations are now as follows for cash:

Lake Superior Charcoal	$15.50 @ $16.00
Local Coke Foundry, No. 1	13.00 @ 13.50
Local Coke Foundry, No. 2	12.50 @ 12.75
Local Coke Foundry, No. 3	12.00 @ 12.50
Local Scotch	13.50 @ 14.00
Ohio Strong Softeners No. 1	15.50 @ 16.00
Southern Silvery, No. 1	@ 13.75
Southern Silvery, No. 2	@ 13.25
Southern Coke, No. 2	12.15 @ 12.40
Southern Coke, No. 3	11.65 @ 11.90
Southern, No. 1, Soft	12.40 @ 12.65
Southern, No. 2, Soft	11.65 @ 11.90
Tennessee Charcoal, No. 1	16.00 @ 16.50
Alabama Car Wheel	18.25 @ 18.50
Jackson County Silvery	16.00 @ 16.50
Other Ohio Silvery	15.00 @ 15.50

The Pittsburgh Pig Iron market is absolutely featureless. Buyers are putting off making purchases just as long as they can, and when they do go in the market buy only enough to run them a short time. In addition, shipments on old contracts are being deferred to a very great degree by buyers who cannot use the Iron as fast as they expected and do not want to pile it up. Another feature of the situation and an important one is that only a limited number of furnaces have made contracts for Coke, and until more of these have been placed the uncertainty of the future as regards prices will continue. We are not advised of any transactions beyond a few sales of 100 and 200 ton lots, and repeat our quotations of last week as follows:

No. 1 Foundry	$11.75 @ $12.00 cash.
No. 2 Foundry	11.25 @ 11.50 "

There has been little or no business in the Southern Pig Iron market during the week, there being no inquiry for large lots for either present or forward delivery, and even the jobbing foundries have taken very few single carload lots. The tone of the market is weak, and especially for foundry grades of Coke Iron; and while there is little urgency to sell, there are indications cropping out now and then which indicate a desire on the part of some furnaces to secure orders. The shipments of the furnaces on old orders have been less liberal this week, and the melting of Iron appears to be much reduced, so many consumers have already contracted for Iron enough to last them much longer than they anticipated and will not be in the market for many weeks. The price of No. 1 Foundry Coke is $9; No. 2 do., $8; and No. 3 do., $7.50 ℔ ton, f.o.b. Birmingham. Charcoal Irons are merely nominal. Quotations are as follows:

Southern Coke, No. 1	$11.75 @ $12.00
Southern Coke, No. 2	10.75 @ 11.00
Southern Coke, No. 3	10.25 @ 10.50
Ohio Soft Stone Coal, No. 1	15.50 @ 16.00
Ohio Soft Stone Coal, No. 2	14.50 @ 14.75
Lake Superior Coke, No. 1	15.00 @ 15.25
Lake Superior Coke, No. 2	14.00 @ 14.25
Hanging Rock Charcoal, No. 1	18.50 @ 19.00
Hanging Rock Charcoal, No. 2	17.50 @ 18.00
Tennessee Charcoal, No. 1	14.00 @ 14.25
Tennessee Charcoal, No. 2	13.00 @ 13.25
Standard Southern Car Wheel	17.75 @ 18.00
Lake Superior Car Wheel and Malleable	17.00 @ 17.25

Metal Market.

Pig Tin.—Prices have remained almost stationary and the market is still bare of distinctly new feature, since speculation is virtually at a standstill, while consumers' purchases, to all accounts, are barely up to the average for the season. Steady inroads are being made upon jobbers' stocks, however, and free or unbonded stocks are in such shape that it is difficult to buy lots of 10 tons or more at less than 20.55¢ @ 20.60¢ for delivery this month or next. Jobbers' prices for small lots rule at 22¢ @ 22½¢ for Banca, and 21½¢ @ 22¢ for Straits Pig.

Copper.—Business has been of distinctly routine character and the demand at present is extremely tame. The offering is also reserved, and, except on Metal Exchange contracts, prices below those named by the leading producers or their agents are extremely few and far between. There is, however, enough of what is commonly termed "outside" offering to keep values in more than usually uncertain form. Fair quotations appear to be about 10⅝¢ @ 10½¢ for Lake Superior Ingot, 9⅞¢ @ 10¢ for Electrolytic and 9½¢ @ 9¾¢ for ordinary casting stock, according to brand and delivery. Jobbing business in both Ingot and Sheet Copper continues quiet, quotations for small quantities being unchanged.

Pig Lead.—Prices have been moved a little higher, but the leading brokers note no sales of importance and profess to be ignorant of any conditions that should bring about an increase in the value of the metal. In other quarters

it is intimated that the advance is purely speculative, and that the speculative backing to the market is of very doubtful endurance. Consumers display a very limited interest in either Pig or Manufactured Lead, orders and inquiries being on an exceedingly moderate scale. For the present 3 25¢ is quoted for ordinary Western brands of Pig in carload or larger lots, and about ¼¢ ℔ lb more for small quantities from store.

Spelter.—Dealings have been on a very moderate scale. The demand has continued moderate also. While not particularly large, the offering has proven sufficient to keep prices rather soft at about 3.70¢ @ 3.75¢ for common, 3 80¢ for prime and 3.85¢ @ 3 90¢ for choice brands in carload or larger lots. Western Spelter in jobbing quantities is quoted at 4 50¢.

Antimony.—Except of small parcels there are few sales making and prices are easy, with 10¼¢ @ 10½¢ quoted for Hallet's, and 10¾¢ @ 11¢ for Cookson's, in small lots.

Tin Plate.—There has been hardly any buying during the past week and the demand at present is exceedingly tame. Orders for future deliveries have been few in number and for comparatively small quantities, while spot business is referred to as being below the average for the season. Such transactions as have passed have been wholly of the hand to mouth character which has marked this trade of late, consumers purchasing just enough to supply their bare wants. Prices on both prompt and future deliveries are somewhat soft, although showing no quotable changes. The British Tin Plate market, according to a cable despatch of December 27, was quiet, owing to the holiday season. Prices were weak, but not absolutely lower. Liverpool quotations were as follows:

IC Charcoal, Alloway grade.....12/3 @ 12/9
IC Bessemer Steel, Coke finish. ...11/3 @ 11/6
IC Siemens " " " .....11/6 @ 11/9
IC Coke, B. V. grade, 14 x 20.....11/3 @ 11/6
Charcoal Terne, Dean grade.....10/9 @ 11/

Sheet Iron.—Black Sheets are dull, with prices unchanged. Some good inquiries are noted for Galvanized Iron, which is now in ample supply. Prices are a little weaker; several lots from stock selling at about 70% @ 70 and 5% off.

WE CAN NOW STATE upon good authority that the Irondale Steel & Iron Company, whose works were recently burned down at Anderson, Ind., will build a new plant at Middletown, notwithstanding contrary reports. Machinery not too badly damaged during the fire will be removed to the new location a few miles distant, and used in connection with such new parts as may be necessary. The plant will not be as large as originally intended, but it will be constructed in a manner that will admit of extension whenever the state of trade warrants such a course of action. The product of the new works will be Iron and Steel Sheets of the lighter gauges.

Chicago Report.

Scrap.—Very little business has transpired in Old Material. Consumers have deferred purchases until January. Dealers furnish the following list of buying prices, Chicago delivery:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$7.00	....
Machinery Cast	7.00	....
Malleable Cast	6.00	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.50	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.50	....
No. 2, such as Shovels, Hoes, &c	4.00	....
Old Boilers—whole (Iron)	4.00	....
" (Iron)—cut in single Sheets and Rings	6.00	....
Old Gas-Pipe and Boiler Tubes	5.00	....
Cast Borings	3.25	....
Turnings	4.00	....
Horseshoes	7.00	....
Copper Bottoms	....	5 ¢
Copper Clips and Heavy	....	7 ¢
Heavy Brass	....	5⅛¢
Light Brass	....	3⅛¢
Pipe Lead	....	2⅛¢
Tea Lead	....	2 ¢
Zinc	....	2 ¢
Rubber	....	4 ¢

Anthracite.—There is almost complete stagnation in the Chicago Anthracite trade. Prices are weak, but no change has been made in the schedule. Carload lots of 12 net tons or over are quoted as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	8.55

THE BOSTON FILTER COMPANY, 21 Broadway, Chelsea, Mass., manufacturers of the Boston Water Purifier, sell their small Filters, but large ones, such as are used by hotels and restaurants, are put in at no original expense to the user, the company charging a nominal rent for the work of the Filter, and taking complete care of the apparatus. Although Boston has been noted as a great consumer of spring waters, the company advise us that they are successfully furnishing 90 per cent of the large hotels and restaurants in the city with their Filters.

A FEW months ago *The Metal Worker* made the statement that No. 27 gauge sheet iron for roofing purposes, which is called No. 27 standard, but really weighs $\frac{84}{100}$ pounds per superficial foot, was sold at $2.65 per 100 pounds, free on board mill. Exception was taken to the statement, although it was proved to be correct. We are now able to state positively that this same material is being sold at $2.50 per 100 pounds, free on board mill.

CONDITION OF THE

Hardware Trade.

THE last week of December is devoted more to preparations for closing the year's business than to active attention to trade, which, except in a few holiday and seasonable specialties, is decidedly light. The matter of making the annual inventory is now in hand with a view to closing the books and estimating the financial results of the year. It is expected that inventories will in most cases show a diminished stock, owing to the conservative policy which has been pursued for the last half of the year, and if the balancing of the books does not show diminished profits there will be reason for exceptional congratulation. Most merchants and manufacturers will, however, probably be confronted by the fact that business during the year was considerably less remunerative than usual, but if their losses were not especially heavy, and they are still in condition for the active prosecution of business in the more prosperous days which it is hoped are before the trade, they have good reason for contentment. The year which is ending will long be remembered as in many respects the most trying one in the experience of the present generation of business men. It, however, draws to a close with the promise of better things in the year to come, and as soon as tariff uncertainties are removed it is hoped that there will be a gradual if not a prompt resumption of normal business activity and profit. The reaction from the curtailment of industry must sooner or later come, and the economies which have been enforced during the hard times will be an excellent preparation for a more healthful and permanent prosperity in which we doubt not the Hardware trade will have full share.

Advices from Chicago.—The jobbing houses are now passing through their usual dull holiday season. Salesmen are either at home or on their way home, and mails are light. Most of the houses here are taking stock and are not specially anxious to be troubled with business at this time. Quite a number of salesmen for Eastern Hardware concerns are traveling through this section soliciting orders for the coming year, but they are not meeting with much encouragement. Jobbers will continue their policy of buying from hand to mouth, except when they are actually offered bargains, until they see some indications of prices hardening.

Notes on Prices.

Wire Nails.—During the past week the volume of business has been light, though it is understood that the low prices ruling have induced the placing of some good orders. The general de-

mand is, however, moderate, the trade not being confident that the lowest prices have yet been touched and deferring their purchases until the opening of the new year. There have been no further developments in the matter of prices, the market being represented as a week ago by the quotation of $1.10 for carload lots at mill, it being, however, understood that this figure is shaded on especially large and desirable assortments. Some of the mills are understood to be fairly well supplied with orders, but others have a good stock on hand and are stopping or curtailing production. In the present condition of the market large buyers will do well to watch it closely, as there is no doubt that for desirable quantities and assortments and for deliveries more or less prompt they can secure more advantageous prices and terms than a few months ago were deemed possible.

Advices from Chicago.—The Wire Nail trade is reported quiet by the manufacturers, and there are few large inquiries from buyers, who are holding off until they are convinced that prices are as low as they are likely to go at this time. Some factories are reported so well sold up that they will go into the new year with a smaller stock than ever before. Nevertheless prices are lower and factory lots are now selling at $1.18½ to $1.25, Chicago. Small lots from stock are sold at $1.30 to city trade and $1.35 to the country.

Cut Nails.—The Cut Nail market is inactive, and purchases are limited by the necessities of buyers. The market in the matter of price is in the same condition as for several weeks, being represented by the quotation of 90 cents for carload lots at mill, a figure which is slightly shaded in the presence of attractive specifications. It is not unlikely that orders especially desirable in the matter of assortment and terms of payment could be placed with some manufacturers at a somewhat lower figure. Small lots from store in New York are quoted at $1.20 to $1.25.

Advices from Chicago. — Cut Steel Nails are quiet, with prices nominally unchanged at $1.15 to $1.20, according to the character of the order. Small lots from stock are quoted at $1.25.

Barb Wire.—Barb Wire continues in substantially the same condition as at our last review, being represented by the quotation of $2.10 for Galvanized and $1.70 for Painted, with 5 cents off in carload lots. The demand is light.

Advices from Chicago.—The Barb Wire market here has weakened and quotations of Galvanized are now made by manufacturers at $2 15, Chicago. The break comes from the East and local manufacturers refuse to meet the cut, as they are selling most of their product direct to the retail trade in small lots, for which they are receiving from $2.30 to $2.35. Jobbers quote small lots from stock at $2.50.

Cordage.—In sympathy with reduced prices for raw material and in the presence of continued active competition among the manufacturers and a very light demand, there has been a decline of about ¼ cent per pound in the prices of Manila and Sisal Rope, Manila being obtainable in large lots at 7¼ cents, and Sisal at 5 cents, terms f.o.b. factory or New York, subject to a discount of 1½ per cent. for cash. New Zealand remains unchanged at 5 cents.

Glass.—There appears to be no encouragement in the way of improved prices or demand for factories to go into blast, or for factories already making Glass to continue in operation. This includes both the Sheet Window Glass and Plate Glass industries. Factories are not likely to be continued in operation unless they have orders to work on, as they see nothing to be gained in piling up stock. It is difficult to obtain reliable quotations, but taking the quotations given in our last issue as a basis, there are no indications of any advance, but if anything the market is weaker.

Old Metals.—The market for Old Metals is dull, with buyers' prices ruling the same as those quoted last week, namely, for New York delivery:

Heavy Copper	℔	7¢
Light and Tinned Copper	℔	6½¢
Heavy Brass	℔	5¢
Light Brass	℔	4½¢
Lead	℔	3¢
Tea Lead	℔	2¾¢
Zinc	℔	2½¢
No. 1 Pewter	℔	14¢
No. 2 Pewter	℔	6¢
Wrought Scrap Iron, ℔ gross ton	$7.00 @	$8.00
Heavy Cast Scrap, ℔ gross ton	8.00 @	9.00
Stove Plate Scrap, ℔ gross ton	4.00 @	5.00
Burnt Iron, ℔ gross ton	2.50 @	3.00

Old Rags, Paper, &c.—Business shows no signs of greater activity. Paper mills are fairly well stocked up, both East and West, and no contracts for Paper stock of any importance are being entered into at present. The market is likely to remain quiet until toward the middle of next month, when stock taking and the adjustment of accounts have been completed. Prices are practically unchanged, New York quotations being as follows:

No. 1 White Rags	℔	3¼ @ 3½¢
No. 2 White Rags	℔	2¼ @ 2½¢
Mixed Rags	℔	¾¢
Blues and 3ds	℔	1 @ 1¼¢
Hard Sized White Shavings	℔	2¼ @ 2⅝¢

Hemp Twine	℔	2 @ 2¼¢
Manila Rope	℔	2¼ @ 2⅝¢
Jute Rope	℔	1½ @ 1⅝¢
Mixed Rope	℔	¾ @ ⅞¢

Old Rubber.—The market for this material is a very narrow one, and values continue low. The following are about the prices given for Old Rubber delivered in New York:

Car Springs, ton lots, ℔	@	$0.03¼
Rubber Shoes, carloads, delivered at factory, ℔	@	.03
Rubber shoes, less than carloads, ℔	@	.03⅛
Large Hose, ℔ ton	@	9.00
White Wringer Rolls, ℔	@	.04¼
White Syringes, ℔	@	.05

Trade Notes.

BAUGHMAN MFG. COMPANY of Orrville, Ohio, have been incorporated, with a capital of $75,000, for the manufacture of brass and copper goods.

THE TENDENCY of trade publications toward greater elaborateness and less conspicuous advertisement is well shown in a portfolio of engravings distributed by the Sickles, Preston & Nutting Company of Davenport, Iowa, as a Christmas greeting to their friends. The publication, which measures 14 x 11 inches in size, contains six very handsome half-tone engravings of paintings.

WE ARE INDEBTED to George B. Blizard, 108-110 Marion street, Philadelphia, Pa., for a pretty calendar for the year 1894. It is a card to hang up on the wall, with the calendar, consisting of monthly sheets, on the lower end. One side of the card is prettily decorated, while the blank space at the right contains the business announcement of Mr. Blizard, who does all kinds of Sheet Metal Work, besides erecting heaters and ranges.

THE ATTENTION of the trade is directed to the page advertisement of the Apollo Iron & Steel Company, Pittsburgh, Pa., which appears elsewhere in this issue. This advertisement is of decidedly unique character, and is composed of the six inside pages of the price-list recently issued by that firm, and to which attention has already been directed in these columns. The plant of this firm, located at Apollo, Pa., is now in operation to nearly full capacity, with the outlook for the new year decidedly promising.

THE STOVE AND TINWARE STORE of E. A. Fisher, Manchester Centre, Vt., was destroyed in an extensive fire which visited that town on December 22. The loss was partly covered by insurance.

THE JOSEPH LE COMTE MFG COMPANY were incorporated at Albany, N. Y., on December 22, to manufacture Plate, Tinware, Sheet Iron, Metal and Stamped Ware in Brooklyn, N.Y., with a capital of $100,000. The directors are Joseph Le Comte and John Brunnemer of Brooklyn, and Victor S. Le Comte of New York City.

THE LUDLOW-SAYLOR WIRE COMPANY, St. Louis, are closing the year with a full order book in their Art Metal department. They are making a number of Directory Frames for the new 14-story Union Trust Building, St. Louis, and also a number for the Realty Building; also a lot of artistic Stair Rails for the residence of Fred. T. Lock, Birmingham, Ala., and a Stair and Floor Rail for the Eddy office building, Bloomington, Ill.

THE PLANT of Randolph & Clowes, Brass manufacturers, at Waterbury,

Conn., closed down on the 23d for one week for the purpose of taking inventory and making minor repairs. The works will reopen January 2 with a prospect for steady work.

The Cambridge Roofing Company Cambridge, Ohio, are adding new machinery and making improvements, notwithstanding hard times. They have recently placed an order with Geo. C. Keene & Co., Cincinnati, for a stand of Corrugating Rolls. A Corrugating and Forming Press made by the same company has just been placed in position in the works of the Cambridge Company.

The New York Asbestos Mfg. Company were recently incorporated, with a capital of $50,000, to manufacture Non-Conducting Boiler and Pipe Covering, Packing and Cement of all suitable materials, especially asbestos. The factory will be located in the city of New York. The directors are Albert Lantzke of Brooklyn, and Adolph Juenger and Henry Schreiter of New York City.

The Enterprise Mfg. Company of Pennsylvania, Philadelphia, advise us that their stock of parts for Great American Meat Cutters is rapidly becoming exhausted, and that in future they can only supply such parts as they may have on hand at time of order, having decided not to continue the manufacture of the Great American Meat Cutters or the parts thereof.

The Illinois Pure Aluminum Company, Lemont, Ill., are manufacturing an Aluminum Sanitary Pail. This article weighs 2½ pounds and is designed for use in hospitals, asylums and public institutions of any description. It is recommended for these uses because of its lightness, perfect cleanliness and freedom from odor, and because it is proof against corrosion.

Knoll & Dorer are a new firm of metal spinners at 104 Centre street, New York, who make a specialty of Brass and Copper Cuspidors, Tea Kettles, Measures, Urns and Trays.

The Griswold Mfg. Company, Erie, Pa., send out a pretty souvenir for New Year's Day, which includes a two-page circular prettily printed in red and blue. On the outside is an advertisement of the concern, while within are a half dozen verses entitled "Seasonable Sauce," which begins with a general greeting, reference to their ware and the commendation it received at Chicago, followed with a reference to their enameled covering; further mention of their Erie griddles, and a final verse mentioning a little griddle that is sent with the announcement. This is a *fac-simile* in cast iron of the larger article reduced to 3 inches in diameter.

On December 26 the Stove and Tinware store of Wm. R. Kine, at Van Wert, Ohio, was destroyed by fire. The loss, which is estimated at $3000, is stated to be fully covered by insurance.

An interesting patent decision has recently been rendered by Judge Putnam in the case of Edmund Converse against Ambrose T. Matthews, both of Worcester, Mass., for the alleged infringement of a patent relating to stove knobs, in which the base is made from a blank with wings or leaves, instead of from a circular piece of sheet metal, as has heretofore been the case. We understand that the decision of Judge Putnam broadly sustains the patent, and cannot fail to interest all manufacturers and dealers in stoves. The patent is owned by the Worcester Ferrule & Mfg. Company of 17 Herman street, Worcester, Mass.

HEATING NOTES.

The Philadelphia office of Jenkins Bros. is now at 117 North Fourth street, where the arrangement of their line of valves in the new quarters makes a busy scene. After the first of the year they will be prepared to furnish standard flanges as provided for by the resolution of the National Association of Steam and Hot Water Fitters.

From C. F. Bachler of the Philadelphia office of the Monitor Steam Generator Mfg. Company, Landisville, Pa., we learn that the trade in their steam and hot water boilers has been so satisfactory during the past year that steps are being taken to double the producing capacity of their plant in time for next year's business.

The popularity of small hot water heating plants for residences in the vicinity of Philadelphia is noted by the H. B. Smith Company, 510 Arch street, by the sale of 40 Cottage boilers in the month of December from that office alone.

SCRAP.

Another tin plate works is projected at Elwood, Ind. The promoters are I. L. Morris of Chicago, Edwin Stevens of Cincinnati and E. Levy of Elwood. Mr. Morris was formerly superintendent of the sheet mills of the Corning Steel Company. They have organized a company with a capital stock of $300,000, and propose to erect a rolling mill to roll black plates and to manufacture 2500 boxes per week. They announce that work on the buildings will begin at once.

A London dispatch of December 25 intimates that the tin plate workers of Neath, Wales, have accepted their employers' ultimatum of a 10 per cent. reduction of wages. Their action is considered important, as it is expected to lead to a change in the scale of wages fixed in 1874.

J. Foerster & Son, 806 East Fifth street, New York, have recently secured the following contracts: Copper cornice, dormers, finials, tin and slate roofing and copper cable lightning rod on the Drew Seminary, Madison, N. J.; copper work on the passageways in the German Hospital, Seventy-seventh street and Lexington avenue, New York; copper and galvanized iron cornice and finial work for convent in Bleecker street, near Central avenue, Brooklyn; ornamental trimmings on the stage front to the theatre of the Staten Island Turn Verein, Stapleton, S. I.

Coal fishing is a curious industry prevailing at the town of Northumberland, on the Susquehanna River. The bed of the stream in this vicinity is thickly lined with coal, washed down from various colliery centers and prevented from going beyond Northumberland by a large dam. The fuel thus recovered from the river last year amounted to 4000 tons, which was sold at an average price of $2.20 per ton.

Tramps are flocking into Kansas in great numbers in consequence of a circular recently issued by Governor Lewelling instructing the police not to molest them and declaring the vagrant law unconstitutional. The Governor has a fellow feeling for the vagabond fraternity, as he confesses to having been a member of it in his early years.

The Lansdale Foundry of the Abram Cox Stove Company, Philadelphia, has shut down for the usual stock taking after a run without any stoppage whatever since February 4 last.

We learn from J. Woodruff & Sons, Salem, Ohio, that the season just closed has been a remarkably satisfactory one to them, and that their business shows a flattering increase over past seasons. They close down December 30, to take inventory and make necessary repairs, but will resume with full force January 15, 1894. The works of the company have run continuously every working day during the year 1893, in spite of hard times and the panic.

It Is Reported—

That Geo. W. Redman's Hardware and Furniture store at Green's Landing, Maine, was considerably damaged by fire on the 9th inst. The damage to the building was $300 and to the goods $500. The former was insured, but there is no insurance on the latter.

That the Stewart & Sox Hardware Company, Albany, Ore., have been incorporated. The capital stock is $35,000, divided into 350 shares. About January 1 the company will move into their new quarters. The members of the company are E. F. Sox, C. H. Stewart and E. Redeker.

That the Tompkins Hardware Company and the Cary Hardware Company of Leadville, Col., have consolidated their interests, and will hereafter conduct business as one establishment. The capital stock of the new company has been placed at $100,000. The officers are as follows: H. H. Tompkins, president; John Harvey, vice-president; D. La Salle, treasurer; I. J. Cary, manager. The directors are H. H. Tompkins, John Harvey, L. H. Tompkins, D. La Salle and I. J. Cary.

That W. C. Grier has sold his Hardware store at Blunt, S. D., to N. E. Westover. Mr. Grier has removed to Plymouth, Wis., where he has purchased a Hardware stock and will continue the business.

That A. F. Anderson has purchased the Hardware business of H. L. Rich at Red Wing, Minn.

That M. A. Simpson has bought the stock of Hardware of H. Fishman, Mt. Ayr, Ill.

That J. H. Barlow and Chas. Turk of Woodward, Iowa, have bought the Hardware stock of E. M. Jones. They will hereafter conduct the business under the style of Barlow & Turk.

That Chas. B. Payne of Knox County has purchased the stock of Hardware of W. B. Keller, Brashear, Mo.

That the second and third stories of the building of the Fones Hardware Company, Little Rock, Ark., were burned out on the 20th inst. The loss, which was heavy, is fully covered by insurance.

That Harrington & Knight, Hardware dealers, who were burned out in the great fire at Fargo, N. D., some months since, have taken possession of their new quarters.

That a new Hardware and Tinware store will soon be opened at Wayne, Mich., by Drew & Doolittle.

That Mitchell's Hardware store at Packwood, Iowa, was destroyed by fire on the 21st inst.

That E. N. Falke, formerly of Massillon, Ohio, has opened up a Hardware store at 811 Monroe street, Toledo.

That J. W. Smith and P. J. Alexander have bought the Hardware store of J. S. Smith & Son, Farber, Mo.

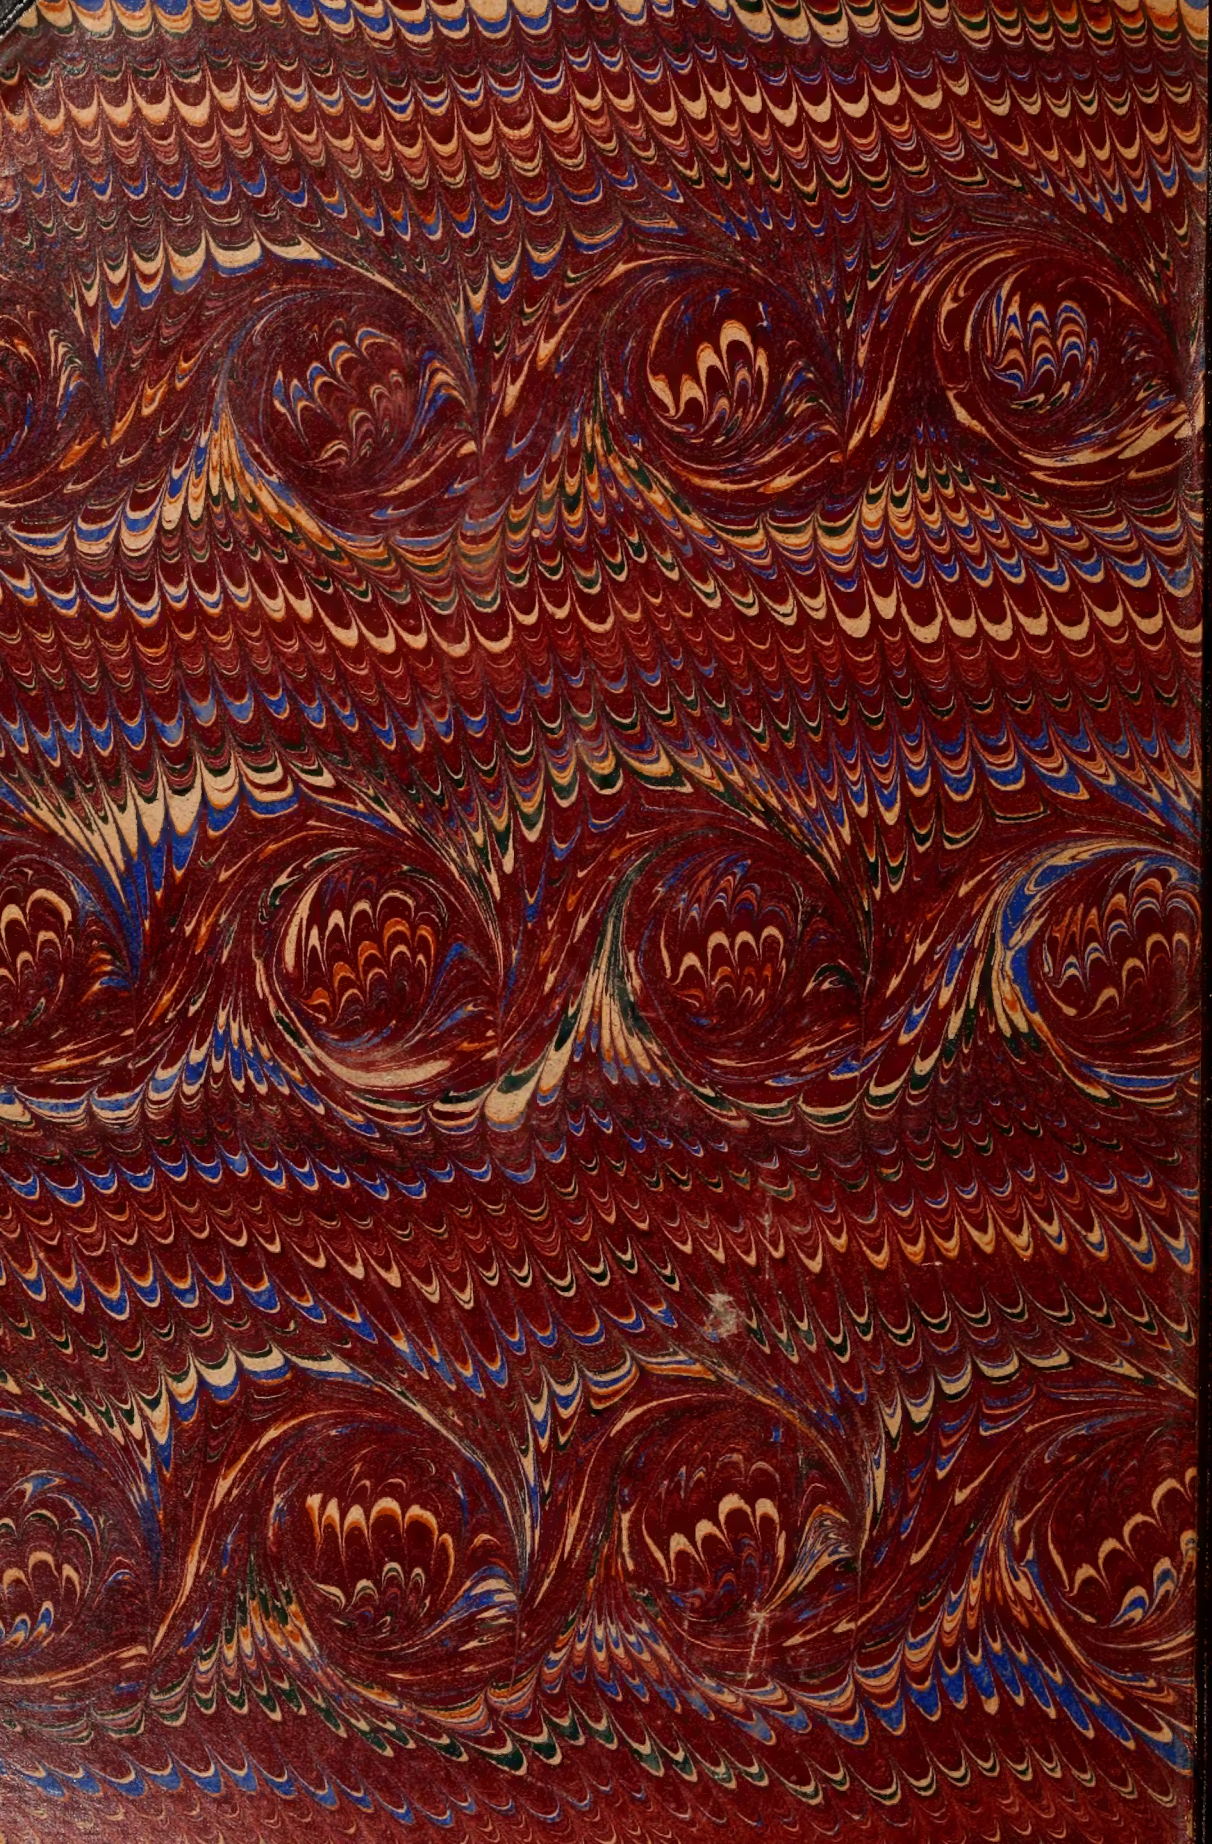
That Emerson & Fehlman, Steele City, Neb., have bought out the Hardware stock of F. Maw.

That J. P. Siner's Hardware store, at Shelburn, Ind., was destroyed by fire on the 19th inst.

That C. H. Cure, Pipestone, Minn., has sold his stock of Hardware to H. A. Marsh of Mason City, Iowa. Mr. Cure will continue with Mr. Marsh for the present.

That the Hardware store of Sires & Tulley, Trenton, Mo., was robbed on the 18th inst.

Price-Lists, Circulars, &c.

M. A. WOODBURY, Bradford, Pa.: Woodbury's Automatic Dry Chain Lubricator. The part resting on the chain is a small sack 1 x 5¼ inches in size, which is doubled over where it is held by a spring clamp, the long upper end of the clamp keeping the loose ends of the sack in place. The sack is filled with fine dry lubricant; the jar of the machine sifts the lubricant on to and into the chain, while the sack dusts the wearing parts of the chain.


THE ALASKA REFRIGERATOR COMPANY, Muskegon, Mich.: Alaska Refrigerators. The 1894 catalogue of the company is well printed on a fine quality of paper, and handsomely illustrated. At the front of the book is a full page view of their works, showing buildings of large extent, in connection with which are their lumber yards. The buildings, which are of brick and stone, include a main factory, three stories high, 340 feet long by 60 feet wide; main warehouse, two stories high, 400 x 60 feet, and another warehouse 100 x 200 feet, besides several smaller buildings. Illustrations are given of soft and hard wood Refrigerators, Apartment House Refrigerators, Sideboards, Butchers', Grocers' and Florists' Refrigerators, Double Coolers, &c.
